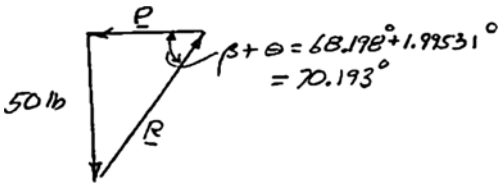
$$OD = \sqrt{(2\text{ in.})^2 + (5\text{ in.})^2}$$

$$OD = 5.3852\text{ in.}$$

$$\sin\theta = \frac{OE}{OD} = \frac{0.1875\text{ in.}}{5.3852\text{ in.}}$$

$$\theta = 1.99531°$$

Force triangle:



P
$\beta+\theta = 68.198° + 1.99531°$
$= 70.193°$
50 lb
R

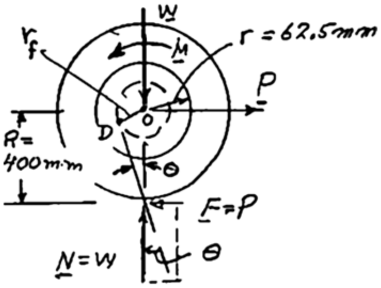
$$P = \frac{50}{\tan(\beta+\theta)} = \frac{50\text{ lb}}{\tan 70.193°}$$

P = 18.01 lb ◀

PROBLEM 8.91

A loaded railroad car has a mass of 30 Mg and is supported by eight 800-mm-diameter wheels with 125-mm-diameter axles. Knowing that the coefficients of friction are $\mu_s = 0.020$ and $\mu_k = 0.015$, determine the horizontal force required (*a*) to start the car moving, (*b*) to keep the car moving at a constant speed. Neglect rolling resistance between the wheels and the track.

SOLUTION



$$r_f = \mu r; \quad R = 400 \text{ mm}$$

$$\sin\theta = \tan\theta = \frac{r_f}{R} = \frac{\mu r}{R}$$

$$P = W\tan\theta = W\frac{\mu r}{R}$$

$$P = W\mu\frac{62.5 \text{ mm}}{400 \text{ mm}}$$

$$= 0.15625W\mu$$

For one wheel:

$$W = \frac{1}{8}(30 \text{ mg})(9.81 \text{ m/s}^2)$$

$$= \frac{1}{8}(294.3 \text{ kN})$$

For eight wheels of railroad car:

$$\Sigma P = 8(0.15625)\frac{1}{8}(294.3 \text{ kN})\mu$$

$$= (45.984\mu) \text{ kN}$$

(*a*) To start motion:

$$\mu_s = 0.020$$

$$\Sigma P = (45.984)(0.020)$$

$$= 0.9197 \text{ kN}$$

$\Sigma P = 920$ N ◀

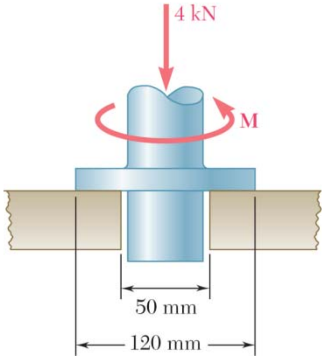
(*b*) To maintain motion:

$$\mu_k = 0.015$$

$$\Sigma P = (45.984)(0.015)$$

$$= 0.6897 \text{ kN}$$

$\Sigma P = 690$ N ◀



PROBLEM 8.92

Knowing that a couple of magnitude $30\ \text{N}\cdot\text{m}$ is required to start the vertical shaft rotating, determine the coefficient of static friction between the annular surfaces of contact.

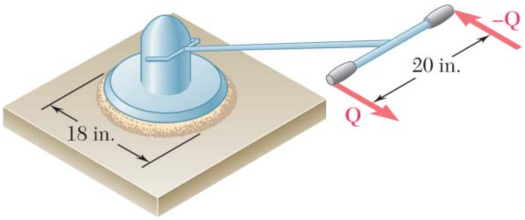
SOLUTION

For annular contact regions, use Equation 8.8 with impending slipping:

$$M = \frac{2}{3}\mu_s N \frac{R_2^3 - R_1^3}{R_2^2 - R_1^2}$$

So,
$$30\ \text{N}\cdot\text{m} = \frac{2}{3}\mu_s (4000\ \text{N})\frac{(0.06\ \text{m})^3 - (0.025\ \text{m})^3}{(0.06\ \text{m})^2 - (0.025\ \text{m})^2}$$

$$\mu_s = 0.1670 \blacktriangleleft$$



PROBLEM 8.93

A 50-lb electric floor polisher is operated on a surface for which the coefficient of kinetic friction is 0.25. Assuming that the normal force per unit area between the disk and the floor is uniformly distributed, determine the magnitude Q of the horizontal forces required to prevent motion of the machine.

SOLUTION

See Figure 8.12 and Eq. (8.9).

Using:

$$R = 9\text{ in.}$$
$$P = 50\text{ lb}$$

and

$$\mu_k = 0.25$$
$$M = \frac{2}{3}\mu_k PR = \frac{2}{3}(0.25)(50\text{ lb})(9\text{ in.})$$
$$= 75\text{ lb}\cdot\text{in.}$$

$\Sigma M_y = 0$ yields:

$$M = Q(20\text{ in.})$$
$$75\text{ lb}\cdot\text{in.} = Q(20\text{ in.})$$

$Q = 3.75\text{ lb}$ ◀

PROBLEM 8.94*

The frictional resistance of a thrust bearing decreases as the shaft and bearing surfaces wear out. It is generally assumed that the wear is directly proportional to the distance traveled by any given point of the shaft and thus to the distance r from the point to the axis of the shaft. Assuming, then, that the normal force per unit area is inversely proportional to r, show that the magnitude M of the couple required to overcome the frictional resistance of a worn-out end bearing (with contact over the full circular area) is equal to 75 percent of the value given by Eq. (8.9) for a new bearing.

SOLUTION

Using Figure 8.12, we assume

$$\Delta N = \frac{k}{r}\Delta A: \quad \Delta A = r\Delta\theta\,\Delta r$$

$$\Delta N = \frac{k}{r} r\Delta\theta\Delta r = k\Delta\theta\Delta r$$

We write

$$P = \Sigma\Delta N \quad \text{or} \quad P = \int dN$$

$$P = \int_0^{2\pi}\int_0^R k\Delta\theta\Delta r = 2\pi Rk; \quad k = \frac{P}{2\pi R}$$

$$\Delta N = \frac{P\Delta\theta\Delta r}{2\pi R}$$

$$\Delta M = r\Delta F = r\mu_k \Delta N = r\mu_k \frac{P\Delta\theta\Delta r}{2\pi R}$$

$$M = \int_0^{2\pi}\int_0^R \frac{\mu_k P}{2\pi R} rdrd\theta = \frac{2\pi\mu_k P}{2\pi R}\cdot\frac{R^2}{2} = \frac{1}{2}\mu_k PR$$

From Eq. (8.9) for a new bearing,

$$M_{\text{new}} = \frac{2}{3}\mu_k PR$$

Thus,

$$\frac{M}{M_{\text{new}}} = \frac{\frac{1}{2}}{\frac{2}{3}} = \frac{3}{4}$$

$M = 0.75M_{\text{new}}$ ◀

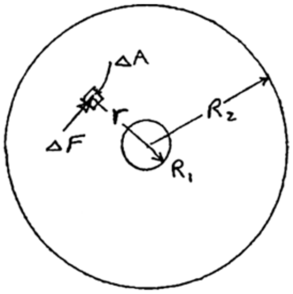
PROBLEM 8.95*

Assuming that bearings wear out as indicated in Problem 8.94, show that the magnitude M of the couple required to overcome the frictional resistance of a worn-out collar bearing is

$$M = \tfrac{1}{2}\mu_k P(R_1 + R_2)$$

where P= magnitude of the total axial force
R_1, R_2= inner and outer radii of collar

SOLUTION



Let normal force on ΔA be ΔN, and $\dfrac{\Delta N}{\Delta A} = \dfrac{k}{r}$.

As in the text, $\Delta F = \mu \Delta N \quad \Delta M = r\Delta F$

The total normal force P is

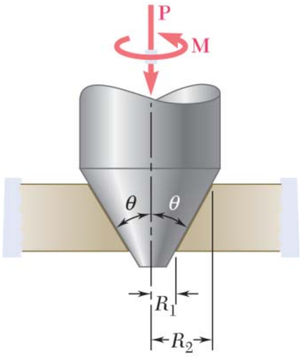
$$P = \lim_{\Delta A \to 0} \Sigma \Delta N = \int_0^{2\pi}\left(\int_{R_1}^{R_2} \frac{k}{r} r\,dr\right) d\theta$$

$$P = 2\pi \int_{R_1}^{R_2} k\,dr = 2\pi k(R_2 - R_1) \quad \text{or} \quad k = \frac{P}{2\pi(R_2 - R_1)}$$

Total couple: $$M_{\text{worn}} = \lim_{\Delta A \to 0} \Sigma \Delta M = \int_0^{2\pi}\left(\int_{R_1}^{R_2} r\mu \frac{k}{r} r\,dr\right) d\theta$$

$$M_{\text{worn}} = 2\pi\mu k \int_{R_1}^{R_2} (r\,dr) = \pi\mu k\left(R_2^2 - R_1^2\right) = \frac{\pi\mu P\left(R_2^2 - R_1^2\right)}{2\pi(R_2 - R_1)}$$

$$M_{\text{worn}} = \frac{1}{2}\mu P(R_2 + R_1) \blacktriangleleft$$



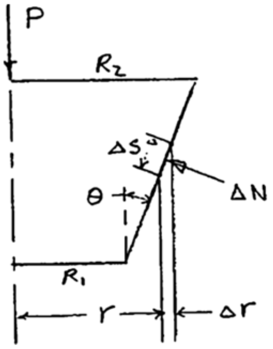
PROBLEM 8.96*

Assuming that the pressure between the surfaces of contact is uniform, show that the magnitude M of the couple required to overcome frictional resistance for the conical bearing shown is

$$M = \frac{2}{3}\frac{\mu_k P}{\sin\theta}\frac{R_2^3 - R_1^3}{R_2^2 - R_1^2}$$

SOLUTION

Let normal force on ΔA be ΔN and $\dfrac{\Delta N}{\Delta A} = k.$



So $\qquad \Delta N = k\Delta A \qquad \Delta A = r\Delta s\Delta\phi \qquad \Delta s = \dfrac{\Delta r}{\sin\theta}$

where ϕ is the azimuthal angle around the symmetry axis of rotation.

$$\Delta F_y = \Delta N\sin\theta = kr\Delta r\Delta\phi$$

Total vertical force: $\qquad P = \lim\limits_{\Delta A\to 0}\Sigma\Delta F_y$

$$P = \int_0^{2\pi}\left(\int_{R_1}^{R_2} krdr\right)d\phi = 2\pi k\int_{R_1}^{R_2} rdr$$

$$P = \pi k\left(R_2^2 - R_1^2\right) \quad \text{or} \quad k = \frac{P}{\pi\left(R_2^2 - R_1^2\right)}$$

Friction force: $\qquad \Delta F = \mu\Delta N = \mu k\Delta A$

Moment: $\qquad \Delta M = r\Delta F = r\mu kr\dfrac{\Delta r}{\sin\theta}\Delta\phi$

Total couple: $\qquad M = \lim\limits_{\Delta A\to 0}\Sigma\Delta M = \displaystyle\int_0^{2\pi}\left(\int_{R_1}^{R_2}\frac{\mu k}{\sin\theta}r^2dr\right)d\phi$

$$M = 2\pi\frac{\mu k}{\sin\theta}\int_{R_1}^{R_2} r^2dr = \frac{2}{3}\frac{\pi\mu}{\sin\theta}\frac{P}{\pi\left(R_2^2 - R_3^2\right)}\left(R_2^3 - R_3^3\right)$$

$$M = \frac{2}{3}\frac{\mu P}{\sin\theta}\frac{R_2^3 - R_1^3}{R_2^2 - R_1^2} \blacktriangleleft$$

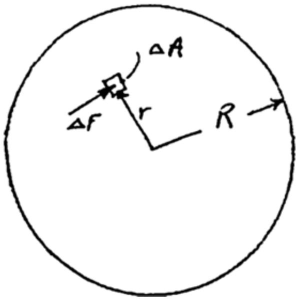
PROBLEM 8.97

Solve Problem 8.93 assuming that the normal force per unit area between the disk and the floor varies linearly from a maximum at the center to zero at the circumference of the disk.

PROBLEM 8.93 A 50-lb electric floor polisher is operated on a surface for which the coefficient of kinetic friction is 0.25. Assuming that the normal force per unit area between the disk and the floor is uniformly distributed, determine the magnitude Q of the horizontal forces required to prevent motion of the machine.

SOLUTION

Let normal force on ΔA be ΔN and $\dfrac{\Delta N}{\Delta A} = k\left(1-\dfrac{r}{R}\right)$.



$$\Delta F = \mu \Delta N = \mu k\left(1-\frac{r}{R}\right)\Delta A = \mu k\left(1-\frac{r}{R}\right) r\Delta r\Delta\theta$$

$$P = \lim_{\Delta A\to 0} \Sigma\Delta N = \int_0^{2\pi}\left[\int_0^R k\left(1-\frac{r}{R}\right) rdr\right]d\theta$$

$$P = 2\pi k\int_0^R \left(1-\frac{r}{R}\right) rdr = 2\pi k\left(\frac{R^2}{2}-\frac{R^3}{3R}\right)$$

$$P = \frac{1}{3}\pi kR^2 \quad \text{or} \quad k = \frac{3P}{\pi R^2}$$

$$M = \lim_{\Delta A\to 0} \Sigma r\Delta F = \int_0^{2\pi}\left[\int_0^R r\mu k\left(1-\frac{r}{R}\right) rdr\right]d\theta$$

$$= 2\pi\mu k\int_0^R \left(r^2-\frac{r^3}{R}\right)dr$$

$$= 2\pi\mu k\left(\frac{R^3}{3}-\frac{R^4}{4R}\right) = \frac{1}{6}\pi\mu kR^3$$

$$= \frac{\pi\mu}{6}\frac{3P}{\pi R^2}R^3 = \frac{1}{2}\mu PR$$

where $\mu = \mu_k = 0.25 \quad R = 9 \text{ in.}$

PROBLEM 8.97 (Continued)

$$P = W = 50 \text{ lb}$$

Then $$M = \frac{1}{2}(0.25)(50 \text{ lb})(9 \text{ in.})$$
$$= 56.250 \text{ lb}\cdot\text{in.}$$

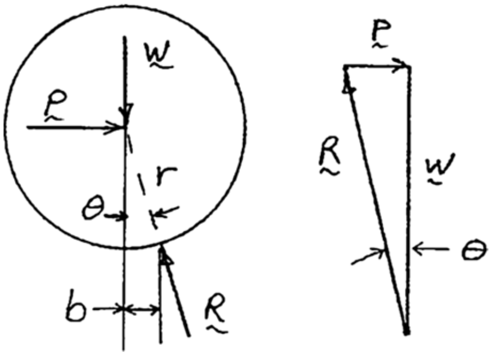
Finally $$Q = \frac{M}{d} = \frac{56.250 \text{ lb}\cdot\text{in.}}{20 \text{ in.}}$$ $Q = 2.81$ lb ◀

PROBLEM 8.98

Determine the horizontal force required to move a 2500-lb automobile with 23-in.-diameter tires along a horizontal road at a constant speed. Neglect all forms of friction except rolling resistance, and assume the coefficient of rolling resistance to be 0.05 in.

SOLUTION

FBD wheel:



$$r = 11.5 \text{ in.}$$

$$b = 0.05 \text{ in.}$$

$$\theta = \sin^{-1}\frac{b}{r}$$

$P = W\tan\theta = W\tan\left(\sin^{-1}\frac{b}{r}\right)$ for each wheel, so for total

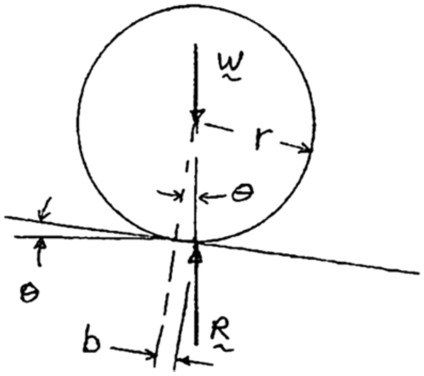
$$P = 2500 \text{ lb}\tan\left(\sin^{-1}\frac{0.05}{11.5}\right) \qquad P = 10.87 \text{ lb} ◀$$

PROBLEM 8.99

Knowing that a 6-in.-diameter disk rolls at a constant velocity down a 2 percent incline, determine the coefficient of rolling resistance between the disk and the incline.

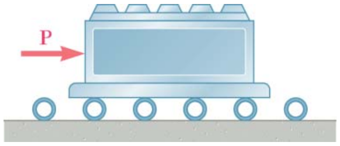
SOLUTION

FBD disk:



$$\tan\theta = \text{slope} = 0.02$$

$$b = r\tan\theta = (3\text{ in.})(0.02) \qquad b = 0.0600\text{ in.} \blacktriangleleft$$

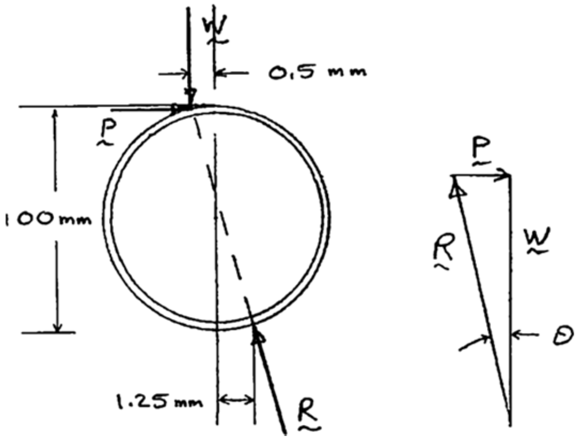


PROBLEM 8.100

A 900-kg machine base is rolled along a concrete floor using a series of steel pipes with outside diameters of 100 mm. Knowing that the coefficient of rolling resistance is 0.5 mm between the pipes and the base and 1.25 mm between the pipes and the concrete floor, determine the magnitude of the force **P** required to slowly move the base along the floor.

SOLUTION

FBD pipe:



$$W = mg$$
$$= (900\text{ kg})(9.81\text{ m/s}^2)$$
$$= 8829.0\text{ N}$$
$$\theta = \sin^{-1}\frac{.5\text{ mm} + 1.25\text{ mm}}{100\text{ mm}}$$
$$= 1.00273°$$

$P = W\tan\theta$ for each pipe, so also for total

$$P = (8829.0\text{ N})\tan(1.00273°)$$

$P = 154.4$ N ◀

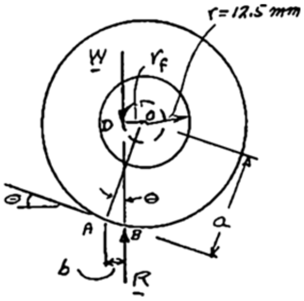
PROBLEM 8.101

Solve Problem 8.85 including the effect of a coefficient of rolling resistance of 1.75 mm.

PROBLEM 8.85 A scooter is to be designed to roll down a 2 percent slope at a constant speed. Assuming that the coefficient of kinetic friction between the 25-mm-diameter axles and the bearings is 0.10, determine the required diameter of the wheels. Neglect the rolling resistance between the wheels and the ground.

SOLUTION

Since the scooter rolls at a constant speed, each wheel is in equilibrium. Thus, **W** and **R** must have a common line of action tangent to the friction circle.



$$a = \text{Radius of wheel}$$

$$\tan\theta = \frac{2}{100} = 0.02$$

Since b and r_f are small compared to a,

$$\tan\theta \approx \frac{r_f + b}{a} = \frac{\mu_k r + b}{a} = 0.02$$

Data: $\mu_k = 0.10, \quad b = 1.75 \text{ mm}, \quad r = 12.5 \text{ mm}$

$$\frac{(0.10)(12.5 \text{ mm}) + 1.75 \text{ mm}}{a} = 0.02$$

$$a = 150 \text{ mm} \qquad \text{Diameter} = 2a = 300 \text{ mm} \blacktriangleleft$$

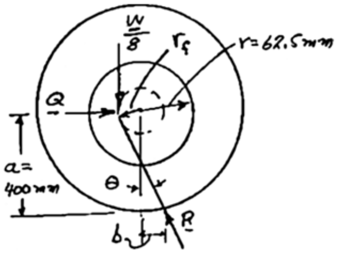
PROBLEM 8.102

Solve Problem 8.91 including the effect of a coefficient of rolling resistance of 0.5 mm.

PROBLEM 8.91 A loaded railroad car has a mass of 30 Mg and is supported by eight 800-mm-diameter wheels with 125-mm-diameter axles. Knowing that the coefficients of friction are $\mu_s = 0.020$ and $\mu_k = 0.015$, determine the horizontal force required (*a*) to start the car moving, (*b*) to keep the car moving at a constant speed. Neglect rolling resistance between the wheels and the track.

SOLUTION

For one wheel:



$$r_f = \mu r$$

$$\tan\theta \approx \sin\theta \approx \frac{r_f + b}{a}$$

$$\tan\theta = \frac{\mu r + b}{a}$$

$$Q = \frac{W}{8}\tan\theta = \frac{W}{8}\frac{\mu r + b}{a}$$

For eight wheels of car:

$$P = W\frac{\mu r + b}{a}$$

$$W = mg = (30 \text{ Mg})(9.81 \text{ m/s}^2) = 294.3 \text{ kN}$$

$$a = 400 \text{ mm}, \quad r = 62.5 \text{ mm}, \quad b = 0.5 \text{ mm}$$

(*a*) To start motion:

$$\mu = \mu_s = 0.02$$

$$P = (294.3 \text{ kN})\frac{(0.020)(62.5 \text{ mm}) + 0.5 \text{ mm}}{400 \text{ mm}}$$

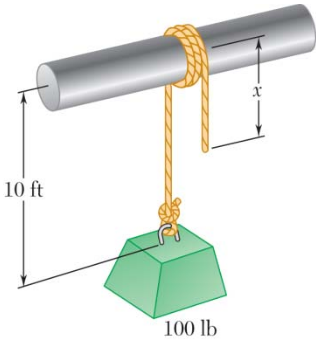
$P = 1.288$ kN ◀

(*b*) To maintain constant speed

$$\mu = \mu_k = 0.015$$

$$P = (294.3 \text{ kN})\frac{(0.015)(62.5 \text{ mm}) + 0.5 \text{ mm}}{400 \text{ mm}}$$

$P = 1.058$ kN ◀



PROBLEM 8.103

A rope having a weight per unit length of 0.4 lb/ft is wound $2\frac{1}{2}$ times around a horizontal rod. Knowing that the coefficient of static friction between the rope and the rod is 0.30, determine the minimum length *x* of rope that should be left hanging if a 100-lb load is to be supported.

SOLUTION

Use eq. (8.14) with

$$T_1 = (0.4 \text{ lb/ft})x$$

$$T_2 = 100 \text{ lb} + (0.4 \text{ lb/ft})(10 \text{ ft}) = 104 \text{ lb}$$

$$\mu_s = 0.30 \qquad \beta = 2.5(2\pi) = 5\pi$$

Then,

$$\frac{T_2}{T_1} = e^{\mu\beta}$$

$$\frac{104}{0.4x} = e^{0.30(5\pi)}$$

$x = 2.34$ ft ◀

PROBLEM 8.104

A hawser is wrapped two full turns around a bollard. By exerting an 80-lb force on the free end of the hawser, a dockworker can resist a force of 5000 lb on the other end of the hawser. Determine (*a*) the coefficient of static friction between the hawser and the bollard, (*b*) the number of times the hawser should be wrapped around the bollard if a 20,000-lb force is to be resisted by the same 80-lb force.

SOLUTION

(*a*)

$$\beta = 2 \text{ turns} = 2(2\pi) = 4\pi$$

$$T_1 = 80 \text{ lb}, \qquad T_2 = 5000 \text{ lb}$$

$$\ln\frac{T_2}{T_1} = \mu_s \beta$$

$$\mu_s = \frac{1}{\beta}\ln\frac{T_2}{T_1} = \frac{1}{4\pi}\ln\frac{5000 \text{ lb}}{80 \text{ lb}}$$

$$\mu_s = \frac{1}{4\pi}\ln 62.5 = \frac{4.1351}{4\pi}$$

$\mu_s = 0.329$ ◀

(*b*)

$$T_1 = 80 \text{ lb}, \quad T_2 = 20{,}000 \text{ lb}, \quad \mu_s = 0.329$$

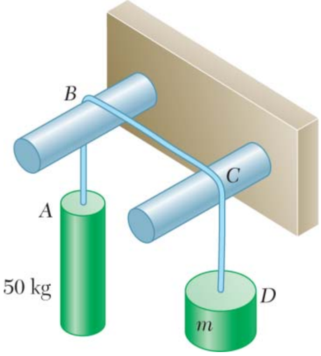
$$\ln\frac{T_2}{T_1} = \mu_s \beta$$

$$\beta = \frac{1}{\mu}\ln\frac{T_2}{T_1} = \frac{1}{0.329}\ln\frac{20{,}000 \text{ lb}}{80 \text{ lb}}$$

$$\beta = \frac{1}{0.329}\ln(250) = \frac{5.5215}{0.329} = 16.783$$

$$\text{Number of turns} = \frac{16.783}{2\pi}$$

Number of turns = 2.67 ◀

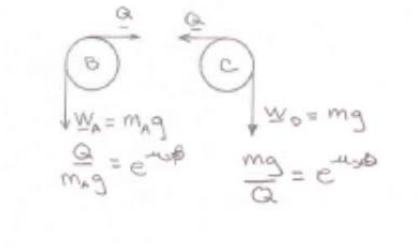


PROBLEM 8.105

Two cylinders are connected by a rope that passes over two fixed rods as shown. Knowing that the coefficient of static friction between the rope and the rods is 0.40, determine the range of the mass *m* of cylinder *D* for which equilibrium is maintained.

SOLUTION

For each rod, $\beta = \frac{\pi}{2}, \quad \mu_s = 0.4$



Q
Q
B
C
$W_A = m_A g$
$W_D = mg$
$\frac{Q}{m_A g} = e^{\mu_s \beta}$
$\frac{mg}{Q} = e^{\mu_s \beta}$

For impending motion of *A* downward,

$$\frac{Q}{m_A g} \cdot \frac{mg}{Q} = e^{\mu_s(\beta+\beta)}: \qquad \frac{m}{m_A} = e^{(0.4)(2)\left(\frac{\pi}{2}\right)} = 3.5136$$

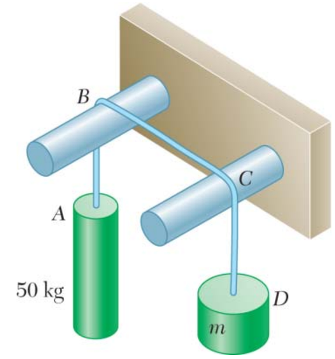
$$m = (50 \text{ kg})(3.5136) = 175.680 \text{ kg}$$

For impending motion of *A* upward,

$$\frac{m_A}{m} = e^{\mu_s(\beta+\beta)} = 3.1536$$

$$m = \frac{50 \text{ kg}}{5.5136} = 14.2304 \text{ kg}$$

Range for equilibrium, $14.23 \text{ kg} \le m \le 175.7 \text{ kg}$ ◀

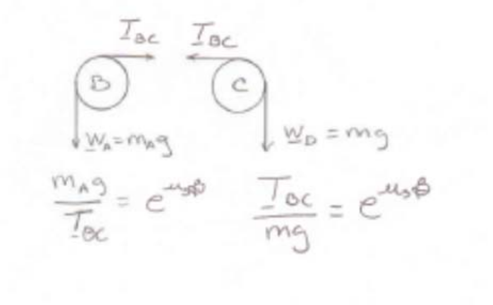


PROBLEM 8.106

Two cylinders are connected by a rope that passes over two fixed rods as shown. Knowing that for cylinder D upward motion impends when $m = 20$ kg, determine (*a*) the coefficient of static friction between the rope and the rods, (*b*) the corresponding tension in portion BC of the rope.

SOLUTION

For each rod, $\beta = \dfrac{\pi}{2}$



T_{BC}
T_{BC}
B
C
$W_A = m_A g$
$W_D = mg$
$\frac{m_A g}{T_{BC}} = e^{\mu_s \beta}$
$\frac{T_{BC}}{mg} = e^{\mu_s \beta}$

(*a*) $$\frac{m_A g}{T_{BC}} \cdot \frac{T_{BC}}{mg} = e^{\mu_s(\beta+\beta)}: \quad \frac{m_A}{m} = e^{\mu_s \pi}$$

$$\frac{50 \text{ kg}}{20 \text{ kg}} = e^{\mu_s \pi}$$
$$0.91629 = \mu_s \pi$$
$$\mu_s = 0.29166$$

$\mu_s = 0.292$ ◀

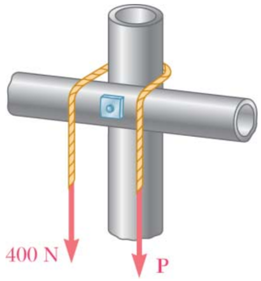
For impending motion of A upward,

$$\frac{m_A}{m} = e^{\mu_s(\beta+\beta)} = 3.1536$$

$$m = \frac{50 \text{ kg}}{5.5136} = 14.2304 \text{ kg}$$

(*b*) $$\frac{T_{BC}}{(20 \text{ kg})g} = e^{(0.29166)\frac{\pi}{2}}$$

$T_{BC} = 310$ N ◀



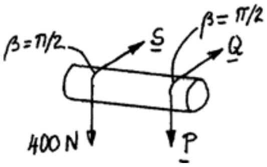
PROBLEM 8.107

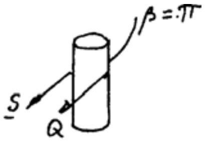
Knowing that the coefficient of static friction is 0.25 between the rope and the horizontal pipe and 0.20 between the rope and the vertical pipe, determine the range of values of *P* for which equilibrium is maintained.

SOLUTION

Horizontal pipe $\mu_s = \mu_h$

Vertical pipe $\mu_s = \mu_v$





For motion of *P* to be impending downward:

$$\frac{P}{Q} = e^{\mu_h(\pi/2)}, \quad \frac{Q}{S} = e^{\mu_v \pi}, \quad \frac{S}{400\text{ N}} = e^{\mu_h(\pi/2)}$$

Multiply equation member by member:

$$\frac{P}{Q}\frac{Q}{S}\frac{S}{400} = e^{(\mu_h + 2\mu_v + \mu_h)(\pi/2)}$$

or:

$$\frac{P}{400\text{ N}} = e^{(\mu_h + \mu_v)\pi} \qquad (1)$$

For motion of **P** to be impending upward, we find in a similar way

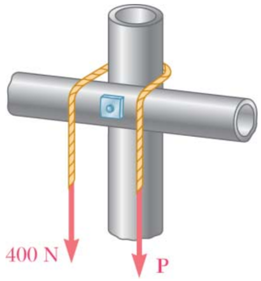
$$\frac{P}{400\text{ N}} = e^{-(\mu_h + \mu_v)\pi} \qquad (2)$$

Given data: $\mu_h = 0.25, \quad \mu_v = 0.20$

From (1): $P = (400\text{ N})e^{0.45\pi} = 1644\text{ N}$

From (2): $P = (400\text{ N})e^{-0.45\pi} = 97.3\text{ N}$

Range for equilibrium: $97.3\text{ N} \leq P \leq 1644\text{ N}$ ◀

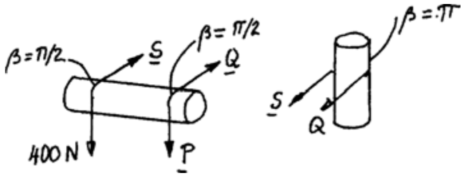


PROBLEM 8.108

Knowing that the coefficient of static friction is 0.30 between the rope and the horizontal pipe and that the smallest value of P for which equilibrium is maintained is 80 N, determine (*a*) the largest value of P for which equilibrium is maintained, (*b*) the coefficient of static friction between the rope and the vertical pipe.

SOLUTION

Horizontal pipe: $\mu_s = \mu_h$ Vertical pipe: $\mu_s = \mu_v$



For motion of P to be impending downward:

$$\frac{P}{Q} = e^{\mu_h(\pi/2)}, \quad \frac{Q}{S} = e^{\mu_v \pi}, \quad \frac{S}{400\text{ N}} = e^{\mu_h(\pi/2)}$$

Multiply equation member by member:

$$\frac{P}{Q}\frac{Q}{S}\frac{S}{400} = e^{(\mu_h + 2\mu_v + \mu_h)(\pi/2)}$$

or:

$$\frac{P}{400\text{ N}} = e^{(\mu_h + \mu_v)\pi} \qquad (1)$$

For motion of **P** to be impending upward, we find in a similar way

$$\frac{P}{400\text{ N}} = e^{-(\mu_h + \mu_v)\pi} \qquad (2)$$

Setting $P = P_{\max}$ in Eq. (1), $P = 80\text{ N}$ in Eq. (2) and $\mu_h = 0.30$ in both, we get

$$\frac{P_{\max}}{400\text{ N}} = e^{(0.30+\mu_v)\pi} \ (1'); \quad \frac{80\text{ N}}{400\text{ N}} = e^{-(0.30+\mu_v)\pi} \ (2')$$

(a) Multiplying $(1')$ by $(2')$:

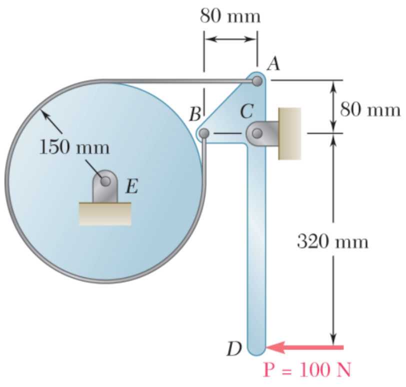
$$\frac{P_{\max}}{400} \cdot \frac{80}{400} = e^0 = 1$$

$P_{\max} = 2000\text{ N}$ ◀

(b) From $(2')$: $(0.30 + \mu_v)\pi = \ln\frac{400}{80} = \ln 5 = 1.60944$

$$0.30 + \mu_v = 0.512$$

$\mu_v = 0.212$ ◀

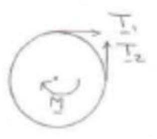


PROBLEM 8.109

A band belt is used to control the speed of a flywheel as shown. Determine the magnitude of the couple being applied to the flywheel, knowing that the coefficient of kinetic friction between the belt and the flywheel is 0.25 and that the flywheel is rotating clockwise at a constant speed. Show that the same result is obtained if the flywheel rotates counterclockwise.

SOLUTION

Free body: Flywheel

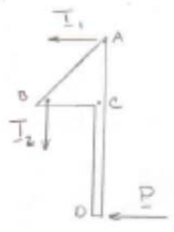


For clockwise rotation of flywheel, $\mathbf{T}_1$ and $\mathbf{T}_2$ are located as shown.

$$\beta = \left(\frac{3}{4}\right)(2\pi) = \frac{3}{2}\pi \text{ radians} \quad \frac{T_2}{T_1} = e^{\mu_k \beta} = e^{0.25\left(\frac{3\pi}{2}\right)} = 3.2482$$

$$T_2 = 3.2482T_1$$

Free body: Handle



$$+\circlearrowleft \Sigma M_C = 0: \quad (T_1 + T_2)(0.08 \text{ m}) - (100 \text{ N})(0.32 \text{ m}) = 0$$

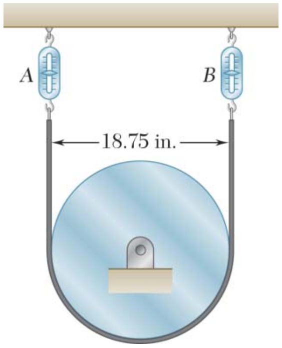
$$T_1 + 3.2482T_1 = 400 \text{ N}$$

$$T_1 = 94.157 \text{ N}, \qquad T_2 = 305.84 \text{ N}$$

From free body: Flywheel

$$+\circlearrowleft \Sigma M_E = 0: \quad M + (T_1 - T_2)(0.15 \text{ m}) = 0$$

$$M + (94.157 \text{ N} - 305.84 \text{ N})(0.15 \text{ m}) = 0 \quad \mathbf{M} = 31.8 \text{ N} \cdot \text{m} \circlearrowleft \blacktriangleleft$$



PROBLEM 8.110

The setup shown is used to measure the output of a small turbine. When the flywheel is at rest, the reading of each spring scale is 14 lb. If a 105-lb · in. couple must be applied to the flywheel to keep it rotating clockwise at a constant speed, determine (*a*) the reading of each scale at that time, (*b*) the coefficient of kinetic friction. Assume that the length of the belt does not change.

SOLUTION

(*a*) Since the length of the belt is constant, the spring in scale *B* will increase in length by $\delta$and the spring in scale *A* will decrease by the same amount. Thus, the sum of the readings in scales *A* and *B* remains constant:

$$T_A + T_B = 14\text{ lb} + 14\text{ lb} \qquad T_A + T_B = 28\text{ lb} \quad (1)$$

On the other hand, the sum of the moments of T_A and T_B about axle must be equal to moment of couple:

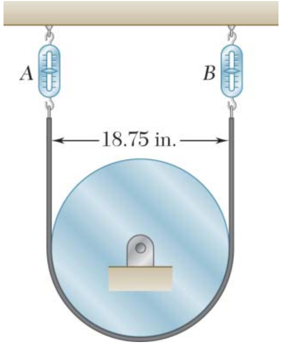
$$(T_B - T_A)(9.375\text{ in.}) = 105\text{ lb}\cdot\text{in.}, \qquad T_B - T_A = 11.2\text{ lb} \quad (2)$$

Solving (1) and (2) simultaneously

$$T_A = 8.40\text{ lb}; \qquad T_B = 19.60\text{ lb} \blacktriangleleft$$

(*b*) Apply Eq. (8.13) with $T_2 = T_B, \quad T_1 = T_A, \ \beta = 180° = \pi$ rad.

$$\ln\frac{T_2}{T_1} = \mu_s \beta: \qquad \mu_s \pi = \ln\frac{19.60}{8.40} = 0.84730 \qquad \mu_s = 0.270 \blacktriangleleft$$



PROBLEM 8.111

The setup shown is used to measure the output of a small turbine. The coefficient of kinetic friction is 0.20 and the reading of each spring scale is 16 lb when the flywheel is at rest. Determine (*a*) the reading of each scale when the flywheel is rotating clockwise at a constant speed, (*b*) the couple that must be applied to the flywheel. Assume that the length of the belt does not change.

SOLUTION

(*a*) Since the length of the belt is constant, the spring in scale *B* will increase in length by $\delta$and the spring in scale *A* will decrease by the same amount. Thus, the sum of the readings in scales *A* and *B* remains constant:

$$T_A + T_B = 16 \text{ lb} + 16 \text{ lb} \qquad T_A + T_B = 32 \text{ lb} \quad (1)$$

We now apply Eq. (8.14) with

$$T_1 = T_A, \quad T_2 = T_B, \quad \mu_k = 0.20, \quad \beta = 180° = \pi \text{ rad.}$$

$$\frac{T_2}{T_1} = e^{\mu_k B}: \quad \frac{T_B}{T_A} = e^{0.20\pi} = 1.87446$$

$$T_B = 1.87446 \; T_A \quad (2)$$

Substituting (2) into (1):

$$T_A + 1.87446 T_A = 32 \text{ lb}$$

$$T_A = 11.1325 \text{ lb} \qquad T_A = 11.13 \text{ lb} \blacktriangleleft$$

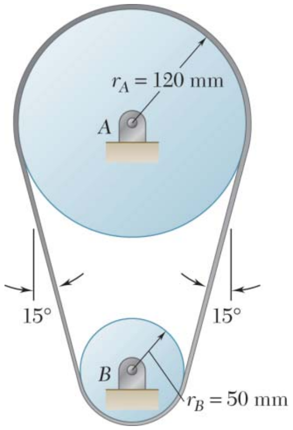
From (1): $T_B = 32 \text{ lb} - 11.1325 \text{ lb}$

$$T_B = 20.868 \text{ lb} \qquad T_B = 20.9 \text{ lb} \blacktriangleleft$$

(*b*) Couple applied to flywheel:

$$M = (T_B - T_A)r$$
$$= (20.868 \text{ lb} - 11.1325 \text{ lb})(9.375 \text{ in.})$$

$$M = 91.3 \text{ lb} \cdot \text{in.} \circlearrowright \blacktriangleleft$$

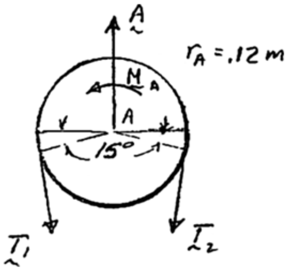


PROBLEM 8.112

A flat belt is used to transmit a couple from drum *B* to drum *A*. Knowing that the coefficient of static friction is 0.40 and that the allowable belt tension is 450 N, determine the largest couple that can be exerted on drum *A*.

SOLUTION

FBD's drums:



$$\beta_A = 180° + 30° = \pi + \frac{\pi}{6} = \frac{7\pi}{6}$$

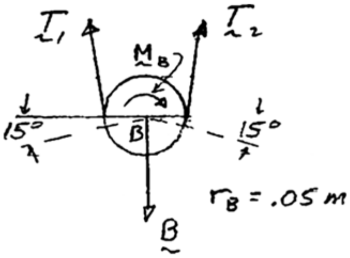
$$\beta_B = 180° - 30° = \pi - \frac{\pi}{6} = \frac{5\pi}{6}$$

Since $\beta_B < \beta_A$, slipping will impend first on *B* (friction coefficients being equal)

So

$$T_2 = T_{\max} = T_1 e^{\mu_s \beta_B}$$

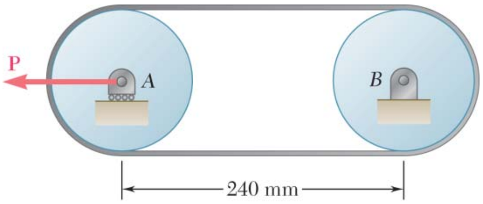
$$450 \text{ N} = T_1 e^{(0.4)5\pi/6} \quad \text{or} \quad T_1 = 157.914 \text{ N}$$



$$\circlearrowleft \Sigma M_A = 0: \quad M_A + (0.12 \text{ m})(T_1 - T_2) = 0$$

$$M_A = (0.12 \text{ m})(450 \text{ N} - 157.914 \text{ N}) = 35.05 \text{ N} \cdot \text{m}$$

$$M_A = 35.1 \text{ N} \cdot \text{m} \blacktriangleleft$$

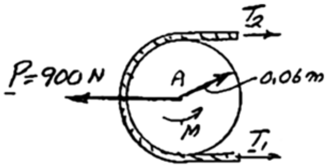


PROBLEM 8.113

A flat belt is used to transmit a couple from pulley *A* to pulley *B*. The radius of each pulley is 60 mm, and a force of magnitude *P*= 900 N is applied as shown to the axle of pulley *A*. Knowing that the coefficient of static friction is 0.35, determine (*a*) the largest couple that can be transmitted, (*b*) the corresponding maximum value of the tension in the belt.

SOLUTION

Drum *A*:



$$\frac{T_2}{T_1} = e^{\mu_s \pi} = e^{(0.35)\pi}$$

$$T_2 = 3.0028 T_1$$

$$\beta = 180° = \pi \text{ radians}$$

(*a*) Torque: $+\circlearrowleft \Sigma M_A = 0: \quad M - (675.15 \text{ N})(0.06 \text{ m}) + (224.84 \text{ N})(0.06 \text{ m})$

$$M = 27.0 \text{ N} \cdot \text{m} \blacktriangleleft$$

(*b*) $\xrightarrow{+} \Sigma F_x = 0: \quad T_1 + T_2 - 900 \text{ N} = 0$

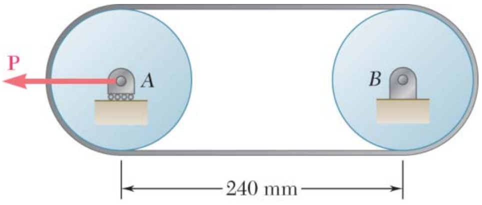
$$T_1 + 3.0028 T_1 - 900 \text{ N} = 0$$

$$4.00282 T_1 = 900$$

$$T_1 = 224.841 \text{ N}$$

$$T_2 = 3.0028(224.841 \text{ N}) = 675.15 \text{ N}$$

$$T_{\max} = 675 \text{ N} \blacktriangleleft$$



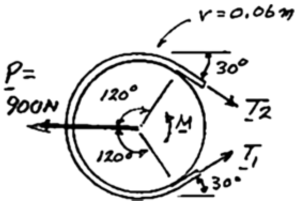
PROBLEM 8.114

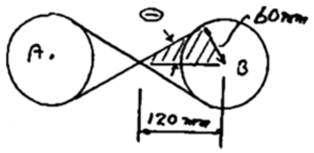
Solve Problem 8.113 assuming that the belt is looped around the pulleys in a figure eight.

PROBLEM 8.113 A flat belt is used to transmit a couple from pulley *A* to pulley *B*. The radius of each pulley is 60 mm, and a force of magnitude *P*= 900 N is applied as shown to the axle of pulley *A*. Knowing that the coefficient of static friction is 0.35, determine (*a*) the largest couple that can be transmitted, (*b*) the corresponding maximum value of the tension in the belt.

SOLUTION

Drum *A*:





$$\beta = 240° = 240°\frac{\pi}{180°} = \frac{4}{3}\pi$$

$$\sin\theta = \frac{60}{120} = \frac{1}{2}$$

$$\theta = 30°$$

$$\frac{T_2}{T_1} = e^{\mu_s \beta} = e^{0.35(4/3\pi)}$$

$$T_2 = 4.3322 T_1$$

(*a*) Torque: $+\circlearrowleft \Sigma M_B = 0: \quad M - (844.3\text{ N})(0.06\text{ m}) + (194.9\text{ N})(0.06\text{ m}) = 0$

$$M = 39.0\text{ N}\cdot\text{m} \blacktriangleleft$$

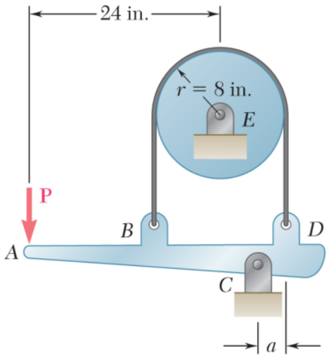
(*b*) $\xrightarrow{+} \Sigma F_x = 0: \quad (T_1 + T_2)\cos 30° - 900\text{ N}$

$$(T_1 + 4.3322T_1)\cos 30° = 900$$

$$T_1 = 194.90\text{ N}$$

$$T_2 = 4.3322(194.90\text{ N}) = 844.3\text{ N}$$

$$T_{\max} = 844\text{ N} \blacktriangleleft$$



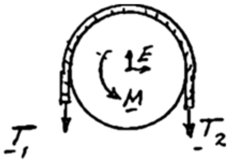
PROBLEM 8.115

The speed of the brake drum shown is controlled by a belt attached to the control bar *AD*. A force **P** of magnitude 25 lb is applied to the control bar at *A*. Determine the magnitude of the couple being applied to the drum, knowing that the coefficient of kinetic friction between the belt and the drum is 0.25, that *a*= 4 in., and that the drum is rotating at a constant speed (*a*) counterclockwise, (*b*) clockwise.

SOLUTION

(*a*) Counterclockwise rotation

Free body: Drum



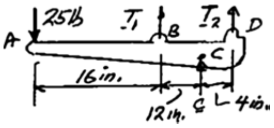
$$r = 8 \text{ in.} \quad \beta = 180° = \pi \text{ radians}$$

$$\frac{T_2}{T_1} = e^{\mu_k \beta} = e^{0.25\pi} = 2.1933$$

$$T_2 = 2.1933 T_1$$

Free body: Control bar

$$+\circlearrowleft \Sigma M_C = 0: \quad T_1(12 \text{ in.}) - T_2(4 \text{ in.}) - (25 \text{ lb})(28 \text{ in.}) = 0$$



$$T_1(12) - 2.1933 T_1(4) - 700 = 0$$

$$T_1 = 216.93 \text{ lb}$$

$$T_2 = 2.1933(216.93 \text{ lb}) = 475.80 \text{ lb}$$

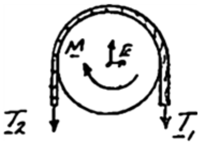
Return to free body of drum

$$+\circlearrowright \Sigma M_E = 0: \quad M + T_1(8 \text{ in.}) - T_2(8 \text{ in.}) = 0$$

$$M + (216.96 \text{ lb})(8 \text{ in.}) - (475.80 \text{ lb})(8 \text{ in.}) = 0$$

$$M = 2070.9 \text{ lb} \cdot \text{in.} \qquad M = 2070 \text{ lb} \cdot \text{in.} ◀$$

(*b*) Clockwise rotation



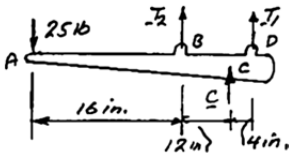
$$r = 8 \text{ in.} \quad \beta = \pi \text{ rad}$$

$$\frac{T_2}{T_1} = e^{\mu_k \beta} = e^{0.25\pi} = 2.1933$$

$$T_2 = 2.1933 T_1$$

PROBLEM 8.115 (Continued)

Free body: Control rod



$$+\circlearrowright \Sigma M_C = 0: \quad T_2(12\text{ in.}) - T_1(4\text{ in.}) - (25\text{ lb})(28\text{ in.}) = 0$$

$$2.1933T_1(12) - T_1(4) - 700 = 0$$

$$T_1 = 31.363\text{ lb}$$

$$T_2 = 2.1933(31.363\text{ lb})$$

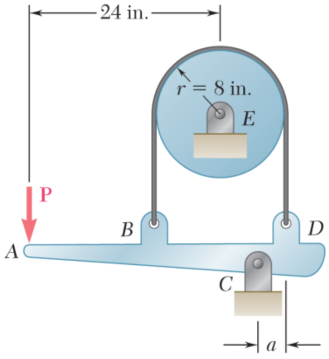
$$T_2 = 68.788\text{ lb}$$

Return to free body of drum

$$+\circlearrowright \Sigma M_E = 0: \quad M + T_1(8\text{ in.}) - T_2(8\text{ in.}) = 0$$

$$M + (31.363\text{ lb})(8\text{ in.}) - (68.788\text{ lb})(8\text{ in.}) = 0$$

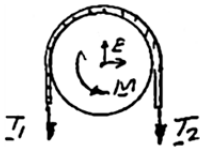
$$M = 299.4\text{ lb}\cdot\text{in.} \qquad M = 299\text{ lb}\cdot\text{in.} \blacktriangleleft$$



PROBLEM 8.116

The speed of the brake drum shown is controlled by a belt attached to the control bar *AD*. Knowing that *a*= 4 in., determine the maximum value of the coefficient of static friction for which the brake is not self-locking when the drum rotates counterclockwise.

SOLUTION

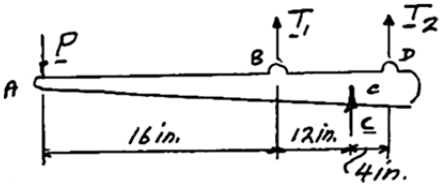


$$r = 8\text{ in.},\quad \beta = 180° = \pi\text{ radians}$$

$$\frac{T_2}{T_1} = e^{\mu_s\beta} = e^{\mu_s\pi}$$

$$T_2 = e^{\mu_s\pi}T_1$$

Free body: Control rod



$$+\circlearrowleft \Sigma M_C = 0:\quad P(28\text{ in.}) - T_1(12\text{ in.}) + T_2(4\text{ in.}) = 0$$

$$28P - 12T_1 + e^{\mu\pi}T_1(4) = 0$$

For self-locking brake: $P = 0$

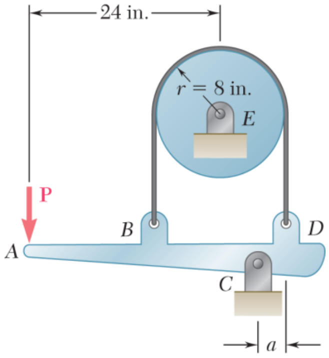
$$12T_1 = 4T_1e^{\mu_s\pi}$$

$$e^{\mu_s\pi} = 3$$

$$\mu_s\pi = \ln 3 = 1.0986$$

$$\mu_s = \frac{1.0986}{\pi} = 0.3497$$

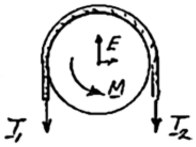
$\mu_s = 0.350$ ◀



PROBLEM 8.117

The speed of the brake drum shown is controlled by a belt attached to the control bar *AD*. Knowing that the coefficient of static friction is 0.30 and that the brake drum is rotating counterclockwise, determine the minimum value of *a* for which the brake is not self-locking.

SOLUTION

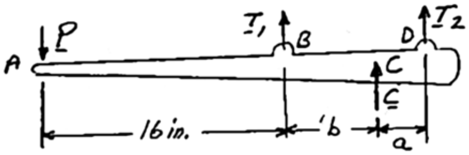


$$r = 8\text{ in.},\quad \beta = \pi \text{ radians}$$

$$\frac{T_2}{T_1} = e^{\mu_s \beta} = e^{0.30\pi} = 2.5663$$

$$T_2 = 2.5663 T_1$$

Free body: Control rod



$$b = 16\text{ in.} - a$$

$$+\circlearrowleft \Sigma M_C = 0:\quad P(16\text{ in.} + b) - T_1 b + T_2 a = 0$$

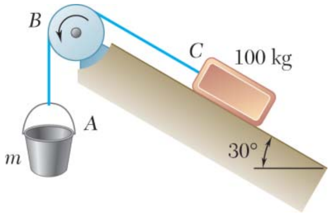
For brake to be self-locking, $P = 0$

$$T_2 a = T_1 b;\quad 2.5663 T_1 a = T_1(16 - a)$$

$$2.5663a = 16 - a$$

$$3.5663a = 16$$

$a = 4.49$ in. ◀

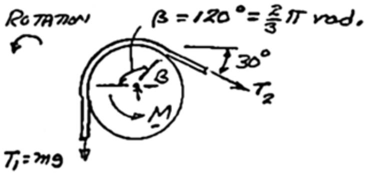


PROBLEM 8.118

Bucket *A* and block *C* are connected by a cable that passes over drum *B*. Knowing that drum *B* rotates slowly counterclockwise and that the coefficients of friction at all surfaces are $\mu_s = 0.35$ and $\mu_k = 0.25$, determine the smallest combined mass *m* of the bucket and its contents for which block *C* will (*a*) remain at rest, (*b*) start moving up the incline, (*c*) continue moving up the incline at a constant speed.

SOLUTION

Free body: Drum



$$\frac{T_2}{mg} = e^{\mu \frac{2}{3}\pi}$$

$$T_2 = mge^{2\mu\pi/3} \qquad (1)$$

(*a*) Smallest *m* for block *C* to remain at rest

Cable slips on drum.

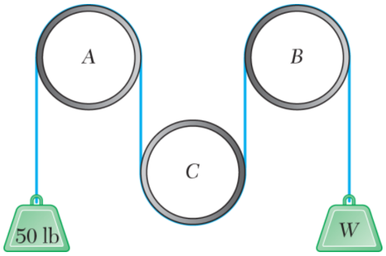
$W = 31.2\text{ lb}$ ◀



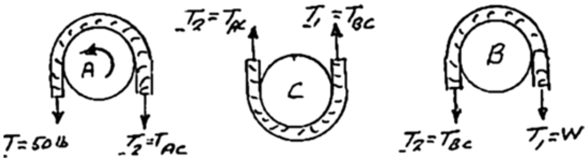
PROBLEM 8.123

A cable is placed around three parallel pipes. Two of the pipes are fixed and do not rotate; the third pipe is slowly rotated. Knowing that the coefficients of friction are $\mu_s = 0.25$ and $\mu_k = 0.20$, determine the largest weight W that can be raised (*a*) if only pipe A is rotated counterclockwise, (*b*) if only pipe C is rotated clockwise.

SOLUTION

(*a*) Pipe *A* rotates $\circlearrowleft$

$\beta = \pi,\ \mu = \mu_s \qquad \beta = \pi,\ \mu = \mu_k \qquad \beta = \pi,\ \mu = \mu_k$



$$\frac{T_{AC}}{50\text{ lb}} = e^{0.25\pi} \qquad \frac{T_{AC}}{T_{BC}} = e^{0.2\pi} \qquad \frac{T_{BC}}{W} = e^{0.2\pi}$$

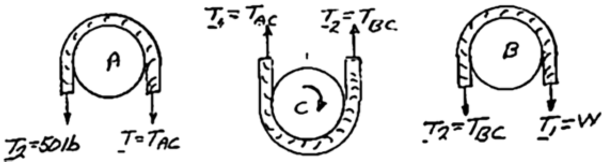
$$\frac{T_{AC}}{50\text{ lb}} \cdot \frac{T_{BC}}{T_{AC}} \cdot \frac{W}{T_{BC}} = e^{\pi/4} \cdot e^{-\pi/5} \cdot e^{-\pi/5}$$

$$= e^{\pi(1/4-1/5-1/5)} = e^{-3\pi/20} = 0.62423$$

$$\frac{W}{50\text{ lb}} = 0.62423; \quad W = 31.21\text{ lb} \qquad W = 31.2\text{ lb} \blacktriangleleft$$

(*b*) Pipe *C* rotates $\circlearrowright$

$\beta = \pi,\ \mu = \mu_k \qquad \beta = \pi,\ \mu = \mu_s \qquad \beta = \pi,\ \mu = \mu_k$

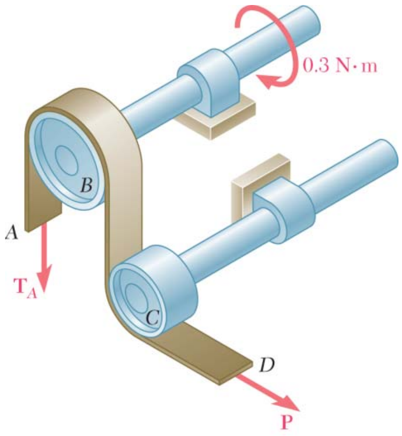


$$\frac{50\text{ lb}}{T_{AC}} = e^{0.2\pi} \qquad \frac{T_{BC}}{T_{AC}} = e^{0.25\pi} \qquad \frac{T_{BC}}{W} = e^{0.2\pi}$$

$$\frac{50\text{ lb}}{T_{AC}} \cdot \frac{T_{AC}}{T_{BC}} \cdot \frac{T_{BC}}{W} = e^{\pi/5} \cdot e^{-\pi/4} \cdot e^{\pi/5} = e^{\pi(1/5-1/4+1/5)} = e^{3\pi/20}$$

$$\frac{50\text{ lb}}{W} = e^{3\pi/20} = 1.602$$

$$W = \frac{50\text{ lb}}{1.602} = 31.21\text{ lb} \qquad W = 31.2\text{ lb} \blacktriangleleft$$

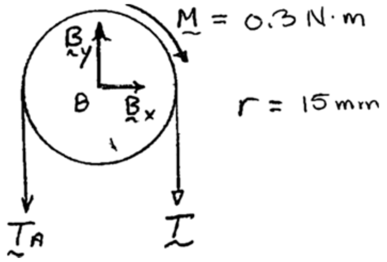


PROBLEM 8.124

A recording tape passes over the 20-mm-radius drive drum *B* and under the idler drum *C*. Knowing that the coefficients of friction between the tape and the drums are $\mu_s = 0.40$ and $\mu_k = 0.30$ and that drum *C* is free to rotate, determine the smallest allowable value of *P* if slipping of the tape on drum *B* is not to occur.

SOLUTION

FBD drive drum:



$$\circlearrowleft \Sigma M_B = 0: \quad r(T_A - T) - M = 0$$

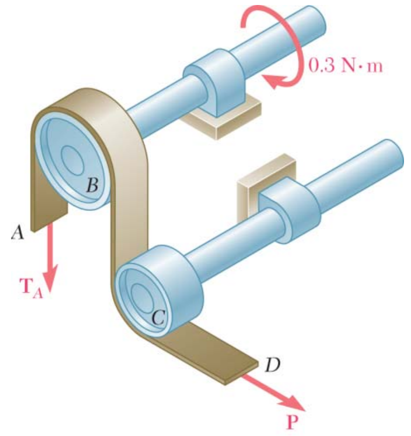
$$T_A - T = \frac{M}{r} = \frac{300\ \text{N}\cdot\text{mm}}{20\ \text{mm}} = 15.0000\ \text{N}$$

Impending slipping: $T_A = Te^{\mu_s \beta} = Te^{0.4\pi}$

So $T(e^{0.4\pi} - 1) = 15.0000\ \text{N}$

or $T = 5.9676\ \text{N}$

If *C* is free to rotate, $P = T$ $\qquad P = 5.97\ \text{N}$ ◀



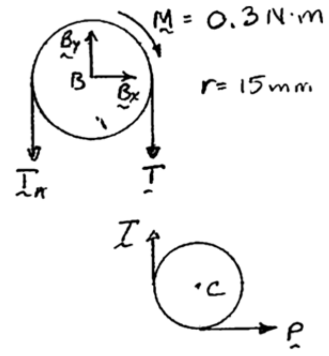
PROBLEM 8.125

Solve Problem 8.124 assuming that the idler drum *C* is frozen and cannot rotate.

PROBLEM 8.124 A recording tape passes over the 20-mm-radius drive drum *B* and under the idler drum *C*. Knowing that the coefficients of friction between the tape and the drums are $\mu_s = 0.40$ and $\mu_k = 0.30$ and that drum *C* is free to rotate, determine the smallest allowable value of *P* if slipping of the tape on drum *B* is not to occur.

SOLUTION

FBD drive drum:



$$\circlearrowleft \Sigma M_B = 0: \quad r(T_A - T) - M = 0$$

$$T_A - T = \frac{M}{r} = 300\ \text{N}\cdot\text{mm} = 15.0000\ \text{N}$$

Impending slipping: $T_A = Te^{\mu_s\beta} = Te^{0.4\pi}$

So $(e^{0.4\pi} - 1)T = 15.000\ \text{N}$

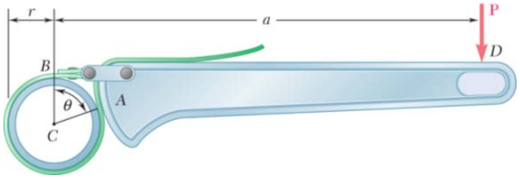
or $T = 5.9676\ \text{N}$

If *C* is fixed, the tape must slip $\circlearrowleft$

So $P = Te^{\mu_k\beta_C} = (5.9676\ \text{N})e^{0.3\pi/2} = 9.5600\ \text{N}$ $\quad P = 9.56\ \text{N}$ ◀

PROBLEM 8.126

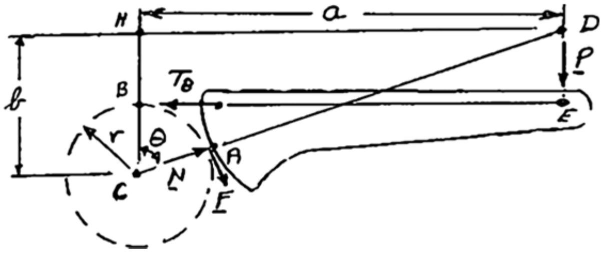
The strap wrench shown is used to grip the pipe firmly without marring the external surface of the pipe. Knowing that the coefficient of static friction is the same for all surfaces of contact, determine the smallest value of μ_s for which the wrench will be self-locking when $a = 200$ mm, $r = 30$ mm, and $\theta = 65°$.



SOLUTION

For wrench to be self-locking $(P = 0)$, the value of μ_s must prevent slipping of strap which is in contact with the pipe from Point *A* to Point *B*and must be large enough so that at Point *A* the strap tension can increase from zero to the minimum tension required to develop “belt friction” between strap and pipe.

Free body: Wrench handle



Geometry In ΔCDH:

$$CH = \frac{a}{\tan\theta}$$

$$CD = \frac{a}{\sin\theta}$$

$$DE = BH = CH - BC$$

$$DE = \frac{a}{\tan\theta} - r$$

$$AD = CD - CA = \frac{a}{\sin\theta} - r$$

On wrench handle

$$+\circlearrowleft \Sigma M_D = 0: \quad T_B(DE) - F(AD) = 0$$

$$\frac{T_B}{F} = \frac{AD}{DE} = \frac{\dfrac{a}{\sin\theta} - r}{\dfrac{a}{\tan\theta} - r} \qquad (1)$$

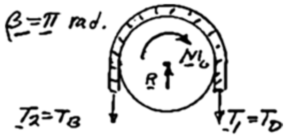
PROBLEM 8.129

Solve Problem 8.128 assuming that a clockwise couple $\mathbf{M}_0$ is applied to the drum.

PROBLEM 8.128 The 10-lb bar *AE* is suspended by a cable that passes over a 5-in.-radius drum. Vertical motion of end *E* of the bar is prevented by the two stops shown. Knowing that $\mu_s = 0.30$ between the cable and the drum, determine (*a*) the largest counterclockwise couple $\mathbf{M}_0$ that can be applied to the drum if slipping is not to occur, (*b*) the corresponding force exerted on end *E* of the bar.

SOLUTION



Drum: Slipping impends

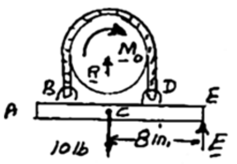
$$\mu_s = 0.30$$

$$\frac{T_2}{T_1} = e^{\mu\beta}$$

$$\frac{T_B}{T_D} = e^{0.30\pi} = 2.5663$$

$$T_B = 2.5663 T_D$$

(*a*) Free body: Drum and bar

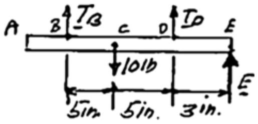


$$+\circlearrowright \Sigma M_C = 0: \quad M_0 - E(8 \text{ in.}) = 0$$

$$M_0 = (2.1538 \text{ lb})(8 \text{ in.})$$

$$\mathbf{M}_0 = 17.23 \text{ lb} \cdot \text{in.} \circlearrowright \blacktriangleleft$$

(*b*) Bar *AE*:



$$+\uparrow \Sigma F_y = 0: \quad T_B + T_D + E - 10 \text{ lb} = 0$$

$$= 2.5663 T_D + T_D + E - 10 \text{ lb}$$

$$E = -3.5663 T_D + 10 \text{ lb} \qquad (1)$$

$$+\circlearrowleft \Sigma M_B = 0: \quad T_D(10 \text{ in.}) - (10 \text{ lb})(5 \text{ in.}) + E(13 \text{ in.}) = 0$$

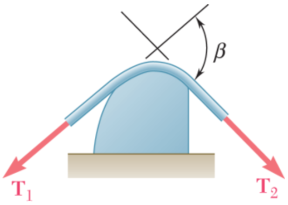
$$T_D(10 \text{ in.}) - 50 \text{ lb} \cdot \text{in.} + (-3.5663 T_D + 10 \text{ lb})(13 \text{ in.}) = 0$$

$$-36.362 T_D + 80 \text{ lb} \cdot \text{in.} = 0; \quad T_D = 2.200 \text{ lb}$$

Eq. (1):

$$E = -3.5633(2.200 \text{ lb}) + 10 \text{ lb}$$

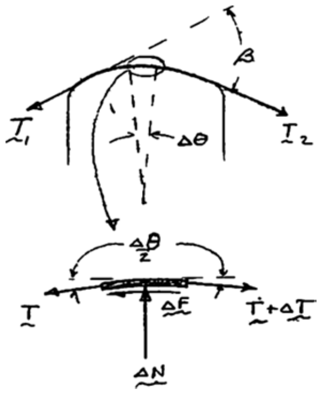
$$E = +2.1538 \text{ lb} \qquad \mathbf{E} = 2.15 \text{ lb} \uparrow \blacktriangleleft$$



PROBLEM 8.130

Prove that Eqs. (8.13) and (8.14) are valid for any shape of surface provided that the coefficient of friction is the same at all points of contact.

SOLUTION



$$\uparrow \Sigma F_n = 0: \quad \Delta N - [T + (T + \Delta T)]\sin\frac{\Delta\theta}{2} = 0$$

or
$$\Delta N = (2T + \Delta T)\sin\frac{\Delta\theta}{2}$$

$$\longrightarrow \Sigma F_t = 0: \quad [(T + \Delta T) - T]\cos\frac{\Delta\theta}{2} - \Delta F = 0$$

or
$$\Delta F = \Delta T \cos\frac{\Delta\theta}{2}$$

Impending slipping:
$$\Delta F = \mu_s \Delta N$$

So
$$\Delta T \cos\frac{\Delta\theta}{2} = \mu_s 2T \sin\frac{\Delta\theta}{2} + \mu_s \Delta T \frac{\sin\Delta\theta}{2}$$

In limit as
$$\Delta\theta \longrightarrow 0: \quad dT = \mu_s T d\theta \quad \text{or} \quad \frac{dT}{T} = \mu_s d\theta$$

So
$$\int_{T_1}^{T_2} \frac{dT}{T} = \int_0^{\beta} \mu_s d\theta$$

and
$$\ln\frac{T_2}{T_1} = \mu_s \beta \qquad \text{or} \quad T_2 = T_1 e^{\mu_s \beta} \blacktriangleleft$$

(*Note:* Nothing above depends on the shape of the surface, except it is assumed to be a smooth curve.)

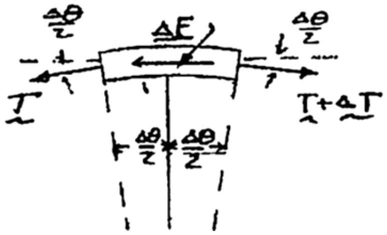
PROBLEM 8.131

Complete the derivation of Eq. (8.15), which relates the tension in both parts of a V belt.

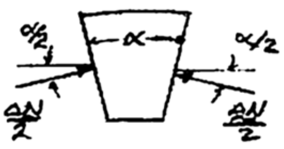
SOLUTION

Small belt section:

Side view:



End view:



$$\uparrow \Sigma F_y = 0: \quad 2\frac{\Delta N}{2}\sin\frac{\alpha}{2} - [T + (T + \Delta T)]\sin\frac{\Delta\theta}{2} = 0$$

$$\longrightarrow \Sigma F_x = 0: \quad [(T + \Delta T) - T]\cos\frac{\Delta\theta}{2} - \Delta F = 0$$

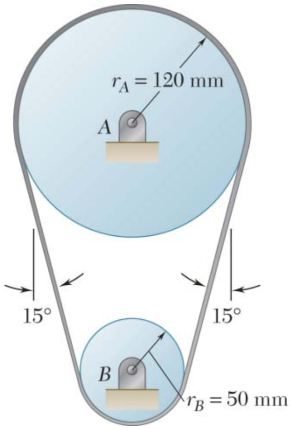
Impending slipping:
$$\Delta F = \mu_s \Delta N \Rightarrow \Delta T\cos\frac{\Delta\theta}{2} = \mu_s\frac{2T + \Delta T}{\sin\frac{\alpha}{2}}\sin\frac{\Delta\theta}{2}$$

In limit as
$$\Delta\theta \longrightarrow 0: \quad dT = \frac{\mu_s T d\theta}{\sin\frac{\alpha}{2}} \quad \text{or} \quad \frac{dT}{T} = \frac{\mu_s}{\sin\frac{\alpha}{2}}d\theta$$

so
$$\int_{T_1}^{T_2}\frac{dT}{T} = \frac{\mu_s}{\sin\frac{\alpha}{2}}\int_0^\beta d\theta$$

or
$$\ln\frac{T_2}{T_1} = \frac{\mu_s\beta}{\sin\frac{\alpha}{2}}$$

or
$$T_2 = T_1 e^{\mu_s\beta/\sin\frac{\alpha}{2}} \blacktriangleleft$$



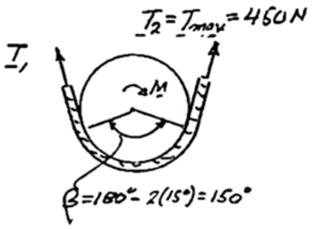
PROBLEM 8.132

Solve Problem 8.112 assuming that the flat belt and drums are replaced by a V belt and V pulleys with $\alpha = 36°$. (The angle α is as shown in Figure 8.15*a*.)

PROBLEM 8.112 A flat belt is used to transmit a couple from drum *B* to drum *A*. Knowing that the coefficient of static friction is 0.40 and that the allowable belt tension is 450 N, determine the largest couple that can be exerted on drum *A*.

SOLUTION

Since β is smaller for pulley *B*. The belt will slip first at *B*.



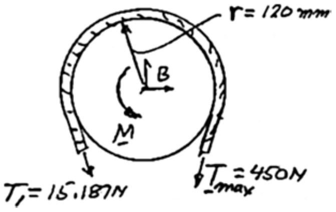
$$\beta = 150°\left(\frac{\pi \text{ rad}}{180°}\right) = \frac{5}{6}\pi \text{ rad}$$

$$\frac{T_2}{T_1} = e^{\mu_s \beta / \sin\frac{\alpha}{2}}$$

$$\frac{450 \text{ N}}{T_1} = e^{(0.4)\frac{5}{6}\pi/\sin 18°} = e^{3.389}$$

$$\frac{450 \text{ N}}{T_1} = 29.63; \quad T_1 = 15.187 \text{ N}$$

Torque on pulley *A*:

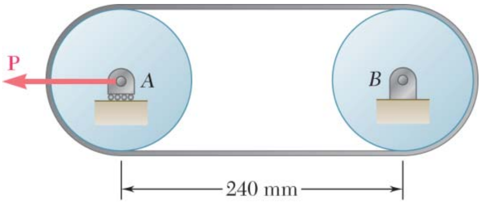


$$+\circlearrowleft \Sigma M_B = 0: \quad M - (T_{\text{max}} - T_1)(0.12 \text{ m}) = 0$$

$$M - (450 \text{ N} - 15.187 \text{ N})(0.12 \text{ m}) = 0$$

$$M = 52.18 \text{ N}\cdot\text{m}$$

$M = 52.2$ N · m ◀



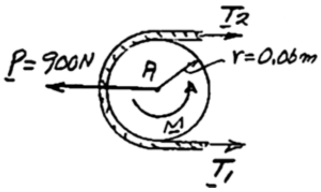
PROBLEM 8.133

Solve Problem 8.113 assuming that the flat belt and pulleys are replaced by a V belt and V pulleys with $\alpha = 36°$. (The angle α is as shown in Figure 8.15*a*.)

PROBLEM 8.113 A flat belt is used to transmit a couple from pulley *A* to pulley *B*. The radius of each pulley is 60 mm, and a force of magnitude $P = 900\text{ N}$ is applied as shown to the axle of pulley *A*. Knowing that the coefficient of static friction is 0.35, determine (*a*) the largest couple that can be transmitted, (*b*) the corresponding maximum value of the tension in the belt.

SOLUTION

Pulley *A*: $\beta = \pi\text{ rad}$



$$\frac{T_2}{T_1} = e^{\mu_s \beta / \sin\frac{\alpha}{2}}$$

$$\frac{T_2}{T_1} = e^{0.35\pi/\sin 18°}$$

$$\frac{T_2}{T_1} = e^{3.558} = 35.1$$

$$T_2 = 35.1T_1$$

$$\xrightarrow{+} \Sigma F_x = 0: \quad T_1 + T_2 - 900\text{ N} = 0$$

$$T_1 + 35.1T_1 - 900\text{ N} = 0$$

$$T_1 = 24.93\text{ N}$$

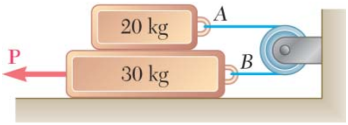
$$T_2 = 35.1(24.93\text{ N}) = 875.03\text{ N}$$

$$+\circlearrowleft \Sigma M_A = 0: \quad M - T_2(0.06\text{ m}) + T_1(0.06\text{ m}) = 0$$

$$M - (875.03\text{ N})(0.06\text{ m}) + (24.93\text{ N})(0.06\text{ m}) = 0$$

$$M = 51.0\text{ N}\cdot\text{m} \blacktriangleleft$$

$$T_{\max} = T_2 \qquad T_{\max} = 875\text{ N} \blacktriangleleft$$



20 kg
A
P
30 kg
B

PROBLEM 8.134

The coefficients of friction are $\mu_s = 0.40$ and $\mu_k = 0.30$ between all surfaces of contact. Determine the smallest force **P** required to start the 30-kg block moving if cable *AB* (*a*) is attached as shown, (*b*) is removed.

SOLUTION

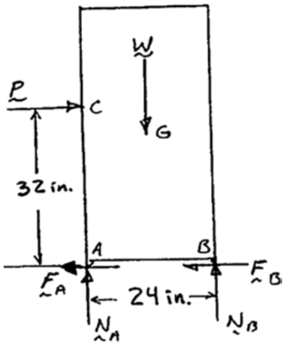
PROBLEM 8.136

A 120-lb cabinet is mounted on casters that can be locked to prevent their rotation. The coefficient of static friction between the floor and each caster is 0.30. If $h = 32$ in., determine the magnitude of the force **P** required to move the cabinet to the right (*a*) if all casters are locked, (*b*) if the casters at *B* are locked and the casters at *A* are free to rotate, (*c*) if the casters at *A* are locked and the casters at *B* are free to rotate.

SOLUTION

FBD cabinet: *Note:* for tipping,



$$N_A = F_A = 0$$

$$\circlearrowleft \Sigma M_B = 0: \quad (12 \text{ in.})W - (32 \text{ in.})P_{\text{tip}} = 0$$

$$P_{\text{tip}} = 2.66667$$

(*a*) All casters locked. Impending slip:

$$F_A = \mu_s N_A$$

$$F_B = \mu_s N_B$$

$$\uparrow \Sigma F_y = 0: \quad N_A + N_B - W = 0$$

$$N_A + N_B = W \qquad W = 120 \text{ lb}$$

So $$F_A + F_B = \mu_s W \qquad \mu_s = 0.3$$

$$\xrightarrow{} \Sigma F_x = 0: \quad P - F_A - F_B = 0$$

$$P = F_A + F_B = \mu_s W$$

$$P = 0.3(120 \text{ lb}) \qquad \text{or} \quad \mathbf{P} = 36.0 \text{ lb} \longrightarrow \blacktriangleleft$$

$$(P = 0.3W < P_{\text{tip}} \quad \text{OK})$$

(*b*) Casters at *A* free, so $F_A = 0$

Impending slip: $F_B = \mu_s N_B$

$$\xrightarrow{} \Sigma F_x = 0: \quad P - F_B = 0$$

$$P = F_B = \mu_s N_B \qquad N_B = \frac{P}{\mu_s}$$

PROBLEM 8.136 (Continued)

$$\circlearrowright \Sigma M_A = 0: \quad (32\text{ in.})P + (12\text{ in.})W - (24\text{ in.})N_B = 0$$

$$8P + 3W - 6\frac{P}{0.3} = 0 \quad P = 0.25W$$

$$(P = 0.25W < P_{\text{tip}} \quad \text{OK})$$

$$P = 0.25(120\text{ lb}) \qquad \text{or} \quad \mathbf{P} = 30.0\text{ lb} \longrightarrow$$ ◀

(*c*) Casters at *B* free, so $F_B = 0$

Impending slip: $F_A = \mu_s N_A$

$$\xrightarrow{} \Sigma F_x = 0: \quad P - F_A = 0 \quad P = F_A = \mu_s N_A$$

$$N_A = \frac{P}{\mu_s} = \frac{P}{0.3}$$

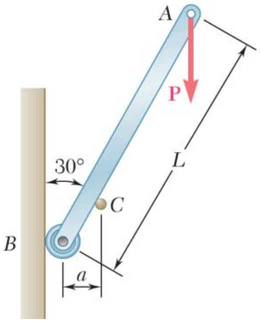
$$\circlearrowleft \Sigma M_B = 0: \quad (12\text{ in.})W - (32\text{ in.})P - (24\text{ in.})N_A = 0$$

$$3W - 8P - 6\frac{P}{0.3} = 0$$

$$P = 0.107143W = 12.8572$$

$$(P < P_{\text{tip}} \quad \text{OK})$$

$$\mathbf{P} = 12.86\text{ lb} \longrightarrow$$ ◀



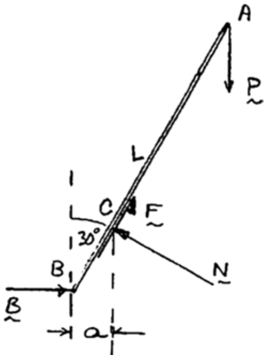
PROBLEM 8.137

A slender rod of length L is lodged between peg C and the vertical wall and supports a load **P** at end A. Knowing that the coefficient of static friction between the peg and the rod is 0.15 and neglecting friction at the roller, determine the range of values of the ratio L/a for which equilibrium is maintained.

SOLUTION

FBD rod:

Free-body diagram: For motion of B impending upward:



$$+\circlearrowleft \Sigma M_B = 0: \quad PL\sin\theta - N_C\left(\frac{a}{\sin\theta}\right) = 0$$

$$N_C = \frac{PL}{a}\sin^2\theta \qquad (1)$$

$$+\uparrow \Sigma F_y = 0: \quad N_C\sin\theta - \mu_s N_C\cos\theta - P = 0$$

$$N_C(\sin\theta - \mu\cos\theta) = P$$

Substitute for N_C from Eq. (1), and solve for a/L.

$$\frac{a}{L} = \sin^2\theta(\sin\theta - \mu_s\cos\theta) \qquad (2)$$

For $\theta = 30°$ and $\mu_s = 0.15$:

$$\frac{a}{L} = \sin^2 30°(\sin 30° - 0.15\cos 30°)$$

$$\frac{a}{L} = 0.092524 \qquad \frac{L}{a} = 10.808$$

For motion of B impending downward, reverse sense of friction force F_C. To do this we make $\mu_s = -0.15$ in. Eq. (2).

Eq. (2):

$$\frac{a}{L} = \sin^2 30°(\sin 30° - (-0.15)\cos 30°)$$

$$\frac{a}{L} = 0.15748 \qquad \frac{L}{a} = 6.350$$

Range of values of L/a for equilibrium: $6.35 \le \frac{L}{a} \le 10.81$ ◀

0.15 m
F_R

$$+\circlearrowright \Sigma M_D = 0: \quad (3 \text{ kN})(0.15 \text{ m}) - F_R(0.15 \text{ m}) - N_R(0.45 \text{ m}) = 0$$

$$0.45 \text{ kN}\cdot\text{m} - (0.3N_R)(0.15 \text{ m}) - N_R(0.45 \text{ m}) = 0$$

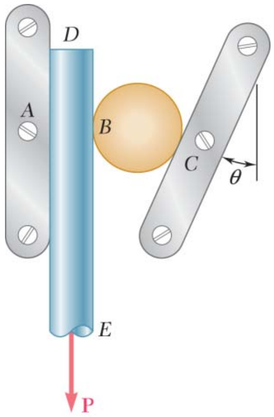
$$0.495 N_R = 0.45$$

$$N_R = 0.9091 \text{ kN}$$
$$F_R = \mu_k N_R = 0.3(0.9091 \text{ kN})$$
$$= 0.2727 \text{ kN} \qquad (3)$$

Substitute for F_L and F_R into (1): $M = (0.25 \text{ m})(0.333 \text{ kN} + 0.2727 \text{ kN})$

$$M = 0.1515 \text{ kN}\cdot\text{m}$$

$$M = 151.5 \text{ N}\cdot\text{m} \blacktriangleleft$$



PROBLEM 8.139

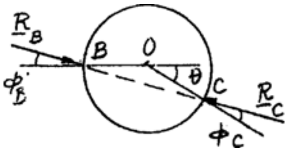
A rod *DE* and a small cylinder are placed between two guides as shown. The rod is not to slip downward, however large the force **P** may be; i.e., the arrangement is said to be self-locking. Neglecting the weight of the cylinder, determine the minimum allowable coefficients of static friction at *A*, *B*, and *C*.

SOLUTION

Free body: Cylinder

Since cylinder is a two-force body, $\mathbf{R}_B$ and $\mathbf{R}_C$ have the same line of action. Thus $\phi_B = \phi_C$:

From triangle *OBC*:



$$\phi_B + \phi_C = \theta$$

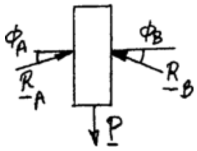
Thus: $$\phi_B = \phi_C = \frac{\theta}{2}$$

For no sliding, we must have $\tan\phi_B \le (\mu_B)_s$, $\tan\phi_C \le (\mu_C)_s$

Therefore: $$(\mu_B)_s \ge \tan\frac{\theta}{2}, \qquad (\mu_c)_s \ge \tan\frac{\theta}{2} \blacktriangleleft$$

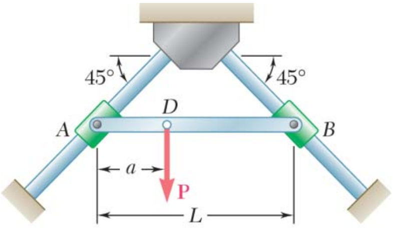
We also note that R_B and R_C are indeterminate.

Free body: Rod



Since R_B is indeterminate, it may be as large as necessary to satisfy equation $\Sigma F_y = 0$, no matter how large **P** is or how small ϕ_A is. Therefore

$(\mu_A)_s$ may have any value ◀

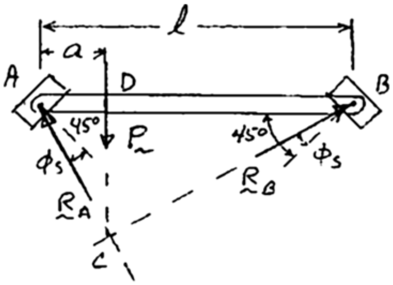


PROBLEM 8.140

Bar *AB* is attached to collars that can slide on the inclined rods shown. A force **P** is applied at Point *D* located at a distance *a* from end *A*. Knowing that the coefficient of static friction μ_s between each collar and the rod upon which it slides is 0.30 and neglecting the weights of the bar and of the collars, determine the smallest value of the ratio *a*/*L* for which equilibrium is maintained.

SOLUTION

FBD bar and collars:



Impending motion:

$$\phi_s = \tan^{-1}\mu_s = \tan^{-1} 0.3 = 16.6992°$$

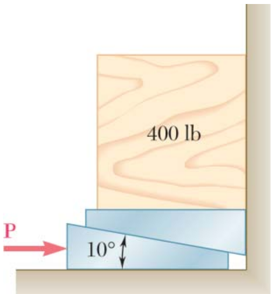
Neglect weights: 3-force *FBD* and $\measuredangle ACB = 90°$

so

$$AC = \frac{a}{\cos(45° + \phi_s)} = l\sin(45° - \phi_s)$$

$$\frac{a}{l} = \sin(45° - 16.6992°)\cos(45° + 16.6992°)$$

$$\frac{a}{l} = 0.225 \blacktriangleleft$$



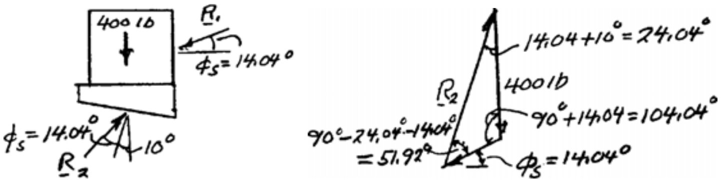
PROBLEM 8.141

Two 10° wedges of negligible weight are used to move and position the 400-lb block. Knowing that the coefficient of static friction is 0.25 at all surfaces of contact, determine the smallest force **P** that should be applied as shown to one of the wedges.

SOLUTION

Free body: Block and top wedge $\phi_s = \tan^{-1} 0.25 = 14.04°$

Force triangle



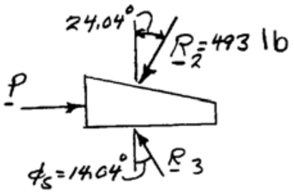
400 lb
R1
ϕs = 14.04°
ϕs = 14.04°
R2
10°
14.04 + 10° = 24.04°
400 lb
R2
90° + 14.04 = 104.04°
90° − 24.04° − 14.04°
= 51.92°
ϕs = 14.04°

Law of sines:

$$\frac{R_2}{\sin 104.04°} = \frac{400\text{ lb}}{\sin 51.92°}$$

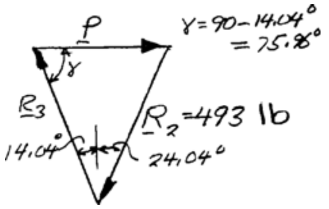
$$R_2 = 493\text{ lb}$$

Free body: Lower wedge



24.04°
R2 = 493 lb
P
ϕs = 14.04°
R3

Force triangle



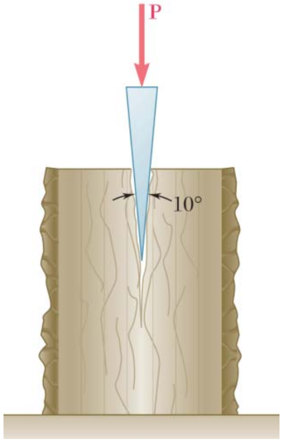
P
γ = 90 − 14.04°
= 75.96°
γ
R3
R2 = 493 lb
14.04°
24.04°

Law of sine:

$$\frac{P}{\sin(14.04° + 24.04°)} = \frac{493\text{ lb}}{\sin 75.96°}$$

$$P = 313.4\text{ N}$$

$$\mathbf{P} = 313\text{ lb} \longrightarrow$$ ◀

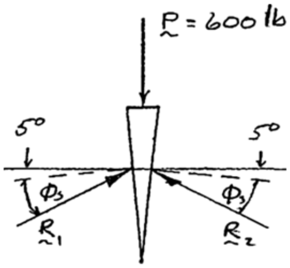


PROBLEM 8.142

A 10° wedge is used to split a section of a log. The coefficient of static friction between the wedge and the log is 0.35. Knowing that a force **P** of magnitude 600 lb was required to insert the wedge, determine the magnitude of the forces exerted on the wood by the wedge after insertion.

SOLUTION

FBD wedge (impending motion ↓):



$$\phi_s = \tan^{-1}\mu_s$$

$$= \tan^{-1} 0.35$$

$$= 19.29°$$

By symmetry: $R_1 = R_2$

$$\uparrow \Sigma F_y = 0: \quad 2R_1 \sin(5° + \phi_s) - 600 \text{ lb} = 0$$

or $$R_1 = R_2 = \frac{300 \text{ lb}}{\sin(5°+19.29°)} = 729.30 \text{ lb}$$

When P is removed, the vertical components of R_1 and R_2 vanish, leaving the horizontal components

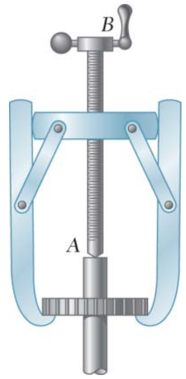
$$R_{1x} = R_{2x}$$

$$= R_1 \cos(5° + \phi_s)$$

$$= (729.30 \text{ lb})\cos(5° + 19.29°)$$

$$R_{1x} = R_{2x} = 665 \text{ lb} \blacktriangleleft$$

(Note that $\phi_s > 5°$, so wedge is self-locking.)

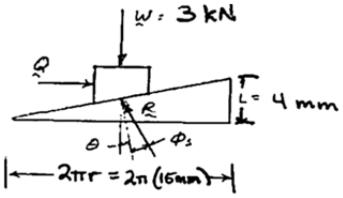


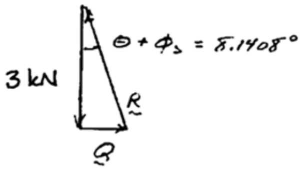
PROBLEM 8.143

In the gear-pulling assembly shown the square-threaded screw *AB* has a mean radius of 15 mm and a lead of 4 mm. Knowing that the coefficient of static friction is 0.10, determine the couple that must be applied to the screw in order to produce a force of 3 kN on the gear. Neglect friction at end *A* of the screw.

SOLUTION

Block/Incline:





$$\theta = \tan^{-1}\frac{4\text{ mm}}{30\pi\text{ mm}}$$

$$= 2.4302°$$

$$\phi_s = \tan^{-1}\mu_s$$

$$= \tan^{-1}(0.10)$$

$$= 5.7106°$$

$$Q = (3000\text{ N})\tan(8.1408°)$$

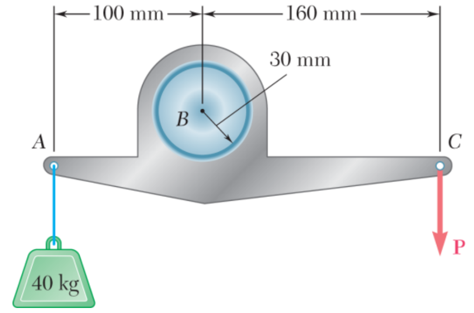
$$= 429.14\text{ N}$$

$$\text{Couple} = rQ$$

$$= (0.015\text{ m})(429.14\text{ N})$$

$$= 6.4371\text{ N}\cdot\text{m}$$

$M = 6.44\text{ N}\cdot\text{m}$ ◀

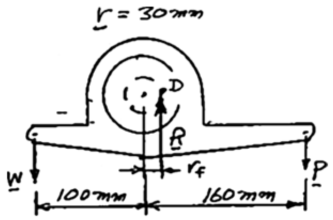


PROBLEM 8.144

A lever of negligible weight is loosely fitted onto a 30-mm-radius fixed shaft as shown. Knowing that a force **P** of magnitude 275 N will just start the lever rotating clockwise, determine (*a*) the coefficient of static friction between the shaft and the lever, (*b*) the smallest force **P** for which the lever does not start rotating counterclockwise.

SOLUTION

(*a*) Impending motion ↻



$$W = (40\text{ kg})(9.81\text{ m/s}^2) = 392.4\text{ N}$$

$$+\circlearrowright \Sigma M_D = 0: \quad P(160 - r_f) - W(100 + r_f) = 0$$

$$r_f = \frac{160P - 100W}{P + W}$$

$$r_f = \frac{(160\text{ mm})(275\text{ N}) - (100\text{ mm})(392.4\text{ N})}{275\text{ N} + 392.4\text{ N}}$$

$$r_f = 7.132\text{ mm}$$

$$r_f = r\sin\phi_s = r\mu_s$$

$$\mu_s = \frac{r_f}{r} = \frac{7.132\text{ mm}}{30\text{ mm}} = 0.2377$$

$\mu_s = 0.238$ ◀

(*b*) Impending motion ↺

$$r_f = r\sin\phi_s = r\mu_s$$

$$= (30\text{ mm})(0.2377)$$

$$r_f = 7.132\text{ mm}$$

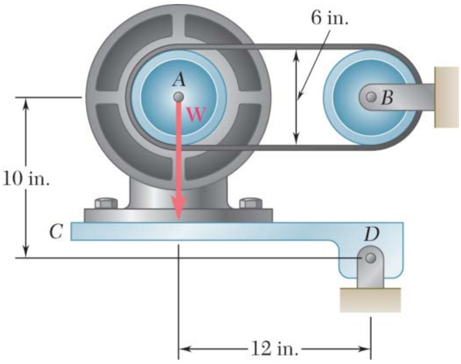
$$P = W\frac{100 - r_f}{160 + r_f}$$

$$P = (392.4\text{ N})\frac{100\text{ mm} - 7.132\text{ mm}}{160\text{ mm} + 7.132\text{ mm}}$$

$$P = 218.04\text{ N}$$

P = 218 N ↓ ◀

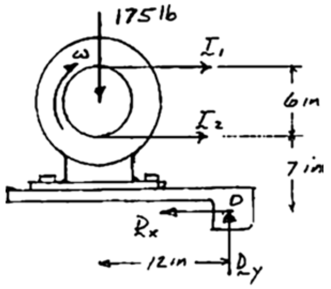


PROBLEM 8.145

In the pivoted motor mount shown the weight **W** of the 175-lb motor is used to maintain tension in the drive belt. Knowing that the coefficient of static friction between the flat belt and drums A and B is 0.40, and neglecting the weight of platform CD, determine the largest couple that can be transmitted to drum B when the drive drum A is rotating clockwise.

SOLUTION

FBD motor and mount:



Impending belt slip: cw rotation

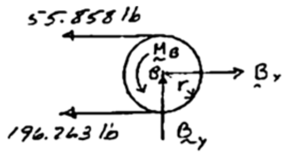
$$T_2 = T_1 e^{\mu_s \beta} = T_1 e^{0.40\pi} = 3.5136 T_1$$

$$\circlearrowleft \Sigma M_D = 0: \quad (12 \text{ in.})(175 \text{ lb}) - (7 \text{ in.})T_2 - (13 \text{ in.})T_1 = 0$$

$$2100 \text{ lb} = [(7 \text{ in.})(3.5136) + 13 \text{ in.}]T_1$$

$$T_1 = 55.858 \text{ lb}, \quad T_2 = 3.5136 T_1 = 196.263 \text{ lb}$$

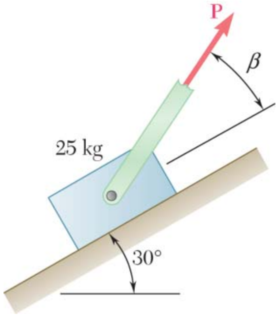
FBD drum at B:



$$\circlearrowleft \Sigma M_B = 0: \quad M_B - (3 \text{ in.})(196.263 \text{ lb} - 55.858 \text{ lb}) = 0$$

$r = 3$ in.

$M_B = 421$ lb · in. ◀

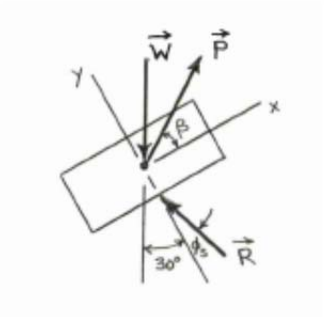


PROBLEM 8.F1

Knowing that the coefficient of friction between the 25-kg block and the incline is $\mu_s = 0.25$, draw the free-body diagram needed to determine both the smallest value of *P* required to start the block moving up the incline and the corresponding value of *β*.

SOLUTION

Free body: Block

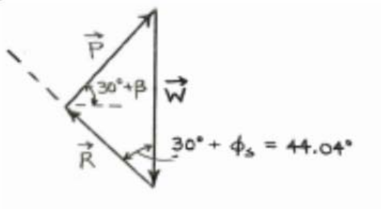


$\vec{W}$
$\vec{P}$
y
x
β
30°
ϕ_s
$\vec{R}$

$$W = (25\text{ kg})(9.81\text{ m/s}^2) = 245.25\text{ N}$$

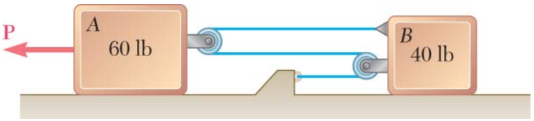
$$\phi_s = \tan^{-1}\mu_s = \tan^{-1}(0.25) = 14.04^\circ$$

Force Triangle:



$\vec{P}$
30°+β
$\vec{W}$
$\vec{R}$
30° + ϕ_s = 44.04°

Note: For minimum *P*, **P** must be perpendicular to **R**; thus, $\beta = \phi_s = 14.04^\circ$

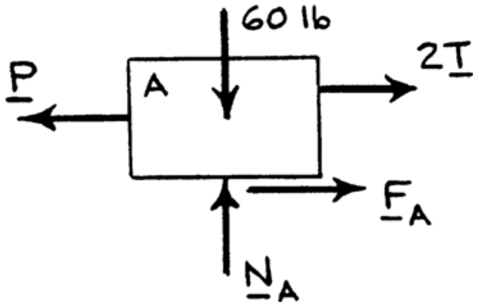


PROBLEM 8.F2

Two blocks *A* and *B* are connected by a cable as shown. Knowing that the coefficient of static friction at all surfaces of contact is 0.30 and neglecting the friction of the pulleys, draw the free-body diagrams needed to determine the smallest force **P** required to move the blocks.

SOLUTION

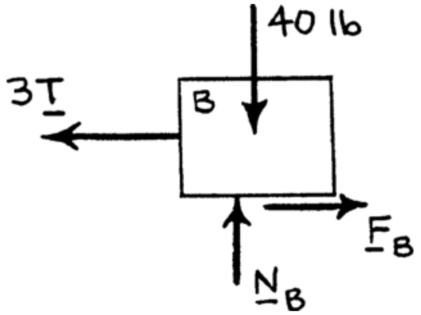
Free body: Block *A*



Motion impends to left, with

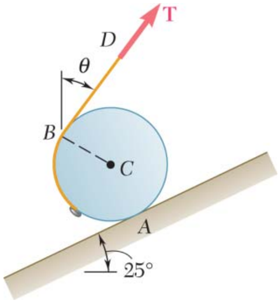
$F_A = \mu_S N_A = 0.30 N_A$

Free body: Block *B*



Motion impends to left, with

$F_B = \mu_s N_B = 0.30\ N_B$



PROBLEM 8.F3

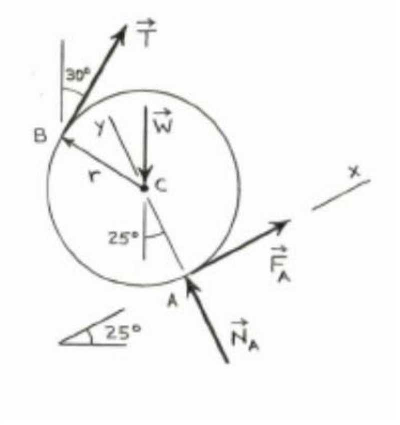
A cord is attached to and partially wound around a cylinder with a weightof *W* and radius *r* that rests on an incline as shown. Knowing that $\theta = 30°$, draw the free-body diagram needed to determine both the tension in the cord and the smallest allowable value of the coefficient of static friction between the cylinder and the incline for which equilibrium is maintained.

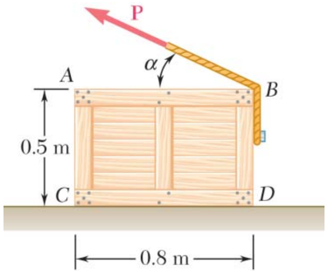
SOLUTION

Free body: Cylinder

For minimum μ_s , motion impends at *A* with

$F_A = \mu_s N_A$

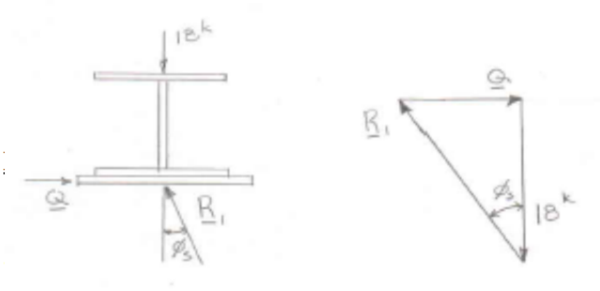




PROBLEM 8.F4

A 40-kg packing crate must be moved to the left along the floor without tipping. Knowing that the coefficient of static friction between the crate and the floor is 0.35, draw the free-body diagram needed to determine both the largest allowable value of α and the corresponding magnitude of the force **P**.

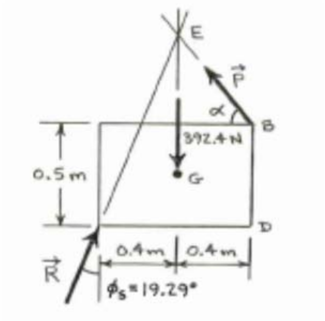
SOLUTION



$1\ \text{m/s}^2) = 392.4\ \text{N}$

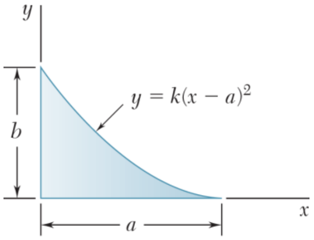
crate and ground is at C only, and the reaction **R** is de, **R** must form with the vertical an angle $\phi_s = \tan^{-1}\mu_s = \tan^{-1}(0.35) = 19.29°$.

Since the crate is a 3-force body, **P** must pass through point E where **R**and **W** intersect. Free body of the crate is then:



Note: After the crate starts moving, μ_s should be replaced with the lower value μ_k. This will yield a larger value of α.

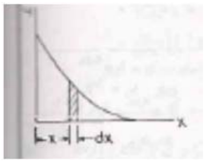
CHAPTER 9



PROBLEM 9.1

Determine by direct integration the moment of inertia of the shaded area with respect to the *y* axis.

SOLUTION



At $x = 0, \quad y = b: \quad b = k(0 - a)^2$

$k = \dfrac{b}{a^2}$ then

$$y = \frac{b}{a^2}(x-a)^2; \; dA = y dx$$

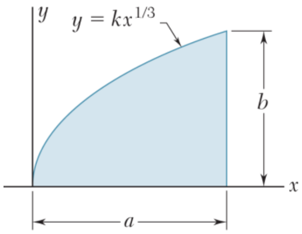
$$dI_y = x^2 dA = x^2 y\, dx$$

$$I_y = \int_0^a \left[\frac{b}{a^2} x^2 (x-a)^2\right] dx$$

$$= \int_0^a \left[\frac{b}{a^2}\left(x^4 - 2ax^3 + a^2x^2\right)\right] dx$$

$$= \frac{b}{a^2}\left[\frac{1}{5}x^5 - \frac{1}{2}ax^4 + \frac{1}{3}a^2x^3\right]_0^a$$

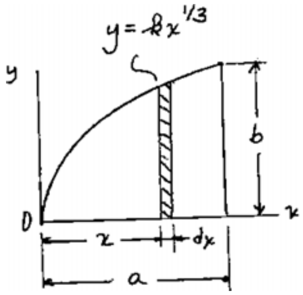
$$I_y = \frac{1}{30}a^3 b \blacktriangleleft$$



PROBLEM 9.2

Determine by direct integration the moment of inertia of the shaded area with respect to the *y* axis.

SOLUTION



$$y = kx^{1/3}$$

For $x = a$:

$$b = ka^{1/3}$$

$$k = b/a^{1/3}$$

Thus:

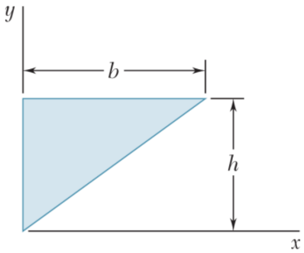
$$y = \frac{b}{a^{1/3}} x^{1/3}$$

$$dI_y = x^2 dA = x^2 y dx$$

$$dI_y = x^2 \frac{b}{a^{1/3}} x^{1/3} dx = \frac{b}{a^{1/3}} x^{7/3} dx$$

$$I_y = \int dI_y = \frac{b}{a^{1/3}} \int_0^a x^{7/3} dx = \frac{b}{a^{1/3}} \left(\frac{3}{10} a^{10/3} \right)$$

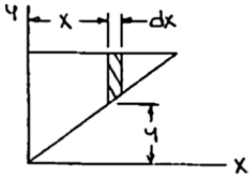
$$I_y = \frac{3}{10} a^3 b \blacktriangleleft$$



PROBLEM 9.3

Determine by direct integration the moment of inertia of the shaded area with respect to the *y* axis.

SOLUTION

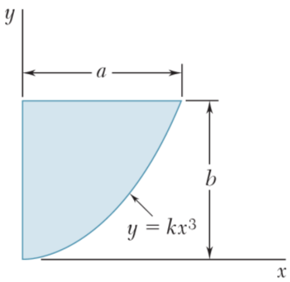


By observation
$$y = \frac{h}{b}x$$

Now
$$dI_y = x^2 \quad dA = x^2[(h-y)dx]$$
$$= hx^2\left(1-\frac{x}{b}\right)dx$$

Then
$$I_y = \int dI_y = \int_0^b hx^2\left(1-\frac{x}{b}\right)dx$$
$$= h\left[\frac{1}{3}x^3 - \frac{x^4}{4b}\right]_0^b$$

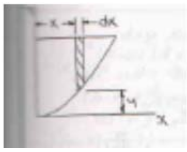
or $I_y = \frac{1}{12}b^3h$ ◀



PROBLEM 9.4

Determine by direct integration the moment of inertia of the shaded area with respect to the *y* axis.

SOLUTION



At $x = 0, \quad y = b: \quad b = ka^3$

$k = \dfrac{b}{a^3}$ then

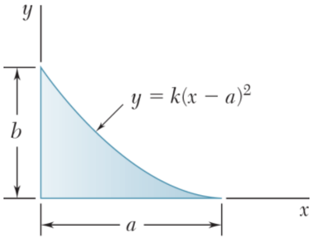
$$y = \frac{b}{a^3}\text{x}^3;\ dA = ydx$$

$$dI_y = x^2 dA = x^2\left(b - y\right)dx$$

$$I_y = \int_0^a \left[bx^2\left(1 - \frac{x^3}{a^3}\right)\right]dx$$

$$= b\left[\frac{1}{3}x^3 - \frac{x^6}{6a^3}\right]_0^a$$

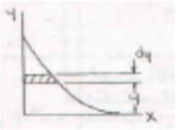
$$I_y = \frac{1}{6}a^3 b \blacktriangleleft$$



PROBLEM 9.5

Determine by direct integration the moment of inertia of the shaded area with respect to the *x* axis.

SOLUTION



At $x = 0, \quad y = b: \quad b = k(0-a)^2$

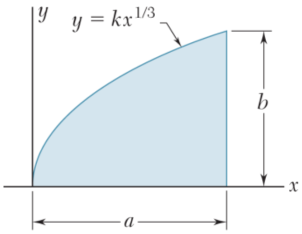
$k = \dfrac{b}{a^2}$ then $y = \dfrac{b}{a^2}(x-a)^2$ or $x = a\left(1 \pm \dfrac{\sqrt{y}}{\sqrt{b}}\right)$, take the negative root so that $y = b$ when $x = 0$.

$$dI_x = y^2 dA = y^2 x\, dy$$

$$I_x = \int_0^b \left[a\left(y^2 - \frac{1}{b^{1/2}} y^{5/2} \right) \right] dy$$

$$= a\left[\frac{1}{3} y^3 - \frac{2}{7}\left(\frac{1}{b^{1/2}}\right) y^{7/2} \right]_0^b$$

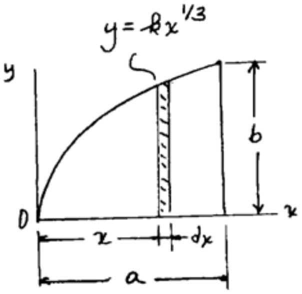
$$I_x = \frac{1}{21} ab^3 \quad ◀$$



PROBLEM 9.6

Determine by direct integration the moment of inertia of the shaded area with respect to the *x* axis.

SOLUTION

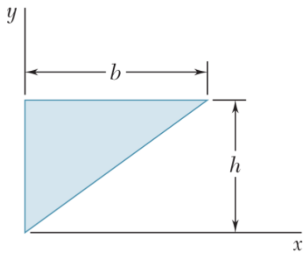


$$y = \frac{b}{a^{1/3}} x^{1/3}$$

$$dI_x = \frac{1}{3} y^3 dx = \frac{1}{3}\left(\frac{b}{a^{1/3}} x^{1/3}\right)^3 dx = \frac{1}{3}\frac{b^3}{a} x dx$$

$$I_x = \int dI_x = \int_0^a \frac{1}{3}\frac{b^3}{a} x dx = \frac{1}{3}\frac{b^3}{a}\frac{a^2}{2}$$

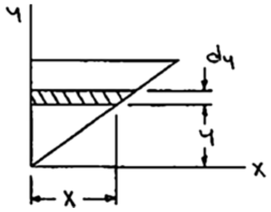
$$I_x = \frac{1}{6} ab^3 \blacktriangleleft$$



PROBLEM 9.7

Determine by direct integration the moment of inertia of the shaded area with respect to the *x* axis.

SOLUTION



By observation $y = \frac{h}{b}x$

or $x = \frac{b}{h}y$

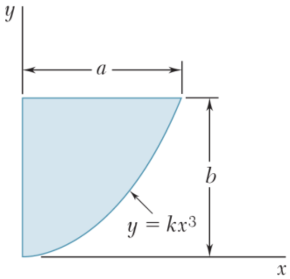
Now

$$dI_x = y^2 dA = y^2 (x\,dy)$$
$$= y^2\left(\frac{b}{h}y\,dy\right)$$
$$= \frac{b}{h}y^3 dy$$

Then

$$I_x = \int dI_x = \int_0^h \frac{b}{h}y^3 dy$$
$$= \frac{b}{h}\left[\frac{1}{4}y^4\right]_0^h$$

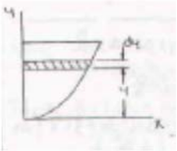
or $I_x = \frac{1}{4}bh^3$ ◀



PROBLEM 9.8

Determine by direct integration the moment of inertia of the shaded area with respect to the *x* axis.

SOLUTION



At $x = a, \quad y = b: \quad b = ka^3$

$k = \dfrac{b}{a^3}$ then

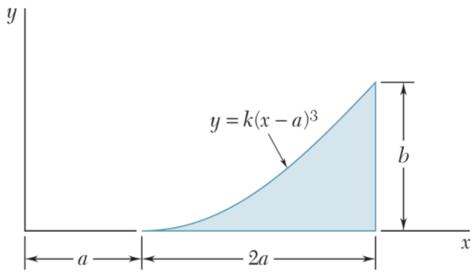
$$y = \frac{b}{a^3}x^3; \; x = \frac{a}{b^{1/3}}y^{1/3}$$

$$dI_x = y^2 dA = y^2\left(\frac{a}{b^{1/3}}y^{1/3}\right)dy$$

$$I_x = \int_0^b \left[\frac{a}{b^{1/3}}y^{7/3}\right]dy$$

$$= \left[\frac{3}{10}\left(\frac{a}{b^{1/3}}\right)y^{10/3}\right]_0^b$$

$$I_x = \frac{3}{10}ab^3 \blacktriangleleft$$

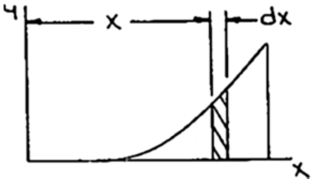


PROBLEM 9.9

Determine by direct integration the moment of inertia of the shaded area with respect to the *x* axis.

SOLUTION

At $x = 3a, \quad y = b$: $\quad b = k(3a-a)^3$



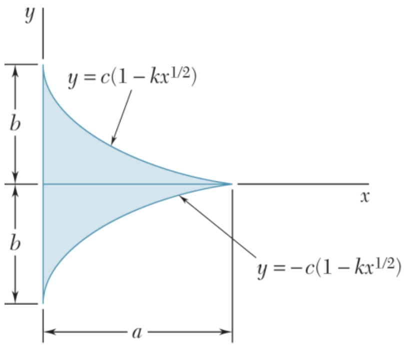
or $\quad k = \dfrac{b}{8a^3}$

Then $\quad y = \dfrac{b}{8a^3}(x-a)^3$

Now
$$dI_x = \frac{1}{3}y^3dx$$
$$= \frac{1}{3}\left[\frac{b}{8a^3}(x-a)^3\right]^3 dx$$
$$= \frac{b^3}{1536a^9}(x-a)^9\,dx$$

Then
$$I_x = \int dI_x = \int_a^{3a}\frac{b^3}{1536a^9}(x-a)^9dx = \frac{b^3}{1536a^9}\left[\frac{1}{10}(x-a)^{10}\right]_a^{3a}$$
$$= \frac{b^3}{15{,}360a^9}[(3a-a)^{10} - 0]$$

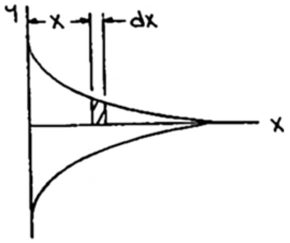
or $\quad I_x = \dfrac{1}{15}ab^3$ ◀



PROBLEM 9.10

Determine by direct integration the moment of inertia of the shaded area with respect to the *x* axis.

SOLUTION



At $x = 0, y = b$: $b = c(1-0)$ or $c = b$

At $x = a, y = 0$: $0 = b(1 - ka^{1/2})$ or $k = \dfrac{1}{a^{1/2}}$

Then $$y = b\left(1 - \frac{x^{1/2}}{a^{1/2}}\right)$$

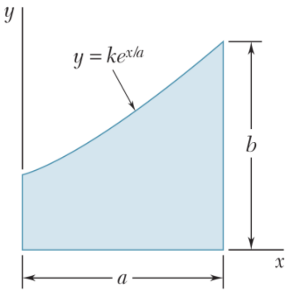
Now $$dI_x = \frac{1}{3}y^3dx = \frac{1}{3}\left[b\left(1 - \frac{x^{1/2}}{a^{1/2}}\right)\right]^3 dx$$

or $$dI_x = \frac{1}{3}b^3\left(1 - 3\frac{x^{1/2}}{a^{1/2}} + 3\frac{x}{a} - \frac{x^{3/2}}{a^{3/2}}\right)dx$$

Then $$I_x = \int dI_x = 2\int_0^a \frac{1}{3}b^3\left(1 - 3\frac{x^{1/2}}{a^{1/2}} + 3\frac{x}{a} - \frac{x^{3/2}}{a^{3/2}}\right)dx$$

$$= \frac{2}{3}b^3\left[x - 2\frac{x^{3/2}}{a^{1/2}} + \frac{3}{2}\frac{x^2}{a} - \frac{2}{5}\frac{x^{5/2}}{a^{3/2}}\right]_0^a$$

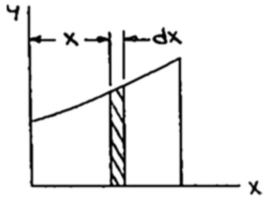
or $I_x = \dfrac{1}{15}ab^3$ ◀



PROBLEM 9.11

Determine by direct integration the moment of inertia of the shaded area with respect to the x axis.

SOLUTION

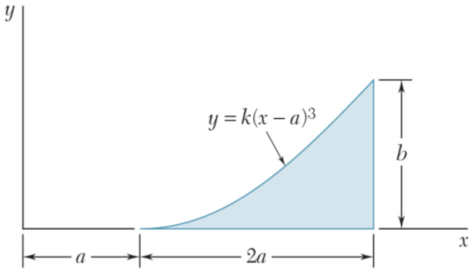


At $x = a,\ y = b$: $\quad b = ke^{a/a} \quad \text{or} \quad k = \frac{b}{e}$

Then $\quad y = \frac{b}{e}e^{x/a} = be^{x/a-1}$

Now
$$dI_x = \frac{1}{3}y^3dx = \frac{1}{3}(be^{x/a-1})^3\,dx$$
$$= \frac{1}{3}b^3e^{3(x/a-1)}dx$$

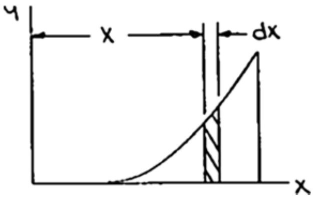
Then
$$I_x = \int dI_x = \int_0^a \frac{1}{3}b^3e^{3(x/a-1)}dx = \frac{b^3}{3}\left[\frac{a}{3}e^{3(x/a-1)}\right]_0^a$$
$$= \frac{1}{9}ab^3(1-e^{-3}) \qquad \text{or} \quad I_x = 0.1056ab^3 \blacktriangleleft$$



PROBLEM 9.12

Determine by direct integration the moment of inertia of the shaded area with respect to the *y* axis.

SOLUTION



At $x = 3a, \quad y = b$: $\quad b = k(3a-a)^3$

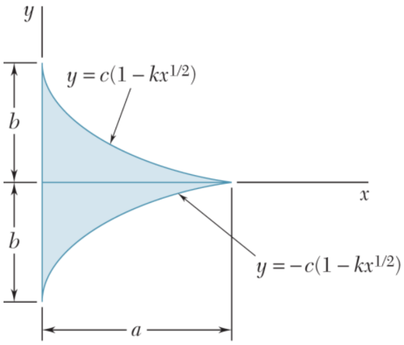
or $\quad k = \dfrac{b}{8a^3}$

Then $\quad y = \dfrac{b}{8a^3}(x-a)^3$

Now
$$dI_y = x^2 dA = x^2(y\,dx) = x^2\left[\frac{b}{8a^3}(x-a)^3\,dx\right]$$
$$= \frac{b}{8a^3}x^2(x^3 - 3x^2a + 3xa^2 - a^3)dx$$

Then
$$I_y = \int dI_y = \int_a^{3a} \frac{b}{8a^3}(x^5 - 3x^4a + 3x^3a^2 - a^3x^2)dx$$
$$= \frac{b}{8a^3}\left[\frac{1}{6}x^6 - \frac{3}{5}ax^5 + \frac{3}{4}a^2x^4 - \frac{1}{3}a^3x^3\right]_a^{3a}$$
$$= \frac{b}{8a^3}\left\{\left[\frac{1}{6}(3a)^6 - \frac{3}{5}a(3a)^5 + \frac{3}{4}a^2(3a)^4 - \frac{1}{3}a^3(3a)^3\right]\right.$$
$$\left. - \left[\frac{1}{6}(a)^6 - \frac{3}{5}a(a)^5 + \frac{3}{4}a^2(a)^4 - \frac{1}{3}a^3(a)^3\right]\right\}$$

or $\quad I_y = 3.43a^3b$ ◀



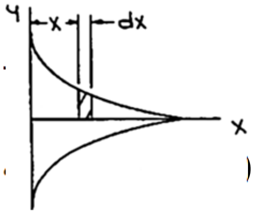
PROBLEM 9.13

Determine by direct integration the moment of inertia of the shaded area with respect to the *y* axis.

SOLUTION

At $x = 0, \quad y = b$: $\qquad b = c(1-0) \qquad$ or $\quad c = b$

$x = a, \quad y = 0$: $\qquad 0 = c(1 - ka^{1/2}) \qquad$ or $\quad k = \dfrac{1}{a^{1/2}}$

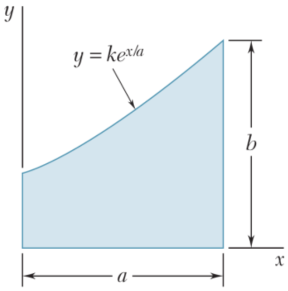


$$\Big) = x^2\left[b\left(1-\frac{x^{1/2}}{a^{1/2}}\right)dx\right]$$

$$I_y = \int dI_y = 2\int_0^a bx^2\left(1-\frac{x^{1/2}}{a^{1/2}}\right)dx$$

$$I_y = 2b\left[\frac{1}{3}x^3 - \frac{2}{7}\frac{x^{7/2}}{a^{1/2}}\right]_0^a$$

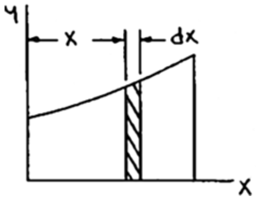
Then $\qquad I_y = \dfrac{2}{21}a^3b$ ◀



PROBLEM 9.14

Determine by direct integration the moment of inertia of the shaded area with respect to the *y* axis.

SOLUTION



At $x = a, \quad y = b$: $\qquad b = ke^{a/a}$

or $\qquad k = \dfrac{b}{e}$

Then $\qquad y = \dfrac{b}{e}e^{x/a} = be^{x/a-1}$

Now
$$dI_y = x^2 dA = x^2(y\,dx)$$
$$= x^2(be^{x/a-1}dx)$$

Then $\qquad I_y = \int dI_y = \int_0^a bx^2 e^{x/a-1}dx$

Now use integration by parts with

$$u = x^2 \qquad dv = e^{x/a-1}dx$$
$$du = 2x\,dx \qquad v = ae^{x/a-1}$$

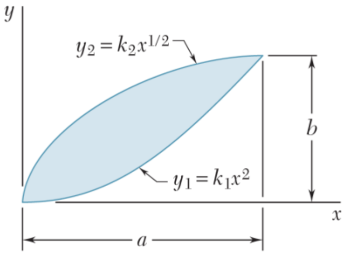
Then
$$\int_0^a x^2 e^{x/a-1}dx = \left[x^2 ae^{x/a-1}\right]_0^a - \int_0^a (ae^{x/a-1})2x\,dx$$
$$= a^3 - 2a\int_0^a xe^{x/a-1}dx$$

Using integration by parts with

$$u = x \qquad dv = e^{x/a-1}dx$$
$$du = dx \qquad v = ae^{x/a-1}$$

Then
$$I_y = b\left\{a^3 - 2a\left[(xae^{x/a-1})\big|_0^a - \int_0^a (ae^{x/a-1})dx\right]\right\}$$
$$= b\left\{a^3 - 2a\left[a^2 - (a^2e^{x/a-1})\big|_0^a\right]\right\}$$
$$= b\left\{a^3 - 2a\left[a^2 - (a^2 - a^2e^{-1})\right]\right\}$$

or $\quad I_y = 0.264a^3b$ ◀

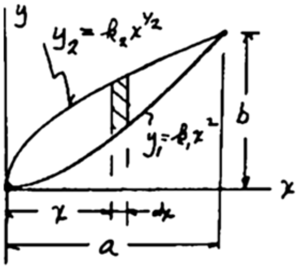


PROBLEM 9.15

Determine the moment of inertia and the radius of gyration of the shaded area shown with respect to the *x* axis.

SOLUTION

$$y_1 = k_1x^2 \qquad y_2 = k_2x^{1/2}$$



For

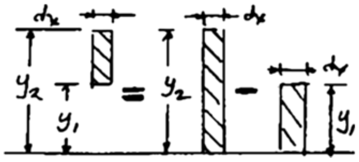
$$x = 0 \quad \text{and} \quad y_1 = y_2 = b$$

$$b = k_1a^2 \qquad b = k_2a^{1/2}$$

$$k_1 = \frac{b}{a^2} \qquad k_2 = \frac{b}{a^{1/2}}$$

Thus,

$$y_1 = \frac{b}{a^2}x^2 \qquad y_2 = \frac{b}{a^{1/2}}x^{1/2}$$



$$dA = (y_2 - y_1)dx$$

$$A = \int_0^a \left[\frac{b}{a^{1/2}}x^{1/2} - \frac{b}{a^2}x^2\right]dx$$

$$A = \frac{2}{3}\frac{ba^{3/2}}{a^{1/2}} - \frac{ba^3}{3a^2}$$

$$A = \frac{1}{3}ab$$

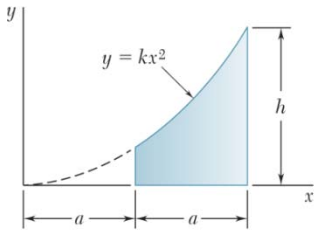
$$dI_x = \frac{1}{3}y_2^3dx - \frac{1}{3}y_1^3dx$$

$$= \frac{1}{3}\frac{b^3}{a^{3/2}}x^{3/2}dx - \frac{1}{3}\frac{b^3}{a^6}x^6dx$$

$$I_x = \int dI_x = \frac{b^3}{3a^{3/2}}\int_0^a x^{3/2}dx - \frac{b^3}{3a^6}\int_0^a x^6dx$$

$$= \frac{b^3}{3a^{3/2}}\frac{a^{5/2}}{\left(\frac{5}{2}\right)} - \frac{b^3}{3a^6}\frac{a^7}{7} = \left(\frac{2}{15} - \frac{1}{21}\right)ab^3 \qquad I_x = \frac{3}{35}ab^3 \blacktriangleleft$$

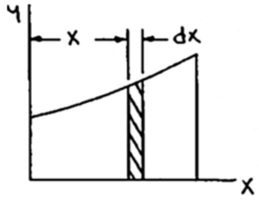
$$k_x^2 = \frac{I_x}{A} = \frac{\left(\frac{3}{35}ab^3\right)}{\frac{ab}{b}} \qquad k_x = b\sqrt{\frac{9}{35}} \blacktriangleleft$$



PROBLEM 9.16

Determine by direct integration the moment of inertia of the shaded area with respect to the *y* axis.

SOLUTION



At $x = 2a, \quad y = h$: $\quad h = k(2a)^2$

or $\quad k = \dfrac{h}{4a^2}$

Then $\quad y = \dfrac{h}{4a^2}x^2$

Now $\quad dA = ydx = \dfrac{h}{4a^2}x^2dx$

$$A = \int dA = \frac{h}{4a^2}\int_a^{2a} x^2dx$$

$$A = \left(\frac{h}{4a^2}\right)\left(\frac{x^3}{3}\right)_a^{2a} = \left(\frac{h}{4a^2}\right)\left(\frac{8a^3}{3} - \frac{a^3}{3}\right) = \frac{7}{12}ah$$

$$dI_x = \frac{1}{3}y^3dx = \frac{1}{3}\left(\frac{h}{64a^6}\right)x^6dx$$

Then $\quad I_x = \int dI_x = \dfrac{h^3}{192a^6}\displaystyle\int_0^{2a} x^6dx$

$$I_x = \left(\frac{h^3}{192a^6}\right)\frac{x^7}{7}\bigg|_a^{2a} = \frac{h^3}{192a^6}\left(\frac{128a^7 - a^7}{7}\right)$$

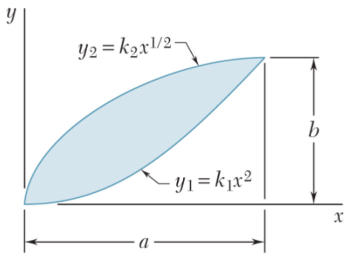
$$I_x = \frac{127}{(7)(192)}ah^3 = 0.094494ah^3$$

$$I_x = 0.0945ah^3 \blacktriangleleft$$

$$k_x{}^2 = \frac{I_x}{A} = \frac{0.094494ah^3}{\frac{7}{12}ah} = 0.161983h^2$$

$$k_x = 0.402h \blacktriangleleft$$

PROBLEM 9.17



Determine the moment of inertia and the radius of gyration of the shaded area shown with respect to the y axis.

SOLUTION

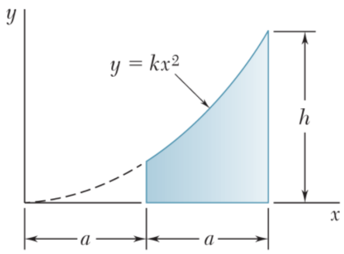
See figure of solution on Problem 9.15.

$$A = \frac{1}{3}ab \qquad dI_y = x^2 dA = x^2(y_2 - y_1)dx$$

$$I_y = \int_0^a x^2\left(\frac{b}{a^{1/2}}x^{1/2} - \frac{b}{a^2}x^2\right)dx = \frac{b}{a^{1/2}}\int_0^a x^{5/2}dx - \frac{b}{a^2}\int_0^a x^4 dx$$

$$I_y = \frac{b}{a^{1/2}} \cdot \frac{b^{7/2}}{\left(\frac{7}{2}\right)} - \frac{b}{a^2} \cdot \frac{a^5}{5} = \left(\frac{2}{7} - \frac{1}{5}\right)a^3 b \qquad I_y = \frac{3}{35}a^3 b \blacktriangleleft$$

$$k_y^2 = \frac{I_y}{A} = \frac{\left(\frac{3}{35}a^3 b\right)}{\frac{ab}{3}} \qquad k_y = a\sqrt{\frac{9}{35}} \blacktriangleleft$$



PROBLEM 9.18

Determine the moment of inertia and the radius of gyration of the shaded area shown with respect to the *y* axis.

SOLUTION

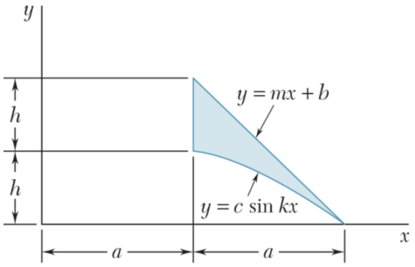
See figure of solution on Problem 9.16

$$y = \frac{h}{4a^2}x^2 \qquad A = \frac{7}{12}ah \qquad dA = ydx \qquad dI_y = x^2 dA = x^2\left(\frac{h}{4a^2}x^2\right)dx$$

$$I_y = \frac{h}{4a^2}\int_0^{2a} x^4 dx = \frac{h}{4a^2}\left(\frac{x^5}{5}\right)\Bigg|_a^{2a}$$

$$I_y = \frac{h}{4a^2}\left(\frac{32a^5}{5} - \frac{a^5}{5}\right) = \frac{31}{20}ha^3 \qquad I_y = \frac{31}{20}ha^3 \blacktriangleleft$$

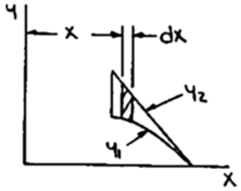
$$k_y^2 = \frac{I_y}{A} = \frac{\left(\frac{31}{20}ha^3\right)}{\frac{7}{12}ah} = \frac{93}{35}a^2 \qquad k_y = a\sqrt{\frac{93}{35}} \blacktriangleleft$$



PROBLEM 9.19

Determine the moment of inertia and the radius of gyration of the shaded area shown with respect to the *x* axis.

SOLUTION



y_1: At $x = 2a$, $y = 0$: $\quad 0 = c\sin k(2a)$

$$2ak = \pi \quad \text{or} \quad k = \frac{\pi}{2a}$$

At $x = a$, $y = h$: $\quad h = c\sin\frac{\pi}{2a}(a) \quad \text{or} \quad c = h$

y_2: At $x = a$, $y = 2h$: $\quad 2h = ma - b$

At $x = 2a$, $y = 0$: $\quad 0 = m(2a) + b$

Solving yields $\quad m = -\frac{2h}{a}, \quad b = 4h$

Then $\quad y_1 = h\sin\frac{\pi}{2a}x \qquad y_2 = -\frac{2h}{a}x + 4h$

$$= \frac{2h}{a}(-x + 2a)$$

Now $\quad dA = (y_2 - y_1)dx = \left[\frac{2h}{a}(-x + 2a) - h\sin\frac{\pi}{2a}x\right]dx$

Then $\quad A = \int dA = \int_a^{2a} h\left[\frac{2}{a}(-x + 2a) - \sin\frac{\pi}{2a}x\right]dx$

$$= h\left[-\frac{1}{a}(-x + 2a)^2 + \frac{2a}{\pi}\cos\frac{\pi}{2a}x\right]_a^{2a}$$

$$= h\left[\left(-\frac{2a}{\pi}\right) + \frac{1}{a}(-a + 2a)^2\right] = ah\left(1 - \frac{2}{\pi}\right)$$

$$= 0.36338ah$$

PROBLEM 9.19 (Continued)

Find: I_x and k_x

We have
$$dI_x = \left(\frac{1}{3}y_2 - \frac{1}{3}y_1\right)dx = \frac{1}{3}\left\{\left[\frac{2h}{a}(-x+2a)\right]^3 - \left(h\sin\frac{\pi}{2a}x\right)^3\right\}dx$$
$$= \frac{h^3}{3}\left[\frac{8}{a^3}(-x+2a)^3 - \sin^3\frac{\pi}{2a}x\right]$$

Then
$$I_x = \int dI_x = \int_a^{2a}\frac{h^3}{3}\left[\frac{8}{a^3}(-x+2a)^3 - \sin^3\frac{\pi}{2a}x\right]dx$$

Now
$$\sin^3\theta = \sin\theta(1-\cos^2\theta) = \sin\theta - \sin\theta\cos^2\theta$$

Then
$$I_x = \frac{h^3}{3}\int_a^{2a}\left[\frac{8}{a^3}(-x+2a)^3 - \left(\sin\frac{\pi}{2a}x - \sin\frac{\pi}{2a}x\cos^2\frac{\pi}{2a}x\right)\right]dx$$
$$= \frac{h^3}{3}\left[-\frac{2}{a^3}(-x+2a)^4 + \frac{2a}{\pi}\cos\frac{\pi}{2a}x - \frac{2a}{3\pi}\cos^3\frac{\pi}{2a}x\right]_a^{2a}$$
$$= \frac{h^3}{3}\left[\left(-\frac{2a}{\pi} + \frac{2a}{3\pi}\right) + \frac{2}{a^3}(-a+2a)^4\right]$$
$$= \frac{2}{3}ah^3\left(1 - \frac{2}{3\pi}\right)$$

$$I_x = 0.52520ah^3$$ or $I_x = 0.525ah^3$ ◀

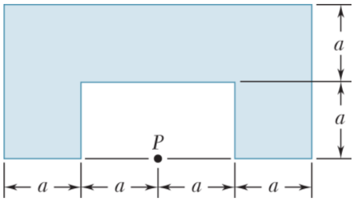
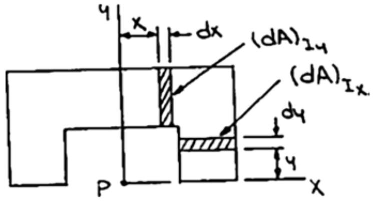
or $k_y = 1.299a$ ◀



PROBLEM 9.21

Determine the polar moment of inertia and the polar radius of gyration of the shaded area shown with respect to Point *P*.

SOLUTION



We have $$dI_x = y^2 dA = y^2[(x_2 - x_1)dy]$$

Then $$I_x = 2\left[\int_2^a y^2(2a-a)dy + \int_a^{2a} y^2(2a-0)dy\right]$$

$$= 2\left\{a\left[\frac{1}{3}y^3\right]_0^a + 2a\left[\frac{1}{3}y^3\right]_a^{2a}\right\}$$

$$= 2\left\{a\left[\frac{1}{3}(a)^3\right] + \frac{2}{3}a\left[(2a)^3 - (a)^3\right]\right\}$$

$$= 10a^4$$

Also $$dI_y = x^2 dA = x^2[(y_2 - y_1)dx]$$

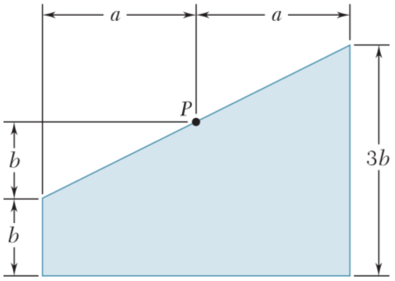
Then $$I_y = 2\left[\int_0^a x^2(2a-a)dx + \int_a^{2a} x^2(2a-0)dx\right]$$

$$= 10a^4$$

Now $$J_P = I_x + I_y = 10a^4 + 10a^4$$ or $J_P = 20a^4$ ◀

and $$k_P^2 = \frac{J_P}{A} = \frac{20a^4}{(4a)(2a)-(2a)(a)}$$

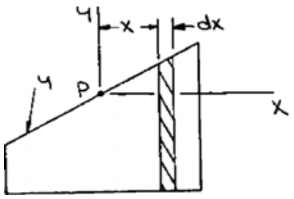
$$= \frac{10}{3}a^2$$ or $k_P = 1.826a$ ◀



PROBLEM 9.22

Determine the polar moment of inertia and the polar radius of gyration of the shaded area shown with respect to Point P.

SOLUTION



By observation
$$y = \frac{b}{a}x$$

First note
$$dA = (y + 2b)dx$$
$$= \frac{b}{a}(x + 2a)dx$$

Now
$$dI_x = \left(\frac{1}{3}y_{\text{top}}^3 - \frac{1}{3}y_{\text{bottom}}^3\right)dx$$
$$= \frac{1}{3}\left[\left(\frac{b}{a}x\right)^3 - (-2b)^3\right]dx$$
$$= \frac{1}{3}\frac{b^3}{a^3}(x^3 + 8a^3)dx$$

Then
$$I_x = \int dI_x = \int_{-a}^{a} \frac{1}{3}\frac{b^3}{a^3}(x^2 + 8a^3)dx$$
$$= \frac{1}{3}\frac{b^3}{a^3}\left[\frac{1}{4}x^4 + 8a^3x\right]_{-a}^{a}$$
$$= \frac{1}{3}\frac{b^3}{a^3}\left\{\left[\frac{1}{4}(a)^4 + 8a^3(a)\right] - \left[\frac{1}{4}(-a)^4 + 8a^3(-a)\right]\right\} = \frac{16}{3}ab^3$$

Also
$$dI_y = x^2dA = x^2\left[\frac{b}{a}(x + 2a)dx\right]$$

Then
$$I_y = \int dI_y = \int_{-a}^{a} \frac{b}{a}x^2(x + 2a)dx$$
$$= \frac{b}{a}\left[\frac{1}{4}x^4 + \frac{2}{3}ax^3\right]_{-a}^{a}$$
$$= \frac{b}{a}\left\{\left[\frac{1}{4}(a)^4 + \frac{2}{3}a(a)^3\right] - \left[\frac{1}{4}(-a)^4 + \frac{2}{3}a(-a)^3\right]\right\} = \frac{4}{3}a^3b$$

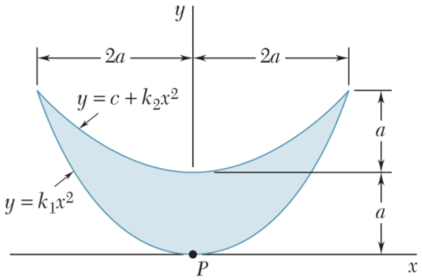
PROBLEM 9.22 (Continued)

Now $$J_P = I_x + I_y = \frac{16}{3}ab^3 + \frac{4}{3}a^3b$$

$$J_P = \frac{4}{3}ab(a^2 + 4b^2) \blacktriangleleft$$

and $$k_P^2 = \frac{J_P}{A} = \frac{\frac{4}{3}ab(a^2 + 4b^2)}{(2a)(3b) - \frac{1}{2}(2a)(2b)}$$

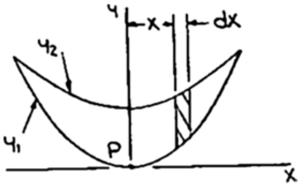
$$= \frac{1}{3}(a^2 + 4b^2) \text{ or } \qquad k_P = \sqrt{\frac{a^2 + 4b^2}{3}} \blacktriangleleft$$



PROBLEM 9.23

Determine the polar moment of inertia and the polar radius of gyration of the shaded area shown with respect to Point *P*.

SOLUTION



y_1: At $x = 2a$, $y = 2a$:

$$2a = k_1(2a)^2 \quad \text{or} \quad k_1 = \frac{1}{2a}$$

y_2: At $x = 0$, $y = a$: $a = c$

At $x = 2a$, $y = 2a$:

$$2a = a + k_2(2a)^2 \quad \text{or} \quad k_2 = \frac{1}{4a}$$

Then

$$y_1 = \frac{1}{2a}x^2 \qquad y_2 = a + \frac{1}{4a}x^2$$
$$= \frac{1}{4a}(4a^2 + x^2)$$

Now

$$dA = (y_2 - y_1)dx = \left[\frac{1}{4a}(4a^2 + x^2) - \frac{1}{2a}x^2\right]dx$$
$$= \frac{1}{4a}(4a^2 - x^2)dx$$

Then

$$A = \int dA = 2\int_0^{2a} \frac{1}{4a}(4a^2 - x^2)dx = \frac{1}{2a}\left[4a^2x - \frac{1}{3}x^3\right]_0^{2a} = \frac{8}{3}a^2$$

Now

$$dI_x = \left(\frac{1}{3}y_2^3 - \frac{1}{3}y_1^3\right)dx = \frac{1}{3}\left\{\left[\frac{1}{4a}(4a^2 + x^2)\right]^3 - \left[\frac{1}{2a}x^2\right]^3\right\}dx$$
$$= \frac{1}{3}\left[\frac{1}{64a^3}(64a^6 + 48a^4x^2 + 12a^2x^4 + x^6) - \frac{1}{8a^3}x^6\right]dx$$
$$= \frac{1}{192a^3}(64a^6 + 48a^4x^2 + 12a^2x^4 - 7x^6)dx$$

PROBLEM 9.23 (Continued)

Then $$I_x = \int dI_x = 2\int_0^{2a} \frac{1}{192a^3}(64a^6 + 48a^4x^2 + 12a^2x^4 - 7x^6)dx$$

$$= \frac{1}{96a^3}\left[64a^6x + 16a^4x^3 + \frac{12}{5}a^2x^5 - x^7\right]_0^{2a}$$

$$= \frac{1}{96a^3}\left[64a^6(2a) + 16a^4(2a)^3 + \frac{12}{5}a^2(2a)^5 - (2a)^7\right]$$

$$= \frac{1}{96}a^4\left(128 + 128 + \frac{12}{5} \times 32 - 128\right) = \frac{32}{15}a^4$$

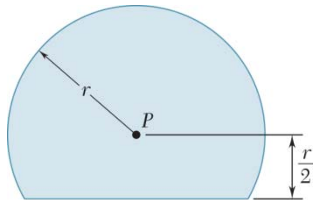
Also $$dI_y = x^2dA = x^2\left[\frac{1}{4a}(4a^2 - x^2)dx\right]$$

Then $$I_y = \int dI_y = 2\int_0^{2a} \frac{1}{4a}x^2(4a^2 - x^2)dx = \frac{1}{2a}\left[\frac{4}{3}a^2x^3 - \frac{1}{5}x^5\right]_0^{2a}$$

$$= \frac{1}{2a}\left[\frac{4}{3}a^2(2a)^3 - \frac{1}{5}(2a)^5\right] = \frac{32}{2}a^4\left(\frac{1}{3} - \frac{1}{5}\right) = \frac{32}{15}a^4$$

Now $$J_P = I_x + I_y = \frac{32}{15}a^4 + \frac{32}{15}a^4$$ or $J_P = \dfrac{64}{15}a^4$ ◀

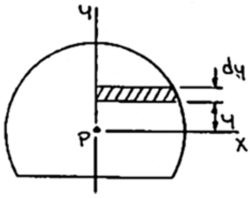
and $$k_P^2 = \frac{J_P}{A} = \frac{\frac{64}{15}a^4}{\frac{8}{3}a^2} = \frac{8}{5}a^2$$ or $k_P = 1.265a$ ◀



PROBLEM 9.24

Determine the polar moment of inertia and the polar radius of gyration of the shaded area shown with respect to Point *P*.

SOLUTION



The equation of the circle is

$$x^2 + y^2 = r^2$$

So that

$$x = \sqrt{r^2 - y^2}$$

Now

$$dA = xdy = \sqrt{r^2 - y^2}\,dy$$

Then

$$A = \int dA = 2\int_{-r/2}^{r} \sqrt{r^2 - y^2}\,dy$$

Let

$$y = r\sin\theta; \quad dy = r\cos\theta\,d\theta$$

Then

$$A = 2\int_{-\pi/6}^{\pi/2} \sqrt{r^2 - (r\sin\theta)^2}\,r\cos\,d\theta$$

$$= 2\int_{-\pi/6}^{\pi/2} r^2\cos^2\theta\,d\theta = 2r^2\left[\frac{\theta}{2} + \frac{\sin 2\theta}{4}\right]_{-\pi/6}^{\pi/2}$$

$$= 2r^2\left[\frac{\frac{\pi}{2}}{2} - \left(\frac{-\frac{\pi}{6}}{2} + \frac{\sin -\frac{\pi}{3}}{4}\right)\right] = 2r^2\left(\frac{\pi}{3} + \frac{\sqrt{3}}{8}\right)$$

$$= 2.5274r^2$$

Now

$$dI_x = y^2 dA = y^2\left(\sqrt{r^2 - y^2}\,dy\right)$$

Then

$$I_x = \int dI_x = 2\int_{-r/2}^{r} y^2\sqrt{r^2 - y^2}\,dy$$

Let

$$y = r\sin\theta; \quad dy = r\cos\theta\,d\theta$$

Then

$$I_x = 2\int_{-\pi/6}^{\pi/2} (r\sin\theta)^2\sqrt{r^2 - (r\sin\theta)^2}\,r\cos\theta\,d\theta$$

$$= 2\int_{-\pi/6}^{\pi/2} r^2\sin^2\theta(r\cos\theta)r\cos\theta\,d\theta$$

Now

$$\sin 2\theta = 2\sin\theta\cos\theta \Rightarrow \sin^2\theta\cos^2\theta = \frac{1}{4}\sin 2\theta$$

PROBLEM 9.24 (Continued)

Then

$$I_x = 2\int_{-\pi/6}^{\pi/2} r^4\left(\frac{1}{4}\sin^2 2\theta\right)d\theta = \frac{r^4}{2}\left[\frac{\theta}{2}-\frac{\sin 4\theta}{8}\right]_{-\pi/6}^{\pi/2}$$

$$= \frac{r^4}{2}\left[\frac{\frac{\pi}{2}}{2} - \left(\frac{\frac{\pi}{6}}{2} - \frac{\sin - \frac{2\pi}{3}}{8}\right)\right]$$

$$= \frac{r^4}{2}\left(\frac{\pi}{3}-\frac{\sqrt{3}}{16}\right)$$

Also

$$dI_y = \frac{1}{3}x^3 dy = \frac{1}{3}\left(\sqrt{r^2-y^2}\right)^3 dy$$

Then

$$I_y = \int dI_y = 2\int_{-r/2}^{r}\frac{1}{3}(r^2-y^2)^{3/2}dy$$

Let

$$y = r\sin\theta; \quad dy = r\cos\theta\, d\theta$$

Then

$$I_y = \frac{2}{3}\int_{-\pi/6}^{\pi/2}[r^2-(r\sin\theta)^2]^{3/2} r\cos\theta\, d\theta$$

$$I_y = \frac{2}{3}\int_{-\pi/6}^{\pi/2}(r^3\cos^3\theta) r\cos\theta\, d\theta$$

Now

$$\cos^4\theta = \cos^2\theta(1-\sin^2\theta) = \cos^2\theta - \frac{1}{4}\sin^2 2\theta$$

Then

$$I_y = \frac{2}{3}\int_{-\pi/6}^{\pi/2} r^4\left(\cos^2\theta - \frac{1}{4}\sin^2 2\theta\right)d\theta$$

$$= \frac{2}{3}r^4\left[\left(\frac{\theta}{2}+\frac{\sin 2\theta}{4}\right)-\frac{1}{4}\left(\frac{\theta}{2}-\frac{\sin 4\theta}{8}\right)\right]_{-\pi/6}^{\pi/2}$$

$$= \frac{2}{3}r^4\left\{\left[\frac{\frac{\pi}{2}}{2}-\frac{1}{4}\left(\frac{\frac{\pi}{2}}{2}\right)\right]-\left[\frac{-\frac{\pi}{6}}{2}+\frac{\sin-\frac{\pi}{3}}{4}-\frac{1}{4}\left(\frac{-\frac{\pi}{6}}{2}-\frac{\sin-\frac{2\pi}{3}}{8}\right)\right]\right\}$$

$$= \frac{2}{3}r^4\left[\frac{\pi}{4}-\frac{\pi}{16}+\frac{\pi}{12}+\frac{1}{4}\left(\frac{\sqrt{3}}{2}\right)-\frac{\pi}{48}+\frac{1}{32}\left(\frac{\sqrt{3}}{2}\right)\right]$$

$$= \frac{2}{3}r^4\left(\frac{\pi}{4}+\frac{9\sqrt{3}}{64}\right)$$

PROBLEM 9.24 (Continued)

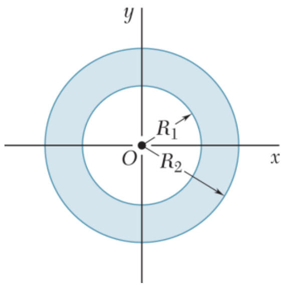
Now $$J_P = I_x + I_y = \frac{r^4}{2}\left(\frac{\pi}{3} - \frac{\sqrt{3}}{16}\right) + \frac{2}{3}r^4\left(\frac{\pi}{4} + \frac{9\sqrt{3}}{64}\right)$$

$$= r^4\left(\frac{\pi}{3} + \frac{\sqrt{3}}{16}\right) = 1.15545r^4$$

or $J_P = 1.155r^4$ ◀

and $$k_P^2 = \frac{J_P}{A} = \frac{1.15545r^4}{2.5274r^2}$$

or $k_P = 0.676r$ ◀



PROBLEM 9.25

(*a*) Determine by direct integration the polar moment of inertia of the annular area shown with respect to Point *O*. (*b*) Using the result of Part *a*, determine the moment of inertia of the given area with respect to the *x* axis.

SOLUTION

(*a*)

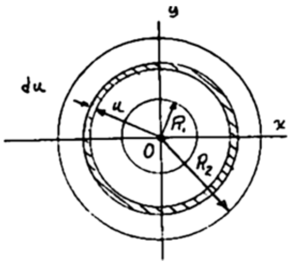
$$dA = 2\pi u\,du$$

$$dJ_O = u^2 dA = u^2(2\pi u\,du)$$

$$= 2\pi u^3\,du$$

$$J_O = \int dJ_O = 2\pi\int_{R_1}^{R_2} u^3 du$$

$$= 2\pi\left|\frac{1}{4}u^4\right|_{R_1}^{R_2}$$



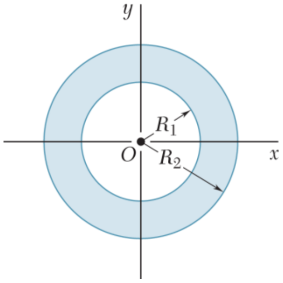
$$J_O = \frac{\pi}{2}\left[R_2^4 - R_1^4\right] \blacktriangleleft$$

(*b*) From Eq. (9.4): (*Note* by symmetry.) $I_x = I_y$

$$J_O = I_x + I_y = 2I_x$$

$$I_x = \frac{1}{2}J_O = \frac{\pi}{4}\left[R_2^4 - R_1^4\right]$$

$$I_x = \frac{\pi}{4}\left[R_2^4 - R_1^4\right] \blacktriangleleft$$

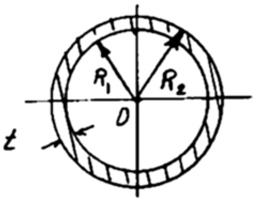


PROBLEM 9.26

(*a*) Show that the polar radius of gyration k_O of the annular area shown is approximately equal to the mean radius $R_m = (R_1 + R_2)/2$ for small values of the thickness $t = R_2 - R_1$. (*b*) Determine the percentage error introduced by using R_m in place of k_O for the following values of t/R_m: 1, $\frac{1}{2}$, and $\frac{1}{10}$.

SOLUTION

(*a*) From Problem 9.23:



$$J_O = \frac{\pi}{2}\left[R_2^4 - R_1^4\right]$$

$$k_O^2 = \frac{J_O}{A} = \frac{\frac{\pi}{2}\left[R_2^4 - R_1^4\right]}{\pi\left(R_2^2 - R_1^2\right)}$$

$$k_O^2 = \frac{1}{2}\left[R_2^2 + R_1^2\right]$$

Thickness: $t = R_2 - R_1$

Mean radius: $R_m = \frac{1}{2}(R_1 + R_2)$

Thus, $R_1 = R_m - \frac{1}{2}t$ and $R_2 = R_m + \frac{1}{2}t$

$$k_O^2 = \frac{1}{2}\left[\left(R_m + \frac{1}{2}t\right)^2 + \left(R_m - \frac{1}{2}t\right)^2\right] = R_m^2 + \frac{1}{4}t^2$$

For t small compared to R_m: $k_O^2 \approx R_m^2$ $\qquad k_O \approx R_m$ ◀

(*b*) Percentage error $= \dfrac{\text{(exact value)} - \text{(approximation value)}}{\text{(exact value)}}100$

$$\text{P.E.} = -\frac{\sqrt{R_m^2 + \frac{1}{4}t^2} - R_m}{\sqrt{R_m^2 + \frac{1}{4}t^2}}(100) = -\frac{\sqrt{1 + \frac{1}{4}\left(\frac{t}{R_m}\right)^2} - 1}{\sqrt{1 + \frac{1}{4}\left(\frac{t}{R_m}\right)^2}}100$$

PROBLEM 9.26 (Continued)

For $\dfrac{t}{R_m} = 1$:

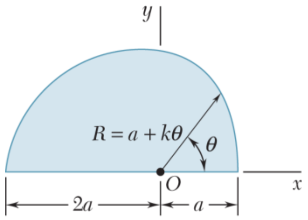
$$\text{P.E.} = \frac{\sqrt{1+\frac{1}{4}}-1}{\sqrt{1+\frac{1}{4}}}(100) = -10.56\%$$ ◀

For $\dfrac{t}{R_m} = \dfrac{1}{2}$:

$$\text{P.E.} = -\frac{\sqrt{1+\frac{1}{4}\left(\frac{1}{2}\right)^2}-1}{\sqrt{1+\frac{1}{4}\left(\frac{1}{2}\right)^2}}(100) = -2.99\%$$ ◀

For $\dfrac{t}{R_m} = \dfrac{1}{10}$:

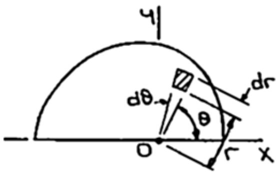
$$\text{P.E.} = \frac{\sqrt{1+\frac{1}{4}\left(\frac{1}{10}\right)^2}-1}{\sqrt{1+\frac{1}{4}\left(\frac{1}{10}\right)^2}}(100) = -0.1250\%$$ ◀



PROBLEM 9.27

Determine the polar moment of inertia and the polar radius of gyration of the shaded area shown with respect to Point *O*.

SOLUTION



At $\theta = \pi, \quad R = 2a$: $$2a = a + k(\pi)$$

or $$k = \frac{a}{\pi}$$

Then $$R = a + \frac{a}{\pi}\theta = a\left(1+\frac{\theta}{\pi}\right)$$

Now $$dA = (dr)(r\,d\theta)$$ $$= r dr\,d\theta$$

Then $$A = \int dA = \int_0^{\pi}\int_0^{a(1+\theta/\pi)} r dr\,d\theta = \int_0^{\pi}\left[\frac{1}{2}r^2\right]_0^{a(1+\theta/\pi)} d\theta$$

$$A = \int_0^{\pi}\frac{1}{2}a^2\left(1+\frac{\theta}{\pi}\right)^2 d\theta = \frac{1}{2}a^2\left[\frac{\pi}{3}\left(1+\frac{\theta}{\pi}\right)^3\right]_0^{\pi}$$

$$= \frac{1}{6}\pi a^2\left[\left(1+\frac{\pi}{\pi}\right)^3 - (1)^3\right] = \frac{7}{6}\pi a^2$$

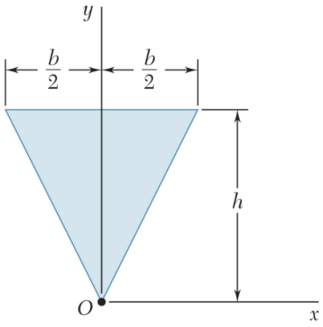
Now $$dJ_O = r^2 dA = r^2(r dr\,d\theta)$$

Then $$J_O = \int dJ_O = \int_0^{\pi}\int_0^{a(1+\theta/\pi)} r^3 dr\,d\theta$$

$$= \int_0^{\pi}\left[\frac{1}{4}r^4\right]_0^{a(1+\theta/\pi)} d\theta = \int_0^{\pi}\frac{1}{4}a^4\left(1+\frac{\theta}{\pi}\right)^4 d\theta$$

$$= \frac{1}{4}a^4\left[\frac{\pi}{5}\left(1+\frac{\theta}{\pi}\right)^5\right]_0^{\pi} = \frac{1}{20}\pi a^4\left[\left(1+\frac{\pi}{\pi}\right)^5 - (1)^5\right]$$ or $J_O = \frac{31}{20}\pi a^4$ ◀

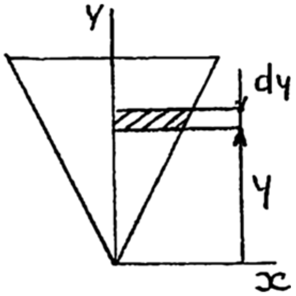
and $$k_O^2 = \frac{J_O}{A} = \frac{\frac{31}{20}\pi a^4}{\frac{7}{6}\pi a^2} = \frac{93}{70}a^2$$ or $k_O = 1.153a$ ◀



PROBLEM 9.28

Determine the polar moment of inertia and the polar radius of gyration of the isosceles triangle shown with respect to Point *O*.

SOLUTION

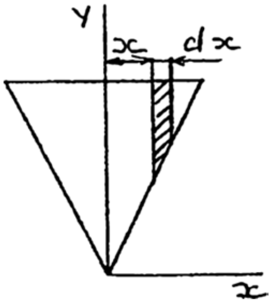


By observation: $$y = \frac{h}{\frac{b}{2}} x$$

or $$x = \frac{b}{2h} y$$

Now $$dA = x dy = \left(\frac{b}{2h} y \right) dy$$

and $$dI_x = y^2 dA = \frac{b}{2h} y^3 dy$$



Then $$I_x = \int dI_x = 2\int_0^h \frac{b}{2h} y^3 dy$$

$$= \frac{b}{h} \frac{y^4}{4} \bigg|_0^h = \frac{1}{4} bh^3$$

From above: $$y = \frac{2h}{b} x$$

Now $$dA = (h - y)dx = \left(h - \frac{2h}{b} x \right) dx$$

$$= \frac{h}{b}(b - 2x)dx$$

and $$dI_y = x^2 dA = x^2 \frac{h}{b}(b - 2x)dx$$

PROBLEM 9.28 (Continued)

Then

$$I_y = \int dI_y = 2\int_0^{b/2} \frac{h}{b} x^2 (b-2x)dx$$

$$= 2\frac{h}{b}\left[\frac{1}{3}bx^3 - \frac{1}{2}x^4\right]_0^{b/2}$$

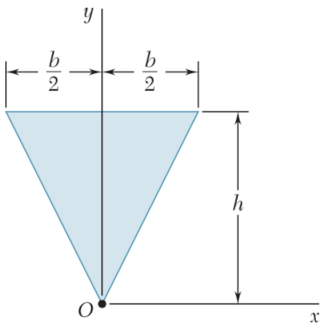
$$= 2\frac{h}{b}\left[\frac{b}{3}\left(\frac{b}{2}\right)^3 - \frac{1}{2}\left(\frac{b}{2}\right)^4\right] = \frac{1}{48}b^3h$$

Now

$$J_O = I_x + I_y = \frac{1}{4}bh^3 + \frac{1}{48}b^3h \qquad \text{or} \quad J_O = \frac{bh}{48}(12h^2 + b^2) \blacktriangleleft$$

and

$$k_O^2 = \frac{J_O}{A} = \frac{\frac{bh}{48}(12h^2 + b^2)}{\frac{1}{2}bh} = \frac{1}{24}(12h^2 + b^2) \quad \text{or} \quad k_O = \frac{\sqrt{12h^2 + b^2}}{24} \blacktriangleleft$$



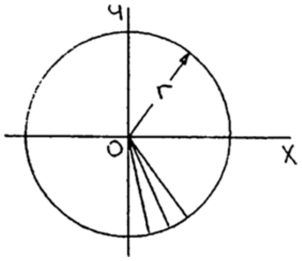
PROBLEM 9.29*

Using the polar moment of inertia of the isosceles triangle of Problem 9.28, show that the centroidal polar moment of inertia of a circular area of radius r is $\pi r^4/2$. (*Hint:* As a circular area is divided into an increasing number of equal circular sectors, what is the approximate shape of each circular sector?)

PROBLEM 9.28 Determine the polar moment of inertia and the polar radius of gyration of the isosceles triangle shown with respect to Point O.

SOLUTION

First the circular area is divided into an increasing number of identical circular sectors. The sectors can be approximated by isosceles triangles. For a large number of sectors the approximate dimensions of one of the isosceles triangles are as shown.



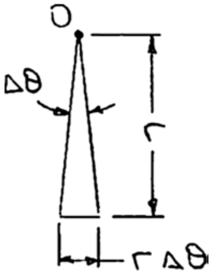
For an isosceles triangle (see Problem 9.28):

$$J_O = \frac{bh}{48}(12h^2 + b^2)$$

Then with $\quad b = r\Delta\theta \quad \text{and} \quad h = r$

$$(\Delta J_O)_{\text{sector}} \simeq \frac{1}{48}(r\Delta\theta)(r)[12r^2 + (r\Delta\theta)^2]$$

$$= \frac{1}{48}r^4\Delta\theta\left[(12 + \Delta\theta^2)\right]$$



Now $$\frac{dJ_{O\,\text{sector}}}{d\theta} = \lim_{\Delta\theta\to 0}\left(\frac{\Delta J_{O\,\text{sector}}}{\Delta\theta}\right) = \lim_{\Delta\theta\to 0}\left\{\frac{1}{48}r^4[12 + (\Delta\theta)^2]\right\}$$

$$= \frac{1}{4}r^4$$

Then $$(J_O)_{\text{circle}} = \int dJ_{O\,\text{sector}} = \int_0^{2\pi}\frac{1}{4}r^4 d\theta = \frac{1}{4}r^4\left[\theta\right]_0^{2\pi}$$

or $\quad (J_O)_{\text{circle}} = \dfrac{\pi}{2}r^4$ ◀

PROBLEM 9.30*

Prove that the centroidal polar moment of inertia of a given area A cannot be smaller than $A^2/2\pi$. (*Hint:* Compare the moment of inertia of the given area with the moment of inertia of a circle that has the same area and the same centroid.)

SOLUTION

From the solution to sample Problem 9.2, the centroidal polar moment of inertia of a circular area is

$$(J_C)_{\text{cir}} = \frac{\pi}{2} r^4$$

The area of the circle is

$$A_{\text{cir}} = \pi r^2$$

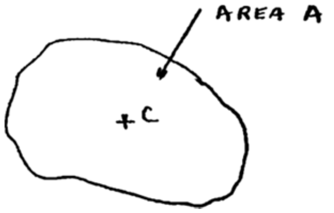
So that

$$[J_C(A)]_{\text{cir}} = \frac{A^2}{2\pi}$$

Two methods of solution will be presented. However, both methods depend upon the observation that as a given element of area dA is moved closer to some Point C. The value of J_C will be decreased $(J_C = \int r^2 dA;$ as r decreases, so must $J_C)$.

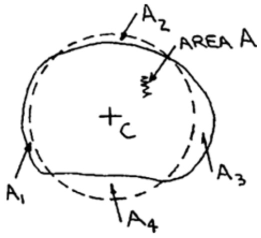
Solution 1

Imagine taking the area A and drawing it into a thin strip of negligible width and of sufficient length so that its area is equal to A. To minimize the value of $(J_C)_A$, the area would have to be distributed as closely as possible about C. This is accomplished by winding the strip into a tightly wound roll with C as its center; any voids in the roll would place the corresponding area farther from C than is necessary, thus increasing the value of $(J_C)_A$. (The process is analogous to rewinding a length of tape back into a roll.) Since the shape of the roll is circular, with the centroid of its area at C, it follows that



$$(J_C)_A \ge \frac{A^2}{2\pi} \quad \text{Q.E.D.} \blacktriangleleft$$

where the equality applies when the original area is circular.



PROBLEM 9.30* (Continued)

Solution 2

Consider an area *A* with its centroid at Point *C* and a circular area of area *A* with its center (and centroid) at Point *C*. Without loss of generality, assume that

$$A_1 = A_2 \qquad A_3 = A_4$$

It then follows that

$$(J_C)_A = (J_C)_{\text{cir}} + [J_C(A_1) - J_C(A_2) + J_C(A_3) - J_C(A_4)]$$

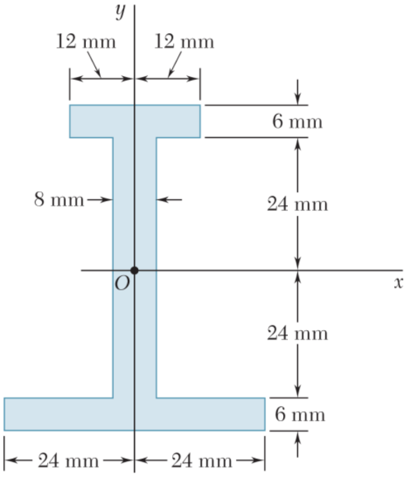
Now observe that

$$J_C(A_1) - J_C(A_2) \geq 0$$

$$J_C(A_3) - J_C(A_4) \geq 0$$

Since as a given area is moved farther away from *C*, its polar moment of inertia with respect to *C* must increase.

$$(J_C)_A \geq (J_C)_{\text{cir}} \qquad \text{or} \quad (J_C)_A \geq \frac{A^2}{2\pi} \quad \text{Q.E.D.} \blacktriangleleft$$



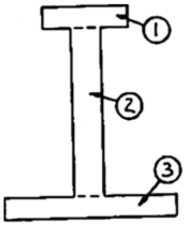
PROBLEM 9.31

Determine the moment of inertia and the radius of gyration of the shaded area with respect to the *x* axis.

SOLUTION

First note that

$$A = A_1 + A_2 + A_3$$
$$= [(24)(6) + (8)(48) + (48)(6)]\ \text{mm}^2$$
$$= (144 + 384 + 288)\ \text{mm}^2$$
$$= 816\ \text{mm}^2$$



Now $$I_x = (I_x)_1 + (I_x)_2 + (I_x)_3$$

where

$$(I_x)_1 = \frac{1}{12}(24\ \text{mm})(6\ \text{mm})^3 + (144\ \text{mm}^2)(27\ \text{mm})^2$$
$$= (432 + 104{,}976)\ \text{mm}^4$$
$$= 105{,}408\ \text{mm}^4$$

$$(I_x)_2 = \frac{1}{12}(8\ \text{mm})(48\ \text{mm})^3 = 73{,}728\ \text{mm}^4$$

$$(I_x)_3 = \frac{1}{12}(48\ \text{mm})(6\ \text{mm})^3 + (288\ \text{mm}^2)(27\ \text{mm})^2$$
$$= (864 + 209{,}952)\ \text{mm}^4 = 210{,}816\ \text{mm}^4$$

Then $$I_x = (105{,}408 + 73{,}728 + 210{,}816)\ \text{mm}^4$$
$$= 389{,}952\ \text{mm}^4$$ or $I_x = 390 \times 10^3\ \text{mm}^4$ ◀

and $$k_x^2 = \frac{I_x}{A} = \frac{389{,}952\ \text{mm}^4}{816\ \text{mm}^2}$$ or $k_x = 21.9$ mm ◀

PROBLEM 9.32

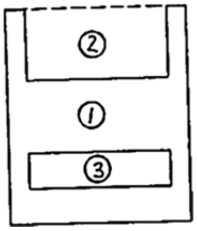
Determine the moment of inertia and the radius of gyration of the shaded area with respect to the *x* axis.

SOLUTION

First note that

$$
\begin{aligned}
A &= A_1 - A_2 - A_3 \\
&= [(5)(6) - (4)(2) - (4)(1)]\ \text{in}^2 \\
&= (30 - 8 - 4)\ \text{in}^2 \\
&= 18\ \text{in}^2
\end{aligned}
$$

Now $I_x = (I_x)_1 - (I_x)_2 - (I_x)_3$



where

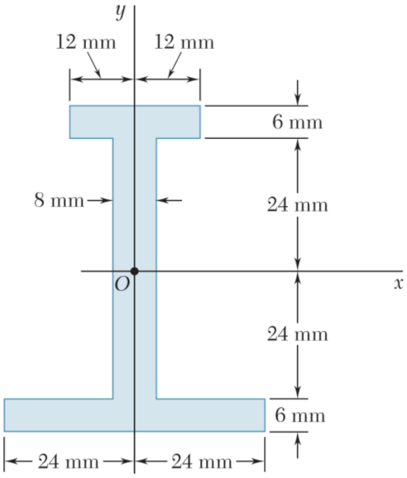
$$(I_x)_1 = \frac{1}{12}(5\ \text{in.})(6\ \text{in.})^3 = 90\ \text{in}^4$$

$$
\begin{aligned}
(I_x)_2 &= \frac{1}{12}(4\ \text{in.})(2\ \text{in.})^3 + (8\ \text{in}^2)(2\ \text{in.})^2 \\
&= 34\frac{2}{3}\ \text{in}^4
\end{aligned}
$$

$$
\begin{aligned}
(I_x)_3 &= \frac{1}{12}(4\ \text{in.})(1\ \text{in.})^3 + (4\ \text{in}^2)\left(\frac{3}{2}\ \text{in.}\right)^2 \\
&= 9\frac{1}{3}\ \text{in}^4
\end{aligned}
$$

Then $$I_x = \left(90 - 34\frac{2}{3} - 9\frac{1}{3}\right)\text{in}^4$$ or $I_x = 46.0\ \text{in}^4$ ◀

and $$k_x^2 = \frac{I_x}{A} = \frac{46.0\ \text{in}^4}{18\ \text{in}^4}$$ or $k_x = 1.599$ in. ◀



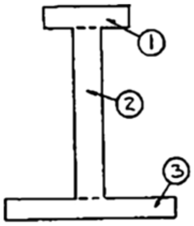
PROBLEM 9.33

Determine the moment of inertia and the radius of gyration of the shaded area with respect to the *y* axis.

SOLUTION

First note that

$$A = A_1 + A_2 + A_3$$
$$= [(24 \times 6) + (8)(48) + (48)(6)]\ \text{mm}^2$$
$$= (144 + 384 + 288)\ \text{mm}^2$$
$$= 816\ \text{mm}^2$$



Now $I_y = (I_y)_1 + (I_y)_2 + (I_y)_3$

where

$$(I_y)_1 = \frac{1}{12}(6\ \text{mm})(24\ \text{mm})^3 = 6912\ \text{mm}^4$$
$$(I_y)_2 = \frac{1}{12}(48\ \text{mm})(8\ \text{mm})^3 = 2048\ \text{mm}^4$$
$$(I_y)_3 = \frac{1}{12}(6\ \text{mm})(48\ \text{mm})^3 = 55{,}296\ \text{mm}^4$$

Then $I_y = (6912 + 2048 + 55{,}296)\ \text{mm}^4 = 64{,}256\ \text{mm}^4$

or $I_y = 64.3 \times 10^3\ \text{mm}^4$ ◀

and $k_y^2 = \dfrac{I_y}{A} = \dfrac{64{,}256\ \text{mm}^4}{816\ \text{mm}^2}$ or $k_y = 8.87\ \text{mm}$ ◀

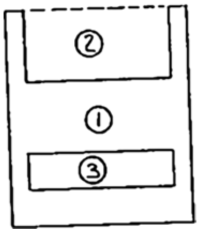
PROBLEM 9.34

Determine the moment of inertia and the radius of gyration of the shaded area with respect to the *y* axis.

SOLUTION

First note that

$$A = A_1 - A_2 - A_3$$
$$= [(5)(6) - (4)(2) - (4)(1)]\ \text{in}^2$$
$$= (30 - 8 - 4)\ \text{in}^2$$
$$= 18\ \text{in}^2$$



Now $$I_y = (I_y)_1 - (I_y)_2 - (I_y)_3$$

where

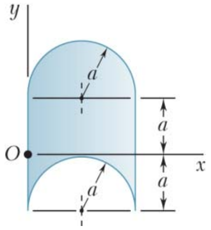
$$(I_y)_1 = \frac{1}{12}(6\text{ in.})(5\text{ in.})^3 = 62.5\text{ in}^4$$

$$(I_y)_2 = \frac{1}{12}(2\text{ in.})(4\text{ in.})^3 = 10\frac{2}{3}\ \text{in}^4$$

$$(I_y)_3 = \frac{1}{12}(1\text{ in.})(4\text{ in.})^3 = 5\frac{1}{3}\text{in}^4$$

Then $$I_y = \left(62.5 - 10\frac{2}{3} - 5\frac{1}{3}\right)\text{in}^4$$ or $I_y = 46.5\text{ in}^4$ ◀

and $$k_y^2 = \frac{I_y}{A} = \frac{46.5\text{ in}^4}{18\text{ in}^2}$$ or $k_y = 1.607$ in. ◀

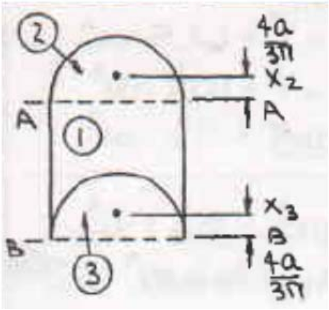


PROBLEM 9.35

Determine the moments of inertia of the shaded area shown with respect to the *x* and *y* axes.

SOLUTION We have $I_x = (I_x)_1 + (I_x)_2 - \left(I_x\right)_3$ where $(I_x)_1 = \frac{1}{12}(2a)(2\text{a})^3$

$$= \frac{4}{3}a^4$$



$$(I_{AA})_2 = \left(I_{BB}\right)_3 = \frac{\pi}{8}a^4$$

$$\left(I_{AA}\right)_2 = \left(\bar{I}_{x_2}\right)_2 + Ad^2$$

$$\left(\bar{I}_{x_2}\right)_2 = \left(\bar{I}_{x_3}\right)_3 = \frac{\pi}{8}a^4 - \left(\frac{\pi}{2}a^2\right)\left(\frac{4a}{3\pi}\right)^2 = \left(\frac{\pi}{8} - \frac{8}{9\pi}\right)a^4$$

$$\left(I_x\right)_2 = \left(\bar{I}_{x_2}\right)_2 + Ad^2 = \left(\frac{\pi}{8} - \frac{8}{9\pi}\right)a^4 + \left(\frac{\pi}{2}\right)a^2\left(a + \frac{4a}{3\pi}\right)^2 = \left(\frac{4}{3} + \frac{5\pi}{8}\right)a^4$$

$$\left(I_x\right)_3 = \left(\bar{I}_{x_3}\right)_3 + Ad^2 = \left(\frac{\pi}{8} - \frac{8}{9\pi}\right)a^4 + \left(\frac{\pi}{2}\right)a^2\left(a - \frac{4a}{3\pi}\right)^2 = \left(-\frac{4}{3} + \frac{5\pi}{8}\right)a^4$$

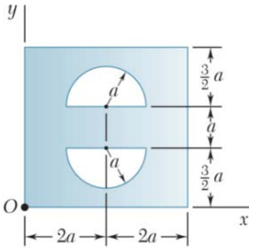
Finally, $I_x = \frac{4}{3}a^4 + \left(\frac{4}{3} + \frac{5\pi}{8}\right)a^4 - \left(-\frac{4}{3} + \frac{5\pi}{8}\right)a^4$ $I_x = 4a^4$ ◀

Also $I_y = (I_y)_1 + (I_y)_2 - \left(I_y\right)_3$

where $(I_y)_1 = \frac{1}{12}\left(2a\right)\left(2a\right)^3 + \left(2a\right)^2\left(a\right)^2 = \frac{16}{3}a^4$

but $(I_y)_2 = \left(I_y\right)_3$

Then $I_y = \frac{16}{3}a^4$ ◀



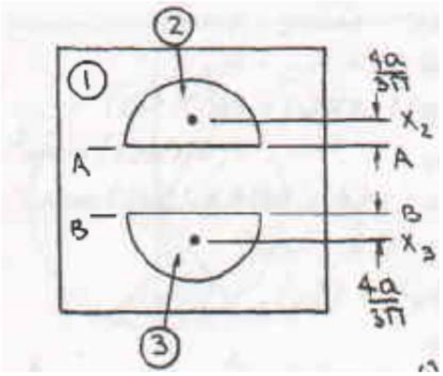
PROBLEM 9.36

Determine the moments of inertia of the shaded area shown with respect to the *x* and *y* axes.

SOLUTION

We have $$I_x = (I_x)_1 - (I_x)_2 - (I_x)_3$$

where $$(I_x)_1 = \frac{1}{12}(4a)(4a)^3 + (4a)^2(2a)^2$$
$$= \frac{256}{3}a^4$$



$$(I_{AA})_2 = (I_{BB})_3 = \frac{\pi}{8}a^4$$
$$(I_{AA})_2 = (\overline{I}_{x_2})_2 + Ad^2$$

$$(\overline{I}_{x_2})_2 = (\overline{I}_{x_3})_3 = \frac{\pi}{8}a^4 - \left(\frac{\pi}{2}a^2\right)\left(\frac{4a}{3\pi}\right)^2 = \left(\frac{\pi}{8} - \frac{8}{9\pi}\right)a^4$$

$$(I_x)_2 = (\overline{I}_{x_2})_2 + Ad^2 = \left(\frac{\pi}{8} - \frac{8}{9\pi}\right)a^4 + \left(\frac{\pi}{2}\right)a^2\left(\frac{5}{2}a + \frac{4a}{3\pi}\right)^2 = \left(\frac{10}{3} + \frac{13\pi}{4}\right)a^4$$

$$(I_x)_3 = (\overline{I}_{x_3})_3 + Ad^2 = \left(\frac{\pi}{8} - \frac{8}{9\pi}\right)a^4 + \left(\frac{\pi}{2}\right)a^2\left(\frac{3}{2}a - \frac{4a}{3\pi}\right)^2 = \left(-2 + \frac{5\pi}{4}\right)a^4$$

Finally, $$I_x = \frac{256}{3}a^4 - \left(\frac{10}{3} + \frac{13\pi}{4}\right)a^4 - \left(-2 + \frac{5\pi}{4}\right)a^4 \quad I_x = 69.9a^4 \blacktriangleleft$$

Also $$I_y = (I_y)_1 - (I_y)_2 - (I_y)_3$$

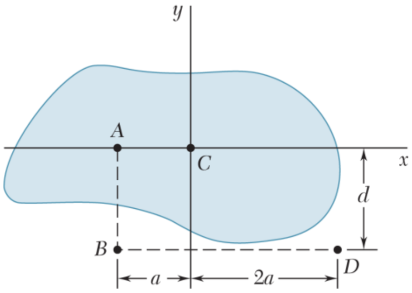
PROBLEM 9.36 (Continued)

$$(I_y)_1 = \frac{1}{12}(4a)(4a)^3 + (4a)^2(2a)^2 = \frac{256}{3}a^4$$

$$(I_y)_2 = \left(I_y\right)_3 = \frac{\pi}{8}a^4 + \left(\frac{\pi}{2}a^2\right)(2a)^2 = \frac{17}{8}\pi a^4$$

Then

$$I_y = \frac{256}{3}a^4 - 2\left(\frac{17}{8}\pi a^4\right) \qquad I_y = 72.0a^4 \blacktriangleleft$$



PROBLEM 9.37

The centroidal polar moment of inertia $\bar{J}_C$ of the 24-in^2 shaded area is 600 in^4. Determine the polar moments of inertia J_B and J_D of the shaded area knowing that $J_D = 2J_B$ and $d = 5$ in.

SOLUTION

Given: $A = 24\text{ in}^2 \quad J_D = 2J_B \quad J_C = 600\text{ in}^4$

$$J_B = \bar{J}_C + A(d_{CB})^2 \quad (1)$$

$$J_D = \bar{J}_C + A(d_{CD})^2 \quad (2)$$

$$\bar{J}_C + A\left(d_{CD}\right)^2 = 2\left(\bar{J}_C + A\left(d_{CB}\right)^2\right)$$

$$\left(d_{CB}\right)^2 = a^2 + d^2 \quad \text{and} \quad \left(d_{CD}\right)^2 = \left(2a\right)^2 + d^2$$

$$A\left(4a^2 + d^2\right) = \bar{J}_C + 2A\left(a^2 + d^2\right)$$

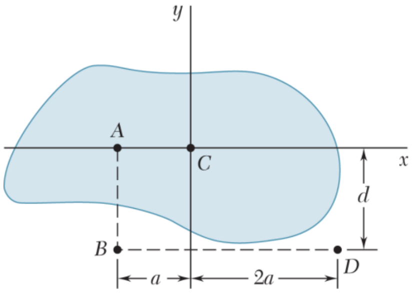
$$a^2 = \frac{1}{2}\left(\frac{\bar{J}_C}{A} + d^2\right)$$

$$a^2 = \frac{1}{2}\left(\frac{600}{24} + (5)^2\right)$$

$a = 5$ in.

Then from Eqn. (1) $\quad J_B = 600 + 24\left(5^2 + 5^2\right) \quad J_B = 1800\text{ in}^4$ ◀

Then from Eqn. (2) $\quad J_D = 600 + 24\left(10^2 + 5^2\right) \quad J_D = 3600\text{ in}^4$ ◀



PROBLEM 9.38

Determine the centroidal polar moment of inertia $\bar{J}_C$ of the 25-in^2 shaded area knowing that the polar moments of inertia of the area with respect to points *A*, *B*, and *D* are, respectively, $J_A = 281$ in^4, $J_B = 810$ in^4, and $J_D = 1578$ in^4.

SOLUTION

$$J_A = \bar{J}_C + A(d_{CA})^2 \qquad (d_{CA})^2 = a^2$$

$$J_B = \bar{J}_C + A(a)^2 \qquad (1)$$

$$J_B = \bar{J}_C + A(d_{CB})^2 \qquad (d_{CB})^2 = a^2 + d^2$$

$$J_B = \bar{J}_C + A(a^2 + d^2) \quad (2)$$

$$J_D = \bar{J}_C + A(d_{CD})^2 \qquad (d_{CD})^2 = 4a^2 + d^2$$

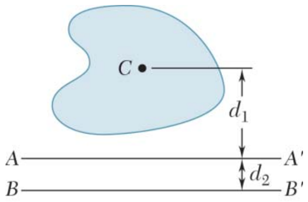
$$J_D = \bar{J}_C + A\left(4a^2 + d^2\right) \qquad (3)$$

Eqn. (3) – Eqn. (2): $$J_D - J_B = 3Aa^2 \qquad (4)$$

Eqn. (4) -3[Eqn. (1)] $$J_D - J_B - 3J_A = 3\bar{J}_C$$

$$\bar{J}_C = 281 - \frac{1}{3}(1578 - 810)$$

$\bar{J}_C = 25.0$ in^4 ◀



PROBLEM 9.39

Determine the shaded area and its moment of inertia with respect to the centroidal axis parallel to AA' knowing that d_1 = 25 mm and d_2 = 10 mm and that its moments of inertia with respect to AA' and BB' are 2.2 × 10^6 mm^4 and 4 × 10^6 mm^4, respectively.

SOLUTION

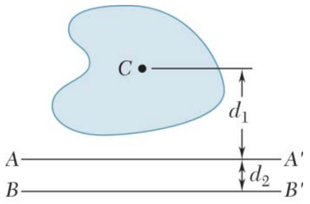
$$I_{AA'} = 2.2\times10^6 \text{ mm}^4 = \bar{I} + A(25\text{ mm})^2 \qquad (1)$$

$$I_{BB'} = 4\times10^6 \text{ mm}^4 = \bar{I} + A(35\text{ mm})^2$$

$$I_{BB'} - I_{AA'} = (4-2.2)\times10^6 = A(35^2 - 25^2)$$

$$1.8\times10^6 = A(600) \qquad A = 3000 \text{ mm}^2 \blacktriangleleft$$

Eq. (1): $$2.2\times10^6 = \bar{I} + (3000)(25)^2 \qquad \bar{I} = 325\times10^3 \text{ mm}^4 \blacktriangleleft$$



PROBLEM 9.40

Knowing that the shaded area is equal to 6000 mm^2 and that its moment of inertia with respect to *AA′* is 18×10^6 mm^4, determine its moment of inertia with respect to *BB′* for $d_1 = 50$ mm and $d_2 = 10$ mm.

SOLUTION

Given: $A = 6000\text{ mm}^2$

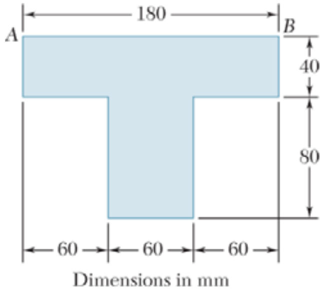
$$I_{AA'} = \bar{I} + Ad_1^2; \quad 18 \times 10^6\text{ mm}^2 = \bar{I} + (6000\text{ mm}^2)(50\text{ mm})^2$$

$$\bar{I} = 3 \times 10^6\text{ mm}^4$$

$$I_{BB'} = \bar{I} + Ad^2 = 3 \times 10^6\text{ mm}^4 + (6000\text{ mm}^2)(50\text{ mm} + 10\text{ mm})^2$$

$$= 3 \times 10^6 + 6000(60)^2 = 24.6 \times 10^6\text{ mm}^4$$

$$I_{BB'} = 24.6 \times 10^6\text{ mm}^4 \blacktriangleleft$$



PROBLEM 9.41

Determine the moments of inertia $\bar{I}_x$ and $\bar{I}_y$ of the area shown with respect to centroidal axes respectively parallel and perpendicular to side *AB*.

SOLUTION

First locate centroid *C* of the area.

Symmetry implies $\bar{X} = 0$

	A, mm^2	$\bar{y}$, mm	$\bar{y}A$, mm^3
Flng.	$180 \times 40 = 7200$	20	144,000
Web	$80 \times 60 = 4800$	80	384,000
Σ	12,000		528,000

Then $\bar{Y}\Sigma A = \Sigma \bar{y}A: \quad \bar{X}(12{,}000 \text{ mm}^2) = 528{,}000 \text{ mm}^3$

or $\bar{Y} = 44.0$ mm (measured from top of flange)

Now $\bar{I}_x = (I_x)_F + (I_x)_W$

where

$$(I_x)_F = \frac{1}{12}(180 \text{ mm})(40 \text{ mm})^3 + \left(7200 \text{ mm}^2\right)\left(44 \text{ mm} - 20 \text{ mm}\right)^2 = 5.170 \times 10^6 \text{mm}^4$$

$$(I_x)_W = \left[\frac{1}{12}(60 \text{ mm})(80 \text{ mm})^3 + \left(4800 \text{ mm}^2\right)(80 \text{ mm} - 44 \text{ mm})^2\right] = 8.78 \times 10^6 \text{ mm}^4$$

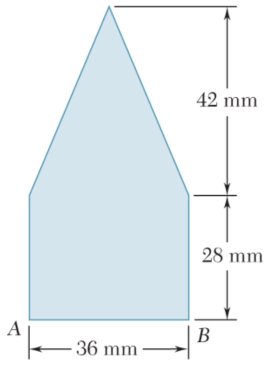
Then $\bar{I}_x = (5.107 + 8.78) \times 10^6 \text{mm}^4$

or $\bar{I}_x = 13.89 \times 10^6 \text{mm}^4$ ◀

Also $\bar{I}_y = (I_y)_F + (I_y)_W$

Then $\bar{I}_y = \left[\frac{1}{12}(40)(180)^3 + \frac{1}{12}(80)(60)^3\right] \text{mm}^4$

or $\bar{I}_y = 20.9 \times 10^6 \text{mm}^4$ ◀



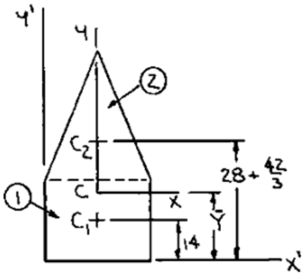
PROBLEM 9.42

Determine the moments of inertia $\bar{I}_x$ and $\bar{I}_y$ of the area shown with respect to centroidal axes respectively parallel and perpendicular to side *AB*.

SOLUTION

First locate *C* of the area.

Symmetry implies $\bar{X} = 18\text{ mm}$.



Dimensions in mm

	A, mm^2	$\bar{y}$, mm	$\bar{y}A$, mm^3
1	$36 \times 28 = 1008$	14	14,112
2	$\frac{1}{2} \times 36 \times 42 = 756$	42	31,752
Σ	1764		45,864

Then $\bar{Y}\Sigma A = \Sigma \bar{y}A$: $\bar{Y}(1764\text{ mm}^2) = 45{,}864\text{ mm}^3$

or $\bar{Y} = 26.0\text{ mm}$

Now $\bar{I}_x = (I_x)_1 + (I_x)_2$

where

$$(I_x)_1 = \frac{1}{12}(36\text{ mm})(28\text{ mm})^3 + (1008\text{ mm}^2)[(26-14)\text{ mm}]^2$$

$$= (65{,}856 + 145{,}152)\text{ mm}^4 = 211.008 \times 10^3\text{ mm}^4$$

$$(I_x)_2 = \frac{1}{36}(36\text{ mm})(42\text{ mm})^3 + (756\text{ mm}^2)[(42-26)\text{ mm}]^2$$

$$= (74{,}088 + 193{,}536)\text{ mm}^4 = 267.624 \times 10^3\text{ mm}^4$$

Then $\bar{I}_x = (211.008 + 267.624) \times 10^3\text{ mm}^4$

or $\bar{I}_x = 479 \times 10^3\text{ mm}^4$ ◀

PROBLEM 9.42 (Continued)

Also $$\bar{I}_y = (I_y)_1 + (I_y)_2$$

where $$(I_y)_1 = \frac{1}{12}(28\text{ mm})(36\text{ mm})^3 = 108.864\times 10^3\text{ mm}^4$$

$$(I_y)_2 = 2\left[\frac{1}{36}(42\text{ mm})(18\text{ mm})^3 + \left(\frac{1}{2}\times 18\text{ mm}\times 42\text{ mm}\right)(6\text{ mm})^2\right]$$

$$= 2(6804 + 13,608)\text{ mm}^4 = 40.824\times 10^3\text{ mm}^4$$

[$(I_y)_2$ is obtained by dividing A_2 into]

Then $$\bar{I}_y = (108.864 + 40.824\times 10^3\text{ mm}^4$$ or $$\bar{I}_y = 149.7\times 10^3\text{ mm}^4$$ ◀

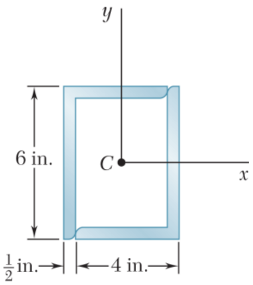
$$= 167.691\times10^6\text{ mm}^4 \qquad \bar{I}_y = 167.7\times10^6\text{ mm}^4 \blacktriangleleft$$

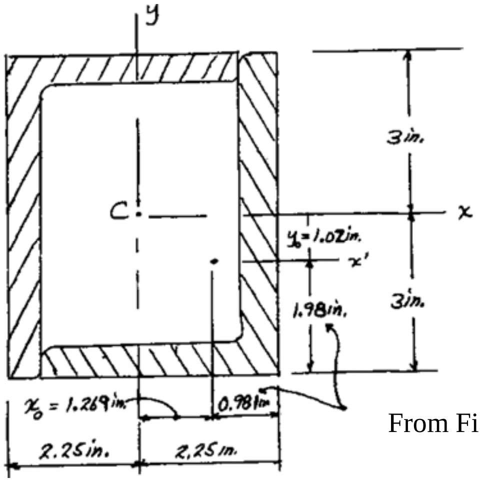
$$k_y^2 = \frac{I_y}{A} = \frac{167.691\times10^6}{13.28\times10^3} = 12.6273\times10^3 \qquad \bar{k}_y = 112.4\text{ mm} \blacktriangleleft$$



PROBLEM 9.50

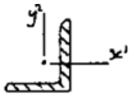
Two L6 × 4 × $\frac{1}{2}$ -in. angles are welded together to form the section shown. Determine the moments of inertia and the radii of gyration of the combined section with respect to the centroidal *x* and *y* axes.

SOLUTION



From Figure 9.13A

From Figure 9.13A: Area $= A = 4.75\ \text{in}^2$



$$I_{x'} = 17.3\ \text{in}^4$$

$$I_{y'} = 6.22\ \text{in}^4$$

$$\bar{I}_x = 2[\bar{I}_{x'} + Ay_O^2] = 2[17.3\ \text{in}^4 + (4.75\ \text{in}^2)(1.02\ \text{in.})^2] = 44.484\ \text{in}^4$$

$$\bar{I}_x = 44.5\ \text{in}^4 \blacktriangleleft$$

Total area = 2(4.75) = 9.50 in^2

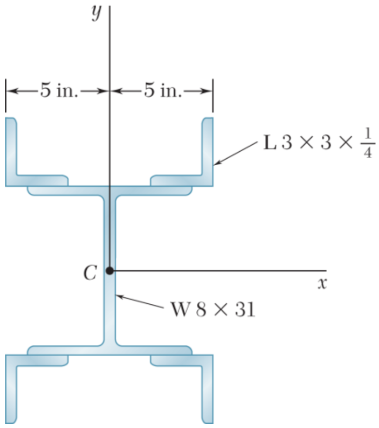
$$\bar{k}_x^2 = \frac{\bar{I}_x}{\text{area}} = \frac{44.484\ \text{in}^4}{9.50\ \text{in}^2} = 4.6825\ \text{in}^2 \qquad \bar{k}_x = 2.16\ \text{in.} \blacktriangleleft$$

$$\bar{I}_y = 2[\bar{I}_{y'} + Ax_O^2] = 2[6.22\ \text{in}^4 + (4.75\ \text{in}^2)(1.269\ \text{in.})^2]$$

$$= 27.738\ \text{in}^4 \qquad \bar{I}_y = 27.7\ \text{in}^4 \blacktriangleleft$$

Total area = 2(4.75) = 9.50 in^2

$$\bar{k}_y^2 = \frac{\bar{I}_y}{\text{area}} = \frac{27.738\ \text{in}^4}{9.50\ \text{in}^2} = 2.9198 \qquad \bar{k}_y = 1.709\ \text{in} \blacktriangleleft$$



PROBLEM 9.51

Two L6 × 4 × $\frac{1}{2}$ -in. angles are welded together to form the section shown. Determine the moments of inertia and the radii of gyration of the combined section with respect to the centroidal *x* and *y* axes.

SOLUTION

W section: $A = 9.12\text{ in}^2 \quad \bar{I}_x = 110\text{ in}^4 \quad \bar{I}_y = 37.1\text{ in}^4$

Angle: $A = 1.44\text{ in}^2 \quad \bar{I}_x = 1.23\text{ in}^4 \quad \bar{I}_y = 1.23\text{ in}^4$

$$A_{\text{total}} = A_{\text{W}} + 4A_{\text{A}}$$

$$= 9.12 + 4(1.44) = 14.880\text{ in}^2$$

Now $$\bar{I}_x = (\bar{I}_x)_{\text{W}} + 4(I_x)_{\text{A}}$$

where $$(I_x)_{\text{A}} = \bar{I}_{x_{\text{A}}} + Ad^2$$

$$= 1.23\text{ in}^4 + (1.44\text{ in}^2)(4.00\text{ in.} + 0.836\text{ in.})^2 = 34.907\text{ in}^4$$

Then $$\bar{I}_x = (110 + 4 \times 34.907)\text{ in}^4 = 249.63\text{ in}^4$$ $\bar{I}_x = 250\text{ in}^4$ ◀

and $$\bar{k}_x^2 = \frac{\bar{I}_x}{A_{\text{total}}} = \frac{249.63\text{ in}^4}{14.880\text{ in}^2}$$ $\bar{k}_x = 4.10\text{ in.}$ ◀

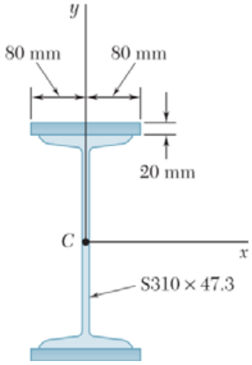
Also $$\bar{I}_y = (\bar{I}_y)_{\text{W}} + 4(\bar{I}_y)_{\text{A}}$$

where $$\left(\bar{I}_y\right)_{\text{A}} = \bar{I}_{y_{\text{A}}} + Ad^2$$

$$= \left(1.23 + 1.44\left(5 - 0.836\right)^2\right)\text{ in}^4 = 26.198\text{ in}^4$$

$$\bar{I}_y = (37.1 + 4 \times 26.198)\text{ in}^4 = 141.892\text{ in}^4$$ $\bar{I}_y = 141.9\text{ in}^4$ ◀

$$\bar{k}_y^2 = \frac{\bar{I}_y}{A_{\text{total}}} = \frac{141.892\text{ in}^4}{14.880\text{ in}^2}$$ $\bar{k}_y = 3.09\text{ in.}$ ◀



PROBLEM 9.52

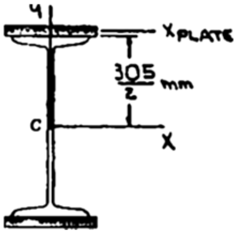
Two 20-mm steel plates are welded to a rolled S section as shown. Determine the moments of inertia and the radii of gyration of the combined section with respect to the centroidal *x* and *y* axes.

SOLUTION

S section: $A = 6010\text{ mm}^2$

$\bar{I}_x = 90.3 \times 10^6\text{ mm}^4$

$\bar{I}_y = 3.88 \times 10^6\text{ mm}^4$



Note:
$$A_{\text{total}} = A_S + 2A_{\text{plate}}$$
$$= 6010\text{ mm}^2 + 2(160\text{ mm})(20\text{ mm})$$
$$= 12,410\text{ mm}^2$$

Now
$$\bar{I}_x = (\bar{I}_x)_S + 2(I_x)_{\text{plate}}$$

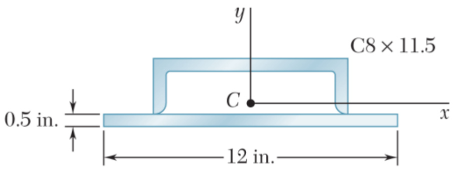
where
$$(I_x)_{\text{plate}} = \bar{I}_{x_{\text{plate}}} + Ad^2$$
$$= \frac{1}{12}(160\text{ mm})(20\text{ mm})^3 + (3200\text{ mm}^2)[(152.5+10)\text{ mm}]^2$$
$$= 84.6067 \times 10^6\text{ mm}^4$$

Then
$$\bar{I}_x = (90.3 + 2 \times 84.6067) \times 10^6\text{ mm}^4$$
$$= 259.5134 \times 10^6\text{ mm}^4 \qquad \text{or} \quad \bar{I}_x = 260 \times 10^6\text{ mm}^4 \blacktriangleleft$$

and
$$\bar{k}_x^2 = \frac{\bar{I}_x}{A_{\text{total}}} = \frac{259.5134 \times 10^6\text{ mm}^4}{12410\text{ mm}^2} \qquad \text{or} \quad \bar{k}_x = 144.6\text{ mm} \blacktriangleleft$$

Also
$$\bar{I}_y = (\bar{I}_y)_S + 2(\bar{I}_y)_{\text{plate}}$$
$$= 3.88 \times 10^6\text{ mm}^4 + 2\left[\frac{1}{12}(20\text{ mm})(160\text{ mm})^3\right]$$
$$= 17.5333 \times 10^6\text{ mm}^4 \qquad \text{or} \quad \bar{I}_y = 17.53 \times 10^6\text{ mm}^4 \blacktriangleleft$$

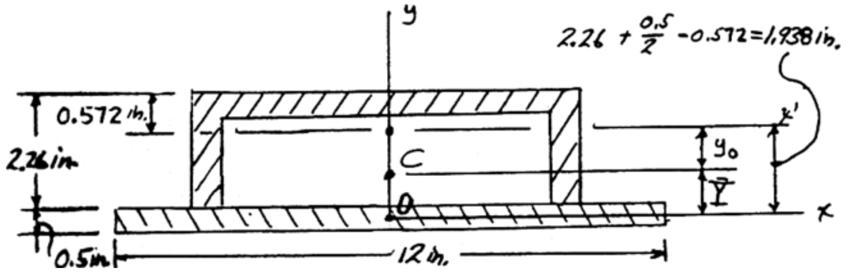
and
$$\bar{k}_y^2 = \frac{\bar{I}_y}{A_{\text{total}}} = \frac{17.5333 \times 10^6\text{ mm}^4}{12,410\text{ mm}^2} \qquad \text{or} \quad \bar{k}_y = 37.6\text{ mm} \blacktriangleleft$$

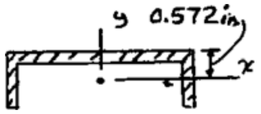


PROBLEM 9.53

A channel and a plate are welded together as shown to form a section that is symmetrical with respect to the *y* axis. Determine the moments of inertia of the combined section with respect to its centroidal *x* and *y* axes.

SOLUTION





From Figure 9.13B $\qquad B = 3.37\ \text{in}^2$

For C8 × 11.5: $\qquad \bar{I}_y = 1.31\ \text{in}^4$

(Note change of axes) $\qquad \bar{I}_y = 32.5\ \text{in}^4$

Location of centroid

$$\bar{Y}\Sigma A = \Sigma \bar{y} A: \qquad \bar{Y}[3.7\ \text{in}^2 + (12\ \text{in.})(0.5\ \text{in.})] = (3.37\ \text{in}^2)(1.938\ \text{in.})$$

$$\bar{Y} = 0.69702\ \text{in.}$$

Moment of inertia with respect to *x* axis.

Plate:
$$I_x = \bar{I}_x + A\bar{Y}^2 = \frac{1}{12}(12\ \text{in.})(0.5\ \text{in.})^3 + (12\ \text{in.})(0.5\ \text{in.})(0.69702\ \text{in.})^2$$
$$= 0.125 + 2.9150 = 3.0400\ \text{in}^4$$

Channel:
$$I_x = \bar{I}_{x'} + A\bar{Y}_0^2 = 1.31\ \text{in}^4 + (3.37\ \text{in.})(1.938\ \text{in.} - 0.69702\ \text{in.})^2$$
$$= 1.31 + 5.1899 = 6.4999\ \text{in}^4$$

Entire section:
$$I_x = 3.0400\ \text{in}^4 + 6.4999\ \text{in}^4 = 9.5399\ \text{in}^4$$

$\bar{I}_x = 9.54\ \text{in}^4$ ◀

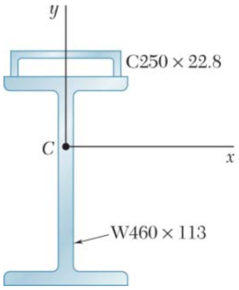
Moment of inertia with respect to *y* axis.

Plate:
$$\bar{I}_y = \frac{1}{12}(0.5\ \text{in.})(12\ \text{in.})^3 = 72\ \text{in}^4$$

Channel:
$$\bar{I}_y = 32.5\ \text{in}^4$$

Entire section:
$$\bar{I}_y = 72\ \text{in}^4 + 32.5\ \text{in}^4 = 104.5\ \text{in}^4$$

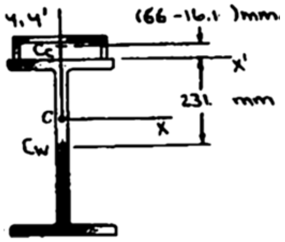
$\bar{I}_y = 104.5\ \text{in}^4$ ◀



PROBLEM 9.54

The strength of the rolled W section shown is increased by welding a channel to its upper flange. Determine the moments of inertia of the combined section with respect to its centroidal *x* and *y* axes.

SOLUTION



W section: $A = 14,400\text{ mm}^2$

$$\bar{I}_x = 554\times10^6\text{ mm}^4$$

$$\bar{I}_y = 63.3\times10^6\text{ mm}^4$$

Channel: $A = 2890\text{ mm}^2$

$$\bar{I}_x = 0.945\times10^6\text{ mm}^4$$

$$\bar{I}_y = 28.0\times10^6\text{ mm}^4$$

First locate centroid *C* of the section.

	A, mm^2	$\bar{y}$, mm	$\bar{y}A$, mm^3
W Section	14,400	–231	–33,26,400
Channel	2,890	49.9	1,44,211
Σ	17,290		–31,82,189

Then $\bar{Y}\Sigma A = \Sigma\bar{y}A$: $\bar{Y}(17,290\text{ mm}^2) = -3,182,189\text{ mm}^3$

or $\bar{Y} = -184.047\text{ mm}$

Now $\bar{I}_x = (I_x)_\text{W} + (I_x)_\text{C}$

where

$$(I_x)_\text{W} = \bar{I}_x + Ad^2$$

$$= 554\times10^6\text{ mm}^4 + (14,400\text{ mm}^2)(231-184.047)^2\text{ mm}^2$$

$$= 585.75\times10^6\text{ mm}^4$$

$$(I_x)_\text{C} = \bar{I}_x - Ad^2$$

$$= 0.945\times10^6\text{ mm}^4 + (2,890\text{ mm}^2)(49.9+184.047)^2\text{ mm}^2$$

$$= 159.12\times10^6\text{ mm}^4$$

PROBLEM 9.54 (Continued)

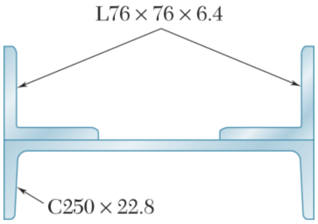
Then $\bar{I}_x = (585.75 + 159.12) \times 10^6 \text{ mm}^4$

or $\bar{I}_x = 745 \times 10^6 \text{ mm}^4$ ◀

also $\bar{I}_y = (I_y)_\text{W} + (I_y)_C$

$= (63.3 + 28.0) \times 10^6 \text{ mm}^4$

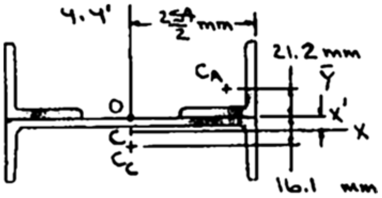
or $\bar{I}_y = 91.3 \times 10^6 \text{ mm}^4$ ◀



PROBLEM 9.55

Two L76 × 76 × 6.4-mm angles are welded to a C250 × 22.8 channel. Determine the moments of inertia of the combined section with respect to centroidal axes respectively parallel and perpendicular to the web of the channel.

SOLUTION



Angle: $A = 929\ \text{mm}^2$

$\bar{I}_x = \bar{I}_y = 0.512 \times 10^6\ \text{mm}^4$

Channel: $A = 2890\ \text{mm}^2$

$\bar{I}_x = 0.945 \times 10^6\ \text{mm}^4$

$\bar{I}_y = 28.0 \times 10^6\ \text{mm}^4$

First locate centroid *C* of the section

	A, mm^2	$\bar{y}$, mm	$\bar{y}A$, mm^3
Angle	$2(929) = 1858$	21.2	39,389.6
Channel	2890	−16.1	−46,529
Σ	4748		−7139.4

Then $\bar{Y}\Sigma A = \Sigma \bar{y} A$: $\quad \bar{Y}(4748\ \text{mm}^2) = -7139.4\ \text{mm}^3$

or $\bar{Y} = -1.50366\ \text{mm}$

Now $\bar{I}_x = 2(I_x)_L + (I_x)_C$

where

$$(I_x)_L = \bar{I}_x + Ad^2 = 0.512 \times 10^6\ \text{mm}^4 + (929\ \text{mm}^2)[(21.2 + 1.50366)\ \text{mm}]^2$$
$$= 0.990859 \times 10^6\ \text{mm}^4$$
$$(I_x)_C = \bar{I}_x + Ad^2 = 0.949 \times 10^6\ \text{mm}^4 + (2890\ \text{mm}^2)[(16.1 - 1.50366)\ \text{mm}]^2$$
$$= 1.56472 \times 10^6\ \text{mm}^4$$

Then $\bar{I}_x = [2(0.990859) + 1.56472 \times 10^6]\ \text{mm}^4$

or $\bar{I}_x = 3.55 \times 10^6\ \text{mm}^4$ ◀

PROBLEM 9.55 (Continued)

Also $$\bar{I}_y = 2(I_y)_L + (I_y)_C$$

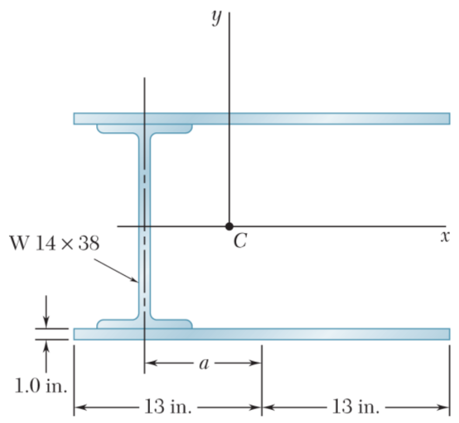
where $$(I_y)_L = \bar{I}_y + Ad^2 = 0.512\times10^6\text{ mm}^4 + (929\text{ mm}^2)[(127-21.2)\text{ mm}]^2$$

$$= 10.9109\times10^6\text{ mm}^4$$

$$(I_y)_C = \bar{I}_y$$

Then $$\bar{I}_y = [2(10.9109) + 28.0]\times10^6\text{ mm}^4$$

or $\bar{I}_y = 49.8\times10^6\text{ mm}^4$ ◀



PROBLEM 9.56

Two steel plates are welded to a rolled W section as indicated. Knowing that the centroidal moments of inertia $\bar{I}_x$ and $\bar{I}_y$ of the combined section are equal, determine (*a*) the distance *a*, (*b*) the moments of inertia with respect to the centroidal *x* and *y* axes.

SOLUTION

For W-section: $A = 11.2\text{ in}^2, \quad \bar{I}_x = 385\text{ in}^4, \quad \bar{I}_y = 26.7\text{ in}^4$

Section	Area, in^2	$\bar{x}$ in.	$\bar{x}A$, in^3
Plate	$2(1)(26) = 52$	a	$52a$
W-section	11.2	0	0
Σ	63.2		$52a$

$$\bar{X}\Sigma A = \Sigma\bar{x}A: \qquad \bar{X}\left(63.2\text{ in}^2\right) = 52a\text{ in}^3$$

$$\bar{x} = 0.82279a\text{ in.}$$

Entire section:

$$\bar{I}_x = (\bar{I}_{x_W} + 2I_{x_{PL}}); \quad I_{x_{PL}} = \bar{I}_x + Ad^2$$

$$= \frac{1}{12}(26\text{ in.})(1\text{ in.})^3 + \left(26\text{ in}^3\right)(7.05\text{ in.} + 0.5\text{ in.})^2$$

$$= 1484.232\text{ in}^4$$

$$\bar{I}_x = 385 + 2(1484.232) = 3353.46\text{ in}^4 \qquad \bar{I}_x = 3350\text{ in}^4 \blacktriangleleft$$

$$\bar{I}_x = \bar{I}_y \qquad \bar{I}_y = 3350\text{ in}^4 \blacktriangleleft$$

$$\bar{I}_y = (\bar{I}_{y_W} + 2I_{y_{PL}}); \quad I_{y_{PL}} = \bar{I}_y + Ad^2$$

$$= \frac{1}{12}(1\text{ in.})(26\text{ in.})^3 + \left(26\text{ in}^2\right)(a - 0.82279a\text{ in.})^2$$

$$= \left(1464.667 + 0.81649a^2\right)\text{ in}^4$$

PROBLEM 9.56 (Continued)

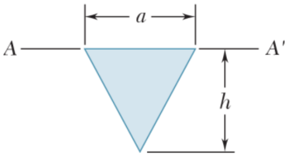
$$\bar{I}_{y_w} = \bar{I}_{y_w} + Ad^2$$

$$= 26.7\text{ in}^4 + \left(11.2\text{ in}^2\right)\left(0.82279a\text{ in.}\right)^2$$

$$= \left(26.7 + 7.5822a^2\right)\text{in}^4$$

$$\bar{I}_y = \left(26.7 + 7.5822a^2\right) + 2\left(1464.667 + 0.81649a^2\right) = 3353.46$$

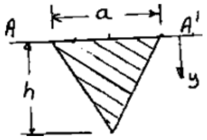
$a = 6.57$ in. ◀



PROBLEM 9.57

The panel shown forms the end of a trough that is filled with water to the line AA'. Referring to section 9.2, determine the depth of the point of application of the resultant of the hydrostatic forces acting on the panel (the center of pressure).

SOLUTION



From section 9.2: $R = \gamma \int y dA, \quad M_{AA'} = \gamma \int y^2 dA$

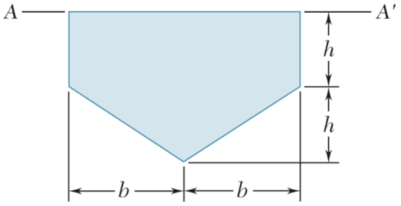
Let y_P= distance of center of pressure from AA'. We must have:

$$Ry_P = M_{AA'}: \quad y_P = \frac{M_{AA'}}{R} = \frac{\gamma \int y^2 dA}{\gamma \int y dA} = \frac{I_{AA'}}{\bar{y} A} \qquad (1)$$

For triangular panel:

$$I_{AA'} = \frac{1}{12} a h^3 \qquad \bar{y} = \frac{1}{3} h \qquad A = \frac{1}{2} a h$$

$$y_P = \frac{I_{AA'}}{\bar{y} A} = \frac{\frac{1}{12} a h^3}{\left(\frac{1}{3} h\right)\left(\frac{1}{2} a h\right)} \qquad y_P = \frac{1}{2} h \blacktriangleleft$$

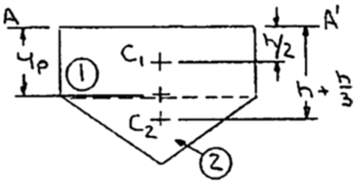


PROBLEM 9.58

The panel shown forms the end of a trough that is filled with water to the line *AA*′. Referring to Section 9.2, determine the depth of the point of application of the resultant of the hydrostatic forces acting on the panel (the center of pressure).

SOLUTION

Using the equation developed on page 506 of the text:



$$y_P = \frac{I_{AA'}}{\bar{y}A}$$

Now $\bar{Y}A = \Sigma \bar{y}A$

$$= \frac{h}{2}(2b \times h) + \frac{4}{3}h\left(\frac{1}{2} \times 2b \times h\right)$$

$$= \frac{7}{3}bh^2$$

and $I_{AA'} = (I_{AA'})_1 + (I_{AA'})_2$

where

$$(I_{AA'})_1 = \frac{1}{3}(2b)(h)^3 = \frac{2}{3}bh^3$$

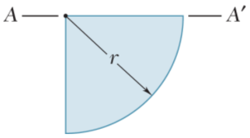
$$(I_{AA'})_2 = \bar{I}_x + Ad^2 = \frac{1}{36}(2b)(h)^3 + \left(\frac{1}{2} \times 2b \times h\right)\left(\frac{4}{3}h\right)^2$$

$$= \frac{11}{6}bh^3$$

Then $I_{AA'} = \frac{2}{3}bh^3 + \frac{11}{6}bh^3 = \frac{5}{2}bh^3$

Finally, $y_P = \dfrac{\frac{5}{2}bh^3}{\frac{7}{3}bh^2}$

or $y_P = \frac{15}{14}h$ ◀



PROBLEM 9.59

The panel shown forms the end of a trough that is filled with water to the line *AA*′. Referring to section 9.2, determine the depth of the point of application of the resultant of the hydrostatic forces acting on the panel (the center of pressure).

SOLUTION

Using the equation developed on page 506 of the text have:

$$y_P = \frac{I_{AA'}}{\overline{y}A}$$

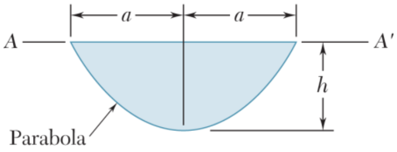
For a quartér circle:

$$I_{AA'} = \frac{\pi}{16} r^4$$

$$\overline{y} = \frac{4r}{3\pi} \qquad A = \frac{\pi}{4} r^2$$

Then $y_P = \dfrac{\frac{\pi}{16} r^4}{\frac{4r}{3\pi} \times \frac{\pi}{4} r^2}$ or

or $y_P = \dfrac{3\pi}{16} r$ ◀



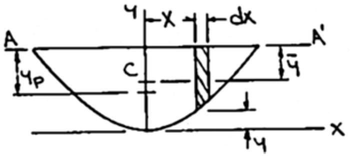
PROBLEM 9.60*

The panel shown forms the end of a trough that is filled with water to the line *AA′*. Referring to section 9.2, determine the depth of the point of application of the resultant of the hydrostatic forces acting on the panel (the center of pressure).

SOLUTION

Using the equation developed on page 506 of the text:

$$y_P = \frac{I_{AA'}}{\bar{y}A}$$



For a parabola:

$$\bar{y} = \frac{2}{5}h \qquad A = \frac{4}{3}ah$$

Now

$$dI_{AA'} = \frac{1}{3}(h-y)^3\,dx$$

By observation

$$y = \frac{h}{a^2}x^2$$

So that

$$dI_{AA'} = \frac{1}{3}\left(h - \frac{h}{a^2}x^2\right)^3 dx = \frac{1}{3}\frac{h^3}{a^6}(a^2 - x^2)^3\,dx$$

$$= \frac{1}{3}\frac{h}{a^6}(a^6 - 3a^4x^2 + 3a^2x^4 - x^6)dx$$

Then

$$I_{AA'} = 2\int_0^a \frac{1}{3}\frac{h^3}{a^6}(a^6 - 3a^4x^2 + 3a^2x^4 - x^6)dx$$

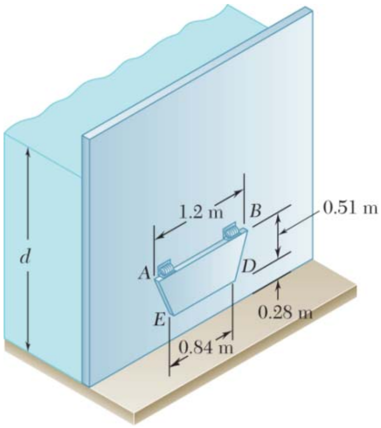
$$= \frac{2}{3}\frac{h^3}{a^6}\left[a^6x - a^4x^3 + \frac{3}{5}a^2x^5 - \frac{1}{7}x^7\right]_0^a$$

$$= \frac{32}{105}ah^3$$

Finally,

$$y_p = \frac{\frac{32}{105}ah^3}{\frac{2}{5}h \times \frac{4}{3}ah}$$

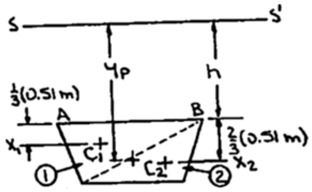
or $y_P = \frac{4}{7}h$ ◀



PROBLEM 9.61

A vertical trapezoidal gate that is used as an automatic valve is held shut by two springs attached to hinges located along edge *AB*. Knowing that each spring exerts a couple of magnitude 1470 N · m, determine the depth *d* of water for which the gate will open.

SOLUTION



From section 9.2:

$$R = \gamma \bar{y} A \qquad y_P = \frac{I_{SS'}}{\bar{y}A}$$

where *R* is the resultant of the hydrostatic forces acting on the gate and y_P is the depth to the point of application of *R*. Now

$$\bar{y}A = \Sigma \bar{y}A = [(h+0.17)\text{ m}]\left(\frac{1}{2}\times 1.2\text{ m}\times 0.51\text{ m}\right) + [(h+0.34)\text{ m}]\left(\frac{1}{2}\times 0.84\times 0.51\text{ m}\right)$$
$$= (0.5202h + 0.124848)\text{ m}^3$$

Recalling that $\gamma = py,$ we have

$$R = (10^3\text{ kg/m}^3 \times 9.81\text{ m/s}^2)(0.5202h + 0.124848)\text{ m}^3$$
$$= 5103.162(h + 0.24)\text{ N}$$

Also
$$I_{SS'} = (I_{SS'})_1 + (I_{SS'})_2$$

where
$$(I_{SS'})_1 = I_x + Ad^2$$
$$= \frac{1}{36}(1.2\text{ m})(0.51\text{ m})^3 + \left(\frac{1}{2}\times 1.2\text{ m}\times 0.51\text{ m}\right)[(h+0.17)\text{ m}]^2$$
$$= [0.0044217 + 0.306(h+0.17)^2]\text{ m}^4$$
$$= (0.306h^2 + 0.10404h + 0.0132651)\text{ m}^4$$

$$(I_{SS'})_2 = \bar{I}_{X_2} + Ad^2$$
$$= \frac{1}{36}(0.84\text{ m})(0.51\text{ m})^3 + \left(\frac{1}{2}\times 0.84\text{ m}\times 0.51\text{ m}\right)[(h+0.34)\text{ m}]^2$$
$$= [0.0030952 + 0.2142(h+0.34)^2]\text{ m}^4$$
$$= (0.2142h^2 + 0.145656h + 0.0278567)\text{ m}^4$$

PROBLEM 9.61 (Continued)

Then
$$I_{SS'} = (I_{SS'})_1 + (I_{SS'})_2$$
$$= (0.5202h^2 + 0.249696h + 0.0411218)\ \text{m}^4$$

and
$$y_P = \frac{(0.5202h^2 + 0.244696h + 0.0411218)\ \text{m}^4}{(0.5202h + 0.124848)\ \text{m}^3}$$
$$= \frac{h^2 + 0.48h + 0.07905}{h + 0.24}\ \text{m}$$

For the gate to open, require that

$$\Sigma M_{AB}: \quad M_{\text{open}} = (y_P - h)R$$

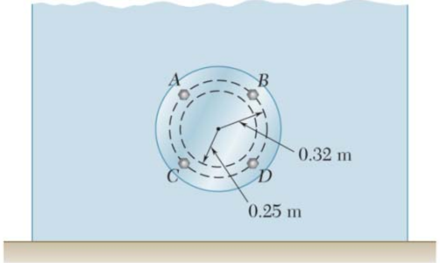
Substituting
$$2940\ \text{N}\cdot\text{m} = \left(\frac{h^2 + 0.48h + 0.07905}{h + 0.24} - h\right)\text{m} \times 5103.162(h + 0.24)\ \text{N}$$

or $5103.162(0.24h + 0.07905) = 2940$

or
$$h = 2.0711\ \text{m}$$

Then
$$d = (2.0711 + 0.79)\ \text{m}$$

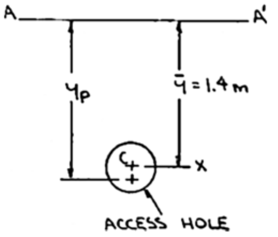
or $d = 2.86\ \text{m}$ ◀



PROBLEM 9.62

The cover for a 0.5-m-diameter access hole in a water storage tank is attached to the tank with four equally spaced bolts as shown. Determine the additional force on each bolt due to the water pressure when the center of the cover is located 1.4 m below the water surface.

SOLUTION



From section 9.2:

$$R = \gamma \bar{y} A \quad y_P = \frac{I_{AA'}}{\bar{y}A}$$

where R is the resultant of the hydrostatic forces acting on the cover and y_P is the depth to the point of application of R.

Recalling that $\gamma = p \cdot y,$ we have

$$R = (10^3 \text{ kg/m}^3 \times 9.81 \text{ m/s}^2)(1.4 \text{ m})[\pi(0.25 \text{ m})^2]$$
$$= 2696.67 \text{ N}$$

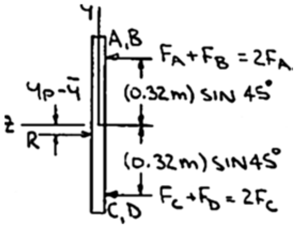
Also
$$I_{AA'} = \bar{I}_x + A\bar{y}^2 = \frac{\pi}{4}(0.25 \text{ m})^4 + [\pi(0.25 \text{ m})^2](1.4 \text{ m})^2$$
$$= 0.387913 \text{ m}^4$$

Then
$$y_P = \frac{0.387913 \text{ m}^4}{(1.4 \text{ m})[\pi(0.25 \text{ m})^2]} = 1.41116 \text{ m}$$

Now note that symmetry implies

$$F_A = F_B \qquad F_C = F_D$$

Next consider the free-body of the cover.



We have
$$+\circlearrowleft \Sigma M_{CD} = 0: \quad [2(0.32 \text{ m}) \sin 45°](2F_A)$$
$$-[0.32 \sin 45° - (1.41116 - 1.4)] \text{ m}$$
$$\times (2696.67 \text{ N}) = 0$$

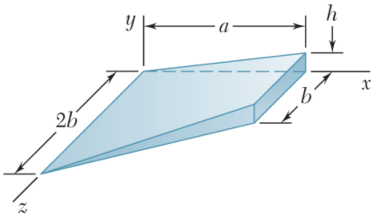
or
$$F_A = 640.92 \text{ N}$$

Then
$$\overset{+}{\longleftarrow} \Sigma F_z = 0: \quad 2(640.92 \text{ N}) + 2F_C - 2696.67 \text{ N} = 0$$

or
$$F_C = 707.42 \text{ N}$$

$$F_A = F_B = 641 \text{ N} \blacktriangleleft$$

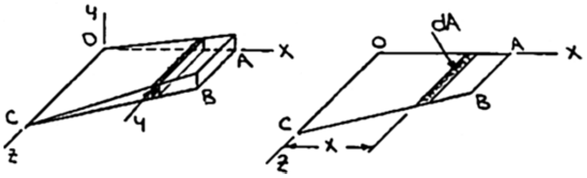
and
$$F_C = F_D = 707 \text{ N} \blacktriangleleft$$



PROBLEM 9.63*

Determine the x coordinate of the centroid of the volume shown. (*Hint:* The height y of the volume is proportional to the x coordinate; consider an analogy between this height and the water pressure on a submerged surface.)

SOLUTION



First note that

$$y = \frac{h}{a}x$$

Now

$$\bar{x}\int dV = \int \bar{x}_{EL}\,dV$$

where

$$\bar{x}_{EL} = x \quad dV = y\,dA = \left(\frac{h}{a}x\right)dA$$

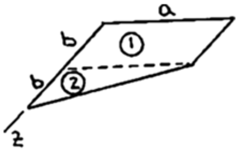
Then

$$\bar{x} = \frac{\int x\left(\frac{h}{a}x\,dA\right)}{\int \frac{h}{a}x\,dA} = \frac{\int x^2 dA}{\int x\,dA} = \frac{(I_z)_A}{(\bar{x}A)_A}$$

where $(I_z)_A$ and $(\bar{x}_A)_A$ pertain to area.

OABC: $(I_z)_A$ is the moment of inertia of the area with respect to the z axis, $\bar{x}_A$ is the x coordinate of the centroid of the area, and A is the area of *OABC*. Then

$$\begin{aligned}(I_z)_A &= (I_z)_{A_1} + (I_z)_{A_2}\\ &= \frac{1}{3}(b)(a)^3 + \frac{1}{12}(b)(a)^3\\ &= \frac{5}{12}a^3 b\end{aligned}$$



and

$$\begin{aligned}(\bar{x}A)_A &= \Sigma\bar{x}A\\ &= \left[\left(\frac{a}{2}\right)(a\times b)\right] + \left[\left(\frac{a}{3}\right)\left(\frac{1}{2}\times a\times b\right)\right]\\ &= \frac{2}{3}a^2 b\end{aligned}$$

PROBLEM 9.63* (Continued)

Finally,
$$\bar{x} = \frac{\frac{5}{12}a^3b}{\frac{2}{3}a^2b}$$

or $\bar{x} = \dfrac{5}{8}a$ ◀

Analogy with hydrostatic pressure on a submerged plate:

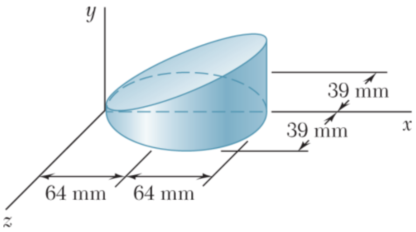
Recalling that $P = \gamma y$, it follows that the following analogies can be established.

Height $y \sim P$

$$dV = ydA \sim pdA = dF$$
$$xdV = x(ydA) \sim ydF = dM$$

Recalling that
$$y_P = \frac{M_x}{R}\left(= \frac{\int dM}{\int dF}\right)$$

It can then be concluded that $x \sim y_P$



PROBLEM 9.64*

Determine the x coordinate of the centroid of the volume shown; this volume was obtained by intersecting an elliptic cylinder with an oblique plane. (*Hint:* The height y of the volume is proportional to the x coordinate; consider an analogy between this height and the water pressure on a submerged surface.)

SOLUTION

Following the “Hint,” it can be shown that (see solution to Problem 9.63)

$$\bar{x} = \frac{(I_z)_A}{(\bar{x}A)_A} x$$

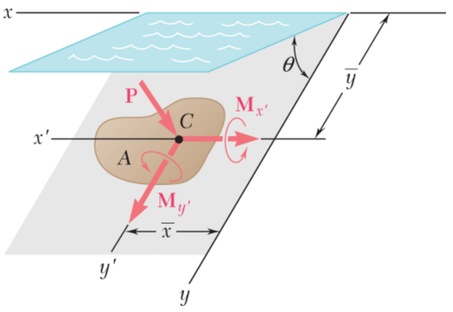
where $(I_z)_A$ and $(\bar{x}A)_A$ are the moment of inertia and the first moment of the area, respectively, of the elliptical area of the base of the volume with respect to the z axis. Then

$$\begin{aligned}(I_z)_A &= \bar{I}_z + Ad^2 \\ &= \frac{\pi}{4}(39 \text{ mm})(64 \text{ mm})^3 + [\pi(64 \text{ mm})(39 \text{ mm})](64 \text{ mm})^2 \\ &= 12.779520\pi \times 10^6 \text{ mm}^4\end{aligned}$$

$$\begin{aligned}(\bar{x}A)_A &= (64 \text{ mm})[\pi(64 \text{ mm})(39 \text{ mm})] \\ &= 0.159744\pi \times 10^6 \text{ mm}^3\end{aligned}$$

Finally $$\bar{x} = \frac{12.779520\pi \times 10^6 \text{ mm}^4}{0.159744\pi \times 10^6 \text{ mm}^4}$$

or $\bar{x} = 80.0$ mm ◀



PROBLEM 9.65*

Show that the system of hydrostatic forces acting on a submerged plane area A can be reduced to a force **P** at the centroid C of the area and two couples. The force **P** is perpendicular to the area and is of magnitude $P = \gamma A\bar{y}\sin\theta$, where γ is the specific weight of the liquid, and the couples are $\mathbf{M}_{x'} = (\gamma \bar{I}_{x'} \sin\theta)\mathbf{i}$ and $\mathbf{M}_{y'} = (\gamma \bar{I}_{x'y'} \sin\theta)\mathbf{j}$, where $\bar{I}_{x'y'} = \int x'y'\,dA$ (see section 9.8). Note that the couples are independent of the depth at which the area is submerged.

SOLUTION

The pressure p at an arbitrary depth $(y\sin\theta)$ is

$$p = \gamma(y\sin\theta)$$

so that the hydrostatic force dF exerted on an infinitesimal area dA is

$$dF = (\gamma y\sin\theta)dA$$

Equivalence of the force **P** and the system of infinitesimal forces dF requires

$$\Sigma F\text{:}\quad P = \int dF = \int \gamma y\sin\theta\,dA = \gamma\sin\theta\int y\,dA$$

or $$P = \gamma A\bar{y}\sin\theta \blacktriangleleft$$

Equivalence of the force and couple $(\mathbf{P},\ \mathbf{M}_{x'} + \mathbf{M}_{y'})$ and the system of infinitesimal hydrostatic forces requires

$$\Sigma M_x\text{:}\quad -\bar{y}P - M_{x'} = \int(-ydF)$$

Now $$-\int ydF = -\int y(\gamma y\sin\theta)dA = -\gamma\sin\theta\int y^2dA$$

$$= -(\gamma\sin\theta)I_x$$

Then $$-\bar{y}P - M_{x'} = -(\gamma\sin\theta)I_x$$

or $$M_{x'} = (\gamma\sin\theta)I_x - \bar{y}(\gamma A\bar{y}\sin\theta)$$

$$= \gamma\sin\theta(I_x - A\bar{y}^2)$$

or $$M_{x'} = \gamma\bar{I}_{x'}\sin\theta \blacktriangleleft$$

$$\Sigma M_y\text{:}\quad \bar{x}P + M_{y'} = \int x\,dF$$

Now $$\int x\,dF = \int x(\gamma y\sin\theta)dA = \gamma\sin\theta\int xy\,dA$$

$$= (\gamma\sin\theta)I_{xy} \qquad \text{(Equation 9.12)}$$

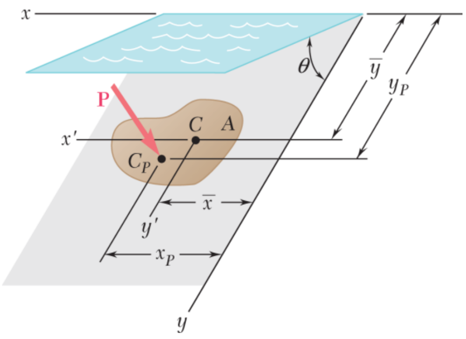
PROBLEM 9.65* (Continued)

Then $$\bar{x}P + M_{y'} = (\gamma \sin\theta) I_{xy}$$

or $$M_{y'} = (\gamma \sin\theta) I_{xy} - \bar{x}(\gamma A \bar{y} \sin\theta)$$

$$= \gamma \sin\theta (I_{xy} - A\bar{x}\,\bar{y})$$

or $$M_{y'} = \gamma \bar{I}_{x'y'} \sin\theta \blacktriangleleft$$



PROBLEM 9.66*

Show that the resultant of the hydrostatic forces acting on a submerged plane area A is a force **P** perpendicular to the area and of magnitude $P = \gamma A\bar{y}\sin\theta = \bar{p}A$, where γ is the specific weight of the liquid and $\bar{p}$ is the pressure at the centroid C of the area. Show that **P** is applied at a Point C_P, called the center of pressure, whose coordinates are $x_P = I_{xy}/A\bar{y}$ and $y_P = I_x/A\bar{y}$, where $\bar{I}_{xy} = \int xy\,dA$ (see section 9.8). Show also that the difference of ordinates $y_P - \bar{y}$ is equal to $\bar{k}_{x'}^2/\bar{y}$ and thus depends upon the depth at which the area is submerged.

SOLUTION

The pressure P at an arbitrary depth $(y\sin\theta)$ is

$$P = \gamma(y\sin\theta)$$

so that the hydrostatic force dP exerted on an infinitesimal area dA is

$$dP = (\gamma y\sin\theta)dA$$

The magnitude **P** of the resultant force acting on the plane area is then

$$P = \int dP = \int \gamma y\sin\theta\,dA = \gamma\sin\theta\int y\,dA$$

$$= \gamma\sin\theta(\bar{y}A)$$

Now $\bar{p} = \gamma\bar{y}\sin\theta$ $\quad P = \bar{p}A$ ◀

Next observe that the resultant **P** is equivalent to the system of infinitesimal forces d**P**. Equivalence then requires

$$\Sigma M_x:\quad -y_P P = -\int y\,dP$$

Now

$$\int y\,dP = \int y(\gamma y\sin\theta)dA = \gamma\sin\theta\int y^2\,dA$$

$$= (\gamma\sin\theta)I_x$$

Then

$$y_P P = (\gamma\sin\theta)I_x$$

or

$$y_P = \frac{(\gamma\sin\theta)I_x}{\gamma\sin\theta(\bar{y}A)}$$

or $\quad y_P = \dfrac{I_x}{A\bar{y}}$ ◀

PROBLEM 9.66* (Continued)

$$\Sigma M_y: \quad x_P P = \int x dP$$

Now $$\int x dP = \int x(\gamma y \sin\theta) dA = \gamma \sin\theta \int xy dA$$

$$= (\gamma \sin\theta) I_{xy} \qquad \text{(Equation 9.12)}$$

Then $$x_P P = (\gamma \sin\theta) I_{xy}$$

or $$x_P = \frac{(\gamma \sin\theta) I_{xy}}{\gamma \sin\theta(\bar{y}A)}$$

or $$x_P = \frac{I_{xy}}{A\bar{y}} \blacktriangleleft$$

Now $$I_x = \bar{I}_{x'} + A\bar{y}^2$$

From above $$I_x = (A\bar{y}) y_P$$

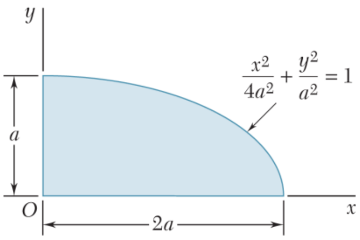
By definition $$\bar{I}_{x'} = \bar{k}_{x'}^2 A$$

Substituting $$(A\bar{y}) y_P = \bar{k}_{x'}^2 A + A\bar{y}^2$$

Rearranging yields $$y_P - \bar{y} = \frac{\bar{k}_{x'}^2}{\bar{y}} \blacktriangleleft$$

Although $\bar{k}_{x'}$ is not a function of the depth of the area (it depends only on the shape of A), $\bar{y}$ is dependent on the depth.

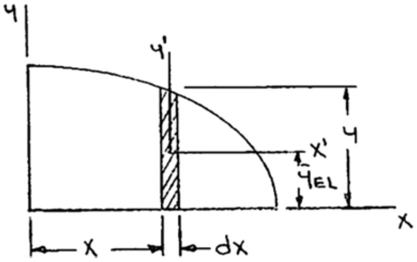
$$(y_P - \bar{y}) = f(\text{depth})$$



PROBLEM 9.67

Determine by direct integration the product of inertia of the given area with respect to the *x* and *y* axes.

SOLUTION



First note

$$y = a\sqrt{1-\frac{x^2}{4a^2}}$$

$$= \frac{1}{2}\sqrt{4a^2 - x^2}$$

We have

$$dI_{xy} = d\bar{I}_{x'y'} + \bar{x}_{EL}\bar{y}_{EL}\,dA$$

where

$$d\bar{I}_{x'y'} = 0 \quad \text{(symmetry)} \quad \bar{x}_{EL} = x$$

$$\bar{y}_{EL} = \frac{1}{2}y = \frac{1}{4}\sqrt{4a^2 - x^2}$$

$$dA = ydx = \frac{1}{2}\sqrt{4a^2 - x^2 dx}$$

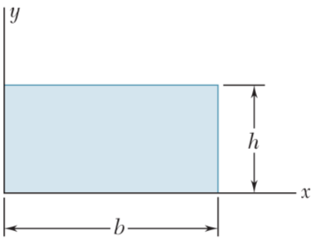
Then

$$I_{xy} = \int dI_{xy} = \int_0^{2a} x\left(\frac{1}{4}\sqrt{4a^2 - x^2}\right)\left(\frac{1}{2}\sqrt{4a^2 - x^2}\right)dx$$

$$= \frac{1}{8}\int_0^{2a}(4a^2x - x^3)dx = \frac{1}{8}\left[2a^2x^2 - \frac{1}{4}x^4\right]_0^{2a}$$

$$= \frac{a^4}{8}\left[2(2)^2 - \frac{1}{4}(2)^4\right]$$

or $I_{xy} = \frac{1}{2}a^4$ ◀



PROBLEM 9.68

Determine by direct integration the product of inertia of the given area with respect to the *x* and *y* axes.

SOLUTION

$$dI_{xy} = d\bar{I}_{x'y'} + \bar{x}_{EL}\bar{y}_{EL}\,dA$$

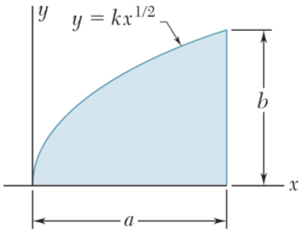
But $d\bar{I}_{x'y'} = 0$ (by symmetry) $\bar{x}_{EL} = x$ $\bar{y}_{EL} = \frac{1}{2}h$

$$dA = hd_x$$

$$I_{xy} = \int dI_{xy} = \int_0^b x\left(\frac{1}{2}h\right)hdx = \frac{1}{2}h^2\int_0^b xdx$$

$$= \frac{1}{2}h^2\frac{b^2}{2}$$

$$I_{xy} = \frac{1}{4}b^2h^2 \blacktriangleleft$$



PROBLEM 9.69

Determine by direct integration the product of inertia of the given area with respect to the *x* and *y* axes.

SOLUTION

For $$x = a, \quad b = ka^{1/2} \quad \text{or} \quad k = \frac{b}{a^{1/2}}$$

Thus, $$y = \frac{b}{a^{1/2}} x^{1/2}$$

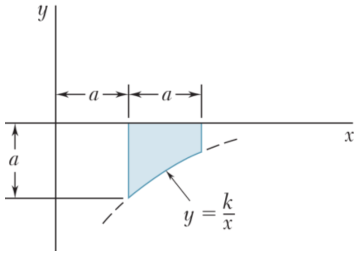
$$d\overline{I}_{xy} = d\overline{I}_{x'y'} + \overline{x}_{EL}\overline{y}_{EL}\, dA, \quad \text{But} \quad dI_{x'y'} = 0 \quad \text{(by symmetry)}$$

with $$\overline{x}_{EL} = x \quad \overline{y}_{EL} = \frac{y}{2} \quad dA = ydx$$

$$I_{xy} = \int dI_{xy} = \int_0^a x\left(\frac{y}{2}\right) ydx = \frac{1}{2}\int_0^a x\left(\frac{b}{a^{1/2}} x^{1/2}\right)^2 dx$$

$$= \frac{1}{2}\frac{b^2}{a}\int_0^a x^2 dx = \frac{b^2}{2a}\left[\frac{x^3}{3}\right]_0^a$$

$$I_{xy} = a^2b^2/6 \blacktriangleleft$$



PROBLEM 9.70

Determine by direct integration the product of inertia of the given area with respect to the *x* and *y* axes.

SOLUTION

For $$x = a, \quad y = -a; \quad -a = \frac{k}{a} \quad \text{or} \quad k = -a^2$$

Thus, $$y = -\frac{a^2}{x}$$

$$d\bar{I}_{xy} = d\bar{I}_{x'y'} + \bar{x}_{EL}\bar{y}_{EL}\,dA, \quad \text{But} \quad dI_{x'y'} = 0 \quad \text{(by symmetry)}$$

with $$\bar{x}_{EL} = x \quad \bar{y}_{EL} = \frac{y}{2} = -\frac{1}{2}\left(\frac{a^2}{x}\right) \quad dA = y\,dx$$

$$I_{xy} = \int dI_{xy} = \int_a^a x\left(\frac{1}{2}\frac{a^2}{x}\right)\left(\frac{a^2}{x}\right)dx = -\frac{a^4}{2}\int_a^{2a}\frac{1}{x}\,dx$$

$$= -\frac{a^4}{2}\left[\ln x\right]_a^{2a}$$

$$= -\frac{a^4}{2}\ln\frac{2a}{a}$$

$$I_{xy} = -0.347a^4 \blacktriangleleft$$

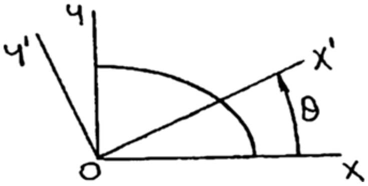
PROBLEM 9.79

Determine for the quarter ellipse of Problem 9.67 the moments of inertia and the product of inertia with respect to new axes obtained by rotating the *x* and *y* axes about *O* (*a*) through 45° counterclockwise, (*b*) through 30° clockwise.

SOLUTION



From Figure 9.12:

$$I_x = \frac{\pi}{16}(2a)(a)^3 = \frac{\pi}{8}a^4$$

$$I_y = \frac{\pi}{16}(2a)^3(a) = \frac{\pi}{2}a^4$$

From Problem 9.67:

$$I_{xy} = \frac{1}{2}a^4$$

First note

$$\frac{1}{2}(I_x + I_y) = \frac{1}{2}\left(\frac{\pi}{8}a^4 + \frac{\pi}{2}a^4\right) = \frac{5}{16}\pi a^4$$

$$\frac{1}{2}(I_x - I_y) = \frac{1}{2}\left(\frac{\pi}{8}a^4 - \frac{\pi}{2}a^4\right) = -\frac{3}{16}\pi a^4$$

Now use Equations (9.18), (9.19), and (9.20).

Equation (9.18):

$$I_{x'} = \frac{1}{2}(I_x + I_y) + \frac{1}{2}(I_x - I_y)\cos 2\theta - I_{xy}\sin 2\theta$$

$$= \frac{5}{16}\pi a^4 - \frac{3}{16}\pi a^4\cos 2\theta - \frac{1}{2}a^4\sin 2\theta$$

Equation (9.19):

$$I_{y'} = \frac{1}{2}(I_x + I_y) - \frac{1}{2}(I_x - I_y)\cos 2\theta + I_{xy}\sin 2\theta$$

$$= \frac{5}{16}\pi a^4 + \frac{3}{16}\pi a^4\cos 2\theta + \frac{1}{2}a^4\sin 2\theta$$

Equation (9.20):

$$I_{x'y'} = \frac{1}{2}(I_x - I_y)\sin 2\theta + I_{xy}\cos 2\theta$$

$$= -\frac{3}{16}\pi a^4\sin 2\theta + \frac{1}{2}a^4\cos 2\theta$$

PROBLEM 9.79 (Continued)

(*a*) $\theta = +45°$:

$$I_{x'} = \frac{5}{16}\pi a^4 - \frac{3}{16}\pi a^4 \cos 90° - \frac{1}{2}a^4 \sin 90°$$

or $I_{x'} = 0.482a^4$ ◀

$$I_{y'} = \frac{5}{16}\pi + \frac{3}{16}\pi a^4 \cos 90° + \frac{1}{2}a^4$$

or $I_{y'} = 1.482a^4$ ◀

$$I_{x'y'} = -\frac{3}{16}\pi a^4 \sin 90° + \frac{1}{2}a^4 \cos 90°$$

or $I_{x'y'} = -0.589a^4$ ◀

(*b*) $\theta = -30°$:

$$I_{x'} = \frac{5}{16}\pi a^4 - \frac{3}{16}\pi a^4 \cos(-60°) - \frac{1}{2}a^4 \sin(-60°)$$

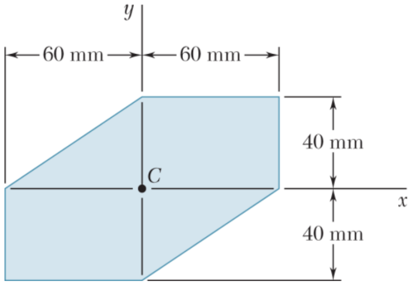
or $I_{x'} = 1.120a^4$ ◀

$$I_{y'} = \frac{5}{16}\pi a^4 + \frac{3}{16}\pi a^4 \cos(-60°) + \frac{1}{2}a^4 \sin(-60°)$$

or $I_{y'} = 0.843a^4$ ◀

$$I_{x'y'} = -\frac{3}{16}\pi a^4 \sin(-60°) + \frac{1}{2}a^4 \cos(-60°)$$

or $I_{x'y'} = 0.760a^4$ ◀

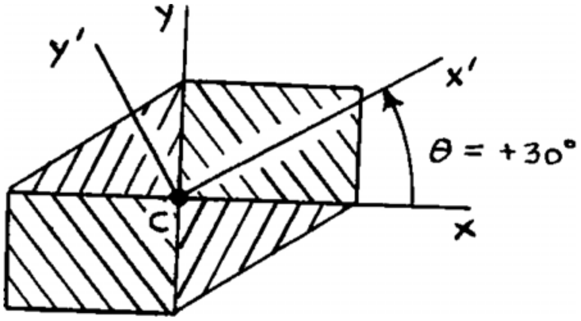


PROBLEM 9.80

Determine the moments of inertia and the product of inertia of the area of Problem 9.72 with respect to new centroidal axes obtained by rotating the *x* and *y* axes 30° counterclockwise.

SOLUTION

From Problem 9.72: $\bar{I}_{xy} = 2.40 \times 10^6 \text{ mm}^4$



Now, with two rectangles and two triangles:

$$\bar{I}_x = 2\left[\frac{1}{3}(60 \text{ mm})(40 \text{ mm})^3\right] + 2\left[\frac{1}{12}(60 \text{ mm})(40 \text{ mm})^3\right]$$

$$\bar{I}_x = 3.20 \times 10^6 \text{ mm}^4$$

$$\bar{I}_y = 2\left[\frac{1}{3}(40 \text{ mm})(60 \text{ mm})^3\right] + 2\left[\frac{1}{12}(40 \text{ mm})(60 \text{ mm})^3\right] = 7.20 \times 10^6 \text{ mm}^4$$

Now
$$\frac{1}{2}(\bar{I}_x + \bar{I}_y) = \frac{1}{2}(3.20 + 7.20) \times 10^6 = 5.20 \times 10^6 \text{ mm}^4$$

$$\frac{1}{2}(\bar{I}_x - \bar{I}_y) = \frac{1}{2}(3.20 - 7.20) \times 10^6 = -2.00 \times 10^6 \text{ mm}^4$$

Using Eqs. (9.18), (9.19), (9.20):

Eq. (9.18):
$$\bar{I}_{x'} = \frac{1}{2}(\bar{I}_x + \bar{I}_y) + \frac{1}{2}(\bar{I}_x - \bar{I}_y)\cos 2\theta - \bar{I}_{xy}\sin 2\theta$$

$$= [5.20 + (-2.00)\cos 60° - (2.40)\sin 60°] \times 10^6 \text{ mm}^4$$

or $\bar{I}_{x'} = 2.12 \times 10^6 \text{ mm}^4$ ◀

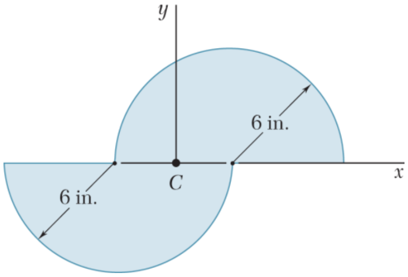
PROBLEM 9.80 (Continued)

Eq. (9.19):
$$\bar{I}_{y'} = \frac{1}{2}(\bar{I}_x + \bar{I}_y) - \frac{1}{2}(\bar{I}_x - \bar{I}_y)\cos 2\theta + \bar{I}_{xy}\sin 2\theta$$
$$= [5.20 - (-2.00)\cos 60° + (2.40)\sin 60°] \times 10^6 \text{ mm}^4$$

or $\bar{I}_{y'} = 8.28 \times 10^6 \text{ mm}^4$ ◀

Eq. (9.20):
$$\bar{I}_{x'y'} = \frac{1}{2}(\bar{I}_x - \bar{I}_y)\sin 2\theta + \bar{I}_{xy}\sin 2\theta$$
$$= [(-2.00)\sin 60° + (2.40)\cos 60°] \times 10^6 \text{ mm}^4$$

or $\bar{I}_{x'y'} = -0.532 \times 10^6 \text{ mm}^4$ ◀



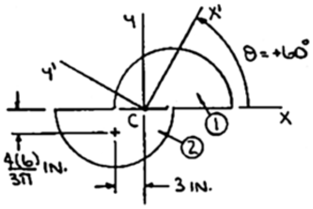
PROBLEM 9.81

Determine the moments of inertia and the product of inertia of the area of Problem 9.73 with respect to new centroidal axes obtained by rotating the x and y axes 60° counterclockwise.

SOLUTION

From Problem 9.73:

$$\bar{I}_{xy} = 864 \text{ in}^4$$



Now $$\bar{I}_x = (I_x)_1 + (I_x)_2$$

where $$(I_x)_1 = (I_x)_2 = \frac{\pi}{8}(6 \text{ in.})^4$$
$$= 162\pi \text{ in}^4$$

Then $$\bar{I}_x = 2(162\pi \text{ in}^4) = 324\pi \text{ in}^4$$

Also $$\bar{I}_y = (I_y)_1 + (I_y)_2$$

where $$(I_y)_1 = (I_y)_2 = \frac{\pi}{8}(6 \text{ in.})^4 + \left[\frac{\pi}{2}(6 \text{ in.})^2\right](3 \text{ in.})^2 = 324\pi \text{ in}^4$$

Then $$\bar{I}_y = 2(324\pi \text{ in}^4) = 648\pi \text{ in}^4$$

Now $$\frac{1}{2}(\bar{I}_x + \bar{I}_y) = \frac{1}{2}(324\pi + 648\pi) = 486\pi \text{ in}^4$$
$$\frac{1}{2}(\bar{I}_x - \bar{I}_y) = \frac{1}{2}(324\pi - 648\pi) = -162\pi \text{ in}^4$$

Using Eqs. (9.18), (9.19), and (9.20):

Eq. (9.18): $$\bar{I}_{x'} = \frac{1}{2}(\bar{I}_x + \bar{I}_y) + \frac{1}{2}(\bar{I}_x - \bar{I}_y)\cos 2\theta - \bar{I}_{xy}\sin 2\theta$$
$$= [486\pi + (-162\pi)\cos 120° - 864 \sin 120°] \text{ in}^4$$

or $\bar{I}_{x'} = 1033 \text{ in}^4$ ◀

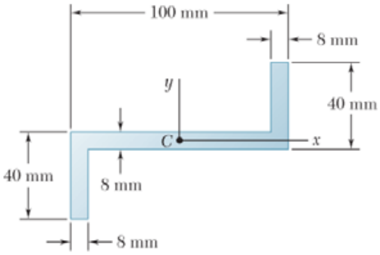
PROBLEM 9.81 (Continued)

Eq. (9.19):
$$\bar{I}_{y'} = \frac{1}{2}(\bar{I}_x + \bar{I}_y) - \frac{1}{2}(\bar{I}_x - \bar{I}_y)\cos 2\theta + \bar{I}_{xy}\sin 2\theta$$
$$= [486\pi - (-162\pi)\cos 120° + 864 \sin 120°]\text{ in}^4$$

or $\bar{I}_{y'} = 2020\text{ in}^4$ ◀

Eq. (9.20):
$$\bar{I}_{x'y'} = \frac{1}{2}(\bar{I}_x - \bar{I}_y)\sin 2\theta + \bar{I}_{xy}\cos 2\theta$$
$$= [(-162\pi)\sin 120° + 864\cos 120°]\text{ in}^4$$

or $\bar{I}_{x'y'} = -873\text{ in}^4$ ◀

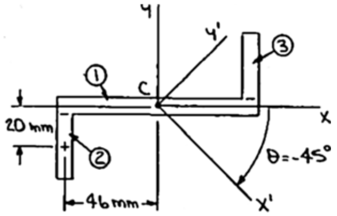


PROBLEM 9.82

Determine the moments of inertia and the product of inertia of the area of Problem 9.75 with respect to new centroidal axes obtained by rotating the *x* and *y* axes 45° clockwise.

SOLUTION

From Problem 9.75:



$$\bar{I}_{xy} = 471{,}040 \text{ mm}^4$$

Now $$\bar{I}_x = (\bar{I}_x)_1 + (I_x)_2 + (I_x)_3$$

where $$(\bar{I}_x)_1 = \frac{1}{12}(100 \text{ mm})(8 \text{ mm})^3$$
$$= 4266.67 \text{ mm}^4$$

$$(I_x)_2 = (I_x)_3 = \frac{1}{12}(8 \text{ mm})(32 \text{ mm})^3 + [(8 \text{ mm})(32 \text{ mm})](20 \text{ mm})^2$$
$$= 124{,}245.33$$

Then $$\bar{I}_x = [4266.67 + 2(124{,}245.33)] \text{ mm}^4 = 252{,}757 \text{ mm}^4$$

Also $$\bar{I}_y = (\bar{I}_y)_1 + (I_y)_2 + (I_y)_3$$

where $$(\bar{I}_y)_1 = \frac{1}{12}(8 \text{ mm})(100 \text{ mm})^3 = 666{,}666.7 \text{ mm}^4$$

$$(\bar{I}_y)_2 = (I_y)_3 = \frac{1}{12}(32 \text{ mm})(8 \text{ mm})^3 + [(8 \text{ mm})(32 \text{ mm})](46 \text{ mm})^2$$
$$= 543{,}061.3 \text{ mm}^4$$

Then $$\bar{I}_y = [666{,}666.7 + 2(543{,}061.3)] \text{ mm}^4 = 1{,}752{,}789 \text{ mm}^4$$

Now $$\frac{1}{2}(\bar{I}_x + \bar{I}_y) = \frac{1}{2}(252{,}757 + 1{,}752{,}789) \text{ mm}^4 = 1{,}002{,}773 \text{ mm}^4$$
$$\frac{1}{2}(\bar{I}_x - \bar{I}_y) = \frac{1}{2}(252{,}757 - 1{,}752{,}789) \text{ mm}^4 = -750{,}016 \text{ mm}^4$$

Using Eqs. (9.18), (9.19), and (9.20):

Eq. (9.18): $$\bar{I}_{x'} = \frac{1}{2}(\bar{I}_x + \bar{I}_y) + \frac{1}{2}(\bar{I}_x - \bar{I}_y)\cos 2\theta - \bar{I}_{xy}\sin 2\theta$$
$$= [1{,}002{,}773 + (-750{,}016)\cos(-90°) - 471{,}040\sin(-90°)]$$

or $\bar{I}_{x'} = 1.474 \times 10^6 \text{ mm}^4$ ◀

PROBLEM 9.82 (Continued)

Eq. (9.19):

$$\bar{I}_{y'} = \frac{1}{2}(\bar{I}_x + \bar{I}_y) - \frac{1}{2}(\bar{I}_x - \bar{I}_y)\cos 2\theta + \bar{I}_{xy}\sin 2\theta$$

$$= [1{,}002{,}773 - (-750{,}016)\cos(-90°) + 471{,}040\sin(-90°)]$$

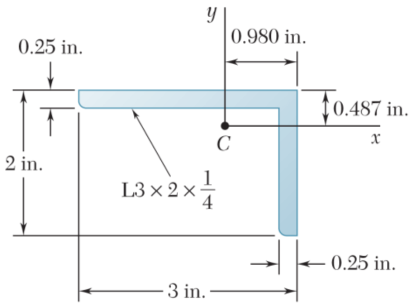
or $\bar{I}_{y'} = 0.532 \times 10^6\,\text{mm}^4$ ◀

Eq. (9.20):

$$\bar{I}_{x'y'} = \frac{1}{2}(\bar{I}_x - \bar{I}_y)\sin 2\theta + \bar{I}_{xy}\cos 2\theta$$

$$= [(-750{,}016)\sin(-90°) + 471{,}040\cos(-90°)]$$

or $\bar{I}_{x'y'} = 0.750 \times 10^6\,\text{mm}^4$ ◀

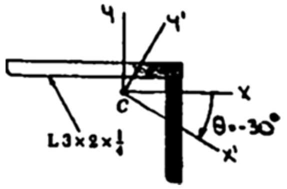


PROBLEM 9.83

Determine the moments of inertia and the product of inertia of the $L3\times 2\times \frac{1}{4}$-in. angle cross section of Problem 9.74 with respect to new centroidal axes obtained by rotating the x and y axes 30° clockwise.

SOLUTION

From Figure 9.13:



$$\bar{I}_x = 0.390 \text{ in}^4$$
$$\bar{I}_y = 1.09 \text{ in}^4$$

From Problem 9.74:

$$\bar{I}_{xy} = -0.37983 \text{ in}^4$$

Now

$$\frac{1}{2}(\bar{I}_x + \bar{I}_y) = \frac{1}{2}(0.390 + 1.09) \text{ in}^4 = 0.740 \text{ in}^4$$
$$\frac{1}{2}(\bar{I}_x - \bar{I}_y) = \frac{1}{2}(0.390 - 1.09) \text{ in}^4 = -0.350 \text{ in}^4$$

Using Eqs. (9.18), (9.19), and (9.20):

Eq. (9.18):

$$\bar{I}_{x'} = \frac{1}{2}(\bar{I}_x + \bar{I}_y) + \frac{1}{2}(\bar{I}_x - \bar{I}_y)\cos 2\theta - \bar{I}_{xy}\sin 2\theta$$
$$= [0.740 + (-0.350)\cos(-60°) - (-0.37983)\sin(-60°)]$$

or $\bar{I}_{x'} = 0.236 \text{ in}^4$ ◀

Eq. (9.19):

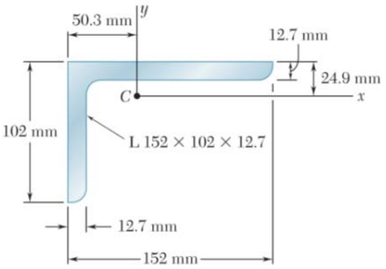
$$\bar{I}_{y'} = \frac{1}{2}(\bar{I}_x + \bar{I}_y) - \frac{1}{2}(\bar{I}_x - \bar{I}_y)\cos 2\theta + \bar{I}_{xy}\sin 2\theta$$
$$= [0.740 - (-0.350)\cos(-60°) + (-0.37983)\sin(-60°)]$$

or $\bar{I}_{y'} = 1.244 \text{ in}^4$ ◀

Eq. (9.20):

$$\bar{I}_{x'y'} = \frac{1}{2}(\bar{I}_x - \bar{I}_y)\sin 2\theta + \bar{I}_{xy}\cos 2\theta$$
$$= [(-0.350)\sin(-60°) + (-0.37983)\cos(-60°)]$$

or $I_{x'y'} = 0.1132 \text{ in}^4$ ◀



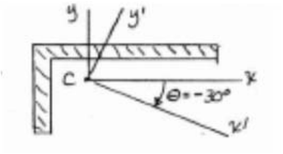
PROBLEM 9.84

Determine the moments of inertia and the product of inertia of the L152 × 102 × 12.7-mm angle cross section of Prob. 9.78 with respect to new centroidal axes obtained by rotating the *x* and *y* axes 30° clockwise.

SOLUTION

From Figure 9.13:

Note the axes are reversed in sketch.



$$\bar{I}_x = 2.59\times 10^6\,\text{mm}^4$$

$$\bar{I}_y = 7.20\times 10^6\,\text{mm}^4$$

From Problem 9.78:

$$\bar{I}_{xy} = 2.54\times 10^6\,\text{mm}^4$$

Now

$$\frac{1}{2}(\bar{I}_x+\bar{I}_y) = \frac{1}{2}(2.59+7.20)\times 10^6\,\text{mm}^4$$

$$= 4.895\times 10^6\,\text{mm}^4$$

$$\frac{1}{2}(\bar{I}_x-\bar{I}_y) = \frac{1}{2}(2.59-7.20)\times 10^6\,\text{mm}^4 = -2.305\times 10^6\,\text{mm}^4$$

Using Eqs. (9.18), (9.19), and (9.20):

Eq. (9.18):

$$\bar{I}_{x'} = \frac{1}{2}(\bar{I}_x+\bar{I}_y)+\frac{1}{2}(\bar{I}_x-\bar{I}_y)\cos 2\theta-\bar{I}_{xy}\sin 2\theta$$

$$= [4.895-2.305\cos(-60°)-2.54\sin(-60°)]\times 10^6\,\text{mm}^4$$

or $\bar{I}_{x'} = 5.94\times 10^6\,\text{mm}^4$ ◀

Eq. (9.19):

$$\bar{I}_{y'} = \frac{1}{2}(\bar{I}_x+\bar{I}_y)-\frac{1}{2}(\bar{I}_x-\bar{I}_y)\cos 2\theta+\bar{I}_{xy}\sin 2\theta$$

$$= [4.895+2.305\cos(-60°)+2.54\sin(-60°)]\times 10^6\,\text{mm}^4$$

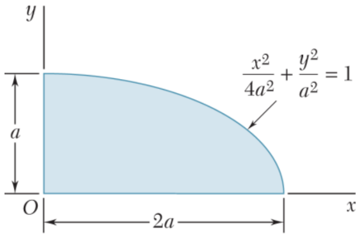
or $\bar{I}_{y'} = 3.85\times 10^6\,\text{mm}^4$ ◀

Eq. (9.20):

$$\bar{I}_{x'y'} = \frac{1}{2}(\bar{I}_x-\bar{I}_y)\sin 2\theta+\bar{I}_{xy}\cos 2\theta$$

$$= [(-2.305\sin(-60°)+2.54\cos(-60°)]\times 10^6\,\text{mm}^4$$

or $\bar{I}_{x'y'} = 3.27\times 10^6\,\text{mm}^4$ ◀



PROBLEM 9.85

For the quarter ellipse of Problem 9.67, determine the orientation of the principal axes at the origin and the corresponding values of the moments of inertia.

SOLUTION

From Problem 9.79: $I_x = \frac{\pi}{8}a^4 \qquad I_y = \frac{\pi}{2}a^4$

Problem 9.67: $I_{xy} = \frac{1}{2}a^4$

Now Eq. (9.25):

$$\tan 2\theta_m = -\frac{2I_{xy}}{I_x - I_y} = -\frac{2\left(\frac{1}{2}a^4\right)}{\frac{\pi}{8}a^4 - \frac{\pi}{2}a^4}$$

$$= \frac{8}{3\pi} = 0.84883$$

Then $2\theta_m = 40.326° \quad \text{and} \quad 220.326°$

or $\theta_m = 20.2° \text{ and } 110.2°$ ◀

Also Eq. (9.27):

$$I_{\max,\min} = \frac{I_x + I_y}{2} \pm \sqrt{\left(\frac{I_x - I_y}{2}\right)^2 + I_{xy}^2}$$

$$= \frac{1}{2}\left(\frac{\pi}{8}a^4 + \frac{\pi}{2}a^4\right)$$

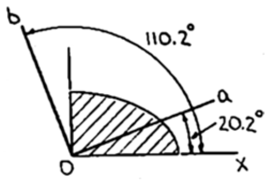
$$\pm \sqrt{\left[\frac{1}{2}\left(\frac{\pi}{8}a^4 - \frac{\pi}{2}a^4\right)\right]^2 + \left(\frac{1}{2}a^4\right)^2}$$

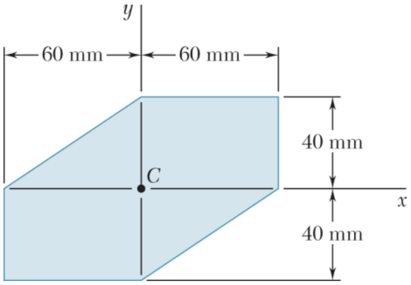
$$= (0.981{,}748 \pm 0.772{,}644)a^4$$

or $I_{\max} = 1.754a^4$ ◀

and $I_{\min} = 0.209a^4$ ◀

By inspection, the *a* axis corresponds to $I_{\min}$ and the *b* axis corresponds to $I_{\max}$.





PROBLEM 9.86

For the area indicated, determine the orientation of the principal axes at the origin and the corresponding values of the moments of inertia.

Area of Problem 9.72.

SOLUTION

From Problem 9.80: $\bar{I}_x = 3.20 \times 10^6 \text{ mm}^4$

$\bar{I}_y = 7.20 \times 10^6 \text{ mm}^4$

From Problem 9.72: $\bar{I}_{xy} = 2.40 \times 10^6 \text{ mm}^4$

Now Eq. (9.25):
$$\tan 2\theta_m = -\frac{2\bar{I}_{xy}}{\bar{I}_x - \bar{I}_y} = -\frac{2(2.40 \times 10^6)}{(3.20 - 7.20) \times 10^6} = 1.200$$

Then $2\theta_m = 50.194°$ and $230.194°$

or $\theta_m = 25.1°$ and $115.1°$ ◀

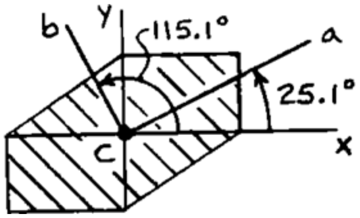
Also Eq. (9.27):
$$\bar{I}_{\max,\min} = \frac{\bar{I}_x + \bar{I}_y}{2} \pm \sqrt{\left(\frac{\bar{I}_x - \bar{I}_y}{2}\right)^2 + I_{xy}^2}$$

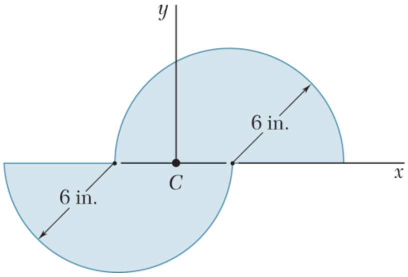
Then
$$\bar{I}_{\max,\min} = \left[\frac{3.20 + 7.20}{2} \pm \sqrt{\left(\frac{3.20 - 7.20}{2}\right)^2 + (2.40)^2}\right] \times 10^6 \text{ mm}^4$$
$$= (5.20 \pm 3.1241) \times 10^6 \text{ mm}^4$$

or $\bar{I}_{\max} = 8.32 \times 10^6 \text{ mm}^4$ ◀

and $\bar{I}_{\min} = 2.08 \times 10^6 \text{ mm}^4$ ◀

By inspection, the *a* axis corresponds to $\bar{I}_{\min}$ and the *b* axis corresponds to $\bar{I}_{\max}$.





PROBLEM 9.87

For the area indicated, determine the orientation of the principal axes at the origin and the corresponding values of the moments of inertia.

Area of Problem 9.73.

SOLUTION

From Problem 9.81: $\bar{I}_x = 324\pi \text{ in}^4 \qquad \bar{I}_y = 648\pi \text{ in}^4$

Problem 9.73: $\bar{I}_{xy} = 864 \text{ in}^4$

Now Eq. (9.25):

$$\tan 2\theta_m = -\frac{2\bar{I}_{xy}}{\bar{I}_x - \bar{I}_y} = -\frac{2(864)}{324\pi - 648\pi}$$
$$= 1.69765$$

Then $2\theta_m = 59.500° \quad \text{and} \quad 239.500°$

or $\theta_m = 29.7° \quad \text{and} \quad 119.7°$ ◀

Also Eq. (9.27):

$$\bar{I}_{\max,\min} = \frac{\bar{I}_x + \bar{I}_y}{2} \pm \sqrt{\left(\frac{\bar{I}_x - \bar{I}_y}{2}\right)^2 + \bar{I}_{xy}^2}$$

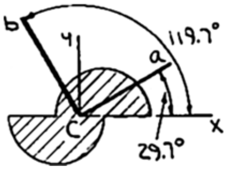
Then

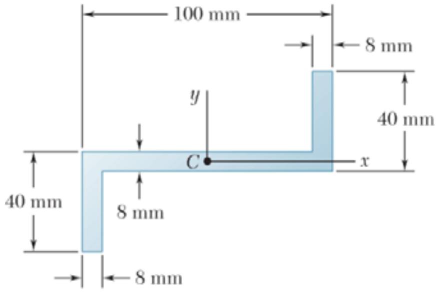
$$\bar{I}_{\max,\min} = \frac{324\pi + 648\pi}{2} \pm \sqrt{\left(\frac{324\pi - 648\pi}{2}\right)^2 + 864^2}$$
$$= (1526.81 \pm 1002.75) \text{ in}^4$$

or $\bar{I}_{\max} = 2530 \text{ in}^4$ ◀

and $\bar{I}_{\min} = 524 \text{ in}^4$ ◀

By inspection, the *a* axis corresponds to $\bar{I}_{\min}$ and the *b* axis corresponds to $\bar{I}_{\max}$.





PROBLEM 9.88

For the area indicated, determine the orientation of the principal axes at the origin and the corresponding values of the moments of inertia.

Area of Problem 9.75.

SOLUTION

From Problem 9.82:

$$\bar{I}_x = 252,757 \text{ mm}^4$$

$$\bar{I}_y = 1,752,789 \text{ mm}^4$$

Problem 9.75:

$$\bar{I}_{xy} = 471,040 \text{ mm}^4$$

Now Eq. (9.25):

$$\tan 2\theta_m = -\frac{2\bar{I}_{xy}}{\bar{I}_x - \bar{I}_y} = -\frac{2(471,040)}{252,757 - 1,752,789} = 0.62804$$

Then

$$2\theta_m = 32.130° \quad \text{and} \quad 212.130°$$

or $\theta_m = 16.07°$ and $106.1°$ ◀

Also Eq. (9.27):

$$\bar{I}_{\text{max, min}} = \frac{\bar{I}_x + \bar{I}_y}{2} \pm \sqrt{\left(\frac{\bar{I}_x - \bar{I}_y}{2}\right)^2 + \bar{I}_{xy}^2}$$

Then

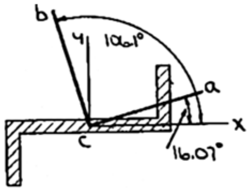
$$\bar{I}_{\text{max, min}} = \frac{252,757 + 1,752,789}{2} \pm \sqrt{\left(\frac{252,757 - 1,752,789}{2}\right)^2 + 471040^2}$$

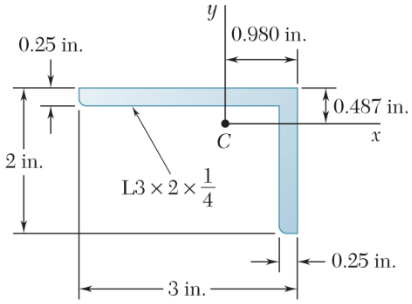
$$= (1,002,773 \pm 885,665) \text{ mm}^4$$

or $\bar{I}_{\max} = 1.888 \times 10^6 \text{ mm}^4$ ◀

and $\bar{I}_{\min} = 0.1171 \times 10^6 \text{ mm}^4$ ◀

By inspection, the *a* axis corresponds to $\bar{I}_{\min}$ and the *b* axis corresponds to $\bar{I}_{\max}$.





PROBLEM 9.89

For the angle cross section indicated, determine the orientation of the principal axes at the origin and the corresponding values of the moments of inertia.

The $L3 \times 2 \times \frac{1}{4}$-in. angle cross section of Problem 9.74.

SOLUTION

From Problem 9.83: $\bar{I}_x = 0.390 \text{ in}^4 \qquad \bar{I}_y = 1.09 \text{ in}^4$

Problem 9.74: $\bar{I}_{xy} = -0.37983 \text{ in}^4$

Now Eq. (9.25):

$$\tan 2\theta_m = -\frac{2\bar{I}_{xy}}{\bar{I}_x - \bar{I}_y} = -\frac{2(-0.37983)}{0.390 - 1.09}$$
$$= -1.08523$$

Then $2\theta_m = -47.341° \text{ and } 132.659°$

or $\theta_m = -23.7° \text{ and } 66.3°$ ◀

Also Eq. (9.27):

$$\bar{I}_{\text{max, min}} = \frac{\bar{I}_x + \bar{I}_y}{2} \pm \sqrt{\left(\frac{\bar{I}_x - \bar{I}_y}{2}\right)^2 + \bar{I}_{xy}^2}$$

Then

$$\bar{I}_{\text{max, min}} = \frac{0.390 + 1.09}{2} \pm \sqrt{\left(\frac{0.390 - 1.09}{2}\right)^2 + (-0.37983)^2}$$
$$= (0.740 \pm 0.51650)^2 \text{ in}^4$$

or $\bar{I}_{\max} = 1.257 \text{ in}^4$ ◀

and $\bar{I}_{\min} = 0.224 \text{ in}^4$ ◀

By inspection, the *a* axis corresponds to $\bar{I}_{\min}$ and the *b* axis corresponds to $\bar{I}_{\max}$.

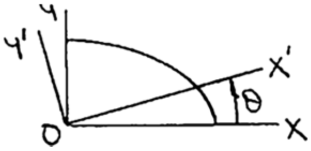
PROBLEM 9.91

Using Mohr’s circle, determine for the quarter ellipse of Problem 9.67 the moments of inertia and the product of inertia with respect to new axes obtained by rotating the *x* and *y* axes about *O* (*a*) through 45° counterclockwise, (*b*) through 30° clockwise.

SOLUTION

From Problem 9.79:
$$I_x = \frac{\pi}{8}a^4$$



$$I_y = \frac{\pi}{2}a^4$$

Problem 9.67:
$$I_{xy} = \frac{1}{2}a^4$$

The Mohr’s circle is defined by the diameter *XY*, where

$$X\left(\frac{\pi}{8}a^4, \frac{1}{2}a^4\right) \quad \text{and} \quad Y\left(\frac{\pi}{2}a^4, -\frac{1}{2}a^4\right)$$

Now
$$I_{\text{ave}} = \frac{1}{2}(I_x + I_y) = \frac{1}{2}\left(\frac{\pi}{8}a^4 + \frac{\pi}{2}a^4\right) = \frac{5}{16}\pi a^4 = 0.98175a^4$$

and
$$R = \sqrt{\left(\frac{I_x - I_y}{2}\right)^2 + I_{xy}^2} = \sqrt{\left[\frac{1}{2}\left(\frac{\pi}{8}a^4 - \frac{\pi}{2}a^4\right)\right]^2 + \left(\frac{1}{2}a^4\right)^2}$$

$$= 0.77264a^4$$

The Mohr’s circle is then drawn as shown.

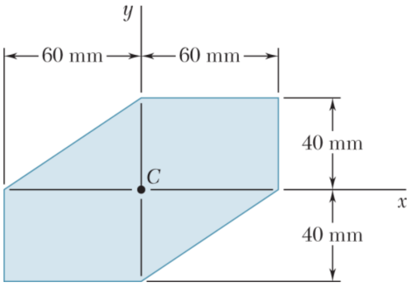
$$I_{x'y'} = R\sin\beta = 0.77264a^4 \sin 79.674°$$

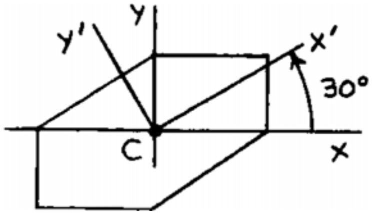
or $I_{x'y'} = 0.760a^4$ ◀



PROBLEM 9.92

Using Mohr's circle, determine the moments of inertia and the product of inertia of the area of Problem 9.72 with respect to new centroidal axes obtained by rotating the *x* and *y* axes 30° counterclockwise.

SOLUTION



From Problem 9.80: $\bar{I}_x = 3.20 \times 10^6 \text{ mm}^4$

$\bar{I}_y = 7.20 \times 10^6 \text{ mm}^4$

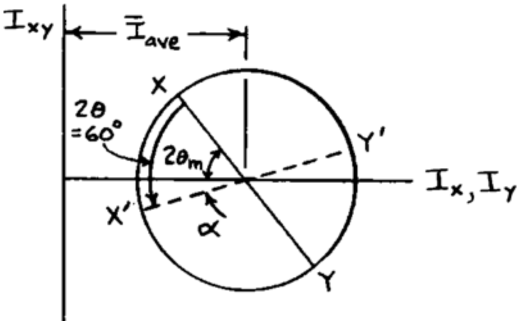
From Problem 9.72: $\bar{I}_{xy} = 2.40 \times 10^6 \text{ mm}^4$

The Mohr's circle is defined by the diameter *XY*, where $X(3.20 \times 10^6,\ 2.40 \times 10^6)$ and $Y(7.20 \times 10^6,\ -2.40 \times 10^6)$.

Now
$$I_{\text{ave}} = \frac{1}{2}(\bar{I}_x + \bar{I}_y) = \frac{1}{2}(3.20 + 7.20) \times 10^6 = 5.20 \times 10^6 \text{ mm}^4$$

and
$$R = \sqrt{\left[\frac{1}{2}(\bar{I}_x - \bar{I}_y)\right]^2 + \bar{I}_{xy}^2} = \left\{\sqrt{\left[\frac{1}{2}(3.20 - 7.20)\right]^2 + (2.40)^2}\right\} \times 10^6 \text{ mm}^4$$
$$= 3.1241 \times 10^6 \text{ mm}^4$$

The Mohr's circle is then drawn as shown.



$$\tan 2\theta_m = -\frac{2\bar{I}_{xy}}{\bar{I}_x - \bar{I}_y}$$
$$= -\frac{2(2.40 \times 10^6)}{(3.20 - 7.20) \times 10^6}$$
$$= 1.200$$

or
$$2\theta_m = 50.1944°$$

Then
$$\alpha = 60° - 50.1944° = 9.8056°$$

PROBLEM 9.92 (Continued)

Then $$\bar{I}_{x'} = \bar{I}_{\text{ave}} - R\cos\alpha = (5.20 - 3.1241\cos 9.8056°)\times 10^6$$

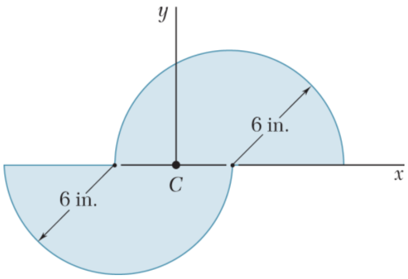
or $\bar{I}_{x'} = 2.12\times 10^6\,\text{mm}^4$ ◀

$$\bar{I}_{y'} = \bar{I}_{\text{ave}} + R\cos\alpha = (5.20 + 3.1241\cos 9.8056°)\times 10^6$$

or $\bar{I}_{y'} = 8.28\times 10^6\,\text{mm}^4$ ◀

$$\bar{I}_{x'y'} = -R\sin\alpha = -(3.1241\times 10^6)\sin 9.8056°$$

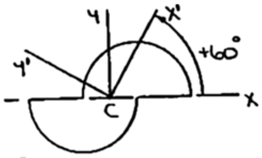
or $\bar{I}_{x'y'} = -0.532\times 10^6\,\text{mm}^4$ ◀



PROBLEM 9.93

Using Mohr's circle, determine the moments of inertia and the product of inertia of the area of Problem 9.73 with respect to new centroidal axes obtained by rotating the *x* and *y* axes 60° counterclockwise.

SOLUTION



From Problem 9.81: $\bar{I}_x = 324\pi \text{ in}^4$

$\bar{I}_y = 648\pi \text{ in}^4$

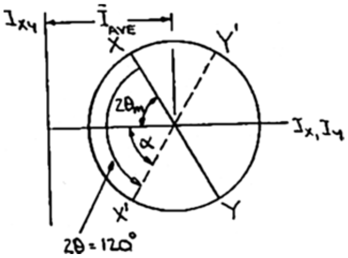
Problem 9.73: $\bar{I}_{xy} = 864 \text{ in}^4$

The Mohr's circle is defined by the diameter *XY*, where $X(324\pi,\ 864)$ and $Y(648\pi,\ -864)$.

Now $$\bar{I}_{\text{ave}} = \frac{1}{2}(\bar{I}_x + \bar{I}_y) = \frac{1}{2}(324\pi + 648\pi) = 1526.81 \text{ in}^4$$

and $$R = \sqrt{\left[\frac{1}{2}(\bar{I}_x - \bar{I}_y)\right]^2 + \bar{I}_{xy}^2} = \sqrt{\left[\frac{1}{2}(324\pi + 648\pi)\right]^2 + 864^2}$$
$$= 1002.75 \text{ in}^4$$

The Mohr's circle is then drawn as shown.



$$\tan 2\theta_m = -\frac{2\bar{I}_{xy}}{\bar{I}_x - \bar{I}_y}$$
$$= -\frac{2(864)}{324\pi - 648\pi}$$
$$= 1.69765$$

or $$2\theta_m = 59.500°$$

Then $$\alpha = 120° - 59.500°$$
$$= 60.500°$$

PROBLEM 9.93 (Continued)

Then $$\bar{I}_{x'} = \bar{I}_{\text{ave}} - R\cos\alpha = 1526.81 - 1002.75\cos 60.500°$$

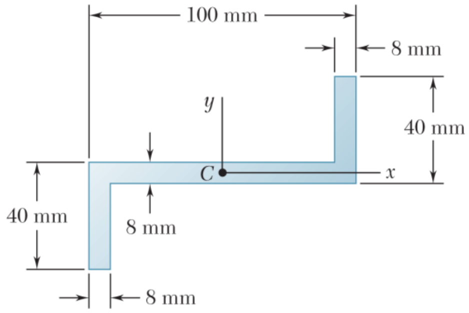
or $\bar{I}_{x'} = 1033 \text{ in}^4$ ◀

$$\bar{I}_{y} = \bar{I}_{\text{ave}} + R\cos\alpha = 1526.81 + 1002.75\cos 60.500°$$

or $\bar{I}_{y'} = 2020 \text{ in}^4$ ◀

$$\bar{I}_{x'y'} = -R\sin\alpha = -1002.75\sin 60.500°$$

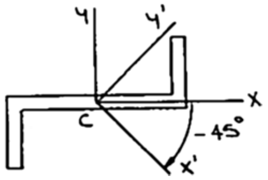
or $\bar{I}_{x'y'} = -873 \text{ in}^4$ ◀



PROBLEM 9.94

Using Mohr's circle, determine the moments of inertia and the product of inertia of the area of Problem 9.75 with respect to new centroidal axes obtained by rotating the *x* and *y* axes 45° clockwise.

SOLUTION



From Problem 9.82: $\bar{I}_x = 252{,}757 \text{ mm}^4$

$\bar{I}_y = 1{,}752{,}789 \text{ mm}^4$

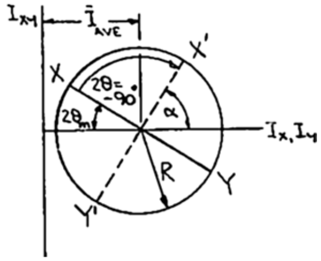
Problem 9.75: $\bar{I}_{xy} = 471{,}040 \text{ mm}^4$

The Mohr's circle is defined by the diameter *XY*, where *X* (252,757; 471,040) and *Y* (1,752,789; −471,040).

Now
$$\bar{I}_{\text{ave}} = \frac{1}{2}(\bar{I}_x + \bar{I}_y) = \frac{1}{2}(252{,}757 + 1{,}752{,}789)$$
$$= 1{,}002{,}773 \text{ mm}^4$$

and
$$R = \sqrt{\left[\frac{1}{2}(\bar{I}_x - \bar{I}_y)\right]^2 + \bar{I}_{xy}^2}$$
$$= \sqrt{\left[\frac{1}{2}(252{,}757 - 1{,}752{,}789)^2\right] + 471{,}040^2}$$
$$= 885{,}665 \text{ mm}^4$$

The Mohr's circle is then drawn as shown.



$$\tan 2\theta_m = -\frac{2\bar{I}_{xy}}{\bar{I}_x - \bar{I}_y}$$
$$= -\frac{2(471{,}040)}{252{,}757 - 1{,}752{,}789}$$
$$= 0.62804$$

or $$2\theta_m = 32.130°$$

Then
$$\alpha = 180° - (32.130 + 90°)$$
$$= 57.870°$$

PROBLEM 9.94 (Continued)

Then $\bar{I}_{x'} = \bar{I}_{\text{ave}} + R\cos\alpha = 1{,}002{,}773 + 885{,}665\cos 57.870°$

or $\bar{I}_{x'} = 1.474\times 10^6\,\text{mm}^4$ ◀

$\bar{I}_{y'} = \bar{I}_{\text{ave}} - R\cos\alpha = 1{,}002{,}773 - 885{,}665\cos 57.870°$

or $\bar{I}_{y'} = 0.532\times 10^6\,\text{mm}^4$ ◀

$\bar{I}_{x'y'} = R\sin\alpha = 885{,}665\sin 57.870°$

The Mohr's circle is then drawn as shown.

$$\tan 2\theta_m = -\frac{2\bar{I}_{xy}}{\bar{I}_x - \bar{I}_y}$$
$$= -\frac{2(2.54 \times 10^6)}{(2.59 - 7.20) \times 10^6} = 1.10195$$

or
$$2\theta_m = 47.777°$$

and
$$\theta_m = 23.9°$$

PROBLEM 9.98 (Continued)

The principal axes are obtained by rotating the *xy* axes through

23.9° counterclockwise ◀

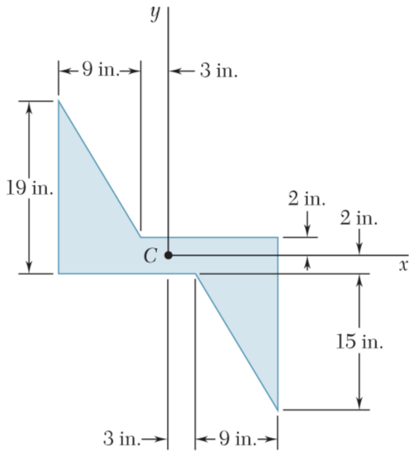
about *C*.

Now $$I_{\max,\min} = \bar{I}_{ave} \pm R = (4.895 \pm 3.43) \times 10^6$$

or $$I_{\max} = 8.33 \times 10^6 \text{ mm}^4$$ ◀

and $$I_{\min} = 1.465 \times 10^6 \text{ mm}^4$$ ◀

From the Mohr's circle it is seen that the x' axis corresponds to $\bar{I}_{\min}$ and the y' axis corresponds to $\bar{I}_{\max}$.

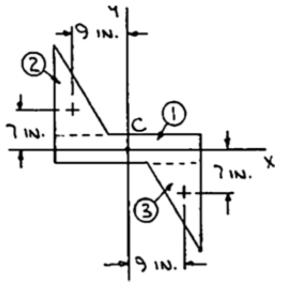


PROBLEM 9.99

Using Mohr’s circle, determine for the area indicated the orientation of the principal centroidal axes and the corresponding values of the moments of inertia.

Area of Problem 9.76.

SOLUTION



From Problem 9.76:

$$\bar{I}_{xy} = -9011.25 \text{ in}^4$$

Now

$$\bar{I}_x = (\bar{I}_x)_1 + (I_x)_2 + (I_x)_3$$

where

$$(\bar{I}_x)_1 = \frac{1}{12}(24 \text{ in.})(4 \text{ in.})^3 = 128 \text{ in}^4$$

$$(I_x)_2 = (I_x)_3 = \frac{1}{36}(9 \text{ in.})(15 \text{ in.})^3 + \left[\frac{1}{2}(9 \text{ in.})(15 \text{ in.})\right](7 \text{ in.})^2$$

$$= 4151.25 \text{ in}^4$$

Then

$$\bar{I}_x = [128 + 2(4151.25)] \text{ in}^4$$

$$= 8430.5 \text{ in}^4$$

Also

$$\bar{I}_y = (\bar{I}_y)_1 + (I_y)_2 + (I_y)_3$$

where

$$(\bar{I}_y)_1 = \frac{1}{12}(4 \text{ in.})(24 \text{ in.})^3 = 4608 \text{ in}^4$$

$$(I_y)_2 = (I_y)_3 = \frac{1}{36}(15 \text{ in.})(9 \text{ in.})^3 + \left[\frac{1}{2}(9 \text{ in.})(15 \text{ in.})\right](9 \text{ in.})^2$$

$$= 5771.25 \text{ in}^4$$

Then

$$\bar{I}_y = [4608 + 2(5771.25)] \text{ in}^4 = 16150.5 \text{ in}^4$$

PROBLEM 9.99 (Continued)

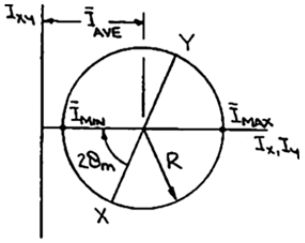
The Mohr's circle is defined by the diameter *XY*, where $X(8430.5,\ -9011.25)$ and $Y(16150.5,\ 9011.25)$.

Now
$$\bar{I}_{\text{ave}} = \frac{1}{2}(\bar{I}_x + \bar{I}_y) = \frac{1}{2}(8430.5 + 16150.5) = 12290.5 \text{ in}^4$$

and
$$\begin{aligned} R &= \sqrt{\left[\frac{1}{2}(\bar{I}_x - \bar{I}_y)\right]^2 + \bar{I}_{xy}^2} \\ &= \sqrt{\left[\frac{1}{2}(8430.5 - 16150.5)\right]^2 + (-9011.25)^2} \\ &= 9803.17 \text{ in}^4 \end{aligned}$$

The Mohr's circle is then drawn as shown.

$$\begin{aligned} \tan 2\theta_m &= -\frac{2\bar{I}_{xy}}{\bar{I}_x - \bar{I}_y} \\ &= -\frac{2(-9011.25)}{8430.5 - 16150.5} \\ &= -2.33452 \end{aligned}$$



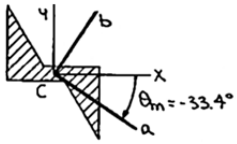
or
$$2\theta_m = -66.812°$$

and
$$\theta_m = -33.4°$$

The principal axes are obtained by rotating the *xy* axes through

33.4° clockwise ◀

about *C*.

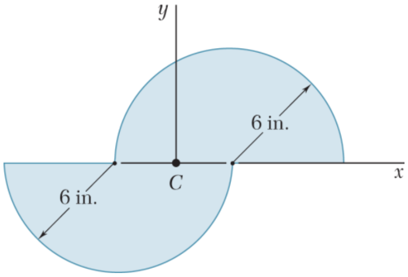


Now
$$\bar{I}_{\text{max, min}} = \bar{I}_{\text{ave}} \pm R = 12290.5 \pm 9803.17$$

or $\bar{I}_{\text{max}} = 22.1 \times 10^3 \text{in}^4$ ◀

and $\bar{I}_{\text{min}} = 2490 \text{ in}^4$ ◀

From the Mohr's circle it is seen that the *a* axis corresponds to $\bar{I}_{\text{min}}$ and the *b* axis corresponds to $\bar{I}_{\text{max}}$.



PROBLEM 9.100

Using Mohr's circle, determine for the area indicated the orientation of the principal centroidal axes and the corresponding values of the moments of inertia.

Area of Problem 9.73

SOLUTION

From Problem 9.81: $\bar{I}_x = 324\pi \text{ in}^4 \qquad \bar{I}_y = 648\pi \text{ in}^4$

Problem 9.73: $\bar{I}_{xy} = 864 \text{ in}^4$

The Mohr's circle is defined by the diameter *XY*, where $X(324\pi,\ 864)$ and $Y(648\pi,\ -864)$.

Now $$\bar{I}_{\text{ave}} = \frac{1}{2}(\bar{I}_x + \bar{I}_y) = \frac{1}{2}(324\pi + 648\pi) = 1526.81 \text{ in}^4$$

and $$R = \sqrt{\left[\frac{1}{2}(\bar{I}_x - \bar{I}_y)^2\right] + I_{xy}^2}$$

$$= \sqrt{\left[\frac{1}{2}(324\pi - 648\pi)\right]^2 + 864^2}$$

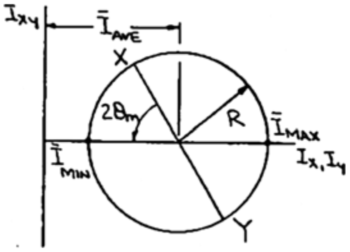
$$= 1002.75 \text{ in}^4$$

The Mohr's circle is then drawn as shown.

$$\tan 2\theta_m = -\frac{2\bar{I}_{xy}}{\bar{I}_x - \bar{I}_y}$$

$$= -\frac{2(864)}{324\pi - 648\pi}$$

$$= 1.69765$$



or $2\theta_m = 59.4998°$

and $\theta_m = 29.7°$

The principal axes are obtained by rotating the *xy* axes through

29.7° counterclockwise ◀

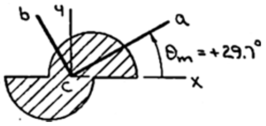
about *C*.

PROBLEM 9.100 (Continued)

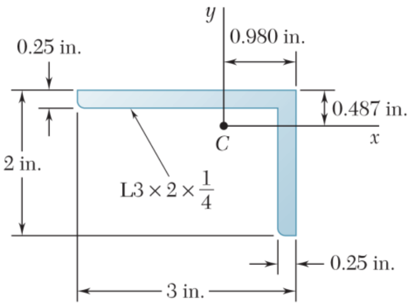
Now $$\bar{I}_{\max,\min} = \bar{I}_{\text{ave}} \pm R = 1526.81 \pm 1002.75$$

or $I_{\max} = 2530 \text{ in}^4$ ◀

and $\bar{I}_{\min} = 524 \text{ in}^4$ ◀



From the Mohr’s circle it is seen that the *a* axis corresponds to $I_{\min}$ and the *b* axis corresponds to $\bar{I}_{\max}$.



PROBLEM 9.101

Using Mohr's circle, determine for the area indicated the orientation of the principal centroidal axes and the corresponding values of the moments of inertia.

Area of Problem 9.74.

SOLUTION

From Problem 9.83: $\bar{I}_x = 0.390 \text{ in}^4$

$\bar{I}_y = 1.09 \text{ in}^4$

Problem 9.74: $\bar{I}_{xy} = -0.37983 \text{ in}^4$

The Mohr's circle is defined by the diameter XY, where $X(0.390, -0.37983)$ and $Y(1.09, 0.37983)$.

Now $$\bar{I}_{\text{ave}} = \frac{1}{2}(\bar{I}_x + \bar{I}_y) = \frac{1}{2}(0.390 + 1.09) = 0.740 \text{ in}^4$$

and $$R = \sqrt{\left[\frac{1}{2}(\bar{I}_x - \bar{I}_y)\right]^2 + \bar{I}_{xy}^2}$$

$$= \sqrt{\left[\frac{1}{2}(0.390 - 1.09)\right]^2 + (-0.37983)^2}$$

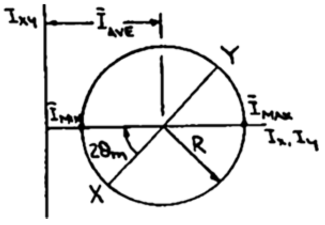
$$= 0.51650 \text{ in}^4$$

The Mohr's circle is then drawn as shown.

$$\tan 2\theta_m = -\frac{2\bar{I}_{xy}}{\bar{I}_x - \bar{I}_y}$$

$$= -\frac{2(-0.37983)}{0.390 - 1.09}$$

$$= -1.08523$$



Then $2\theta_m = -47.341°$

and $\theta_m = -23.7°$

The principal axes are obtained by rotating the xy axes through

23.7° clockwise ◀

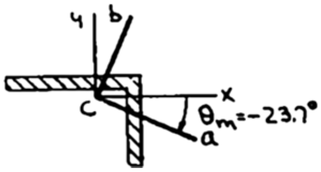
about C.

PROBLEM 9.101 (Continued)

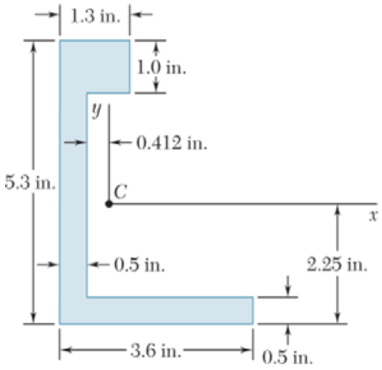
Now $$\bar{I}_{\text{max,min}} = \bar{I}_{\text{ave}} \pm R = 0.740 \pm 0.51650$$

or $\bar{I}_{\text{max}} = 1.257 \text{ in}^4$ ◀

and $\bar{I}_{\text{min}} = 0.224 \text{ in}^4$ ◀



From the Mohr's circle it is seen that the *a* axis corresponds to I_{min} and the *b* axis corresponds to I_{max}.



PROBLEM 9.102

Using Mohr's circle, determine for the area indicated the orientation of the principal centroidal axes and the corresponding values of the moments of inertia.

Area of Problem 9.77

(The moments of inertia $\bar{I}_x$ and $\bar{I}_y$ of the area of Problem 9.102 were determined in Problem 9.44).

SOLUTION

From Problem 9.44:
$$\bar{I}_x = 18.1282 \text{ in}^4$$
$$\bar{I}_y = 4.5080 \text{ in}^4$$

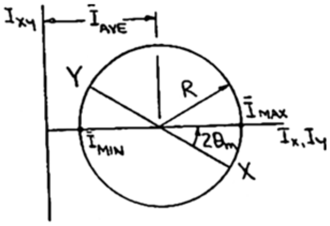
Problem 9.77:
$$\bar{I}_{xy} = -4.25320 \text{ in}^4$$

The Mohr's circle is defined by the diameter XY, where $X(18.1282, -4.25320)$ and $Y(4.5080, 4.25320)$.

Now
$$\bar{I}_{\text{ave}} = \frac{1}{2}(\bar{I}_x + \bar{I}_y) = \frac{1}{2}(18.1282 + 4.5080) = 11.3181 \text{ in}^4$$

and
$$R = \sqrt{\left[\frac{1}{2}(\bar{I}_x - \bar{I}_y)\right]^2 + \bar{I}_{xy}^2}$$
$$= \sqrt{\left[\frac{1}{2}(18.1282 - 4.5080)\right]^2 + (-4.25320)^2}$$
$$= 8.02915 \text{ in}^4$$

The Mohr's circle is then drawn as shown.



$$\tan 2\theta_m = -\frac{2\bar{I}_{xy}}{\bar{I}_x - \bar{I}_y}$$
$$= -\frac{2(-4.25320)}{18.1282 - 4.5080}$$
$$= 0.62454$$

or
$$2\theta_m = 31.986°$$

and
$$\theta_m = 15.99°$$

The principal axes are obtained by rotating the xy axes through

15.99° counterclockwise ◀

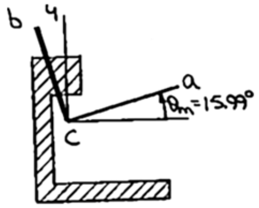
about C.

PROBLEM 9.102 (Continued)

Now $$\bar{I}_{\max,\min} = \bar{I}_{\text{ave}} \pm R = 11.3181 \pm 8.02915$$

or $$\bar{I}_{\max} = 19.35 \text{ in}^4 \blacktriangleleft$$

and $$\bar{I}_{\min} = 3.29 \text{ in}^4 \blacktriangleleft$$



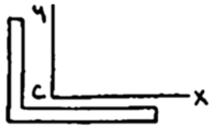
From the Mohr's circle it is seen that the *a* axis corresponds to $I_{\max}$ and the *b* axis corresponds to $I_{\min}$.

PROBLEM 9.103

The moments and product of inertia of an L4 × 3 × $\frac{1}{4}$-in. angle cross section with respect to two rectangular axes x and y through C are, respectively, $\bar{I}_x = 1.33$ in^4, $\bar{I}_y = 2.75$ in^4, and $\bar{I}_{xy} < 0$, with the minimum value of the moment of inertia of the area with respect to any axis through C being $\bar{I}_{\min} = 0.692$ in^4. Using Mohr's circle, determine (*a*) the product of inertia $\bar{I}_{xy}$ of the area, (*b*) the orientation of the principal axes, (*c*) the value of $\bar{I}_{\max}$.

SOLUTION

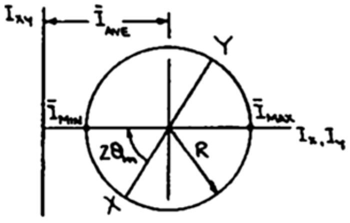
(*Note:* A review of a table of rolled-steel shapes reveals that the given values of $\bar{I}_x$ and $\bar{I}_y$ are obtained when the 4-in. leg of the angle is parallel to the x axis. Further, for $\bar{I}_{xy} < 0$, the angle must be oriented as shown.)



Now $$\bar{I}_{\text{ave}} = \frac{1}{2}(\bar{I}_x + \bar{I}_y) = \frac{1}{2}(1.33 + 2.75) = 2.040 \text{ in}^4$$

and $$\bar{I}_{\min} = \bar{I}_{\text{ave}} - R \quad \text{or} \quad R = 2.040 - 0.692$$
$$= 1.348 \text{ in}^4$$

Using $\bar{I}_{\text{ave}}$ and R, the Mohr's circle is then drawn as shown; note that for the diameter XY, $X(1.33,\ \bar{I}_{xy})$ and $Y(2.75,\ |\bar{I}_{xy}|)$.



(*a*) We have $$R^2 = \left[\frac{1}{2}(\bar{I}_x - \bar{I}_y)\right]^2 + \bar{I}_{xy}^2$$

or $$\bar{I}_{xy}^2 = 1.348^2 - \left[\frac{1}{2}(1.33 - 2.75)\right]^2$$

Solving for $\bar{I}_{xy}$ and taking the negative root (since $\bar{I}_{xy} < 0$) yields $\bar{I}_{xy} = -1.14586$ in^4.

$\bar{I}_{xy} = -1.146$ in^4 ◀

(*b*) We have $$\tan 2\theta_m = -\frac{2\bar{I}_{xy}}{\bar{I}_x - \bar{I}_y} = -\frac{2(-1.14586)}{1.33 - 2.75}$$
$$= -1.61389$$

or $$2\theta_m = -58.217° \qquad \theta_m = -29.1°$$

The principal axes are obtained by rotating the xy axes through

29.1° clockwise ◀

about C.

(*c*) We have $$\bar{I}_{\max} = \bar{I}_{\text{ave}} + R = 2.040 + 1.348$$

or $\bar{I}_{\max} = 3.39$ in^4 ◀

Σ				-1,165,061

PROBLEM 9.105 (Continued)

$$\bar{I}_{xy} = -1.16506 \times 10^6 \text{ mm}^4$$

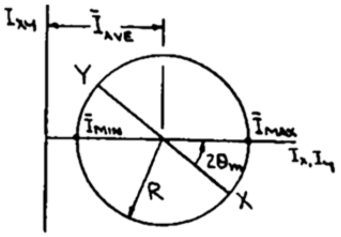
The Mohr's circle is defined by the diameter *XY*, where $X(3.93 \times 10^6, -1.165061 \times 10^6)$ and $Y(1.06 \times 10^6, 1.165061 \times 10^6)$.

Now $$I_{\text{ave}} = \frac{1}{2}(\bar{I}_x + \bar{I}_y)$$
$$= \frac{1}{2}(3.93 + 1.06) \times 10^6$$
$$= 2.495 \times 10^6 \text{mm}^4$$

and $$R = \sqrt{\left[\frac{1}{2}(\bar{I}_x - \bar{I}_y)\right]^2 + \bar{I}_{xy}^2}$$
$$= \left\{\sqrt{\left[\frac{1}{2}(3.93 - 1.06)\right]^2 + (-1.165061)^2}\right\} \times 10^6 = 1.84840 \times 10^6 \text{mm}^4$$

The Mohr's circle is then drawn as shown.

$$\tan 2\theta_m = -\frac{2\bar{I}_{xy}}{\bar{I}_x - \bar{I}_y} = -\frac{2(-1.165061 \times 10^6)}{(3.93 - 1.06) \times 10^6}$$
$$= 0.81189$$



or $$2\theta_m = 39.073°$$

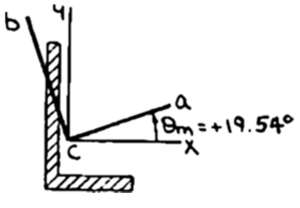
and $$\theta_m = 19.54°$$

The principal axes are obtained by rotating the *xy* axes through 19.54° counterclockwise ◀ about *C*.

Now $$\bar{I}_{\text{max, min}} = \bar{I}_{\text{ave}} \pm R = (2.495 \pm 1.84840) \times 10^6$$

or $\bar{I}_{\text{max}} = 4.34 \times 10^6 \text{mm}^4$ ◀

and $\bar{I}_{\text{min}} = 0.647 \times 10^6 \text{mm}^4$ ◀



From the Mohr's circle it is seen that the *a* axis corresponds to $\bar{I}_{\text{max}}$ and the *b* axis corresponds to $\bar{I}_{\text{min}}$.

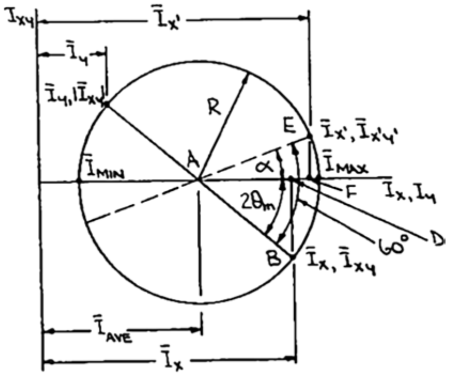
PROBLEM 9.106*

For a given area the moments of inertia with respect to two rectangular centroidal x and y axes are $\bar{I}_x = 1200\ \text{in}^4$ and $\bar{I}_y = 300\ \text{in}^4$, respectively. Knowing that after rotating the x and y axes about the centroid 30° counterclockwise, the moment of inertia relative to the rotated x axis is 1450 in^4, use Mohr's circle to determine (*a*) the orientation of the principal axes, (*b*) the principal centroidal moments of inertia.

SOLUTION

We have $$\bar{I}_{\text{ave}} = \frac{1}{2}(\bar{I}_x + \bar{I}_y) = \frac{1}{2}(1200 + 300) = 750\ \text{in.}^4$$

Now observe that $\bar{I}_x > \bar{I}_{\text{ave}}$, $\bar{I}_{x'} > \bar{I}_x$, and $2\theta = +60°$. This is possible only if $\bar{I}_{xy} < 0$. Therefore, assume $\bar{I}_{xy} < 0$ and (for convenience) $\bar{I}_{x'y'} > 0$. Mohr's circle is then drawn as shown.



We have $$2\theta_m + \alpha = 60°$$

Now using ΔABD: $$R = \frac{\bar{I}_x - \bar{I}_{\text{ave}}}{\cos 2\theta_m} = \frac{1200 - 750}{\cos 2\theta_m}$$
$$= \frac{450}{\cos 2\theta_m} \quad (\text{in}^4)$$

Using ΔAEF: $$R = \frac{\bar{I}_{x'} - \bar{I}_{\text{ave}}}{\cos \alpha} = \frac{1450 - 750}{\cos \alpha}$$
$$= \frac{700}{\cos \alpha} \quad (\text{in}^4)$$

Then $$\frac{450}{\cos 2\theta_m} = \frac{700}{\cos \alpha} \qquad \alpha = 60° - 2\theta_m$$

or $$9\cos(60° - 2\theta_m) = 14\cos 2\theta_m$$

Expanding: $$9(\cos 60° \cos 2\theta_m + \sin 60° \sin 2\theta_m) = 14\cos 2\theta_m$$

or $$\tan 2\theta_m = \frac{14 - 9\cos 60°}{9\sin 60°} = 1.21885$$

or $$2\theta_m = 50.633° \quad \text{and} \quad \theta_m = 25.3°$$

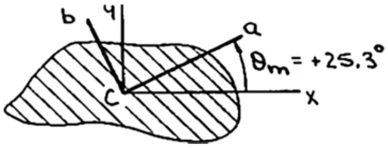
(*Note:* $2\theta_m < 60°$ implies assumption $\bar{I}_{x'y'} > 0$ is correct.)

Finally, $$R = \frac{450}{\cos 50.633°} = 709.46\ \text{in}^4$$

(*a*) From the Mohr's circle it is seen that the principal axes are obtained by rotating the given centroidal x and y axes through θ_m about the centroid C or

25.3° counterclockwise ◀

PROBLEM 9.106* (Continued)



(*b*) We have $\bar{I}_{\max,\min} = \bar{I}_{\text{ave}} \pm R = 750 \pm 709.46$

or $\bar{I}_{\max} = 1459 \text{ in}^4$ ◀

and $\bar{I}_{\min} = 40.5 \text{ in}^4$ ◀

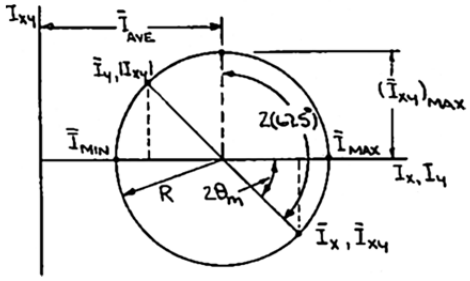
From the Mohr's circle it is seen that the *a* axis corresponds to $\bar{I}_{\max}$ and the *b* axis corresponds to $\bar{I}_{\min}$.

PROBLEM 9.107

It is known that for a given area $\bar{I}_y = 48 \times 10^6$ mm^4 and $\bar{I}_{xy} = -20 \times 10^6$ mm^4, where the *x* and *y* axes are rectangular centroidal axes. If the axis corresponding to the maximum product of inertia is obtained by rotating the *x* axis 67.5° counterclockwise about *C*, use Mohr's circle to determine (*a*) the moment of inertia $\bar{I}_x$ of the area, (*b*) the principal centroidal moments of inertia.

SOLUTION

First assume $\bar{I}_x > \bar{I}_y$ and then draw the Mohr's circle as shown. (*Note:* Assuming $\bar{I}_x < \bar{I}_y$ is not consistent with the requirement that the axis corresponding to $(\bar{I}_{xy})_{\max}$ is obtained after rotating the *x* axis through 67.5° CCW.)



From the Mohr's circle we have

$$2\theta_m = 2(67.5°) - 90° = 45°$$

(*a*) From the Mohr's circle we have

$$\bar{I}_x = \bar{I}_y + 2\frac{|I_{xy}|}{\tan 2\theta_m} = 48 \times 10^6 + 2\,\frac{20 \times 10^6}{\tan 45°}$$

or $\bar{I}_x = 88.0 \times 10^6 \text{ mm}^4$ ◀

(*b*) We have

$$\bar{I}_{\text{ave}} = \frac{1}{2}(\bar{I}_x + \bar{I}_y) = \frac{1}{2}(88.0 + 48) \times 10^6$$
$$= 68.0 \times 10^6 \text{ mm}^4$$

and

$$R = \frac{|I_{xy}|}{\sin 2\theta_m} = \frac{20 \times 10^6}{\sin 45°} = 28.284 \times 10^6 \text{ mm}^4$$

Now

$$\bar{I}_{\text{max, min}} = \bar{I}_{\text{ave}} \pm R = (68.0 \pm 28.284) \times 10^6$$

or $\bar{I}_{\max} = 96.3 \times 10^6 \text{ mm}^4$ ◀

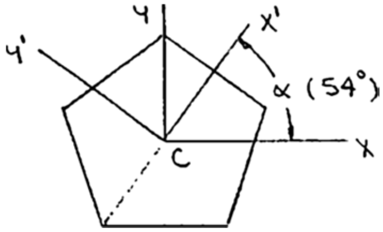
and $\bar{I}_{\min} = 39.7 \times 10^6 \text{ mm}^4$ ◀

PROBLEM 9.108

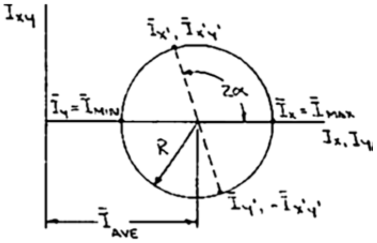
Using Mohr's circle, show that for any regular polygon (such as a pentagon) (*a*) the moment of inertia with respect to every axis through the centroid is the same, (*b*) the product of inertia with respect to every pair of rectangular axes through the centroid is zero.

SOLUTION

Consider the regular pentagon shown, with centroidal axes *x* and *y*.



Because the *y* axis is an axis of symmetry, it follows that $\bar{I}_{xy} = 0.$ Since $\bar{I}_{xy} = 0,$ the *x* and *y* axes must be principal axes. Assuming $\bar{I}_x = \bar{I}_{\text{max}}$ and $\bar{I}_y = \bar{I}_{\text{min}},$ the Mohr's circle is then drawn as shown.



I_{xy}
$\bar{I}_{x'}, \bar{I}_{x'y'}$
2α
$\bar{I}_y = \bar{I}_{MIN}$
$\bar{I}_x = \bar{I}_{MAX}$
I_x, I_y
R
$\bar{I}_{y'}, -\bar{I}_{x'y'}$
$\bar{I}_{AVE}$

Now rotate the coordinate axes through an angle α as shown; the resulting moments of inertia, $\bar{I}_{x'}$ and $\bar{I}_{y'}$, and product of inertia, $\bar{I}_{x'y'}$, are indicated on the Mohr's circle. However, the x' axis is an axis of symmetry, which implies $\bar{I}_{x'y'} = 0.$ For this to be possible on the Mohr's circle, the radius *R* must be equal to zero (thus, the circle degenerates into a point). With $R = 0,$ it immediately follows that

(*a*) $\bar{I}_x = \bar{I}_y = \bar{I}_{x'} = \bar{I}_{y'} = \bar{I}_{\text{ave}}$ (for all moments of inertia with respect to an axis through *C*) ◀

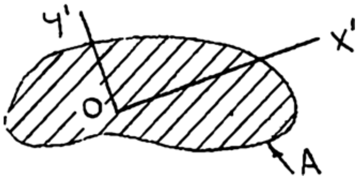
(*b*) $\bar{I}_{xy} = \bar{I}_{x'y'} = 0$ (for all products of inertia with respect to all pairs of rectangular axes with origin at *C*) ◀

PROBLEM 9.109

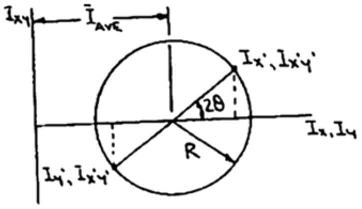
Using Mohr's circle, prove that the expression $I_{x'}I_{y'} - I_{x'y'}^2$ is independent of the orientation of the x' and y' axes, where $I_{x'}$, $I_{y'}$, and $I_{x'y'}$ represent the moments and product of inertia, respectively, of a given area with respect to a pair of rectangular axes x' and y' through a given Point O. Also show that the given expression is equal to the square of the length of the tangent drawn from the origin of the coordinate system to Mohr's circle.

SOLUTION

First observe that for a given area A and origin O of a rectangular coordinate system, the values of I_{ave} and R are the same for all orientations of the coordinate axes. Shown below is a Mohr's circle, with the moments of inertia, $I_{x'}$ and $I_{y'}$, and the product of inertia, $I_{x'y'}$, having been computed for an arbitrary orientation of the $x'y'$ axes.



From the Mohr's circle



$$I_{x'} = I_{\text{ave}} + R\cos 2\theta$$

$$I_{y'} = I_{\text{ave}} - R\cos 2\theta$$

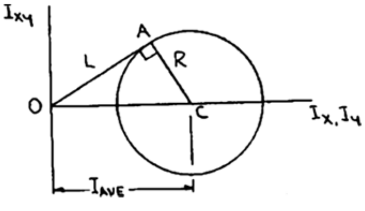
$$I_{x'y'} = R\sin 2\theta$$

Then, forming the expression $I_{x'}I_{y'} - I_{x'y'}^2$

$$\begin{aligned} I_{x'}I_{y'} - I_{x'y'}^2 &= (I_{\text{ave}} + R\cos 2\theta)(I_{\text{ave}} - R\cos 2\theta) - (R\sin 2\theta)^2 \\ &= \left(I_{\text{ave}}^2 - R^2\cos^2 2\theta\right) - (R^2\sin^2 2\theta) \\ &= I_{\text{ave}}^2 - R^2 \quad \text{which is a constant} \end{aligned}$$

$I_{x'}I_{y'} - I_{x'y'}^2$ is independent of the orientation of the coordinate axes Q.E.D. ◀

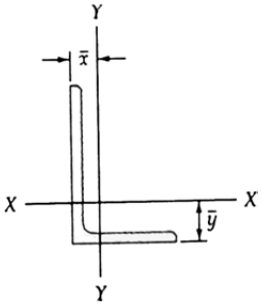
Shown is a Mohr's circle, with line $\overline{OA}$, of length L, the required tangent.



Noting that $\angle OAC$ is a right angle, it follows that

$$L^2 = I_{\text{ave}}^2 - R^2$$

or $L^2 = I_{x'}I_{y'} - I_{x'y'}^2$ Q.E.D. ◀



PROBLEM 9.110

Using the invariance property established in the preceding problem, express the product of inertia I_{xy} of an area A with respect to a pair of rectangular axes through O in terms of the moments of inertia I_x and I_y of A and the principal moments of inertia $I_{\min}$ and $I_{\max}$ of A about O. Use the formula obtained to calculate the product of inertia I_{xy} of the L3 × 2 × $\frac{1}{4}$ -in. angle cross section shown in Figure 9.13A, knowing that its maximum moment of inertia is 1.257 in^4.

SOLUTION

Consider the following two sets of moments and products of inertia, which correspond to two different orientations of the coordinate axes whole origin is at Point *O*.

Case 1: $I_{x'} = I_x, \quad I_{y'} = I_y, \quad I_{x'y'} = I_{xy}$

Case 2: $I_{x'} = I_{\max}, \quad I_{y'} = I_{\min}, \quad I_{x'y'} = 0$

The invariance property then requires

$$I_x I_y - I_{xy}^2 = I_{\max} I_{\min} \qquad \text{or} \qquad I_{xy} = \pm\sqrt{I_x I_y - I_{\max} I_{\min}} \blacktriangleleft$$

From Figure 9.13A: $\bar{I}_x = 1.09 \text{ in}^4$

$\bar{I}_y = 0.390 \text{ in}^4$

Using Eq. (9.21): $\bar{I}_x + \bar{I}_y = \bar{I}_{\max} + \bar{I}_{\min}$

Substituting $1.09 + 0.390 = 1.257 + \bar{I}_{\min}$

or $\bar{I}_{\min} = 0.223 \text{ in}^4$

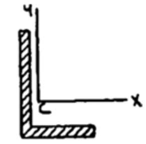
Then

$$\bar{I}_{xy} = \sqrt{(1.09)(0.390) - (1.257)(0.223)}$$

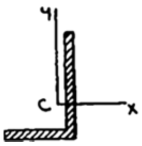
$$= \pm 0.381 \text{ in}^4$$

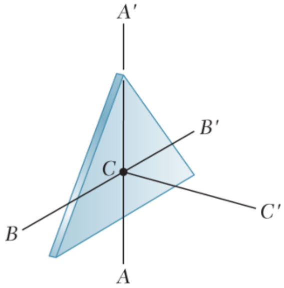
The two roots correspond to the following two orientations of the cross section.

For $\bar{I}_{xy} = -0.381 \text{ in}^4 \blacktriangleleft$



and for $\bar{I}_{xy} = 0.381 \text{ in}^4 \blacktriangleleft$



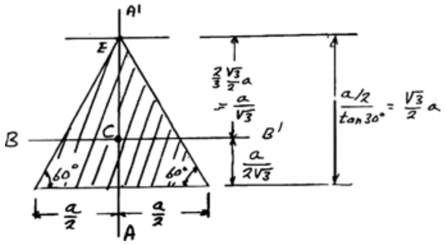


PROBLEM 9.111

A thin plate of mass m is cut in the shape of an equilateral triangle of side a. Determine the mass moment of inertia of the plate with respect to (*a*) the centroidal axes AA' and BB', (*b*) the centroidal axis CC' that is perpendicular to the plate.

SOLUTION

$$\text{Area} = \frac{1}{2}a\left(\frac{\sqrt{3}}{2}a\right) = \frac{\sqrt{3}}{4}a^2$$



A'
E
B
C
B'
60°
60°
$\frac{2}{3}\frac{\sqrt{3}}{2}a$
$= \frac{a}{\sqrt{3}}$
$\frac{a}{2\sqrt{3}}$
$\frac{a/2}{\tan 30°} = \frac{\sqrt{3}}{2}a$
$\frac{a}{2}$
$\frac{a}{2}$
A

$$\text{Mass} = m = \rho V = \rho t A$$

$$I_{\text{mass}} = \rho t I_{\text{area}} = \frac{m}{A} I_{\text{area}}$$

(*a*) Axis AA':

$$I_{AA',\text{area}} = 2\left[\frac{1}{12}\left(\frac{\sqrt{3}}{2}a\right)\left(\frac{a}{2}\right)^3\right] = \frac{\sqrt{3}}{96}a^4$$

$$I_{AA',\text{ mass}} = \frac{m}{A} I_{AA',\text{ area}} = \frac{\frac{m}{\sqrt{3}}}{4}a^2\left(\frac{\sqrt{3}}{96}a^4\right) = \frac{1}{24}ma^2 \quad ◀$$

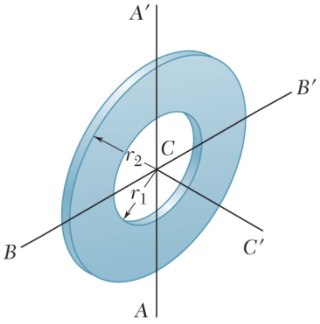
Axis BB'':

$$I_{BB',\text{ area}} = \frac{1}{36}a\left(\frac{\sqrt{3}}{2}a\right)^3 = \frac{\sqrt{3}}{96}a^4 \qquad (\text{we check that } I_{AA} = I_{BB})$$

$$I_{BB',\text{mass}} = \frac{m}{A} I_{BB',\text{ area}} = \frac{\frac{m}{\sqrt{3}}}{4}a^2\left(\frac{\sqrt{3}}{96}a^4\right) = \frac{1}{24}ma^2 \quad ◀$$

(b) Eq. (9.38):

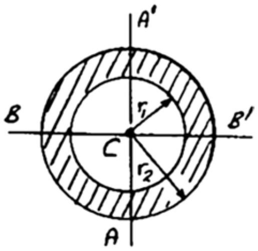
$$I_{CC'} = I_{AA'} + I_{BB'} = 2\left(\frac{1}{24}ma^2\right) \qquad I_{CC'} = \frac{1}{12}ma^2 \quad ◀$$



PROBLEM 9.112

Determine the mass moment of inertia of a ring of mass *m*, cut from a thin uniform plate, with respect to (*a*) the axis *AA*′, (*b*) the centroidal axis *CC*′ that is perpendicular to the plane of the ring.

SOLUTION



$$\text{Mass} = m = \rho V = \rho t A$$

$$I_{\text{mass}} = \rho t I_{\text{area}} = \frac{m}{A} I_{\text{area}}$$

We first determine

$$A = \pi r_2^2 - \pi r_1^2 = \pi\left(r_2^2 - r_1^2\right)$$

$$I_{AA',\text{area}} = \frac{\pi}{4} r_2^4 - \frac{\pi}{4} r_1^4 = \frac{\pi}{4}\left(r_2^4 - r_1^4\right)$$

(*a*)

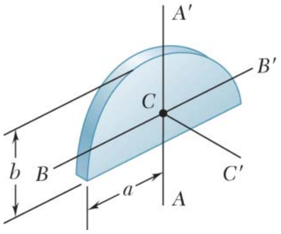
$$I_{AA',\text{ mass}} = \frac{m}{A} I_{AA',\text{ area}} = \frac{m}{\pi\left(r_2^2 - r_1^2\right)} \frac{\pi}{4}\left(r_2^4 - r_1^4\right) = \frac{1}{4} m\left(r_2^2 + r_1^2\right)$$

$$I_{AA'} = \frac{1}{4} m\left(r_1^2 + r_2^2\right) \blacktriangleleft$$

(*b*) By symmetry: $I_{BB'} = I_{AA'}$

Eq. (9.38): $I_{CC'} = I_{AA'} + I_{BB'} = 2I_{AA'}$

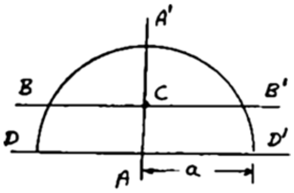
$$I_{CC'} = \frac{1}{2} m\left(r_1^2 + r_2^2\right) \blacktriangleleft$$



PROBLEM 9.113

A thin, semielliptical plate has a mass m. Determine the mass moment of inertia of the plate with respect to (a) the centroidal axis BB', (b) the centroidal axis CC' that is perpendicular to the plate.

SOLUTION



$$\text{mass} = m = \rho t A$$

$$I_{\text{mass}} = \rho t I_{\text{area}} = \frac{2m}{\pi ab} I_{\text{area}}$$

Area: $$A = \frac{1}{2}\pi a^2$$

$$I_{x,\text{area}} = I_{BB',\text{area}} + A\bar{y}^2$$

$$I_{BB',\text{area}} = \frac{\pi}{8}ab^3 - \left(\frac{\pi}{2}ab\right)\left(\frac{4b}{3\pi}\right)^2$$

$$I_{BB',\text{area}} = \frac{\pi}{8}ab^3\left(1 - \frac{64}{9\pi^2}\right)$$

(a) $$I_{BB',\text{mass}} = \frac{2m}{\pi ab}\left(\frac{\pi}{8}ab^3\right)\left(1 - \frac{64}{9\pi^2}\right)$$

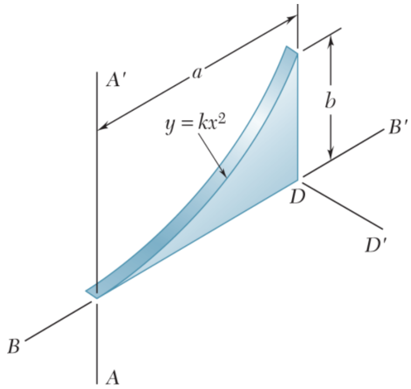
$$= \frac{1}{4}mb^2\left(1 - \frac{64}{9\pi^2}\right)$$

$$I_{BB'} = 0.0699mb^2 \blacktriangleleft$$

(b) Fig. (9.12): $I_{AA',area} = \frac{\pi}{8}a^3b$, then $I_{AA',mass} = \left(\frac{2m}{\pi ab}\right)\left(\frac{\pi}{8}a^3b\right) = \frac{1}{4}ma^2$

$$I_{CC',mass} = I_{AA',mass} + I_{BB',mass} = \frac{1}{4}ma^2 + \frac{1}{4}mb^2\left(1 - \frac{64}{9\pi^2}\right)$$

$$I_{CC'} = \frac{1}{4}\text{m}(a^2 + 0.279b^2) \blacktriangleleft$$



PROBLEM 9.114

The parabolic spandrel shown was cut from a thin, uniform plate. Denoting the mass of the spandrel by *m*, determine its mass moment of inertia with respect to (*a*) the axis *BB*′, (*b*) the axis *DD*′ that is perpendicular to the spandrel. (*Hint:* See Sample Problem 9.3.)

SOLUTION

First note

$$\text{mass} = m = \rho V = \rho t A$$

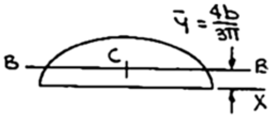
$$= \rho t\left(\frac{\pi}{2}ab\right)$$

Also

$$I_{\text{mass}} = \rho t I_{\text{area}}$$

$$= \frac{2m}{\pi ab} I_{\text{area}}$$

(*a*) We have



$$I_{x,\text{area}} = I_{BB',\text{area}} + A\bar{y}^2$$

or

$$I_{BB',\text{area}} = \frac{\pi}{8}ab^3 - \left(\frac{\pi}{2}ab\right)\left(\frac{4b}{3\pi}\right)^2$$

(*a*) From Sample Problem 9.3:

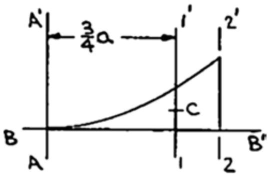
$$I_{BB',\text{area}} = \frac{1}{21}ab^3$$

Then

$$I_{BB',\text{mass}} = \frac{3m}{ab} \times \frac{1}{21}ab^3$$

or $\quad I_{BB'} = \frac{1}{7}mb^2$ ◀

(*b*) From Sample Problem 9.3:



$$I_{AA',\text{area}} = \frac{1}{5}a^3b$$

Now

$$I_{AA',\text{area}} = I_{11',\text{area}} + A\left(\frac{3}{4}a\right)^2$$

PROBLEM 9.114 (Continued)

and $$I_{22',\text{area}} = I_{11',\text{area}} + A\left(\frac{1}{4}a\right)^2$$

Then $$I_{22',\text{area}} = I_{AA',\text{area}} + A\left[\left(\frac{1}{4}a\right)^2 - \left(\frac{3}{4}a\right)^2\right]$$

$$= \frac{1}{5}a^3b + \frac{1}{3}ab\left(\frac{1}{16}a^2 - \frac{9}{16}a^2\right)$$

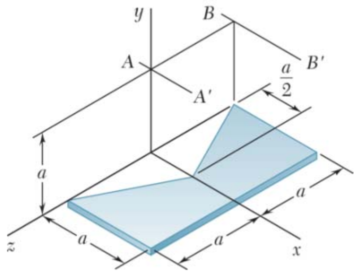
$$= \frac{1}{30}a^3b$$

and $$I_{22',\text{mass}} = \frac{3m}{ab} \times \frac{1}{30}a^3b$$

$$= \frac{1}{10}ma^2$$

Finally, $$I_{DD',\text{mass}} = I_{BB',\text{mass}} + I_{22',\text{mass}}$$

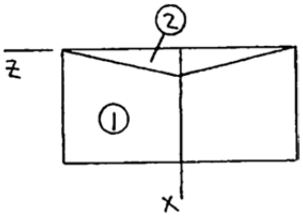
$$= \frac{1}{7}mb^2 + \frac{1}{10}ma^2$$ or $$I_{DD'} = \frac{1}{70}m(7a^2 + 10b^2)$$ ◀



PROBLEM 9.115

A piece of thin, uniform sheet metal is cut to form the machine component shown. Denoting the mass of the component by *m*, determine its mass moment of inertia with respect to (*a*) the *x* axis, (*b*) the *y* axis.

SOLUTION



First note

$$\text{mass} = m = \rho V = \rho t A$$

$$= \rho t\left[(2a)(a) - \frac{1}{2}(2a)\left(\frac{a}{2}\right)\right]$$

$$= \frac{3}{2}\rho t a^2$$

Also

$$I_{\text{mass}} = \rho t I_{\text{area}}$$

$$= \frac{2m}{3a^2} I_{\text{area}}$$

(*a*) Now

$$\bar{I}_{x,\text{area}} = (I_x)_{1,\text{area}} - 2(I_x)_{2,\text{area}}$$

$$= \frac{1}{12}(a)(2a)^3 - 2\left[\frac{1}{12}\left(\frac{a}{2}\right)(a)^3\right]$$

$$= \frac{7}{12}a^4$$

Then

$$\bar{I}_{x,\text{mass}} = \frac{2m}{3a^2} \times \frac{7}{12}a^4$$

or $\bar{I}_x = \frac{7}{18}ma^2$ ◀

(*b*) We have

$$\bar{I}_{z,\text{area}} = (I_z)_{1,\text{area}} - 2(I_z)_{2,\text{area}}$$

$$= \frac{1}{3}(2a)(a)^3 - 2\left[\frac{1}{12}(a)\left(\frac{a}{2}\right)^3\right]$$

$$= \frac{31}{48}a^4$$

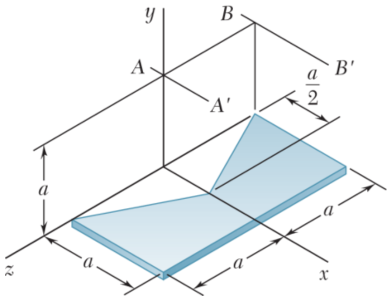
Then

$$I_{z,\text{mass}} = \frac{2m}{3a^2} \times \frac{31}{48}a^4$$

$$= \frac{31}{72}ma^2$$

Finally,
$$\begin{aligned} I_{y,\text{mass}} &= \bar{I}_{x,\text{mass}} + I_{z,\text{mass}} \\ &= \frac{7}{18}ma^2 + \frac{31}{72}ma^2 \\ &= \frac{59}{72}ma^2 \end{aligned}$$

or $I_y = 0.819ma^2$ ◀



PROBLEM 9.116

A piece of thin, uniform sheet metal is cut to form the machine component shown. Denoting the mass of the component by m, determine its mass moment of inertia with respect to (a) the axis AA', (b) the axis BB', where the AA' and BB' axes are parallel to the x axis and lie in a plane parallel to and at a distance a above the xz plane.

SOLUTION

First note that the x axis is a centroidal axis so that

$$I = \bar{I}_{x,\text{mass}} + md^2$$

and that from the solution to Problem 9.115,

$$\bar{I}_{x,\text{mass}} = \frac{7}{18}ma^2$$

(a) We have

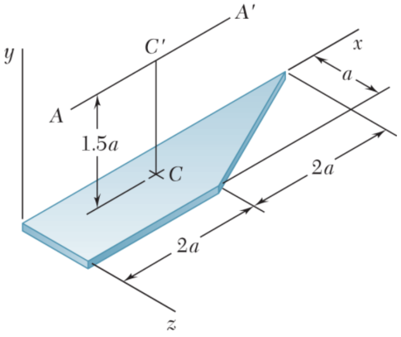
$$I_{AA',\text{mass}} = \frac{7}{18}ma^2 + m(a)^2$$

or $I_{AA'} = 1.389ma^2$ ◀

(b) We have

$$I_{BB',\text{mass}} = \frac{7}{18}ma^2 + m(a\sqrt{2})^2$$

or $I_{BB'} = 2.39ma^2$ ◀



PROBLEM 9.117

A thin plate of mass *m* has the trapezoidal shape shown. Determine the mass moment of inertia of the plate with respect to (*a*) the *x* axis, (*b*) the *y* axis.

SOLUTION

First note

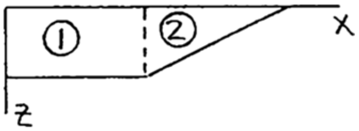
$$\text{mass} = m = \rho V = \rho t A$$

$$= \rho t \left[(2a)(a) + \frac{1}{2}(2a)(a) \right] = 3\rho t a^2$$

Also

$$I_{\text{mass}} = \rho t I_{\text{area}} = \frac{m}{3a^2} I_{\text{area}}$$

(*a*) Now



$$I_{x,\text{area}} = (I_x)_{1,\text{area}} + (I_x)_{2,\text{area}}$$

$$= \frac{1}{3}(2a)(a)^3 + \frac{1}{12}(2a)(a)^3$$

$$= \frac{5}{6}a^4$$

Then

$$I_{x,\text{mass}} = \frac{m}{3a^2} \times \frac{5}{6}a^4$$

or $I_{x,\text{ mass}} = \frac{5}{18}ma^2$ ◀

(*b*) We have

$$I_{z,\text{area}} = (I_z)_{1,\text{area}} + (I_z)_{2,\text{ area}}$$

$$= \left[\frac{1}{3}(a)(2a)^3 \right] + \left[\frac{1}{36}(a)(2a)^3 + \frac{1}{2}(2a)(a)\left(2a + \frac{1}{3} \times 2a \right)^2 \right] = 10a^4$$

Then

$$I_{x,\text{mass}} = \frac{m}{3a^2} \times 10a^4 = \frac{10}{3}ma^2$$

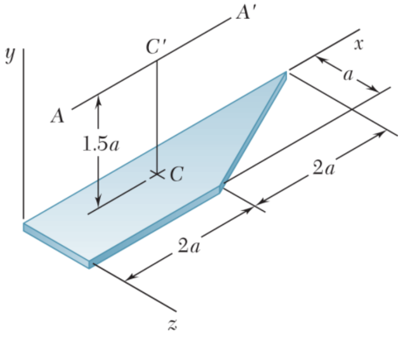
Finally,

$$I_{y,\text{mass}} = I_{x,\text{mass}} + I_{z,\text{mass}}$$

$$= \frac{5}{18}ma^2 + \frac{10}{3}ma^2$$

$$= \frac{65}{18}ma^2$$

or $I_{y,\text{mass}} = 3.61ma^2$ ◀



PROBLEM 9.118

A thin plate of mass m has the trapezoidal shape shown. Determine the mass moment of inertia of the plate with respect to (a) the centroidal axis CC' that is perpendicular to the plate, (b) the axis AA' that is parallel to the x axis and is located at a distance $1.5a$ from the plate.

SOLUTION

First locate the centroid C.

$$\bar{X}\Sigma A = \Sigma \bar{x}A: \quad \bar{X}(2a^2 + a^2) = a(2a^2) + \left(2a + \frac{1}{3}\times 2a\right)(a^2)$$

or
$$\bar{X} = \frac{14}{9}a$$

$$\bar{Z}\Sigma A = \Sigma \bar{z}A: \quad \bar{Z}(2a^2 + a^2) = \left(\frac{1}{2}a\right)(2a^2) + \left(\frac{1}{3}a\right)(a^2)$$

or
$$\bar{Z} = \frac{4}{9}a$$

(a) We have
$$I_{y,\,\text{mass}} = \bar{I}_{CC',\,\text{mass}} + m(\bar{X}^2 + \bar{Z}^2)$$

From the solution to Problem 9.117:

$$I_{y,\text{mass}} = \frac{65}{18}ma^2$$

Then
$$\bar{I}_{cc',\text{mass}} = \frac{65}{18}ma^2 - m\left[\left(\frac{14}{9}a\right)^2 + \left(\frac{4}{9}a\right)^2\right]$$

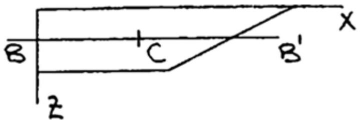
or $\bar{I}_{cc'} = 0.994ma^2$ ◀

(b) We have
$$I_{x,\text{mass}} = \bar{I}_{BB',\text{mass}} + m(\bar{Z})^2$$

and
$$I_{AA',\,\text{mass}} = \bar{I}_{BB',\,\text{mass}} + m(1.5a)^2$$

Then
$$I_{AA',\,\text{mass}} = I_{x,\,\text{mass}} + m\left[(1.5a)^2 - \left(\frac{4}{9}a\right)^2\right]$$

PROBLEM 9.118 (Continued)

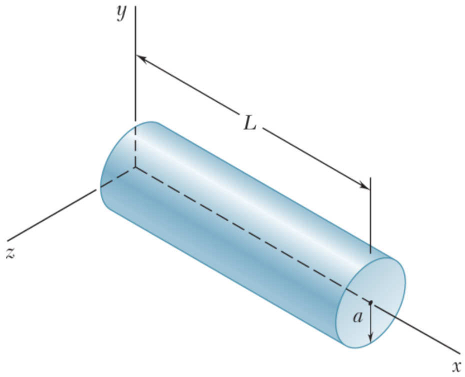


From the solution to Problem 9.193:

$$I_{x,\text{mass}} = \frac{5}{18}ma^2$$

Then
$$I_{AA',\text{mass}} = \frac{5}{18}ma^2 + m\left[(1.5a)^2 - \left(\frac{4}{9}a\right)^2\right]$$

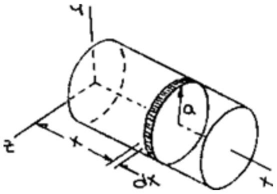
or $I_{AA'} = 2.33ma^2$ ◀



PROBLEM 9.119

Determine by direct integration the mass moment of inertia with respect to the z axis of the right circular cylinder shown, assuming that it has a uniform density and a mass m.

SOLUTION



For the cylinder: $m = \rho V = \rho\pi a^2 L$

For the element shown: $dm = \rho\pi a^2 dx$

$$= \frac{m}{L}dx$$

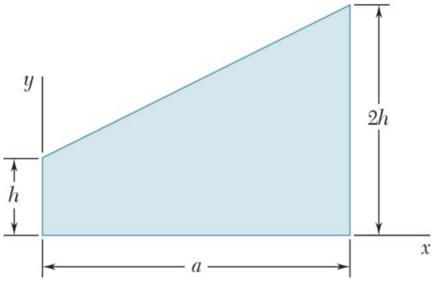
and $dI_z = dI_z + x^2 dm$

$$= \frac{1}{4}a^2 dm + x^2 dm$$

Then $I_z = \int dI_z = \int_0^L \left(\frac{1}{4}a^2 + x^2\right)\left(\frac{m}{L}dx\right)$

$$= \frac{m}{L}\left[\frac{1}{4}a^2 x + \frac{1}{3}x^3\right]_0^L$$

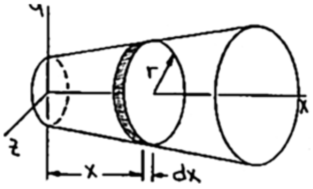
$$I_z = \frac{1}{12}m(3a^2 + 4L^2) \blacktriangleleft$$



PROBLEM 9.120

The area shown is revolved about the *x* axis to form a homogeneous solid of revolution of mass *m*. Using direct integration, express the mass moment of inertia of the solid with respect to the *x* axis in terms of *m* and *h*.

SOLUTION



We have $$y = \frac{2h - h}{a}x + h$$

so that $$r = \frac{h}{a}(x + a)$$

For the element shown:

$$dm = \rho\pi r^2 dx \quad dI_x = \frac{1}{2}r^2 dm$$

$$= \rho\pi\left[\frac{h}{a}(x + a)\right]^2 dx$$

Then $$m = \int dm = \int_0^a \rho\pi\frac{h^2}{a^2}(x + a)^2 dx = \frac{1}{3}\rho\pi\frac{h^2}{a^2}[(x + a)^3]_0^a$$

$$= \frac{1}{3}\rho\pi\frac{h^2}{a^2}(8a^3 - a^3) = \frac{7}{3}\rho\pi a h^2$$

Now $$I_x = \int dI_x = \int\frac{1}{2}r^2(\rho\pi r^2 dx) = \frac{1}{2}\rho\pi\int_0^a\left[\frac{h}{a}(x + a)\right]^4 dx$$

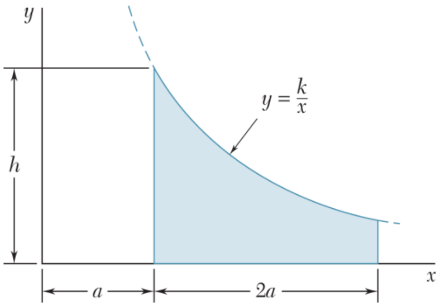
$$= \frac{1}{2}\rho\pi \times \frac{1}{5}\frac{h^4}{a^4}[(x + a)^5]_0^a = \frac{1}{10}\rho\pi\frac{h^4}{a^4}(32a^5 - a^5)$$

$$= \frac{31}{10}\rho\pi a h^4$$

From above: $$\rho\pi a h^2 = \frac{3}{7}m$$

Then $$I_x = \frac{31}{10}\left(\frac{3}{7}m\right)h^2 = \frac{93}{70}mh^2$$

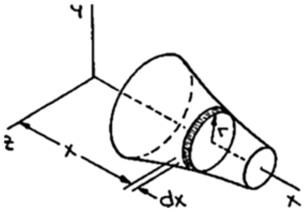
or $I_x = 1.329\, mh^2$ ◀



PROBLEM 9.121

The area shown is revolved about the *x* axis to form a homogeneous solid of revolution of mass *m*. Determine by direct integration the mass moment of inertia of the solid with respect to (*a*) the *x* axis, (*b*) the *y* axis. Express your answers in terms of *m* and the dimensions of the solid.

SOLUTION



We have at (a, h): $h = \frac{k}{a}$

or $k = ah$

For the element shown:

$$r = 4$$

$$dm = \rho\pi r^2 dx$$

$$= \rho\pi\left(\frac{ah}{x}\right)^2 dx$$

Then $$m = \int dm = \int_a^{3a} \rho\pi\left(\frac{ah}{x}\right)^2 dx$$

$$= \rho\pi a^2h^2\left[-\frac{1}{x}\right]_a^{3a}$$

$$= \rho\pi a^2h^2\left[-\frac{1}{3a} - \left(-\frac{1}{a}\right)\right] = \frac{2}{3}\rho\pi a h^2$$

(*a*) For the element: $dI_x = \frac{1}{2}r^2 dm = \frac{1}{2}\rho\pi r^4 dx$

Then $$I_x = \int dI_x = \int_a^{3a} \frac{1}{2}\rho\pi\left(\frac{ah}{x}\right)^4 dx = \frac{1}{2}\rho\pi a^4h^4\left[-\frac{1}{3}\frac{1}{x^3}\right]_a^{3a}$$

$$= -\frac{1}{6}\rho\pi a^4h^4\left[\left(\frac{1}{3a}\right)^3 - \left(\frac{1}{a}\right)^3\right] = \frac{1}{6}\times\frac{26}{27}\rho\pi a h^4$$

$$= \frac{1}{6}\times\frac{2}{3}\rho\pi a h^2 \times \frac{13}{9}h^2 = \frac{13}{54}mh^2$$

or $I_x = 0.241\,mh^2$ ◀

PROBLEM 9.121 (Continued)

(*b*) For the element:

$$dI_y = dI_y + x^2 dm$$

$$= \frac{1}{4} r^2 dm + x^2 dm$$

Then

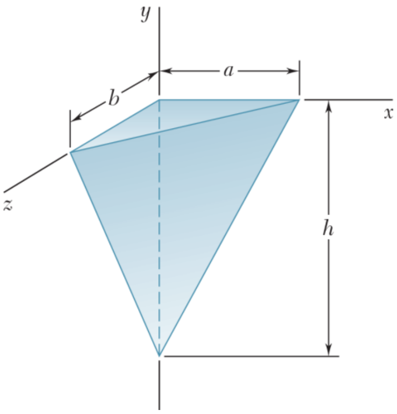
$$I_y = \int dI_y = \int_a^{3a} \left[\frac{1}{4} \left(\frac{ah}{x} \right)^2 + x^2 \right] \rho\pi \left(\frac{ah}{x} \right)^2 dx$$

$$= \rho\pi a^2 h^2 \int_a^{3a} \left(\frac{1}{4} \frac{a^2 h^2}{x^4} + 1 \right) dx = \rho\pi a^2 h^2 \left[-\frac{1}{12} \frac{a^2 h^2}{x^3} + x \right]_a^{3a}$$

$$= \left(\frac{3}{2} m \right) a \left\{ \left[-\frac{1}{12} \frac{a^2 h^2}{(3a)^3} + 3a \right] - \left[-\frac{1}{12} \frac{a^2 h^2}{(a)^3} + a \right] \right\}$$

$$= \frac{3}{2} ma \left(\frac{1}{12} \times \frac{26}{27} \frac{h^2}{a} + 2a \right) = m \left(\frac{13}{108} h^2 + 3a^2 \right)$$

or $I_y = m(3a^2 + 0.1204h^2)$ ◀



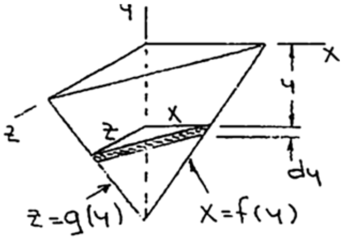
PROBLEM 9.122

Determine by direct integration the mass moment of inertia with respect to the *x* axis of the tetrahedron shown, assuming that it has a uniform density and a mass *m*.

SOLUTION

We have $$x = \frac{a}{h}y + a = a\left(1 + \frac{y}{h}\right)$$

and $$z = \frac{b}{h}y + b = b\left(1 + \frac{y}{h}\right)$$



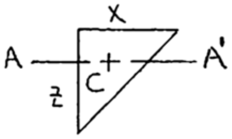
For the element shown: $$dm = \rho\left(\frac{1}{2}xz\,dy\right) = \frac{1}{2}\rho ab\left(1 + \frac{y}{h}\right)^2 dy$$

Then $$m = \int dm = \int_{-h}^{0} \frac{1}{2}\rho ab\left(1 + \frac{y}{h}\right)^2 dy$$

$$= \frac{1}{2}\rho ab \times \frac{h}{3}\left[\left(1 + \frac{y}{h}\right)^3\right]_{-h}^{0}$$

$$= \frac{1}{6}\rho abh\left[(1)^3 - (1-1)^3\right]$$

$$= \frac{1}{6}\rho abh$$



Now, for the element: $$I_{AA',\text{area}} = \frac{1}{36}xz^3 = \frac{1}{36}ab^3\left(1 + \frac{y}{h}\right)^4$$

Then $$dI_{AA',\text{mass}} = \rho t I_{AA',\text{area}} = \rho(dy)\left[\frac{1}{3}ab^3\left(1 + \frac{y}{h}\right)^4\right]$$

PROBLEM 9.122 (Continued)

Now

$$dI_x = dI_{AA',\text{mass}} + \left[y^2 + \left(\frac{1}{3}z\right)^2\right]dm$$

$$= \frac{1}{36}\rho ab^3\left(1+\frac{y}{h}\right)^4 dy$$

$$+\left\{y^2 + \left[\frac{1}{3}b\left(1+\frac{y}{h}\right)\right]^2\right\}\left[\frac{1}{2}\rho ab\left(1+\frac{y}{h}\right)^2 dy\right]$$

$$= \frac{1}{12}\rho ab^3\left(1+\frac{y}{h}\right)^4 dy + \frac{1}{2}\rho ab\left(y^2 + 2\frac{y^3}{h} + \frac{y^4}{h^2}\right)dy$$

Now $$m = \frac{1}{6}\rho abh$$

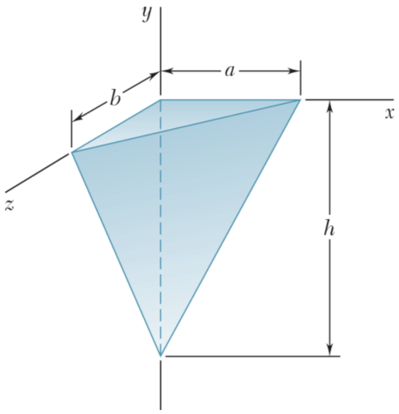
Then $$dI_x = \left[\frac{1}{2}m\frac{b^2}{h}\left(1+\frac{y}{h}\right)^4 + \frac{3m}{h}\left(y^2 + 2\frac{y^3}{h} + \frac{y^4}{h^2}\right)\right]dy$$

and $$I_x = \int dI_x = \int_{-h}^{0}\frac{m}{2h}\left[b^2\left(1+\frac{y}{h}\right)^4 + 6\left(y^2 + 2\frac{y^3}{h} + \frac{y^4}{h^2}\right)\right]dy$$

$$= \frac{m}{2h}\left[b^2 \times \frac{h}{5}\left(1+\frac{y}{h}\right)^5 + 6\left(\frac{1}{3}y^3 + \frac{1}{2}\frac{y^4}{h} + \frac{y^5}{5h^2}\right)\right]_{-h}^{0}$$

$$= \frac{m}{2h}\left\{\frac{1}{5}b^2h(1)^5 - 6\left[\frac{1}{3}(-h)^3 + \frac{1}{2h}(-h)^4 + \frac{1}{5h^2}(-h)^5\right]\right\}$$

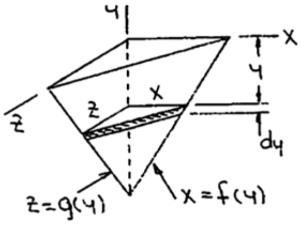
or $$I_x = \frac{1}{10}m(b^2 + h^2) \blacktriangleleft$$



PROBLEM 9.123

Determine by direct integration the mass moment of inertia with respect to the *y* axis of the tetrahedron shown, assuming that it has a uniform density and a mass *m*.

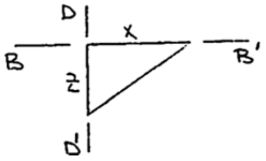
SOLUTION



We have $$x = \frac{a}{h}y + a = a\left(1 + \frac{y}{h}\right)$$

and $$z = \frac{b}{h}y + b = b\left(1 + \frac{y}{h}\right)$$

For the element shown: $$dm = \rho\left(\frac{1}{2}xz\,dy\right) = \frac{1}{2}\rho ab\left(1 + \frac{y}{h}\right)^2 dy$$



Then $$m = \int dm = \int_{-h}^{0} \frac{1}{2}\rho ab\left(1 + \frac{y}{h}\right)^2 dy$$

$$= \frac{1}{2}\rho ab \times \frac{h}{3}\left[\left(1 + \frac{y}{h}\right)^3\right]_{-h}^{0}$$

$$= \frac{1}{6}\rho abh\left[(1)^3 - (1-1)^3\right]$$

$$= \frac{1}{6}\rho abh$$

Also $$I_{BB',\text{area}} = \frac{1}{12}xz^3 \qquad I_{DD',\text{area}} = \frac{1}{12}zx^3$$

Then, using $$I_{\text{mass}} = \rho t I_{\text{area}}$$

we have $$dI_{BB',\text{mass}} = \rho(dy)\left(\frac{1}{12}xz^3\right) \qquad dI_{DD',\text{mass}} = \rho(dy)\left(\frac{1}{12}zx^3\right)$$

PROBLEM 9.123 (Continued)

Now

$$dI_y = dI_{BB',\,\text{mass}} + dI_{DD',\,\text{mass}}$$

$$= \frac{1}{12}\rho xz(x^2 + z^2)dy$$

$$= \frac{1}{12}\rho ab\left(1+\frac{y}{h}\right)^2\left[(a^2+b^2)\left(1+\frac{y}{h}\right)^2\right]dy$$

We have $m = \frac{1}{6}\rho abh \Rightarrow dI_y = \frac{m}{2h}(a^2+b^2)\left(1+\frac{y}{h}\right)^4 dy$

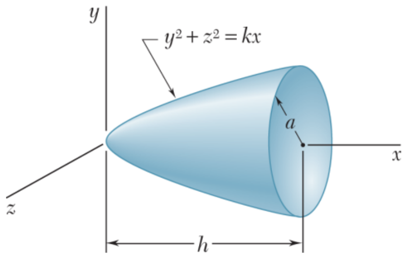
Then

$$I_y = \int dI_y = \int_{-h}^{0}\frac{m}{2h}(a^2+b^2)\left(1+\frac{y}{h}\right)^4 dy$$

$$= \frac{m}{2h}\left(a^2+b^2\right)\times\frac{h}{5}\left[\left(1+\frac{y}{h}\right)^5\right]_{-h}^{0}$$

$$= \frac{m}{10}\left(a^2+b^2\right)\left[(1)^5 - (1-1)^5\right]$$

or $I_y = \frac{1}{10}m(a^2+b^2)$ ◀



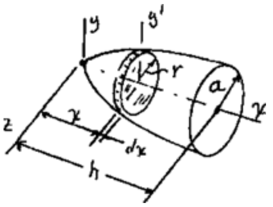
PROBLEM 9.124

Determine by direct integration the mass moment of inertia and the radius of gyration with respect to the x axis of the paraboloid shown, assuming that it has a uniform density and a mass m.

SOLUTION

$r^2 = y^2 + z^2 = kx$: at $x = h,\ r = a;\quad a^2 = kh;\quad k = \dfrac{a^2}{h}$

Thus: $r^2 = \dfrac{a^2}{h}x$



$$dm = \rho\pi r^2 dx = \rho\pi \frac{a^2}{h} xdy$$

$$m = \int_0^h dm = \rho\pi \frac{a^2}{h}\int_0^h xdx;\quad m = \frac{1}{2}\rho\pi a^2 h$$

$$dI_x = \left(\frac{1}{2}r^2\right)dm$$

$$I_x = \int_0^h dI_x = \frac{1}{2}\int_0^h \left(r^2\right)\left(\rho\pi r^2 dx\right) = \frac{1}{2}\rho\pi\int_0^h r^4 dx$$

$$= \frac{1}{2}\rho\pi\int_0^h \left(\frac{a^2}{h}x\right)^2 dx = \frac{\rho\pi a^4}{2h^2}\int_0^h x^2 dx$$

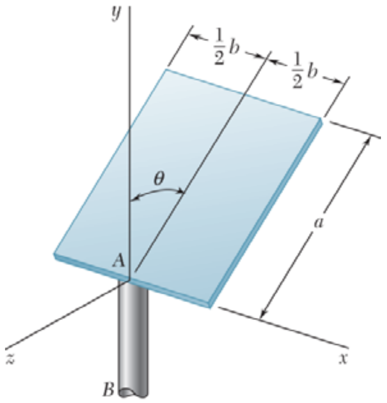
$$I_x = \frac{1}{6}\rho\pi a^4 h \ \triangleleft$$

Recall: $m = \dfrac{1}{2}\rho\pi a^2 h$; $\quad I_x = \left(\dfrac{1}{2}\rho\pi a^2 h\right)\left(\dfrac{1}{3}\right)a^2$

$$I_x = \frac{1}{3}ma^2 \ \blacktriangleleft$$

$$\left(k_x\right)^2 = \frac{I}{m} = \left(\frac{\frac{1}{3}ma^2}{m}\right) = \frac{1}{3}a^2$$

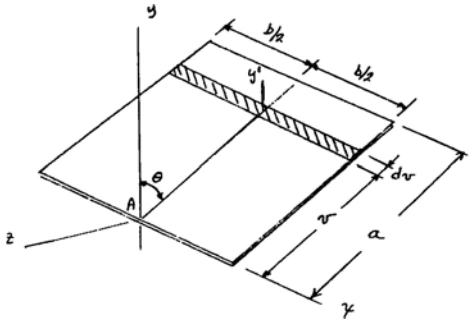
$$k_x = \frac{a}{\sqrt{3}} \ \blacktriangleleft$$



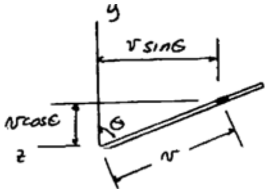
PROBLEM 9.125

A thin rectangular plate of mass *m* is welded to a vertical shaft *AB* as shown. Knowing that the plate forms an angle θ with the *y* axis, determine by direct integration the mass moment of inertia of the plate with respect to (*a*) the *y* axis, (*b*) the *z* axis.

SOLUTION



Projection on *yz* plane



Mass of plate: $m = \rho tab$

(*a*) For element shown: $dm = \rho btdv$

$$d\bar{I}_y = d\bar{I}_{y'} + (v\sin\theta)^2\,dm = \frac{1}{12}b^2dm + v^2\sin^2\theta dm$$

$$= \left(\frac{1}{12}b^2 + v^2\sin^2\theta\right)\rho btdv$$

$$I_y = \int dI_y = \rho bt\int_0^a\left(\frac{1}{12}b^2 + v^2\sin^2\theta\right)dv$$

$$= \rho bt\left|\frac{1}{12}b^2v + \frac{v^3}{3}\sin\theta\right|_0^a = \rho bt\left(\frac{1}{12}ab^2 + \frac{a^3}{3}\sin^2\theta\right)$$

$$= (\rho tab)\frac{1}{12}(b^2 + 4a^2\sin^2\theta)$$

PROBLEM 9.125 (Continued)

$$I_y = \frac{1}{12}m(b^2 + 4a^2 \sin^2 \theta) \blacktriangleleft$$

(b)

$$dI_z = d\bar{I}_{z'} + (v\cos\theta)^2 dm = \frac{1}{12}b^2 dm + v^2 \cos^2 \theta dm$$

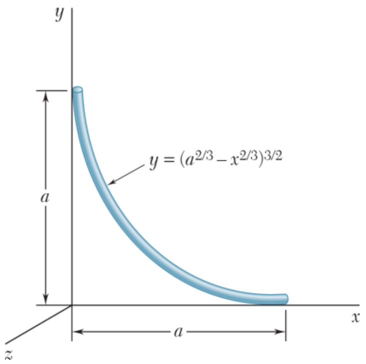
$$= \left(\frac{1}{12}b^2 + v^2 \cos^2 \theta\right)\rho btdv$$

$$I_z = \int dI_z = \rho bt\int_0^a \left(\frac{1}{12}b^2 + v^2 \cos^2 \theta\right)dv$$

$$= \rho bt\left|\frac{1}{12}b^2 v + \frac{v^3}{3}\cos^2 \theta\right|_0^a = \rho bt\left(\frac{1}{12}ab^2 + \frac{a^3}{3}\cos^2 \theta\right)$$

$$= (\rho tab)\frac{1}{12}(b^2 + 4a^2 \cos^2 \theta)$$

$$I_z = \frac{1}{12}m(b^2 + 4a^2 \cos^2 \theta) \blacktriangleleft$$



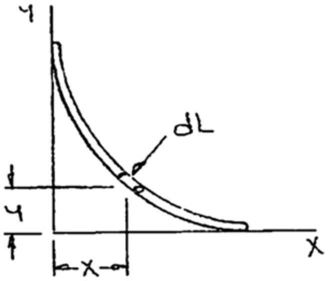
PROBLEM 9.126*

A thin steel wire is bent into the shape shown. Denoting the mass per unit length of the wire by m', determine by direct integration the mass moment of inertia of the wire with respect to each of the coordinate axes.

SOLUTION

First note
$$\frac{dy}{dx} = -x^{-1/3}(a^{2/3} - x^{2/3})^{1/2}$$

Then
$$1+\left(\frac{dy}{dx}\right)^2 = 1 + x^{-2/3}(a^{2/3} - x^{2/3})$$
$$= \left(\frac{a}{x}\right)^{2/3}$$



For the element shown:
$$dm = m'dL = m'\sqrt{1+\left(\frac{dy}{dx}\right)^2}\,dx$$
$$= m'\left(\frac{a}{x}\right)^{1/3} dx$$

Then
$$m = \int dm = \int_0^a m'\frac{a^{1/3}}{x^{1/3}}dx = \frac{3}{2}m'a^{1/3}\left[x^{2/3}\right]_0^a = \frac{3}{2}m'a$$

Now
$$I_x = \int y^2 dm = \int_0^a (a^{2/3} - x^{2/3})^3\left(m'\frac{a^{1/3}}{x^{1/3}}dx\right)$$
$$= m'a^{1/3}\int_0^a\left(\frac{a^2}{x^{1/3}} - 3a^{4/3}x^{1/3} + 3a^{2/3}x - x^{5/3}\right)dx$$
$$= m'a^{1/3}\left[\frac{3}{2}a^2x^{2/3} - \frac{9}{4}a^{4/3}x^{4/3} + \frac{3}{2}a^{2/3}x^2 - \frac{3}{8}x^{8/3}\right]_0^a$$
$$= m'a^3\left(\frac{3}{2} - \frac{9}{4} + \frac{3}{2} - \frac{3}{8}\right) = \frac{3}{8}m'a^3$$

or $I_x = \frac{1}{4}ma^2$ ◀

Symmetry implies $I_y = \frac{1}{4}ma^2$ ◀

PROBLEM 9.126* (Continued)

Alternative solution:

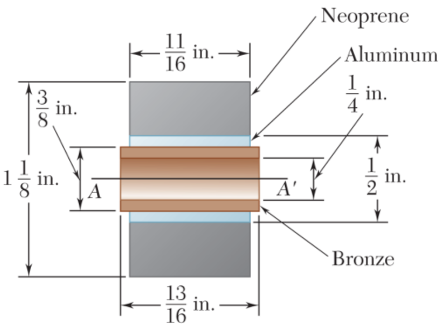
$$I_y = \int x^2 dm = \int_0^a x^2 \left(m' \frac{a^{1/3}}{x^{1/3}} dx \right) = m'a^{1/3} \int_0^a x^{5/3} dx$$

$$= m'a^{1/3} \times \frac{3}{8} \left[x^{8/3} \right]_0^a = \frac{3}{8} m'a^3$$

$$= \frac{1}{4} ma^2$$

Also $$I_z = \int (x^2 + y^2)\, dm = I_y + I_x$$

or $$I_z = \frac{1}{2} ma^2 \blacktriangleleft$$



PROBLEM 9.127

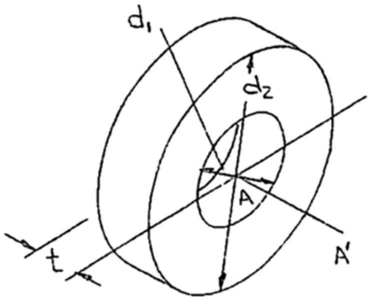
Shown is the cross section of an idler roller. Determine its mass moment of inertia and its radius of gyration with respect to the axis AA'. (The specific weight of bronze is 0.310 lb/in^3; of aluminum, 0.100 lb/in^3; and of neoprene, 0.0452 lb/in^3.)

SOLUTION

First note for the cylindrical ring shown that

$$m = \rho V = \rho t \times \frac{\pi}{4}\left(d_2^2 - d_1^2\right) = \frac{\pi}{4}\rho t\left(d_2^2 - d_1^2\right)$$

and, using Figure 9.28, that



$$\begin{aligned}
I_{AA'} &= \frac{1}{2}m_2\left(\frac{d_2}{2}\right)^2 - \frac{1}{2}m_1\left(\frac{d_1}{2}\right)^2 \\
&= \frac{1}{8}\left[\left(\rho t \times \frac{\pi}{4}d_2^2\right)d_2^2 - \left(\rho t \times \frac{\pi}{4}d_1^2\right)d_1^2\right] \\
&= \frac{1}{8}\left(\frac{\pi}{4}\rho t\right)\left(d_2^4 - d_1^4\right) \\
&= \frac{1}{8}\left(\frac{\pi}{4}\rho t\right)\left(d_2^2 - d_1^2\right)\left(d_2^2 + d_1^2\right) \\
&= \frac{1}{8}m\left(d_1^2 + d_2^2\right)
\end{aligned}$$

Now treat the roller as three concentric rings and, working from the bronze outward, we have

$$\begin{aligned}
m = \frac{\pi}{4} \times \frac{1}{32.2}\,\text{ft/s}^2 \Bigg\{ &(0.310\ \text{lb/in}^3)\left(\frac{13}{16}\text{in.}\right)\left[\left(\frac{3}{8}\right)^2 - \left(\frac{1}{4}\right)^2\right]\text{in}^2 \\
&+ (0.100\ \text{lb/in}^3)\left(\frac{11}{16}\ \text{in.}\right)\left[\left(\frac{1}{2}\right)^2 - \left(\frac{3}{8}\right)^2\right]\text{in}^2 \\
&+ (0.0452\ \text{lb/in}^3)\left(\frac{11}{16}\text{in.}\right)\left[\left(1\frac{1}{8}\right)^2 - \left(\frac{1}{2}\right)^2\right]\text{in}^2 \Bigg\} \\
= {} &(479.96 + 183.41 + 769.80) \times 10^{-6}\ \text{lb}\cdot\text{s}^2/\text{ft} \\
= {} &1.4332 \times 10^{-3}\ \text{lb}\cdot\text{s}^2/\text{ft}
\end{aligned}$$

PROBLEM 9.127 (Continued)

and
$$I_{AA'} = \frac{1}{8}\left\{(479.96)\left[\left(\frac{1}{4}\right)^2 + \left(\frac{3}{8}\right)^2\right] + (183.41)\left[\left(\frac{3}{8}\right)^2 + \left(\frac{1}{2}\right)^2\right]\right.$$

$$\left. + (769.80)\left[\left(1\frac{1}{8}\right)^2 + \left(\frac{1}{2}\right)^2\right]\right\} \times 10^{-6}\ \text{lb}\cdot\text{s}^2/\text{ft} \times \text{in}^2 \times \frac{1\ \text{ft}^2}{144\ \text{in}^2}$$

$$= (84.628 + 62.191 + 1012.78) \times 10^{-9}\ \text{lb}\cdot\text{ft}\cdot\text{s}^2$$

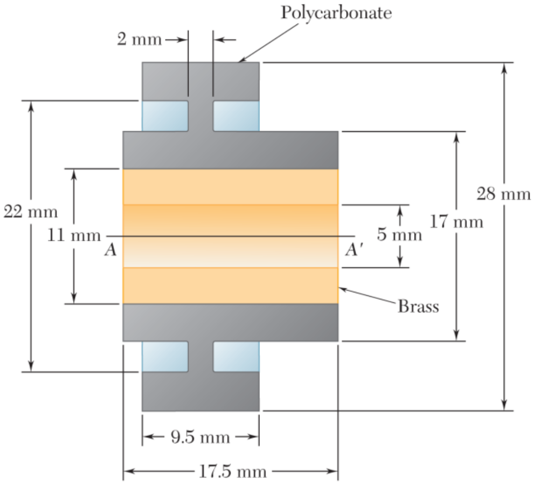
$$= 1.15960 \times 10^{-6}\ \text{lb}\cdot\text{ft}\cdot\text{s}^2$$

or $I_{AA'} = 1.160 \times 10^{-6}\ \text{lb}\cdot\text{ft}\cdot\text{s}^2$ ◀

Now
$$k_{AA'}^2 = \frac{I_{AA'}}{m} = \frac{1.15960 \times 10^{-6}\ \text{lb}\cdot\text{ft}\cdot\text{s}^2}{1.4332 \times 10^{-3}\ \text{lb}\cdot\text{s}^2/\text{ft}} = 809.09 \times 10^{-6}\ \text{ft}^2$$

Then
$$k_{AA'} = 28.445 \times 10^{-3}\ \text{ft}$$

or $k_{AA'} = 0.341\ \text{in.}$ ◀



PROBLEM 9.128

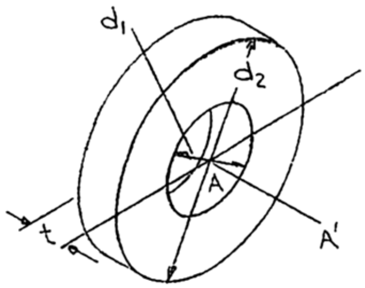
Shown is the cross section of a molded flat-belt pulley. Determine its mass moment of inertia and its radius of gyration with respect to the axis *AA*′. (The density of brass is 8650 kg/m^3 and the density of the fiber-reinforced polycarbonate used is 1250 kg/m^3.)

SOLUTION

First note for the cylindrical ring shown that

$$m = \rho V = \rho t \times \frac{\pi}{4}\left(d_2^2 - d_1^2\right)$$

and, using Figure 9.28, that



$$\begin{aligned}
I_{AA'} &= \frac{1}{2}m_2\left(\frac{d_2}{2}\right)^2 - \frac{1}{2}m_1\left(\frac{d_1}{2}\right)^2 \\
&= \frac{1}{8}\left[\left(\rho t \times \frac{\pi}{4}d_2^2\right)d_2^2 - \left(\rho t \times \frac{\pi}{4}d_1^2\right)d_1^2\right] \\
&= \frac{1}{8}\left(\frac{\pi}{4}\rho t\right)\left(d_2^4 - d_1^4\right) \\
&= \frac{1}{8}\left(\frac{\pi}{4}\rho t\right)\left(d_2^2 - d_1^2\right)\left(d_2^2 + d_1^2\right) \\
&= \frac{1}{8}m\left(d_1^2 + d_2^2\right)
\end{aligned}$$

Now treat the pulley as four concentric rings and, working from the brass outward, we have

$$\begin{aligned}
m = \frac{\pi}{4}\{&8650\text{ kg/m}^3 \times (0.0175\text{ m}) \times (0.011^2 - 0.005^2)\text{ m}^2 \\
&+ 1250\text{ kg/m}^3[(0.0175\text{ m}) \times (0.017^2 - 0.011^2)\text{ m}^2 \\
&+ (0.002\text{ m}) \times (0.022^2 - 0.017^2)\text{ m}^2 \\
&+ (0.0095\text{ m}) \times (0.028^2 - 0.022^2)\text{ m}^2]\} \\
= {}&(11.4134 + 2.8863 + 0.38288 + 2.7980) \times 10^{-3}\text{ kg} \\
= {}&17.4806 \times 10^{-3}\text{ kg}
\end{aligned}$$

PROBLEM 9.128 (Continued)

and

$$I_{AA'} = \frac{1}{8}[(11.4134)(0.005^2 + 0.011^2) + (2.8863)(0.011^2 + 0.017^2)$$

$$+ (0.38288)(0.017^2 + 0.022^2)$$

$$+ (2.7980)(0.022^2 + 0.028^2)] \times 10^{-3}\text{ kg} \times \text{m}^2$$

$$= (208.29 + 147.92 + 37.00 + 443.48) \times 10^{-9}\text{ kg}\cdot\text{m}^2$$

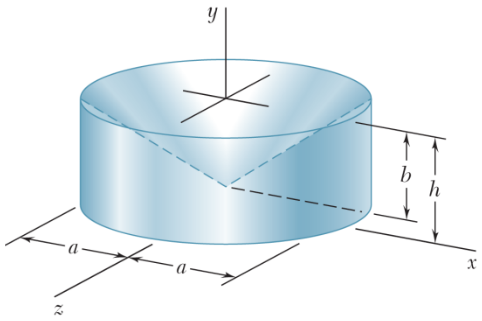
$$= 836.69 \times 10^{-9}\text{ kg}\cdot\text{m}^2$$

or $I_{AA'} = 837 \times 10^{-9}\text{ kg}\cdot\text{m}^2$ ◀

Now

$$k_{AA'}^2 = \frac{I_{AA'}}{m} = \frac{836.69 \times 10^{-9}\text{ kg}\cdot\text{m}^2}{17.4806 \times 10^{-3}\text{ kg}} = 47.864 \times 10^{-6}\text{ m}^2$$

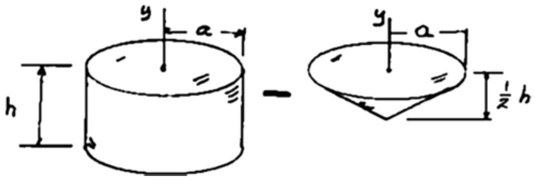
or $k_{AA'} = 6.92\text{ mm}$ ◀



PROBLEM 9.129

The machine part shown is formed by machining a conical surface into a circular cylinder. For $b = \frac{1}{2}h$, determine the mass moment of inertia and the radius of gyration of the machine part with respect to the y axis.

SOLUTION



Mass:

$$m_{\text{cyl}} = \rho\pi a^2 h \qquad m_{\text{cone}} = \frac{1}{3}\rho\pi a^2 \frac{h}{2} = \frac{1}{6}\rho\pi a^2 h$$

$$I_y: \quad I_{\text{cyl}} = \frac{1}{2}m_{\text{cyl}}a^2 \qquad I_{\text{cone}} = \frac{3}{10}m_{\text{cone}}a^2$$

$$= \frac{1}{2}\rho\pi a^4 h \qquad = \frac{1}{20}\rho\pi a^4 h$$

For entire machine part:

$$m = m_{\text{cyl}} - m_{\text{cone}} = \rho\pi a^2 h - \frac{1}{6}\rho\pi a^2 h = \frac{5}{6}\rho\pi a^2 h$$

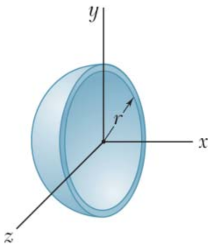
$$I_y = I_{\text{cyl}} - I_{\text{cone}} = \frac{1}{2}\rho\pi a^4 h - \frac{1}{20}\rho\pi a^4 h = \frac{9}{20}\rho\pi a^4 h$$

or

$$I_y = \left(\frac{5}{6}\rho\pi a^2 h\right)\left(\frac{6}{5}\right)\left(\frac{9}{20}\right)a^2 \qquad I_y = \frac{27}{50}ma^2 \blacktriangleleft$$

Then

$$k_y^2 = \frac{I}{m} = \frac{27}{50}a^2 \qquad k_y = 0.735a \blacktriangleleft$$



PROBLEM 9.130

Knowing that the thin hemispherical shell shown has a mass m and thickness t, determine the mass moment of inertia and the radius of gyration of the shell with respect to the x axis. (*Hint:* Consider the shell as formed by removing a hemisphere of radius r from a hemisphere of radius $r + t$; then neglect the terms containing t^2 and t^3 and keep those terms containing t.)

SOLUTION

Consider shell to be formed by removing hemisphere of radius r from hemisphere of radius $r+t$.

For a hemisphere,

$$I = \frac{2}{5}mr^2; \quad A = \frac{1}{2}\left(4\pi r^2\right) = 2\pi r^2$$

$$m = \rho V = \frac{1}{2}\rho\left(\frac{4}{3}\pi r^3\right) = \frac{2}{3}\rho\pi r^3$$

Then
$$I = \frac{2}{5}\left(\frac{2}{3}\rho\pi r^3\right)r^2$$

$$= \frac{4}{15}\rho\pi r^5$$

Now following the hint, for a hemispherical shell,

$$I = \frac{4}{15}\rho\pi\left[\left(r+t\right)^5 - r^5\right]$$

$$I = \frac{4}{15}\rho\pi\left[r^5 + 5r^4t + 10r^3t^2 + \ldots - r^5\right]$$

Neglect terms with powers of $t > 1$. $I = \frac{4}{3}\rho\pi r^4 t = \left(2\rho\pi r^2\right)\frac{2}{3}r^2 t$

Mass of shell,

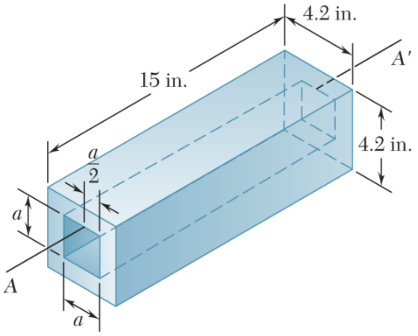
$$m = \rho V = \rho t A = \rho t\left(2\pi r^2\right) = 2\rho\pi r^2 t$$

Substituting with expression for m to simplify,

$$I = \frac{2}{3}mr^2 \blacktriangleleft$$

Radius of gyration, $k^2 = \frac{I}{m} = \frac{2}{3}r^2$

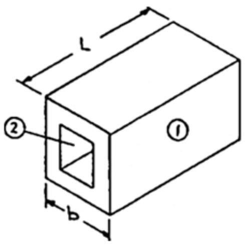
$$k = 0.816r \blacktriangleleft$$



PROBLEM 9.131

A square hole is centered in and extends through the aluminum machine component shown. Determine (*a*) the value of *a* for which the mass moment of inertia of the component with respect to the axis *AA*′, which bisects the top surface of the hole, is maximum, (*b*) the corresponding values of the mass moment of inertia and the radius of gyration with respect to the axis *AA*′. (The specific weight of aluminum is 0.100 lb/in^3.)

SOLUTION



First note $$m_1 = \rho V_1 = \rho b^2 L$$

and $$m_2 = \rho V_2 = \rho a^2 L$$

(*a*) Using Figure 9.28 and the parallel-axis theorem, we have

$$\begin{aligned}
I_{AA'} &= (I_{AA'})_1 - (I_{AA'})_2 \\
&= \left[\frac{1}{12}m_1(b^2+b^2) + m_1\left(\frac{a}{2}\right)^2\right] \\
&\quad - \left[\frac{1}{12}m_2(a^2+a^2) + m_2\left(\frac{a}{2}\right)^2\right] \\
&= (\rho b^2 L)\left(\frac{1}{6}b^2 + \frac{1}{4}a^2\right) - (\rho a^2 L)\left(\frac{5}{12}a^2\right) \\
&= \frac{\rho L}{12}(2b^4 + 3b^2a^2 - 5a^4)
\end{aligned}$$

Then $$\frac{dI_{AA'}}{da} = \frac{\rho L}{12}(6b^2 a - 20a^3) = 0$$

or $$a = 0 \qquad \text{and} \qquad a = b\sqrt{\frac{3}{10}}$$

Also $$\frac{d^2 I_{AA'}}{da^2} = \frac{\rho L}{12}(6b^2 - 60a^2) = \frac{1}{2}\rho L(b^2 - 10a^2)$$

Now for $a = 0$, $$\frac{d^2 I_{AA'}}{da^2} > 0$$

and for $a = b\sqrt{\frac{3}{10}}$, $$\frac{d^2 I_{AA'}}{da^2} < 0$$

$(I_{AA'})_{\text{max}}$ occurs when $a = b\sqrt{\frac{3}{10}}$

Then $a = (4.2\text{ in.})\sqrt{\frac{3}{10}}$

or $a = 2.30\text{ in.}$ ◀

(*b*) From part *a*:

$$(I_{AA'})_{\text{max}} = \frac{\rho L}{12}\left[2b^4 + 3b^2\left(b\sqrt{\frac{3}{10}}\right)^2 - 5\left(b\sqrt{\frac{3}{10}}\right)^4\right] = \frac{49}{240}\rho L b^4$$

$$= \frac{49}{240}\frac{\gamma_{AL}}{g}Lb^4 = \frac{49}{240}\times\frac{0.100\text{ lb/in}^3}{32.2\text{ ft/s}^2}\times(15\text{ in.})(4.2\text{ in.})^4\left(\frac{1\text{ ft}}{12\text{ in.}}\right)^2$$

or $(I_{AA'})_{\text{max}} = 20.6\times10^{-3}\text{ lb}\cdot\text{ft}\cdot\text{s}^2$ ◀

Now $k_{AA'}^2 = \frac{(I_{AA'})_{\text{max}}}{m}$

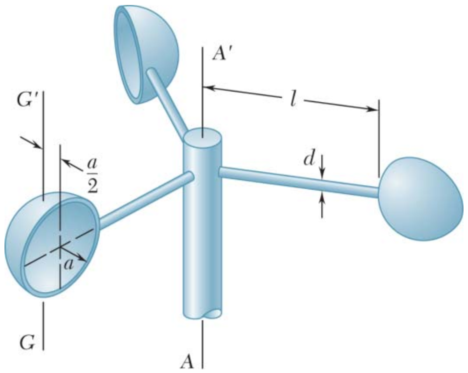
where $m = m_1 - m_2 = \rho L(b^2 - a^2)$

$$= \rho L\left[b^2 - \left(b\sqrt{\frac{3}{10}}\right)^2\right]$$

$$= \frac{7}{10}\rho L b^2$$

Then $k_{AA'}^2 = \frac{\frac{49}{240}\rho L b^4}{\frac{7}{10}\rho L b^2} = \frac{7}{24}b^2 = \frac{7}{24}(4.2\text{ in.})^2$

or $k_{AA'} = 2.27\text{ in.}$ ◀

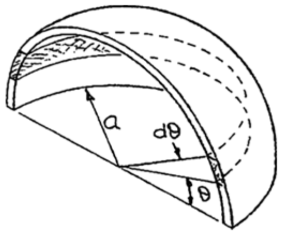


PROBLEM 9.132

The cups and the arms of an anemometer are fabricated from a material of density ρ. Knowing that the mass moment of inertia of a thin, hemispherical shell of mass m and thickness t with respect to its centroidal axis GG' is $5ma^2/12$, determine (*a*) the mass moment of inertia of the anemometer with respect to the axis AA', (*b*) the ratio of a to l for which the centroidal moment of inertia of the cups is equal to 1 percent of the moment of inertia of the cups with respect to the axis AA'.

SOLUTION

(*a*) First note
$$m_{\text{arm}} = \rho V_{\text{arm}} = \rho \times \frac{\pi}{4} d^2 l$$



and
$$dm_{\text{cup}} = \rho dV_{\text{cup}}$$
$$= \rho[(2\pi a \cos\theta)(t)(a d\theta)]$$

Then
$$m_{\text{cup}} = \int dm_{\text{cup}} = \int_0^{\pi/2} 2\pi\rho a^2 t \cos\theta d\theta$$
$$= 2\pi\rho a^2 t[\sin\theta]_0^{\pi/2}$$
$$= 2\pi\rho a^2 t$$

Now
$$(I_{AA'})_{\text{anem}} = (I_{AA'})_{\text{cups}} + (I_{AA'})_{\text{arms}}$$

Using the parallel-axis theorem and assuming the arms are slender rods, we have

$$(I_{AA'})_{\text{anem}} = 3\left[(I_{GG'})_{\text{cup}} + m_{\text{cup}} d_{AG}^2\right] + 3\left[\bar{I}_{\text{arm}} + m_{\text{arm}} d_{AG_{\text{arm}}}\right]$$
$$= 3\left\{\frac{5}{12} m_{\text{cup}} a^2 + m_{\text{cup}}\left[(l+a)^2 + \left(\frac{a}{2}\right)^2\right]\right\} + 3\left[\frac{1}{2} m_{\text{arm}} l^2 + m_{\text{arm}}\left(\frac{l}{2}\right)^2\right]$$
$$= 3m_{\text{cup}}\left(\frac{5}{3}a^2 + 2la + l^2\right) + m_{\text{arm}} l^2$$
$$= 3(2\pi\rho a^2 t)\left(\frac{5}{3}a^2 + 2la + l^2\right) + \left(\frac{\pi}{4}\rho d^2 l\right)(l^2)$$

or
$$(I_{AA'})_{\text{anem}} = \pi\rho l^2\left[6a^2 t\left(\frac{5}{3}\frac{a^2}{l^2} + 2\frac{a}{l} + 1\right) + \frac{d^2 l}{4}\right] \blacktriangleleft$$

(*b*) We have
$$\frac{(I_{GG'})_{\text{cup}}}{(I_{AA'})_{\text{cup}}} = 0.01$$

or
$$\frac{5}{12} m_{\text{cup}} a^2 = 0.01 m_{\text{cup}} \left(\frac{5}{3} a^2 + 2la + l^2 \right) \quad \text{(from part } a\text{)}$$

Now let $\zeta = \dfrac{a}{l}$.

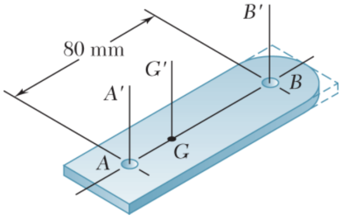
Then
$$5\zeta^2 = 0.12\left(\frac{5}{3}\zeta^2 + 2\zeta + 1 \right)$$

or
$$40\zeta^2 - 2\zeta - 1 = 0$$

Then
$$\zeta = \frac{2 \pm \sqrt{(-2)^2 - 4(40)(-1)}}{2(40)}$$

or
$$\zeta = 0.1851 \quad \text{and} \quad \zeta = -0.1351$$

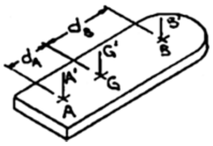
$$\frac{a}{l} = 0.1851 \blacktriangleleft$$



PROBLEM 9.133

After a period of use, one of the blades of a shredder has been worn to the shape shown and is of mass 0.18 kg. Knowing that the mass moments of inertia of the blade with respect to the *AA*′ and *BB*′ axes are $0.320\ \text{g}\cdot\text{m}^2$ and $0.680\ \text{g}\cdot\text{m}^2$, respectively, determine (*a*) the location of the centroidal axis *GG*′, (*b*) the radius of gyration with respect to axis *GG*′.

SOLUTION



(*a*) We have $d_B = (0.08 - d_A)\ \text{m}$

and, using the parallel axis

$$I_{AA'} = \overline{I}_{GG'} + md_A^2$$
$$I_{BB'} = \overline{I}_{GG'} + md_B^2$$

Then

$$\begin{aligned} I_{BB'} - I_{AA'} &= m\left(d_B^2 - d_A^2\right) \\ &= m\left[(0.08 - d_A)^2 - d_A^2\right] \\ &= m(0.0064 - 0.16d_A) \end{aligned}$$

Substituting:

$$(0.68 - 0.32)\times 10^{-3}\ \text{kg}\cdot\text{m}^2 = 0.18\ \text{kg}(0.0064 - 0.16d_A)\ \text{m}^2$$

or $d_A = 27.5\ \text{mm}$ ◀

to the right of *A*

(*b*) We have $I_{AA'} = I_{GG'} + md_A^2$

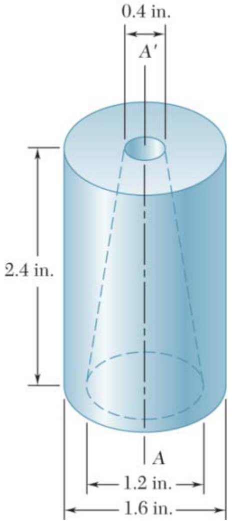
or

$$\begin{aligned} I_{GG'} &= 0.32\times 10^{-3}\ \text{kg}\cdot\text{m}^2 - 0.18\ \text{kg}\cdot(0.0275\ \text{m})^2 \\ &= 0.183875\times 10^{-3}\ \text{kg}\cdot\text{m}^2 \end{aligned}$$

Then

$$k_{GG'}^2 = \frac{I_{GG'}}{m} = \frac{0.183875\times 10^{-3}\ \text{kg}\cdot\text{m}^2}{0.18\ \text{kg}} = 1.02153\times 10^{-3}\ \text{m}^2$$

or $k_{GG'} = 32.0\ \text{mm}$ ◀

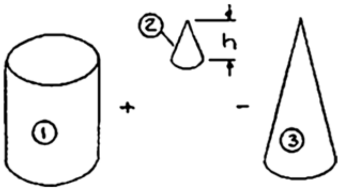


PROBLEM 9.134

Determine the mass moment of inertia of the 0.9-lb machine component shown with respect to the axis *AA*′.

SOLUTION

First note that the given shape can be formed adding a small cone to a cylinder and then removing a larger cone as indicated.



Now $$\frac{h}{0.4} = \frac{h + 2.4}{1.2} \quad \text{or} \quad h = 1.2 \text{ in.}$$

The weight of the body is given by

$$W = mg = g(m_1 + m_2 - m_3) = \rho g(V_1 + V_2 - V_3)$$

or $$0.9 \text{ lb} = \rho \times 32.2 \text{ ft/s}^2$$

$$\left[\pi(0.8)^2(2.4) + \frac{\pi}{3}(0.2)^2(1.2) - \frac{\pi}{3}(0.6)^2(3.6)\right] \text{in}^3 \times \left(\frac{1 \text{ ft}}{12 \text{ in.}}\right)^3$$

$$= \rho \times 32.2 \text{ ft/s}^2 (2.79253 + 0.02909 - 0.78540) \times 10^{-3} \text{ ft}^3$$

or $$\rho = 13.7266 \text{ lb}\cdot\text{s}^2/\text{ft}^4$$

Then $$m_1 = (13.7266)(2.79253 \times 10^{-3}) = 0.038332 \text{ lb} \cdot \text{s}^2/\text{ft}$$

$$m_2 = (13.7266)(0.02909 \times 10^{-3}) = 0.000399 \text{ lb} \cdot \text{s}^2/\text{ft}$$

$$m_3 = (13.7266)(0.78540 \times 10^{-3}) = 0.010781 \text{ lb} \cdot \text{s}^2/\text{ft}$$

PROBLEM 9.134 (Continued)

Finally, using Figure 9.28, we have

$$\begin{aligned} I_{AA'} &= (I_{AA'})_1 + (I_{AA'})_2 - (I_{AA'})_3 \\ &= \frac{1}{2}m_1a_1^2 + \frac{3}{10}m_2a_2^2 - \frac{3}{10}m_3a_3^2 \\ &= \left[\frac{1}{2}(0.038332)(0.8)^2 + \frac{3}{10}(0.000399)(0.2)^2 - \frac{3}{10}(0.010781)(0.6)^2\right](\text{lb}\cdot\text{s}^2/\text{ft})\times\text{in}^2\times\left(\frac{1\text{ ft}}{12\text{ in.}}\right)^2 \\ &= (85.1822 + 0.0333 - 8.0858)\times 10^{-6}\,\text{lb}\cdot\text{ft}\cdot\text{s}^2 \end{aligned}$$

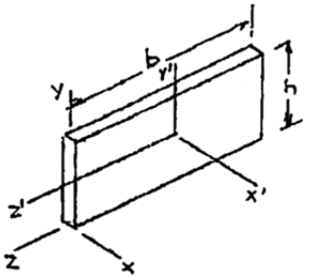
or $I_{AA'} = 77.1\times 10^{-6}\,\text{lb}\cdot\text{ft}\cdot\text{s}^2$ ◀

To the instructor:

The following formulas for the mass moment of inertia of thin plates and a half cylindrical shell are derived at this time for use in the solutions of Problems 9.135 through 9.140.

Thin rectangular plate

$$\begin{aligned}(I_x)_m &= (\bar{I}_{x'})_m + md^2\\ &= \frac{1}{12}m(b^2+h^2) + m\left[\left(\frac{b}{2}\right)^2 + \left(\frac{h}{2}\right)^2\right]\\ &= \frac{1}{3}m(b^2+h^2)\end{aligned}$$

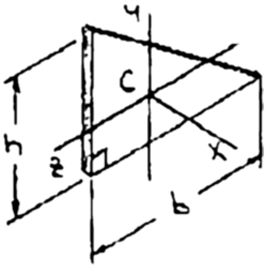


$$\begin{aligned}(I_y)_m &= (\bar{I}_{y'})_m + md^2\\ &= \frac{1}{12}mb^2 + m\left(\frac{b}{2}\right)^2 = \frac{1}{3}mb^2\end{aligned}$$

$$\begin{aligned}I_z &= (\bar{I}_{z'})_m + md^2\\ &= \frac{1}{12}mh^2 + m\left(\frac{h}{2}\right)^2 = \frac{1}{3}mh^2\end{aligned}$$

Thin triangular plate

We have $$m = \rho V = \rho\left(\frac{1}{2}bht\right)$$



and $$\bar{I}_{z,\text{area}} = \frac{1}{36}bh^3$$

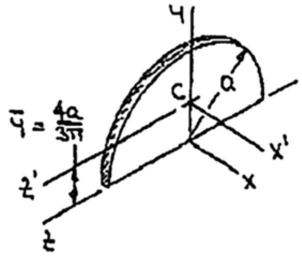
Then $$\begin{aligned}\bar{I}_{z,\text{mass}} &= \rho t I_{z,\text{area}}\\ &= \rho t \times \frac{1}{36}bh^3\\ &= \frac{1}{18}mh^2\end{aligned}$$

Similarly, $$\bar{I}_{y,\text{mass}} = \frac{1}{18}mb^2$$

Now $$\bar{I}_{x,\text{mass}} = \bar{I}_{y,\text{mass}} + \bar{I}_{z,\text{mass}} = \frac{1}{18}m(b^2+h^2)$$

Thin semicircular plate

We have $$m = \rho V = \rho\left(\frac{\pi}{2}a^2 t\right)$$



and $$\bar{I}_{y,\text{area}} = I_{z,\text{area}} = \frac{\pi}{8}a^4$$

(Continued)

Then
$$\bar{I}_{y,\text{mass}} = I_{z,\text{mass}} = \rho t \bar{I}_{y,\text{area}}$$
$$= \rho t \times \frac{\pi}{8} a^4$$
$$= \frac{1}{4} m a^2$$

Now
$$I_{x,\text{mass}} = \bar{I}_{y,\text{mass}} + I_{z,\text{mass}} = \frac{1}{2} m a^2$$

Also
$$I_{x,\text{mass}} = \bar{I}_{x',\text{mass}} + m\bar{y}^2 \quad \text{or} \quad \bar{I}_{x',\text{mass}} = m\left(\frac{1}{2} - \frac{16}{9\pi^2}\right)a^2$$

and
$$I_{z,\text{mass}} = \bar{I}_{z',\text{mass}} + m\bar{y}^2 \quad \text{or} \quad \bar{I}_{z',\text{mass}} = m\left(\frac{1}{4} - \frac{16}{9\pi^2}\right)a^2$$

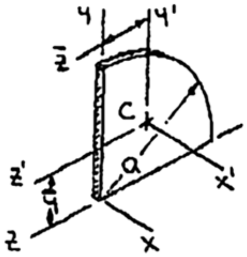
$$\bar{y} = \bar{z} = \frac{4a}{3\pi}$$

Thin Quarter-Circular Plate

We have
$$m = \rho V = \rho\left(\frac{\pi}{4} a^2 t\right)$$

and
$$I_{y,\text{area}} = I_{z,\text{area}} = \frac{\pi}{16} a^4$$

Then
$$I_{y,\text{mass}} = I_{z,\text{mass}} = \rho t I_{y,\text{area}}$$
$$= \rho t \times \frac{\pi}{16} a^4$$
$$= \frac{1}{4} m a^2$$



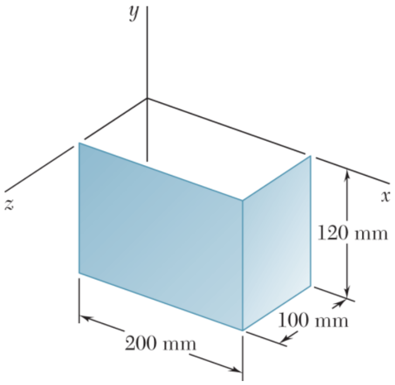
Now
$$I_{x,\text{mass}} = I_{y,\text{mass}} + I_{z,\text{mass}} = \frac{1}{2} m a^2$$

Also
$$I_{x,\text{mass}} = I_{x',\text{mass}} + m(\bar{y}^2 + \bar{z}^2)$$

or
$$\bar{I}_{x',\text{mass}} = m\left(\frac{1}{2} - \frac{32}{9\pi^2}\right)a^2$$

and
$$I_{y,\text{mass}} = I_{y',\text{mass}} + m\bar{z}^2$$

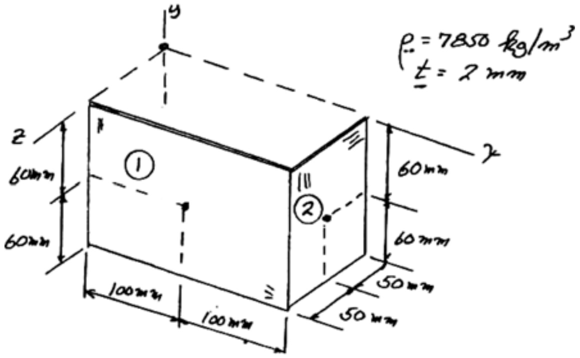
or
$$\bar{I}_{y',\text{mass}} = m\left(\frac{1}{4} - \frac{16}{9\pi^2}\right)a^2$$



PROBLEM 9.135

A 2-mm thick piece of sheet steel is cut and bent into the machine component shown. Knowing that the density of steel is 7850 kg/m^3, determine the mass moment of inertia of the component with respect to each of the coordinate axes.

SOLUTION



$$m_1 = \rho V = 7850 \text{ kg/m}^3 (0.120 \text{ m})(0.200 \text{ m})(0.002 \text{ m}) = 0.3768 \text{ kg}$$

$$m_2 = \rho V = 7850 \text{ kg/m}^3 (0.120 \text{ m})(0.100 \text{ m})(0.002 \text{ m}) = 0.1884 \text{ kg}$$

Panel 1:

$$I_x = \bar{I}_x + md^2 = \frac{1}{12}(0.3768 \text{ kg})(0.12 \text{ m})^2 + (0.3768 \text{ kg})\left[(0.1 \text{ m})^2 + (0.06 \text{ m})^2\right]$$

$$I_x = 5.577\times10^{-3} \text{ kg}\cdot\text{m}^2$$

$$I_y = \bar{I}_y + md^2 = \frac{1}{12}(0.3768 \text{ kg})(0.2 \text{ m})^2 + (0.3768 \text{ kg})\left[(0.1 \text{ m})^2 + (0.1 \text{ m})^2\right]$$

$$I_y = 8.792\times10^{-3} \text{ kg}\cdot\text{m}^2$$

$$I_z = \bar{I}_z + md^2 = \frac{1}{12}(0.3768 \text{ kg})\left[(0.2 \text{ m})^2 + (0.12 \text{ m})^2\right] + (0.3768 \text{ kg})\left[(0.1 \text{ m})^2 + (0.06 \text{ m})^2\right]$$

$$I_z = 6.833\times10^{-3} \text{ kg}\cdot\text{m}^2$$

PROBLEM 9.135 (Continued)

Panel 2:

$$I_x = \bar{I}_x + md^2 = \frac{1}{12}(0.1884\text{ kg})\left[(0.12\text{ m})^2 + (0.1\text{ m})^2\right] + (0.1884\text{ kg})\left[(0.05\text{ m})^2 + (0.06\text{ m})^2\right]$$

$I_x = 1.532 \times 10^{-3}\ \text{kg}\cdot\text{m}^2$

$$I_y = \bar{I}_y + md^2 = \frac{1}{12}(0.1884\text{ kg})(0.1\text{ m})^2 + (0.1884\text{ kg})\left[(0.05\text{ m})^2 + (0.2\text{ m})^2\right]$$

$I_y = 8.164 \times 10^{-3}\ \text{kg}\cdot\text{m}^2$

$$I_z = \bar{I}_z + md^2 = \frac{1}{12}(0.1884\text{ kg})(0.12\text{ m})^2 + (0.1884\text{ kg})\left[(0.06\text{ m})^2 + (0.2\text{ m})^2\right]$$

$I_z = 8.440 \times 10^{-3}\ \text{kg}\cdot\text{m}^2$

Total Mass Moments of Inertia: $I_T = I_1 + I_2$

$I_x = 7.11 \times 10^{-3}\ \text{kg}\cdot\text{m}^2$ ◀

$I_y = 16.96 \times 10^{-3}\ \text{kg}\cdot\text{m}^2$ ◀

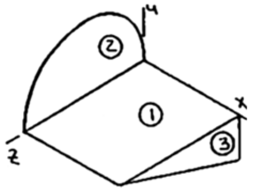
PROBLEM 9.136

A 2-mm thick piece of sheet steel is cut and bent into the machine component shown. Knowing that the density of steel is 7850 kg/m^3, determine the mass moment of inertia of the component with respect to each of the coordinate axes.

SOLUTION

First compute the mass of each component. We have

$$m = \rho_{\text{ST}} V = \rho_{\text{ST}} tA$$



Then

$$m_1 = (7850\ \text{kg/m}^3)(0.002\ \text{m})(0.35 \times 0.39)\ \text{m}^2$$
$$= 2.14305\ \text{kg}$$

$$m_2 = (7850\ \text{kg/m}^3)(0.002\ \text{m})\left(\frac{\pi}{2} \times 0.195^2\right)\text{m}^2 = 0.93775\ \text{kg}$$

$$m_3 = (7850\ \text{kg/m}^3)(0.002\ \text{m})\left(\frac{1}{2} \times 0.39 \times 0.15\right)\text{m}^2 = 0.45923\ \text{kg}$$

Using Figure 9.28 for component 1 and the equations derived above for components 2 and 3, we have

$$I_x = (I_x)_1 + (I_x)_2 + (I_x)_3$$
$$= \left[\frac{1}{12}(2.14305\ \text{kg})(0.39\ \text{m})^2 + (2.14305\ \text{kg})\left(\frac{0.39}{2}\ \text{m}\right)^2\right]$$
$$+ \left\{\left(\frac{1}{2} - \frac{16}{9\pi^2}\right)(0.93775\ \text{kg})(0.195\ \text{m})^2 + (0.93775\ \text{kg})\left[\left(\frac{4 \times 0.195}{3\pi}\right)^2 + (0.195)^2\right]\text{m}^2\right\}$$

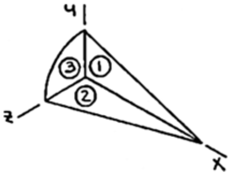
PROBLEM 9.137

A subassembly for a model airplane is fabricated from three pieces of 1.5-mm plywood. Neglecting the mass of the adhesive used to assemble the three pieces, determine the mass moment of inertia of the subassembly with respect to each of the coordinate axes. (The density of the plywood is $780\ \text{kg/m}^3$.)

SOLUTION



First compute the mass of each component. We have

$$m = \rho V = \rho t A$$

Then

$$m_1 = m_2 = (780\ \text{kg/m}^3)(0.0015\ \text{m})\left(\frac{1}{2}\times 0.3\times 0.12\right)\text{m}^2$$

$$= 21.0600\times 10^{-3}\ \text{kg}$$

$$m_3 = (780\ \text{kg/m}^3)(0.0015\ \text{m})\left(\frac{\pi}{4}\times 0.12^2\right)\text{m}^2 = 13.2324\times 10^{-3}\ \text{kg}$$

Using the equations derived above and the parallel-axis theorem, we have

$$(I_x)_1 = (I_x)_2$$

$$I_x = (I_x)_1 + (I_x)_2 + (I_x)_3$$

$$= 2\left[\frac{1}{18}(21.0600\times 10^{-3}\ \text{kg})(0.12\ \text{m})^2 + (21.0600\times 10^{-3}\ \text{kg})\left(\frac{0.12}{3}\ \text{m}\right)^2\right]$$

$$+\left[\frac{1}{2}(13.2324\times 10^{-3}\ \text{kg})(0.12\ \text{m})^2\right]$$

$$= [2(16.8480 + 33.6960) + (95.2733)]\times 10^{-6}\ \text{kg}\cdot\text{m}^2$$

$$= [2(50.5440) + (95.2733)]\times 10^{-6}\ \text{kg}\cdot\text{m}^2$$

or $I_x = 196.4\times 10^{-6}\ \text{kg}\cdot\text{m}^2$ ◀

PROBLEM 9.137 (Continued)

$$I_y = (I_y)_1 + (I_y)_2 + (I_y)_3$$

$$= \left[\frac{1}{18}(21.0600\times10^{-3}\text{ kg})(0.3\text{ m})^2 + (21.0600\text{ kg})\left(\frac{0.3}{3}\text{m}\right)^2\right]$$

$$+\left\{\frac{1}{18}(21.0600\times10^{-3}\text{ kg})[(0.3)^2+(0.12)^2]\,\text{m}^2\right.$$

$$\left.+(21.0600\times10^{-3}\text{ kg})\left[\left(\frac{0.3}{3}\right)^2+\left(\frac{0.12}{3}\right)^2\right]\text{m}^2\right\}$$

$$+\left[\frac{1}{4}(13.2324\times10^{-3}\text{ kg})(0.12\text{ m})^2\right]$$

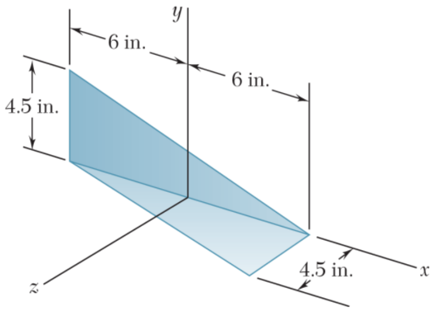
$$= [(105.300 + 210.600) + (122.148 + 244.296)$$
$$+ (47.637)]\times10^{-6}\text{ kg}\cdot\text{m}^2$$

$$= (315.900 + 366.444 + 47.637)\times10^{-6}\text{ kg}\cdot\text{m}^2$$

or $I_y = 730\times10^{-6}\text{ kg}\cdot\text{m}^2$ ◀

Symmetry implies $I_y = I_z$

$I_z = 730\times10^{-6}\text{ kg}\cdot\text{m}^2$ ◀



PROBLEM 9.138

A section of sheet steel 0.03 in. thick is cut and bent into the sheet metal machine component shown. Determine the mass moment of inertia of the component with respect to each of the coordinate axes. (The specific weight of steel is 490 lb/ft^3.)

SOLUTION

First consider one triangular plate with local axes *u*-*v*. We have

$$m = \rho V = \frac{\gamma}{g} tA = \left(\frac{490\text{ lb/ft}^3}{32.2\text{ ft/s}^2}\right)\frac{1}{2}(1\text{ ft})\left(\frac{4.5\text{ in.}}{12\text{ in./ft}}\right)\left(\frac{0.03\text{ in.}}{12\text{ in./ft}}\right) = 7.1332\times10^{-3}\text{ lb}\cdot\text{s}^2/\text{ft}$$

$$I_{mass} = \rho t I_{area} = \frac{m}{A} I_{area}$$

Then $\bar{I}_u = \left(\frac{m}{\frac{1}{2}bh}\right)\left(\frac{1}{36}bh^3\right) = \frac{1}{18}mh^2,\qquad \bar{I}_v = \frac{1}{18}mb^2$

$$I_u = \frac{1}{18}(7.1332\times10^{-3})\left(\frac{4.5\text{ in.}}{12\text{ in./ft}}\right)^2 = 55.728\times10^{-6}\text{ lb}\cdot\text{ft}\cdot\text{s}^2$$

$$I_v = \frac{1}{18}(7.1332\times10^{-3})(1\text{ ft})^2 = 396.29\times10^{-6}\text{ lb}\cdot\text{ft}\cdot\text{s}^2$$

For composite area:

$$\bar{I}_x = 2\left[I_u + md^2\right] = 2\left[55.728\times10^{-6} + 7.1332\times10^{-3}\left(\frac{1.5\text{ in.}}{12\text{ in./ft}}\right)^2\right]$$

$$\bar{I}_x = 334\times10^{-6}\text{ lb}\cdot\text{ft}\cdot\text{s}^2 \blacktriangleleft$$

For $\bar{I}_y$, consider plates separately.

Plate 1 in *x*-*y* plane:

$$\bar{I}_{y_1} = I_v + md^2 = 396.29\times10^{-6} + 7.1332\times10^{-3}\left(\frac{2\text{ in.}}{12\text{ in./ft}}\right)^2 = 594.43\times10^{-6}\text{ lb}\cdot\text{ft}\cdot\text{s}^2$$

PROBLEM 9.138 (Continued)

Plate 2 in *x*-*z* plane:
Note: By Eqn. 9.38,

$$\bar{I}_{y'} = I_u + I_v = 55.728\times10^{-6} + 396.29\times10^{-6}$$

$$\bar{I}_{y'} = 452.02\times10^{-6}\ \text{lb}\cdot\text{ft}\cdot\text{s}^2$$

Now applying the Parallel Axis Theorem,

$$\bar{I}_{y_2} = I_{y'} + md^2$$

$$\bar{I}_{y_2} = 452.02\times10^{-6} + \left(7.1332\times10^{-3}\right)\left[\left(\frac{2}{12}\right)^2 + \left(\frac{1.5}{12}\right)^2\right]$$

$$\bar{I}_{y_2} = 761.62\times10^{-6}\ \text{lb}\cdot\text{ft}\cdot\text{s}^2$$

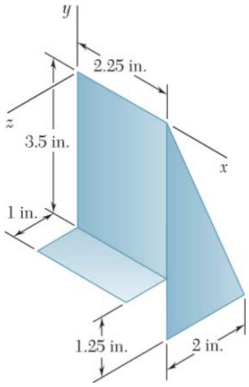
Finally, total for both plates 1 and 2 gives,

$$\bar{I}_y = \bar{I}_{y_1} + \bar{I}_{y_2} = 594.43\times10^{-6} + 761.62\times10^{-6}$$

$$I_y = 1.356\times10^{-3}\ \text{lb}\cdot\text{ft}\cdot\text{s}^2 \blacktriangleleft$$

By symmetry, $I_y = I_z$

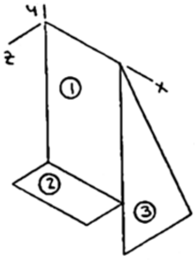
$$I_z = 1.356\times10^{-3}\ \text{lb}\cdot\text{ft}\cdot\text{s}^2 \blacktriangleleft$$



PROBLEM 9.139

A framing anchor is formed of 0.05-in.-thick galvanized steel. Determine the mass moment of inertia of the anchor with respect to each of the coordinate axes. (The specific weight of galvanized steel is 470 lb/ft^3.)

SOLUTION



First compute the mass of each component. We have

$$m = \rho V = \frac{\gamma_{\text{G.S.}}}{g} tA$$

Then

$$m_1 = \frac{470 \text{ lb/ft}^3}{32.2 \text{ ft/s}^2} \times 0.05 \text{ in.} \times (2.25 \times 3.5) \text{ in}^2 \times \left(\frac{1 \text{ ft}}{12 \text{ in.}}\right)^3$$
$$= 3325.97 \times 10^{-6} \text{ lb} \cdot \text{s}^2/\text{ft}$$

$$m_2 = \frac{470 \text{ lb/ft}^3}{32.2 \text{ ft/s}^2} \times 0.05 \text{ in.} \times (2.25 \times 1) \text{ in}^2 \times \left(\frac{1 \text{ ft}}{12 \text{ in.}}\right)^3$$
$$= 950.28 \times 10^{-6} \text{ lb} \cdot \text{s}^2/\text{ft}$$

$$m_3 = \frac{470 \text{ lb/ft}^3}{32.2 \text{ ft/s}^2} \times 0.05 \text{ in.} \times \left(\frac{1}{2} \times 2 \times 4.75\right) \text{ in}^2 \times \left(\frac{1 \text{ ft}}{12 \text{ in.}}\right)^3$$
$$= 2006.14 \times 10^{-6} \text{ lb} \cdot \text{s}^2/\text{ft}$$

Using Figure 9.28 for components 1 and 2 and the equations derived above for component 3, we have

$$\begin{aligned} I_x &= (I_x)_1 + (I_x)_2 + (I_x)_3 \\ &= \left[\frac{1}{12}(3325.97 \times 10^{-6} \text{ lb} \cdot \text{s}^2/\text{ft})(3.5 \text{ in.})^2 \right. \\ &\quad \left. + (3325.97 \times 10^{-6} \text{ lb} \cdot \text{s}^2/\text{ft})\left(\frac{3.5}{2} \text{ in}^2\right)\right]\left(\frac{1 \text{ ft}}{12 \text{ in.}}\right)^2 \\ &\quad + \left\{\frac{1}{12}(950.28 \times 10^{-6} \text{ lb} \cdot \text{s}^2/\text{ft})(1 \text{ in.})^2 \right. \\ &\quad \left. + (950.28 \times 10^{-6} \text{ lb} \cdot \text{s}^2/\text{ft})\left[(3.5)^2 + \left(\frac{1}{2}\right)^2\right] \text{ in}^2\right\}\left(\frac{1 \text{ ft}}{12 \text{ in.}}\right)^2 \end{aligned}$$

PROBLEM 9.139 (Continued)

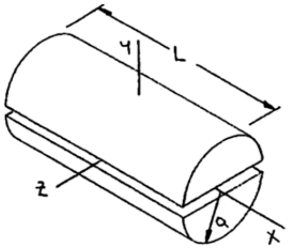
or $I_z = 14.30 \times 10^{-3}\text{ kg}\cdot\text{m}^2$ ◀

To the Instructor:

The following formulas for the mass of inertia of a semicylinder are derived at this time for use in the solutions of Problems 9.142 through 9.145.

From Figure 9.28:



Cylinder
$$(I_x)_{\text{cyl}} = \frac{1}{2} m_{\text{cyl}} a^2$$

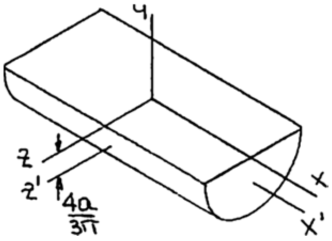
$$(I_y)_{\text{cyl}} = (I_z)_{\text{cyl}} = \frac{1}{12} m_{\text{cyl}} (3a^2 + L^2)$$

Symmetry and the definition of the mass moment of inertia $(I = \int r^2 dm)$ imply

$$(I)_{\text{semicylinder}} = \frac{1}{2}(I)_{\text{cylinder}}$$

$$(I_x)_{\text{sc}} = \frac{1}{2}\left(\frac{1}{2} m_{\text{cyl}} a^2\right)$$

and
$$(I_y)_{\text{sc}} = (I_z)_{\text{sc}} = \frac{1}{2}\left[\frac{1}{12} m_{\text{cyl}} (3a^2 + L^2)\right]$$



However,
$$m_{\text{sc}} = \frac{1}{2} m_{\text{cyl}}$$

Thus,
$$(I_x)_{\text{sc}} = \frac{1}{2} m_{\text{sc}} a^2$$

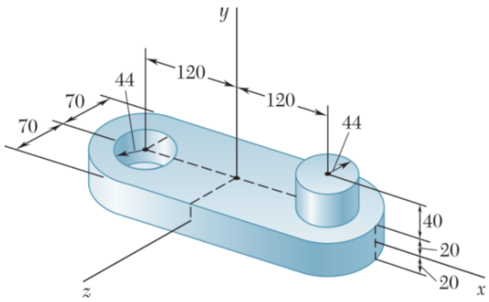
and
$$(I_y)_{\text{sc}} = (I_z)_{\text{sc}} = \frac{1}{12} m_{\text{sc}} (3a^2 + L^2)$$

Also, using the parallel axis theorem find

$$\bar{I}_{x'} = m_{\text{sc}}\left(\frac{1}{2} - \frac{16}{9\pi^2}\right)a^2$$

$$\bar{I}_{z'} = m_{\text{sc}}\left[\left(\frac{1}{4} - \frac{16}{9\pi^2}\right)a^2 + \frac{1}{12}L^2\right]$$

where x' and z' are centroidal axes.

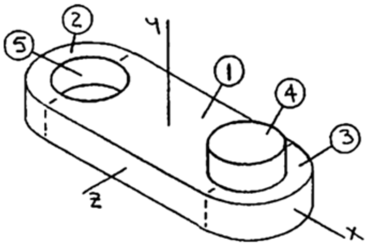


Dimensions in mm

PROBLEM 9.142

Determine the mass moments of inertia and the radii of gyration of the steel machine element shown with respect to the *x* and *y* axes. (The density of steel is 7850 kg/m^3.)

SOLUTION



First compute the mass of each component. We have

$$m = \rho_{\text{ST}} V$$

Then

$$m_1 = (7850\text{ kg/m}^3)(0.24 \times 0.04 \times 0.14)\text{ m}^3$$
$$= 10.5504\text{ kg}$$

$$m_2 = m_3 = (7850\text{ kg/m}^3)\left[\frac{\pi}{2}(0.07)^2 \times 0.04\right]\text{m}^3 = 2.41683\text{ kg}$$

$$m_4 = m_5 = (7850\text{ kg/m}^3)[\pi(0.044)^2 \times (0.04)]\text{ m}^3 = 1.90979\text{ kg}$$

Using Figure 9.28 for components 1, 4, and 5 and the equations derived above (before the solution to Problem 9.144) for a semicylinder, we have

$$I_x = (I_x)_1 + (I_x)_2 + (I_x)_3 + (I_x)_4 - (I_x)_5 \quad \text{where} \quad (I_x)_2 = (I_x)_3$$
$$= \left[\frac{1}{12}(10.5504\text{ kg})(0.04^2 + 0.14^2)\text{ m}^2\right] + 2\left\{\frac{1}{12}(2.41683\text{ kg})[3(0.07\text{ m})^2 + (0.04\text{ m})^2]\right\}$$
$$+ \left\{\frac{1}{12}(1.90979\text{ kg})[3(0.044\text{ m})^2 + (0.04\text{ m})^2] + (1.90979\text{ kg})(0.04\text{ m})^2\right\}$$
$$- \left\{\frac{1}{12}(1.90979\text{ kg})[3(0.044\text{ m})^2 + (0.04\text{ m})^2]\right\}$$
$$= [(0.0186390) + 2(0.0032829) + (0.0011790 + 0.0030557) - (0.0011790)]\text{ kg}\cdot\text{m}^2$$
$$= 0.0282605\text{ kg}\cdot\text{m}^2$$

or $I_x = 28.3 \times 10^{-3}\text{ kg}\cdot\text{m}^2$ ◀

PROBLEM 9.142 (Continued)

$$I_y = (I_y)_1 + (I_y)_2 + (I_y)_3 + (I_y)_4 - (I_y)_5$$

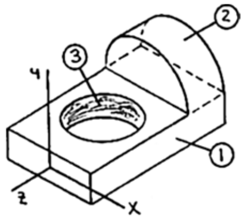
PROBLEM 9.143

Determine the mass moment of inertia of the steel machine element shown with respect to the *x* axis. (The density of steel is 490 lb/ft^3.)

SOLUTION

First compute the mass of each component. We have



$$\rho = \frac{\gamma}{g} = \frac{490\ \text{lb}\cdot\text{s}^2}{32.2\ \text{ft}}; \qquad m = \rho V$$

Then

$$m_1 = \rho\left(\frac{3.6\times 1.2\times 6}{12^3}\right)\text{ft}^3$$

$$= 15\times 10^{-3}\rho$$

$$m_2 = \rho\left[\frac{\pi}{2}\left(\frac{1.8}{12}\right)^2\left(\frac{1.6}{12}\right)\right]\text{ft}^3$$

$$= 4.7124\times 10^{-3}\rho$$

$$m_3 = \rho\left[\pi\left(\frac{1.5}{12}\right)^2\left(\frac{1.2}{12}\right)\right]\text{ft}^3 = 4.9087\times 10^{-3}\rho$$

Using Figure 9.28 for components 1 and 3 and the equation derived above (before the solution to Problem 9.142) for a semicylinder, we have

$$I_x = (I_x)_1 + (I_x)_2 - (I_x)_3$$

$$I_{x_1} = \left[\frac{1}{12}\left(15\times 10^{-3}\rho\right)\left(\left(\frac{1.2}{12}\right)^2 + \left(\frac{6}{12}\right)^2\right) + \left(15\times 10^{-3}\rho\right)\left(\frac{3}{12}\right)^2\right]$$

$$I_{x_1} = 1.26250\times 10^{-3}\rho$$

Half-cylinder, centroidal, $I_{x_{2''}} = \frac{m}{12}\left(3r^2 + L^2\right) = \frac{4.7124\times 10^{-3}\rho}{12}\left(3\left(\frac{1.8}{12}\right)^2 + \left(\frac{1.6}{12}\right)^2\right) = 3.3489\times 10^{-5}\rho$

PROBLEM 9.143 (Continued)

Half-cylinder about base,

$$I_{x_{2''}} = \bar{I}_{x_{2'}} + md^2$$

$$3.3489\times10^{-5}\rho = \bar{I}_{x_{2'}} + 4.7124\times10^{-3}\rho\left(\frac{0.7639}{12}\right)^2$$

$$\bar{I}_{x_{2'}} = 1.43925\times10^{-5}\rho$$

$$I_{x_2} = \bar{I}_{x_{2'}} + md^2$$

$$I_{x_2} = 1.43925\times10^{-5}\rho + 4.7124\times10^{-3}\rho\left[\left(\frac{5.2}{12}\right)^2 + \left(\frac{0.6+0.7639}{12}\right)^2\right]$$

$$I_{x_2} = 9.6015\times10^{-4}\rho$$

$$I_{x_3} = \frac{m}{12}\left(3r^2 + L^2\right) + md^2$$

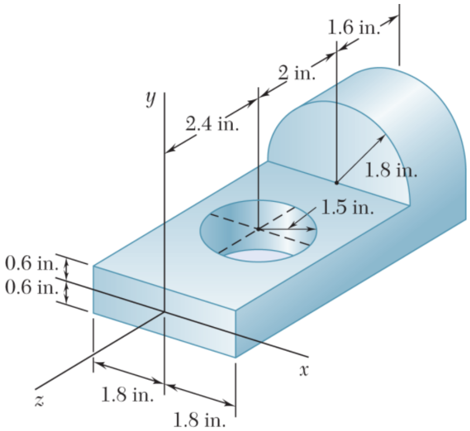
$$I_{x_3} = \frac{4.9087\times10^{-3}\rho}{12}\left[3\left(\frac{1.5}{12}\right)^2 + \left(\frac{1.2}{12}\right)^2\right] + 4.9087\times10^{-3}\rho\left(\frac{2.4}{12}\right)^2$$

$$I_{x_3} = 2.1961\times10^{-4}\rho$$

Now combining all components and substituting for ρ,

$$I_x = \frac{490}{32.2}\left(1.26250\times10^{-3} + 9.6015\times10^{-4} - 2.1961\times10^{-4}\right)$$

or $I_x = 30.5\times10^{-3}\ \text{lb}\cdot\text{ft}\cdot\text{s}^2$ ◀

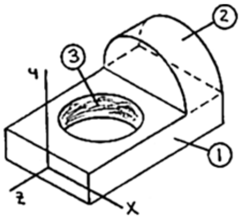


PROBLEM 9.144

Determine the mass moment of inertia of the steel machine element shown with respect to the *y* axis. (The density of steel is 490 lb/ft^3.)

SOLUTION

First compute the mass of each component. We have



$$\rho = \frac{\gamma}{g} = \frac{490 \text{ lb}\cdot\text{s}^2}{32.2 \text{ ft}}; \qquad m = \rho V$$

Then

$$m_1 = \rho\left(\frac{3.6\times 1.2\times 6}{12^3}\right)\text{ ft}^3$$

$$= 15\times 10^{-3}\rho$$

$$m_2 = \rho\left[\frac{\pi}{2}\left(\frac{1.8}{12}\right)^2\left(\frac{1.6}{12}\right)\right]\text{ ft}^3$$

$$= 4.7124\times 10^{-3}\rho$$

$$m_3 = \rho\left[\pi\left(\frac{1.5}{12}\right)^2\left(\frac{1.2}{12}\right)\right]\text{ ft}^3 = 4.9087\times 10^{-3}\rho$$

Using Figure 9.28 for components 1 and 3 and the equation derived above (before the solution to Problem 9.142) for a semicylinder, we have

$$I_y = (I_y)_1 + (I_y)_2 - (I_y)_3$$

$$I_{y_1} = \left[\frac{1}{12}(15\times 10^{-3}\rho)\left(\left(\frac{3.6}{12}\right)^2 + \left(\frac{6}{12}\right)^2\right) + (15\times 10^{-3}\rho)\left(\frac{3}{12}\right)^2\right]$$

$$I_{y_1} = 1.36250\times 10^{-3}\rho$$

PROBLEM 9.144 (Continued)

$$I_{y_2} = \bar{I}_{y_{2'}} + md^2$$

$$I_{y_2} = \frac{4.7124\times10^{-3}\rho}{12}\left(3\left(\frac{1.8}{12}\right)^2 + \left(\frac{1.6}{12}\right)^2\right) + 4.7124\times10^{-3}\rho\left(\frac{5.2}{12}\right)^2$$

$$I_{y_2} = 9.1837\times10^{-4}\rho$$

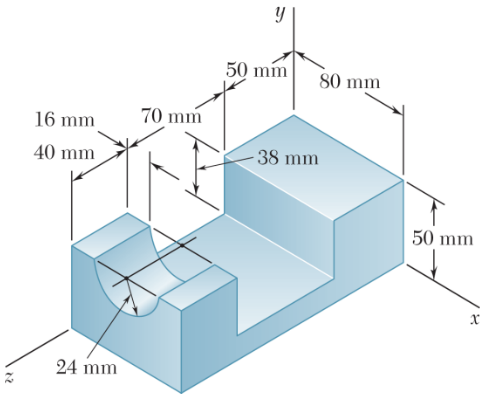
$$I_{y_3} = \frac{4.9087\times10^{-3}\rho}{2}\left(\frac{1.5}{12}\right)^2 + 4.9087\times10^{-3}\rho\left(\frac{2.4}{12}\right)^2$$

$$I_{y_3} = 2.3470\times10^{-4}\rho$$

Now combining all components and substituting for ρ,

$$I_y = \frac{490}{32.2}\left(1.36250\times10^{-3} + 9.1837\times10^{-4} - 2.3470\times10^{-4}\right)$$

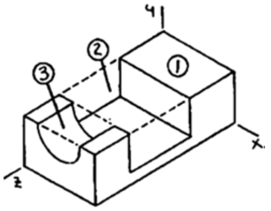
or $I_y = 31.1\times10^{-3}\ \text{lb}\cdot\text{ft}\cdot\text{s}^2$ ◀



PROBLEM 9.145

Determine the mass moment of inertia of the steel fixture shown with respect to (*a*) the *x* axis, (*b*) the *y* axis, (*c*) the *z* axis. (The density of steel is 7850 kg/m^3.)

SOLUTION



First compute the mass of each component. We have

$$m = \rho_{\mathrm{ST}} V$$

Then

$$m_1 = 7850\ \mathrm{kg/m^3} \times (0.08 \times 0.05 \times 0.160)\ \mathrm{m^3}$$
$$= 5.02400\ \mathrm{kg}$$

$$m_2 = 7850\ \mathrm{kg/m^3} \times (0.08 \times 0.038 \times 0.07)\ \mathrm{m^3} = 1.67048\ \mathrm{kg}$$

$$m_3 = 7850\ \mathrm{kg/m^3} \times \left(\frac{\pi}{2} \times 0.024^2 \times 0.04\right) \mathrm{m^3} = 0.28410\ \mathrm{kg}$$

Using Figure 9.28 for components 1 and 2 and the equations derived above for component 3, we have

(*a*) $I_x = (I_x)_1 - (I_x)_2 - (I_x)_3$

$$= \left\{\frac{1}{12}(5.02400\ \mathrm{kg})[(0.05)^2 + (0.16)^2]\ \mathrm{m^2} + (5.02400\ \mathrm{kg})\left[\left(\frac{0.05}{2}\right)^2 + \left(\frac{0.16}{2}\right)^2\right]\mathrm{m^2}\right\}$$

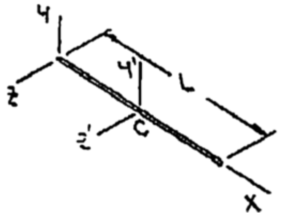
or $I_z = 8.58 \times 10^{-3}\text{ kg}\cdot\text{m}^2$ ◀

To the instructor:

The following formulas for the mass moment of inertia of wires are derived or summarized at this time for use in the solutions of Problems 9.146 through 9.148.

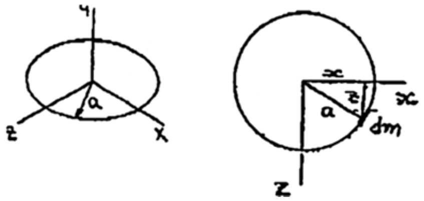
Slender Rod



$$I_x = 0 \qquad \bar{I}_{y'} = \bar{I}_{z'} = \frac{1}{12} mL^2 \text{ (Figure 9.28)}$$

$$I_y = I_z = \frac{1}{3} mL^2 \text{ (Sample Problem 9.9)}$$

Circle



We have $\bar{I}_y = \int r^2 dm = ma^2$

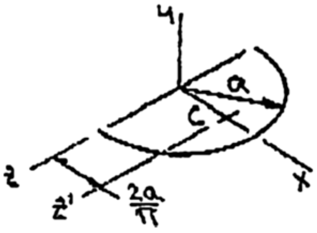
Now $\bar{I}_y = \bar{I}_x + \bar{I}_z$

And symmetry implies $\bar{I}_x = \bar{I}_z$

$$\bar{I}_x = \bar{I}_z = \frac{1}{2} ma^2$$

Semicircle

Following the above arguments for a circle, We have

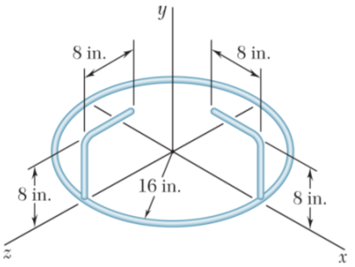


$$\bar{I}_x = I_z = \frac{1}{2} ma^2 \qquad I_y = ma^2$$

Using the parallel-axis theorem

$$I_z = \bar{I}_{z'} + m\bar{x}^2 \qquad x = \frac{2a}{\pi}$$

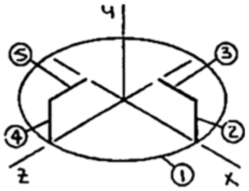
or $I_{z'} = m\left(\frac{1}{2} - \frac{4}{\pi^2}\right)a^2$



PROBLEM 9.146

Aluminum wire with a weight per unit length of 0.033 lb/ft is used to form the circle and the straight members of the figure shown. Determine the mass moment of inertia of the assembly with respect to each of the coordinate axes.

SOLUTION



First compute the mass of each component. We have

$$m=\frac{W}{g}=\frac{1}{g}\left(\frac{W}{L}\right)_{\text{AL}}L$$

Then

$$m_1=\frac{1}{32.2\ \text{ft/s}^2}\times 0.033\ \text{lb/ft}\times(2\pi\times 16\ \text{in.})\times\frac{1\ \text{ft}}{12\ \text{in.}}$$

$$=8.5857\times 10^{-3}\ \text{lb}\cdot\text{s}^2/\text{ft}$$

$$m_2=m_3=m_4=m_5=\frac{1}{32.2\ \text{ft/s}^2}\times 0.033\ \text{lb/ft}\times 8\ \text{in.}\times\frac{1\ \text{ft}}{12\ \text{in.}}$$

$$=0.6832\ \text{lb}\cdot\text{s}^2/\text{ft}$$

Using the equations given above and the parallel-axis theorem, we have

$$I_x=(I_x)_1+(I_x)_2+(I_x)_3+(I_x)_4+(I_x)_5$$

$$=\left[\frac{1}{2}(8.5857\times 10^{-3}\ \text{lb}\cdot\text{s}^2/\text{ft})(16\ \text{in.})^2\right]\times\left(\frac{1\ \text{ft}}{12\ \text{in.}}\right)^2$$

$$+\left[\frac{1}{3}(0.6832\ \text{lb}\cdot\text{s}^2/\text{ft})(8\ \text{in.})^2\right]\times\left(\frac{1\ \text{ft}}{12\ \text{in.}}\right)^2$$

$$+[0+(0.6832\ \text{lb}\cdot\text{s}^2/\text{ft})(8\ \text{in.})^2]\times\left(\frac{1\ \text{ft}}{12\ \text{in.}}\right)^2$$

$$+\left[\frac{1}{12}(0.6832\ \text{lb}\cdot\text{s}^2/\text{ft})(8\ \text{in.})^2+(0.6832\ \text{lb}\cdot\text{s}^2/\text{ft})(4^2+16^2)\ \text{in}^2\right]\times\left(\frac{1\ \text{ft}}{12\ \text{in.}}\right)^2$$

$$+\left[\frac{1}{12}(0.6832\ \text{lb}\cdot\text{s}^2/\text{ft})(8\ \text{in.})^2+(0.6832\ \text{lb}\cdot\text{s}^2/\text{ft})(8^2+12^2)\ \text{in}^2\right]\times\left(\frac{1\ \text{ft}}{12\ \text{in.}}\right)^2$$

$$=[(7.6315)+(0.1012)+(0.3036)+(0.0253+1.2905)+(0.0253+0.9868)]\times 10^{-3}\ \text{lb}\cdot\text{ft}\cdot\text{s}^2$$

$$=(7.6315+0.1012+0.3036)+1.3158+1.0121)\times 10^{-3}\ \text{lb}\cdot\text{ft}\cdot\text{s}^2$$

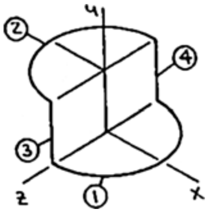
PROBLEM 9.147

The figure shown is formed of $\frac{1}{8}$-in.-diameter steel wire. Knowing that the specific weight of the steel is 490 lb/ft^3, determine the mass moment of inertia of the wire with respect to each of the coordinate axes.

SOLUTION



First compute the mass of each component. We have

$$m = \rho_{\text{ST}}V = \frac{\gamma_{\text{ST}}}{g}AL$$

Then

$$m_1 = m_2 = \frac{490\text{ lb/ft}^3}{32.2\text{ ft/s}^2}\times\left[\frac{\pi}{4}\left(\frac{1}{8}\text{ in.}\right)^2\right]\times(\pi\times 18\text{ in.})\times\left(\frac{1\text{ ft}}{12\text{ in.}}\right)^3$$

$$= 6.1112\times 10^{-3}\text{ lb}\cdot\text{s}^2/\text{ft}$$

$$m_3 = m_4 = \frac{490\text{ lb/ft}^3}{32.2\text{ ft/s}^2} = \left[\frac{\pi}{4}\left(\frac{1}{8}\text{in.}\right)^2\right]\times 18\text{ in.}\times\left(\frac{1\text{ ft}}{12\text{ in.}}\right)^3$$

$$= 1.9453\times 10^{-3}\text{ lb}\cdot\text{s}^2/\text{ft}$$

Using the equations given above and the parallel-axis theorem, we have

$$(I_x)_3 = (I_x)_4$$

$$I_x = (I_x)_1 + (I_x)_2 + (I_x)_3 + (I_x)_4$$

$$= \left[\frac{1}{2}(6.1112\times 10^{-3}\text{ lb}\cdot\text{s}^2/\text{ft})(18\text{ in.})^2\right]\times\left(\frac{1\text{ ft}}{12\text{ in.}}\right)^2$$

$$+\left[\frac{1}{2}(6.1112\times 10^{-3}\text{ lb}\cdot\text{s}^2/\text{ft})(18\text{ in.})^2 + (6.1112\times 10^{-3}\text{ lb}\cdot\text{s}^2/\text{ft})(18\text{ in.})^2\right]\times\left(\frac{1\text{ ft}}{12\text{ in.}}\right)^2$$

$$+2\left[\frac{1}{12}(1.9453\times 10^{-3}\text{ lb}\cdot\text{s}^2/\text{ft})(18\text{ in.})^2 + (6.1112\times 10^{-3}\text{ lb}\cdot\text{s}^2/\text{ft})(9^2+18^2)\text{ in}^2\right]\times\left(\frac{1\text{ ft}}{12\text{ in.}}\right)^2$$

$$= [(6.8751) + (6.8751 + 13.1502) + 2(0.3647 + 5.4712)]\times 10^{-3}\text{ lb}\cdot\text{ft}\cdot\text{s}^2$$

$$= [6.8751 + 20.6252 + 2(5.8359)]\times 10^{-3}\text{ lb}\cdot\text{ft}\cdot\text{s}^2$$

$$= 39.1721\times 10^{-3}\text{ lb}\cdot\text{ft}\cdot\text{s}^2$$

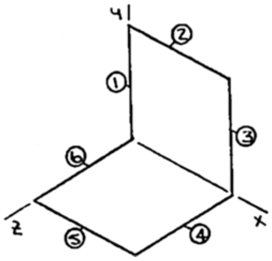
PROBLEM 9.148

A homogeneous wire with a mass per unit length of 0.056 kg/m is used to form the figure shown. Determine the mass moment of inertia of the wire with respect to each of the coordinate axes.

SOLUTION



First compute the mass m of each component. We have

$$m = (m/L)L$$
$$= 0.056 \text{ kg/m} \times 1.2 \text{ m}$$
$$= 0.0672 \text{ kg}$$

Using the equations given above and the parallel-axis theorem, we have

$$I_x = (I_x)_1 + (I_x)_2 + (I_x)_3 + (I_x)_4 + (I_x)_5 + (I_x)_6$$

Now $\quad (I_x)_1 = (I_x)_3 = (I_x)_4 = (I_x)_6 \quad \text{and} \quad (I_x)_2 = (I_x)_5$

Then

$$I_x = 4\left[\frac{1}{3}(0.0672 \text{ kg})(1.2 \text{ m})^2\right] + 2[0 + (0.0672 \text{ kg})(1.2 \text{ m})^2]$$
$$= [4(0.03226) + 2(0.09677)] \text{ kg}\cdot\text{m}^2$$
$$= 0.32258 \text{ kg}\cdot\text{m}^2 \qquad \text{or} \qquad I_x = 0.323 \text{ kg}\cdot\text{m}^2 \blacktriangleleft$$

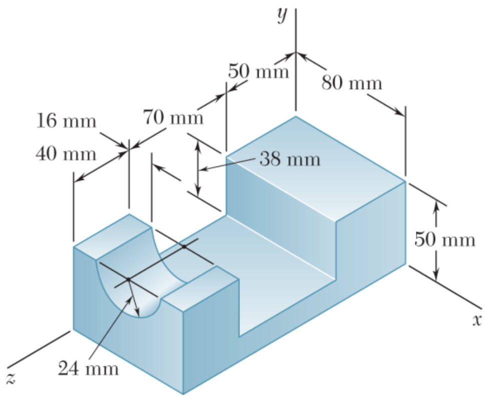
$$I_y = (I_y)_1 + (I_y)_2 + (I_y)_3 + (I_y)_4 + (I_y)_5 + (I_y)_6$$

Now $\quad (I_y)_1 = 0, \quad (I_y)_2 = (I_y)_6, \quad \text{and} \quad (I_y)_4 = (I_y)_5$

Then

$$I_y = 2\left[\frac{1}{3}(0.0672 \text{ kg})(1.2 \text{ m})^2\right] + [0 + (0.0672 \text{ kg})(1.2 \text{ m})^2]$$
$$+ 2\left[\frac{1}{12}(0.0672 \text{ kg})(1.2 \text{ m})^2 + (0.0672 \text{ kg})(1.2^2 + 0.6^2) \text{ m}^2\right]$$
$$= [2(0.03226) + (0.09677) + 2(0.00806 + 0.12096)] \text{ kg}\cdot\text{m}^2$$
$$= [2(0.03226) + (0.09677) + 2(0.12902)] \text{ kg}\cdot\text{m}^2$$
$$= 0.41933 \text{ kg}\cdot\text{m}^2 \qquad \text{or} \qquad I_y = 0.419 \text{ kg}\cdot\text{m}^2 \blacktriangleleft$$

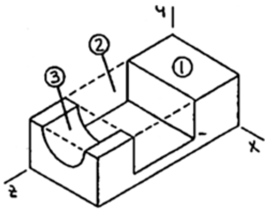
Symmetry implies $\quad I_y = I_z \qquad I_z = 0.419 \text{ kg}\cdot\text{m}^2 \blacktriangleleft$



PROBLEM 9.149

Determine the mass products of inertia I_{xy}, I_{yz}, and I_{zx} of the steel fixture shown. (The density of steel is 7850 kg/m^3.)

SOLUTION



First compute the mass of each component. We have

$$m = \rho V$$

Then

$$m_1 = 7850 \text{ kg/m}^3 \times (0.08 \times 0.05 \times 0.16) \text{ m}^3 = 5.02400 \text{ kg}$$

$$m_2 = 7850 \text{ kg/m}^3 \times (0.08 \times 0.038 \times 0.07) \text{ m}^3 = 1.67048 \text{ kg}$$

$$m_3 = 7850 \text{ kg/m}^3 \times \left(\frac{\pi}{2} \times 0.024^2 \times 0.04\right) \text{m}^3 = 0.28410 \text{ kg}$$

Now observe that the centroidal products of inertia, $\bar{I}_{x'y'}$, $\bar{I}_{y'z'}$, and $\bar{I}_{z'x'}$, of each component are zero because of symmetry. Now

$$\bar{y}_2 = \left(0.05 - \frac{0.038}{2}\right) \text{m} = 0.031 \text{ m}$$

$$\bar{y}_3 = \left(0.05 - \frac{4 \times 0.024}{3\pi}\right) \text{m} = 0.039814 \text{ m}$$

and then

	m, kg	$\bar{x}$, m	$\bar{y}$, m	$\bar{z}$, m	$m\bar{x}\bar{y}$, kg·m^2	$m\bar{y}\bar{z}$, kg·m^2	$m\bar{z}\bar{x}$, kg·m^2
1	5.02400	0.04	0.025	0.08	5.0240×10^{-3}	10.0480×10^{-3}	16.0768×10^{-3}
2	1.67048	0.04	0.031	0.085	2.0714×10^{-3}	4.4017×10^{-3}	5.6796×10^{-3}

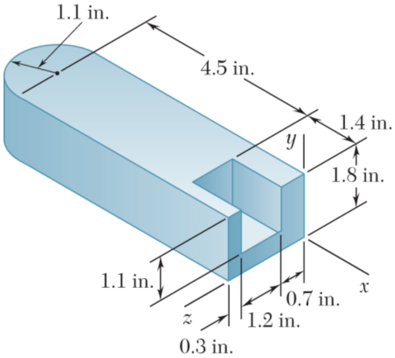
For the cylinder

$$m = \rho V = (7850\ \text{kg/m}^3)\pi(0.022\ \text{m})^2(0.02\ \text{m}) = 0.2387\ \text{kg}$$

$$I'_{xy} = \bar{I}_{x'y'} + m\bar{x}\,\bar{y} = 0 + (0.2387\ \text{kg})(0.06\ \text{m})(0.02\ \text{m}) = +286.4 \times 10^{-6}\ \text{kg}\cdot\text{m}^2$$

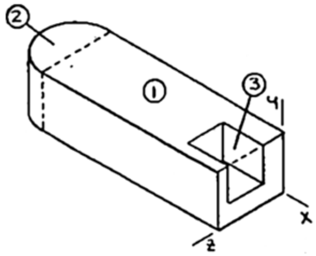
$$I_{xy} = 286 \times 10^{-6}\ \text{kg}\cdot\text{m}^2$$ ◀



PROBLEM 9.151

Determine the mass products of inertia I_{xy}, I_{yz}, and I_{zx} of the cast aluminum machine component shown. (The specific weight of aluminum is 0.100 lb/in^3)

SOLUTION



First compute the mass of each component. We have

$$m = \rho_{\text{AL}} V = \frac{\gamma_{\text{AL}}}{g} V$$

Then

$$m_1 = \frac{0.100 \text{ lb/in}^3}{32.2 \text{ ft/s}^2} \times (5.9 \times 1.8 \times 2.2) \text{ in}^3$$

$$= 72.5590 \times 10^{-3} \text{ lb} \cdot \text{s}^2/\text{ft}$$

$$m_2 = \frac{0.100 \text{ lb/in}^3}{32.2 \text{ ft/s}^2} \times \left[\frac{\pi}{2}(1.1)^2 \times 1.8\right] \text{ in}^3$$

$$= 10.6248 \times 10^{-3} \text{ lb} \cdot \text{s}^2/\text{ft}$$

$$m_3 = \frac{0.100 \text{ lb/in}^3}{32.2 \text{ ft/s}^2} \times (1.4 \times 1.1 \times 1.2) \text{ in}^3$$

$$= 5.7391 \times 10^{-3} \text{ lb} \cdot \text{s}^2/\text{ft}$$

Now observe that the centroidal products of inertia, $\bar{I}_{x'y'}, \bar{I}_{y'z'}$, and $\bar{I}_{z'x'}$, of each component are zero because of symmetry. Now

$$\bar{x}_2 = -\left(5.9 + \frac{4 \times 1.1}{3\pi}\right) \text{ in.}$$

$$= -6.36685 \text{ in.}$$

$$\bar{y}_3 = \left(1.8 - \frac{1.1}{2}\right) \text{ in.}$$

$$= 1.25 \text{ in.}$$

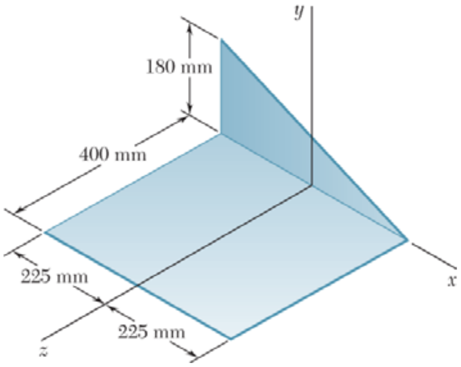
$I_{yz} = \Sigma(\cancelto{0}{\bar{I}_{y'z'}} + m\bar{y}\,\bar{z})$ or $I_{yz} = -171.4\times10^{-6}\ \text{lb}\cdot\text{ft}\cdot\text{s}^2$ ◀

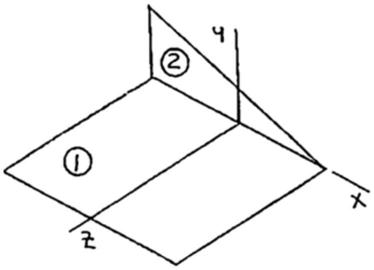
$I_{zx} = \Sigma(\cancelto{0}{\bar{I}_{z'x'}} + m\bar{z}\,\bar{x})$ or $I_{zx} = 1120\times10^{-6}\ \text{lb}\cdot\text{ft}\cdot\text{s}^2$ ◀



PROBLEM 9.153

A section of sheet steel 2 mm thick is cut and bent into the machine component shown. Knowing that the density of steel is 7850 kg/m^3, determine the mass products of inertia I_{xy}, I_{yz}, and I_{zx} of the component.

SOLUTION



First compute the mass of each component.

We have $$m = \rho_{\text{ST}} V = \rho_{\text{ST}} tA$$

Then $$m_1 = (7850\ \text{kg/m}^3)[(0.002)(0.4)(0.45)]\text{m}^3$$
$$= 2.8260\ \text{kg}$$
$$m_2 = 7850\ \text{kg/m}^3\left[(0.002)\left(\frac{1}{2}\times 0.45\times 0.18\right)\right]\text{m}^3$$
$$= 0.63585\ \text{kg}$$

Now observe that

$$(\bar{I}_{x'y'})_1 = (\bar{I}_{y'z'})_1 = (\bar{I}_{z'x'})_1 = 0$$
$$(\bar{I}_{y'z'})_2 = (\bar{I}_{z'x'})_2 = 0$$

From Sample Problem 9.6: $$(\bar{I}_{x'y'})_{2,\text{area}} = -\frac{1}{72}b_2^2h_2^2$$

Then $$(\bar{I}_{x'y'})_2 = \rho_{\text{ST}} t(I_{x'y'})_{2,\text{area}} = \rho_{\text{ST}} t\left(-\frac{1}{72}b_2^2h_2^2\right) = -\frac{1}{36}m_2b_2h_2$$

Also $$\bar{x}_1 = \bar{y}_1 = \bar{z}_2 = 0 \qquad \bar{x}_2 = \left(-0.225 + \frac{0.45}{3}\right)\text{m} = -0.075\ \text{m}$$

PROBLEM 9.153 (Continued)

Finally,
$$I_{xy} = \Sigma(\bar{I}_{xy} + m\bar{x}\,\bar{y}) = (0+0) + \left[-\frac{1}{36}(0.63585\text{ kg})(0.45\text{ m})(0.18\text{ m})\right.$$
$$\left. + (0.63585\text{ kg})(-0.075\text{ m})\left(\frac{0.18\text{ m}}{3}\right)\right]$$
$$= (-1.43066\times10^{-3} - 2.8613\times10^{-3})\text{ kg}\cdot\text{m}^2$$

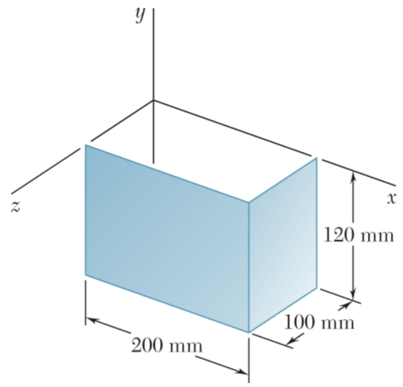
or $I_{xy} = -4.29\times10^{-3}\text{ kg}\cdot\text{m}^2$ ◀

and
$$I_{yz} = \Sigma(\bar{I}_{y'z'} + m\bar{y}\,\bar{z}) = (0+0) + (0+0) = 0$$

or $I_{yz} = 0$ ◀

$$I_{zx} = \Sigma(\bar{I}_{z'x'} + m\bar{z}\,\bar{x}) = (0+0) + (0+0) = 0$$

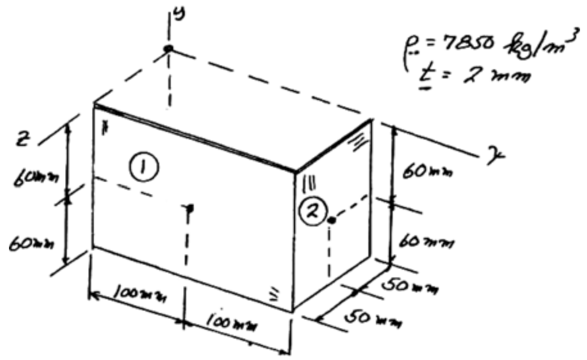
or $I_{zx} = 0$ ◀



PROBLEM 9.154

A section of sheet steel 2 mm thick is cut and bent into the machine component shown. Knowing that the density of steel is 7850 kg/m^3, determine the mass products of inertia I_{xy}, I_{yz}, and I_{zx} of the component.

SOLUTION



$$m_1 = \rho V = 7850\ \text{kg/m}^3\ (0.120\ \text{m})(0.200\ \text{m})(0.002\ \text{m}) = 0.3768\ \text{kg}$$

$$m_2 = \rho V = 7850\ \text{kg/m}^3\ (0.120\ \text{m})(0.100\ \text{m})(0.002\ \text{m}) = 0.1884\ \text{kg}$$

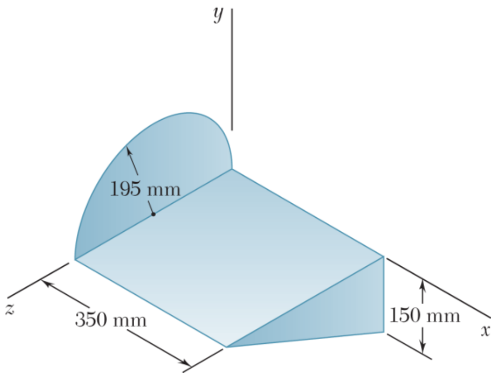
For each panel the centroidal product of inertia is zero with respect to each pair of coordinate axes.

	m, kg	$\bar{x}$, m	$\bar{y}$, m	$\bar{z}$, m	$m\bar{x}\bar{y}$	$m\bar{y}\bar{z}$	$m\bar{z}\bar{x}$
①	0.3768	0.1	–0.06	0.1	-2.261×10^{-3}	-2.261×10^{-3}	$+3.768\times10^{-3}$
②	0.1884	0.2	–0.06	0.05	-2.261×10^{-3}	-0.565×10^{-3}	$+1.884\times10^{-3}$
Σ					-4.522×10^{-3}	-2.826×10^{-3}	$+5.652\times10^{-3}$

$I_{xy} = -4.52\times10^{-3}\ \text{kg}\cdot\text{m}^2$ ◀

$I_{yz} = -2.83\times10^{-3}\ \text{kg}\cdot\text{m}^2$ ◀

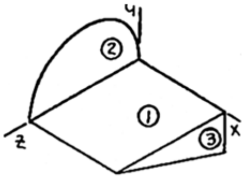
$I_{zx} = +5.65\times10^{-3}\ \text{kg}\cdot\text{m}^2$ ◀



PROBLEM 9.155

A section of sheet steel 2 mm thick is cut and bent into the machine component shown. Knowing that the density of steel is 7850 kg/m^3, determine the mass products of inertia I_{xy}, I_{yz}, and I_{zx} of the component.

SOLUTION



First compute the mass of each component. We have

$$m = \rho_{\mathrm{ST}} V = \rho_{\mathrm{ST}} t A$$

Then
$$m_1 = (7850\text{ kg/m}^3)(0.002\text{ m})(0.35 \times 0.39)\text{ m}^2$$
$$= 2.14305\text{ kg}$$
$$m_2 = (7850\text{ kg/m}^3)(0.002\text{ m})\left(\frac{\pi}{2} \times 0.195^2\right)\text{ m}^2$$
$$= 0.93775\text{ kg}$$
$$m_3 = (7850\text{ kg/m}^3)(0.002\text{ m})\left(\frac{1}{2} \times 0.39 \times 0.15\right)\text{ m}^2$$
$$= 0.45923\text{ kg}$$

Now observe that because of symmetry the centroidal products of inertia of components 1 and 2 are zero and

$$(\bar{I}_{x'y'})_3 = (\bar{I}_{z'x'})_3 = 0$$

Also
$$(\bar{I}_{y'z'})_{3,\text{mass}} = \rho_{\mathrm{ST}} t (\bar{I}_{y'z'})_{3,\text{area}}$$

Using the results of Sample Problem 9.6 and noting that the orientation of the axes corresponds to a 90° rotation, we have

$$(\bar{I}_{y'z'})_{3,\text{area}} = \frac{1}{72} b_3^2 h_3^2$$

Then
$$(I_{y'z'})_3 = \rho_{\mathrm{ST}} t \left(\frac{1}{72} b_3^2 h_3^2\right) = \frac{1}{36} m_3 b_3 h_3$$

Also
$$\bar{y}_1 = \bar{x}_2 = 0$$
$$\bar{y}_2 = \frac{4 \times 0.195}{3\pi}\text{ m} = 0.082761\text{ m}$$

PROBLEM 9.155 (Continued)

Finally,

$$I_{xy} = \Sigma(\bar{I}_{x'y'} + m\bar{x}\,\bar{y})$$

$$= (0+0) + (0+0) + \left[0 + (0.45923\text{ kg})(0.35\text{ m})\left(-\frac{0.15}{3}\text{ m}\right)\right]$$

$$I_{yz} = \Sigma(\bar{I}_{y'z'} + m\bar{y}\,\bar{z})$$

$$= (0+0) + [0 + (0.93775\text{ kg})(0.082761\text{ m})(0.195\text{ m})]$$

$$+\left[\frac{1}{36}(0.45923\text{ kg})(0.39\text{ m})(0.15\text{ m}) + (0.45923\text{ kg})\left(-\frac{0.15}{3}\text{ m}\right)\left(\frac{0.39}{3}\text{ m}\right)\right]$$

$$= [(15.1338) + (0.7462 - 2.9850)]\times10^{-3}\text{ kg}\cdot\text{m}^2$$

$$= (15.1338 - 2.2388)\times10^{-3}\text{ kg}\cdot\text{m}^2$$

$$= 12.8950\times10^{-3}\text{ kg}\cdot\text{m}^2 \qquad \text{or } I_{yz} = 12.90\times10^{-3}\text{ kg}\cdot\text{m}^2 \blacktriangleleft$$

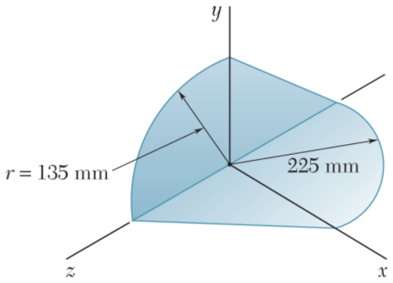
$$I_{zx} = \Sigma(\bar{I}_{z'x'} + m\bar{z}\,\bar{x})$$

$$= [0 + (2.14305\text{ kg})(0.175\text{ m})(0.195\text{ m})] + (0+0)$$

$$+\left[0 + (0.45923\text{ kg})\left(\frac{0.39}{3}\text{ m}\right)(0.35\text{ m})\right]$$

$$= (73.1316 + 20.8950)\times10^{-3}\text{ kg}\cdot\text{m}^2$$

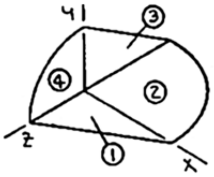
$$= 94.0266\times10^{-3}\text{ kg}\cdot\text{m}^2 \qquad \text{or } I_{zx} = 94.0\times10^{-3}\text{ kg}\cdot\text{m}^2 \blacktriangleleft$$



PROBLEM 9.156

A section of sheet steel 2 mm thick is cut and bent into the machine component shown. Knowing that the density of steel is 7850 kg/m^3, determine the mass products of inertia I_{xy}, I_{yz}, and I_{zx} of the component.

SOLUTION



First compute the mass of each component. We have

$$m = \rho_{\mathrm{ST}} V = \rho_{\mathrm{ST}} t A$$

Then

$$m_1 = m_3 = (7850\ \mathrm{kg/m^3})(0.002\ \mathrm{m})\left(\frac{1}{2} \times 0.225 \times 0.135\right)\mathrm{m^2} = 0.23844\ \mathrm{kg}$$

$$m_2 = (7850\ \mathrm{kg/m^3})(0.002\ \mathrm{m})\left(\frac{\pi}{4} \times 0.225^2\right)\mathrm{m^2} = 0.62424\ \mathrm{kg}$$

$$m_4 = (7850\ \mathrm{kg/m^3})(0.002\ \mathrm{m})\left(\frac{\pi}{4} \times 0.135^2\right)\mathrm{m^2} = 0.22473\ \mathrm{kg}$$

Now observe that the following centroidal products of inertia are zero because of symmetry.

$$(\bar{I}_{x'y'})_1 = (\bar{I}_{y'z'})_1 = 0 \qquad (\bar{I}_{x'y'})_2 = (\bar{I}_{y'z'})_2 = 0$$
$$(\bar{I}_{x'y'})_3 = (\bar{I}_{z'x'})_3 = 0 \qquad (\bar{I}_{x'y'})_4 = (\bar{I}_{z'x'}) = 0$$

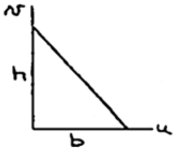
Also $\bar{y}_1 = \bar{y}_2 = 0 \qquad \bar{x}_3 = \bar{x}_4 = 0$

Now $I_{xy} = \Sigma(\bar{I}_{x'y'} + m\bar{x}\,\bar{y})$

so that $I_{xy} = 0$ ◀

Using the results of Sample Problem 9.6, we have

$$I_{uv,\mathrm{area}} = \frac{1}{24} b^2 h^2$$



Now

$$I_{uv,\mathrm{mass}} = \rho_{\mathrm{ST}} t\, I_{uv,\mathrm{area}}$$
$$= \rho_{\mathrm{ST}} t\left(\frac{1}{24} b^2 h^2\right)$$
$$= \frac{1}{12} mbh$$

Thus,

$$(I_{zx})_1 = \frac{1}{12} m_1 b_1 h_1$$

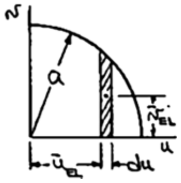
PROBLEM 9.156 (Continued)

While $$(I_{yz})_3 = -\frac{1}{12}m_3b_3h_3$$

because of a 90° rotation of the coordinate axes.

To determine I_{uv} for a quarter circle, we have

$$dI_{uv} = d\cancelto{0}{\bar{I}_{u'v'}} + u_{\text{EL}}v_{\text{EL}}\,dm$$



Where $$\bar{u}_{\text{EL}} = u \quad \bar{v}_{\text{EL}} = \frac{1}{2}v = \frac{1}{2}\sqrt{a^2 - u^2}$$

$$dm = \rho_{\text{ST}}t\,dA = \rho_{\text{ST}}tv\,du = \rho_{\text{ST}}t\sqrt{a^2 - u^2}\,du$$

Then $$I_{uv} = \int dI_{uv} = \int_0^a (u)\left(\frac{1}{2}\sqrt{a^2 - u^2}\right)\left(\rho_{\text{ST}}t\sqrt{a^2 - u^2}\,du\right)$$

$$= \frac{1}{2}\rho_{\text{ST}}t\int_0^a u(a^2 - u^2)\,du$$

$$= \frac{1}{2}\rho_{\text{ST}}t\left[\frac{1}{2}a^2u^2 - \frac{1}{4}u^4\right]_0^a = \frac{1}{8}\rho_{\text{ST}}t\;a^4 = \frac{1}{2\pi}ma^4$$

Thus $$(I_{zx})_2 = -\frac{1}{2\pi}m_2a_2^2$$

because of a 90° rotation of the coordinate axes. Also

$$(I_{yz})_4 = \frac{1}{2\pi}m_4a_4^2$$

Finally,

$$I_{yz} = \Sigma(I_{yz}) = [(\cancelto{0}{\bar{I}_{y'z'}}) + m_1\bar{y}_1\bar{z}_1] + [(\cancelto{0}{\bar{I}_{y'z'}}) + m_2\bar{y}_2\bar{z}_2] + (I_{yz})_3 + (I_{yz})_4$$

$$= \left[-\frac{1}{12}(0.23844\text{ kg})(0.225\text{ m})(0.135\text{ m})\right] + \left[\frac{1}{2\pi}(0.22473\text{ kg})(0.135\text{ m})^2\right]$$

$$= (-0.60355 + 0.65185)\times 10^{-3}\text{ kg}\cdot\text{m}^2$$

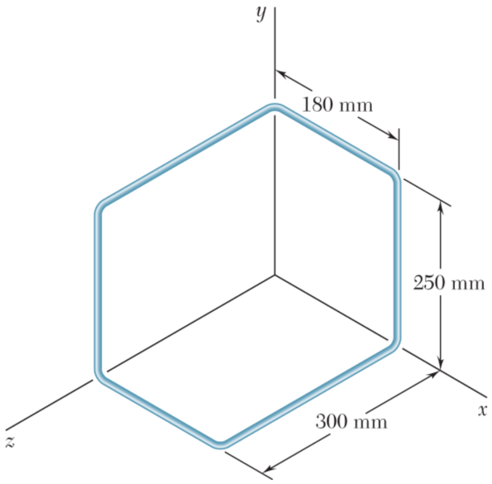
or $I_{yz} = 48.3\times 10^{-6}\text{ kg}\cdot\text{m}^2$ ◀

$$I_{zx} = \Sigma(I_{zx}) = (I_{zx})_1 + (I_{zx})_2 + [(\cancelto{0}{\bar{I}_{z'x'}})_3 + m_3\bar{z}_3\bar{x}_3] + [(\cancelto{0}{\bar{I}_{z'x'}})_4 + m_4\bar{z}_4\bar{x}_4]$$

$$= \left[\frac{1}{12}(0.23844\text{ kg})(0.225\text{ m})(0.135\text{ m})\right] + \left[-\frac{1}{2\pi}(0.62424\text{ kg})(0.225\text{ m})^2\right]$$

$$= (0.60355 - 5.02964)\times 10^{-3}\text{ kg}\cdot\text{m}^2$$

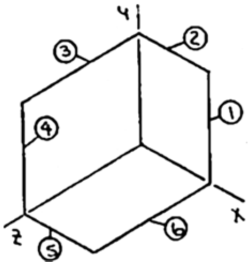
or $I_{zx} = -4.43\times 10^{-3}\text{ kg}\cdot\text{m}^2$ ◀



PROBLEM 9.157

The figure shown is formed of 1.5-mm-diameter aluminum wire. Knowing that the density of aluminum is 2800 kg/m^3, determine the mass products of inertia I_{xy}, I_{yz}, and I_{zx} of the wire figure.

SOLUTION



First compute the mass of each component. We have

$$m = \rho_{\text{AL}}V = \rho_{\text{AL}}AL$$

Then

$$m_1 = m_4 = (2800\text{ kg/m}^3)\left[\frac{\pi}{4}(0.0015\text{ m})^2\right](0.25\text{ m})$$

$$= 1.23700\times 10^{-3}\text{ kg}$$

$$m_2 = m_5 = (2800\text{ kg/m}^3)\left[\frac{\pi}{4}(0.0015\text{ m})^2\right](0.18\text{ m})$$

$$= 0.89064\times 10^{-3}\text{ kg}$$

$$m_3 = m_6 = (2800\text{ kg/m}^3)\left[\frac{\pi}{4}(0.0015\text{ m})^2\right](0.3\text{ m})$$

$$= 1.48440\times 10^{-3}\text{ kg}$$

PROBLEM 9.157 (Continued)

Now observe that the centroidal products of inertia, $\bar{I}_{x'y'}, \bar{I}_{y'z'}$, and $\bar{I}_{z'x'}$, of each component are zero because of symmetry.

	m, kg	$\bar{x}$, m	$\bar{y}$, m	$\bar{z}$, m	$m\bar{x}\,\bar{y}$, $\text{kg}\cdot\text{m}^2$	$m\bar{y}\,\bar{z}$, $\text{kg}\cdot\text{m}^2$	$m\bar{z}\,\bar{x}$, $\text{kg}\cdot\text{m}^2$
1	1.23700×10^{-3}	0.18	0.125	0	27.8325×10^{-6}	0	0

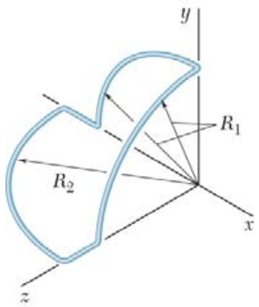
Σ					47.8719×10^{-6}	102.0525×10^{-6}	64.1261×10^{-6}

Then $I_{xy} = \Sigma(\cancelto{0}{\bar{I}_{x'y'}} + m\bar{x}\,\bar{y})$ or $I_{xy} = 47.9\times10^{-6}\ \text{kg}\cdot\text{m}^2$ ◀

$I_{yz} = \Sigma(\cancelto{0}{\bar{I}_{y'z'}} + m\bar{y}\,\bar{z})$ or $I_{yz} = 102.1\times10^{-6}\ \text{kg}\cdot\text{m}^2$ ◀

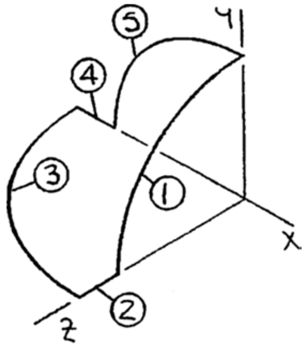
$I_{zx} = \Sigma(\cancelto{0}{\bar{I}_{z'x'}} + m\bar{z}\,\bar{x})$ or $I_{zx} = 64.1\times10^{-6}\ \text{kg}\cdot\text{m}^2$ ◀



PROBLEM 9.158

Thin aluminum wire of uniform diameter is used to form the figure shown. Denoting by m' the mass per unit length of the wire, determine the mass products of inertia I_{xy}, I_{yz}, and I_{zx} of the wire figure.

SOLUTION



First compute the mass of each component. We have

$$m = \left(\frac{m}{L}\right)L = m'L$$

Then

$$m_1 = m_5 = m'\left(\frac{\pi}{2}R_1\right) = \frac{\pi}{2}m'R_1$$

$$m_2 = m_4 = m'(R_2 - R_1)$$

$$m_3 = m'\left(\frac{\pi}{2}R_2\right) = \frac{\pi}{2}m'R_2$$

Now observe that because of symmetry the centroidal products of inertia, $\bar{I}_{x'y'}, \bar{I}_{y'z'},$ and $\bar{I}_{z'x'},$ of components 2 and 4 are zero and

$$(\bar{I}_{x'y'})_1 = (\bar{I}_{z'x'})_1 = 0 \qquad (\bar{I}_{x'y'})_3 = (\bar{I}_{y'z'})_3 = 0$$

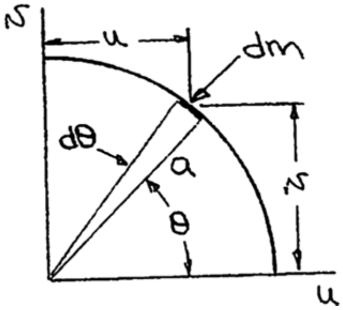
$$(\bar{I}_{y'z'})_5 = (\bar{I}_{z'x'})_5 = 0$$

Also

$$\bar{x}_1 = \bar{x}_2 = 0 \qquad \bar{y}_2 = \bar{y}_3 = \bar{y}_4 = 0 \qquad \bar{z}_4 = \bar{z}_5 = 0$$

Using the parallel-axis theorem [Equations (9.47)], it follows that $I_{xy} = I_{yz} = I_{zx}$ for components 2 and 4.

To determine I_{uv} for one quarter of a circular arc, we have $dI_{uv} = uv\,dm$



where

$$u = a\cos\theta \qquad v = a\sin\theta$$

and

$$dm = \rho dV = \rho[A(ad\theta)]$$

where A is the cross-sectional area of the wire. Now

$$m = m'\left(\frac{\pi}{2}a\right) = \rho A\left(\frac{\pi}{2}a\right)$$

so that

$$dm = m'ad\theta$$

and

$$dI_{uv} = (a\cos\theta)(a\sin\theta)(m'ad\theta)$$

$$= m'a^3 \sin\theta\cos\theta d\theta$$

PROBLEM 9.158 (Continued)

Then
$$I_{uv} = \int dI_{uv} = \int_0^{\pi/2} m'a^3 \sin\theta\cos\theta d\theta$$
$$= m'a^3\left[\frac{1}{2}\sin^2\theta\right]_0^{\pi/2} = \frac{1}{2}m'a^3$$

Thus,
$$(I_{yz})_1 = \frac{1}{2}m'R_1^3$$

and
$$(I_{zx})_3 = -\frac{1}{2}m'R_2^3 \quad (I_{xy})_5 = -\frac{1}{2}m'R_1^3$$

because of 90° rotations of the coordinate axes. Finally,

$$I_{xy} = \Sigma(I_{xy}) = [(\cancelto{0}{\bar{I}_{x'y'}})_1 + m_1\bar{x}_1\bar{y}_1] + [(\cancelto{0}{\bar{I}_{x'y'}})_3 + m_3\bar{x}_3\bar{y}_3] + (I_{xy})_5$$

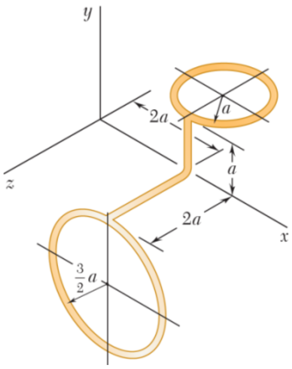
or $I_{xy} = -\frac{1}{2}m'R_1^3$ ◀

$$I_{yz} = \Sigma(I_{yz}) = (I_{yz})_1 + [(\cancelto{0}{\bar{I}_{y'z'}})_3 + m_3\bar{y}_3\bar{z}_3] + [(\cancelto{0}{\bar{I}_{y'z'}})_5 + m_5\bar{y}_5\bar{z}_5]$$

or $I_{yz} = \frac{1}{2}m'R_1^3$ ◀

$$I_{zx} = \Sigma(I_{zx}) = [(\cancelto{0}{\bar{I}_{z'x'}})_1 + m_1\bar{z}_1\bar{x}_1] + (I_{zx})_3 + [(\cancelto{0}{\bar{I}_{z'x'}})_5 + m_5\bar{z}_5\bar{x}_5]$$

or $I_{zx} = -\frac{1}{2}m'R_2^3$ ◀



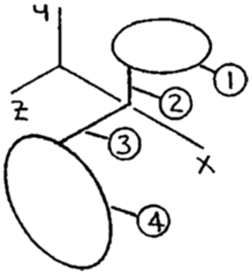
PROBLEM 9.159

Brass wire with a weight per unit length w is used to form the figure shown. Determine the mass products of inertia I_{xy}, I_{yz}, and I_{zx} of the wire figure.

SOLUTION

First compute the mass of each component. We have

$$m = \frac{W}{g} = \frac{1}{g}wL$$



Then

$$m_1 = \frac{W}{g}(2\pi \times a) = 2\pi \frac{w}{g}a$$

$$m_2 = \frac{w}{g}(a) = \frac{w}{g}a$$

$$m_3 = \frac{w}{g}(2a) = 2\frac{w}{g}a$$

$$m_4 = \frac{w}{g}\left(2\pi \times \frac{3}{2}a\right) = 3\pi\frac{w}{g}a$$

Now observe that the centroidal products of inertia, $\bar{I}_{x'y'}, \bar{I}_{y'z'}$, and $\bar{I}_{z'x'}$, of each component are zero because of symmetry.

	m	$\bar{x}$	$\bar{y}$	$\bar{z}$	$m\bar{x}\,\bar{y}$	$m\bar{y}\,\bar{z}$	$m\bar{z}\,\bar{x}$

Σ					$-11\frac{w}{g}a^3$	$\frac{w}{g}\left(\frac{\pi}{2}+3\right)a^3$	$-\frac{1}{4}\frac{w}{g}a^3$

PROBLEM 9.160 (Continued)

Then $I_{xy} = \Sigma(\cancelto{0}{\bar{I}_{x'y'}} + m\bar{x}\,\bar{y})$ or $I_{xy} = -11\dfrac{w}{g}a^3$ ◀

$I_{yz} = \Sigma(\cancelto{0}{\bar{I}_{y'z'}} + m\bar{y}\,\bar{z})$ or $I_{yz} = \dfrac{1}{2}\dfrac{w}{g}a^3(\pi + 6)$ ◀

$I_{zx} = \Sigma(\cancelto{0}{\bar{I}_{z'x'}} + m\bar{z}\,\bar{x})$ or $I_{zx} = -\dfrac{1}{4}\dfrac{w}{g}a^3$ ◀

PROBLEM 9.161

Complete the derivation of Eqs. (9.47), which express the parallel-axis theorem for mass products of inertia.

SOLUTION

We have
$$I_{xy} = \int xydm \quad I_{yz} = \int yzdm \quad I_{zx} = \int zxdm \tag{9.45}$$

and
$$x = x' + \overline{x} \quad y = y' + \overline{y} \quad z = z' + \overline{z} \tag{9.31}$$

Consider
$$I_{xy} = \int xydm$$

Substituting for *x* and for *y*

$$I_{xy} = \int (x' + \overline{x})(y' + \overline{y})\, dm$$
$$= \int x'y'dm + \overline{y}\int x'dm + \overline{x}\int y'dm + \overline{x}\,\overline{y}\int dm$$

By definition
$$\overline{I}_{x'y'} = \int x'y'dm$$

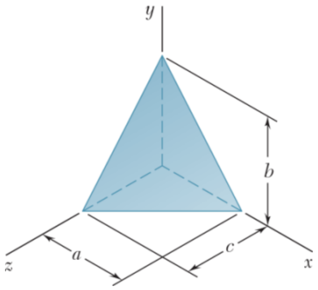
and
$$\int x'dm = m\overline{x}'$$
$$\int y'dm = m\overline{y}'$$

However, the origin of the primed coordinate system coincides with the mass center *G*, so that

$$\overline{x}' = \overline{y}' = 0$$

$$I_{xy} = \overline{I}_{x'y'} + m\overline{x}\,\overline{y} \quad \text{Q.E.D.} \blacktriangleleft$$

The expressions for I_{yz} and I_{zx} are obtained in a similar manner.

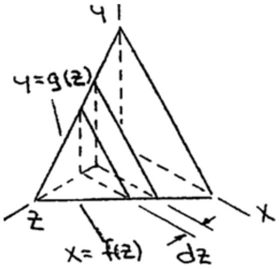


PROBLEM 9.162

For the homogeneous tetrahedron of mass *m* shown, (*a*) determine by direct integration the mass product of inertia I_{zx}, (*b*) deduce I_{yz} and I_{xy} from the result obtained in part *a*.

SOLUTION

(*a*) First divide the tetrahedron into a series of thin vertical slices of thickness *dz* as shown.



Now $$x = -\frac{a}{c}z + a = a\left(1 - \frac{z}{c}\right)$$

and $$y = -\frac{b}{c}z + b = b\left(1 - \frac{z}{c}\right)$$

The mass *dm* of the slab is

$$dm = \rho dV = \rho\left(\frac{1}{2}xydz\right) = \frac{1}{2}\rho ab\left(1 - \frac{z}{c}\right)^2 dz$$

Then $$m = \int dm = \int_0^c \frac{1}{2}\rho ab\left(1 - \frac{z}{c}\right)^2 dz$$

$$= \frac{1}{2}\rho ab\left[\left(-\frac{c}{3}\right)\left(1 - \frac{z}{c}\right)^3\right]_0^c = \frac{1}{6}\rho abc$$

Now $$dI_{zx} = d\bar{I}_{z'x'} + \bar{z}_{\text{EL}}\bar{x}_{\text{EL}}dm$$

where $$d\bar{I}_{z'x'} = 0 \quad \text{(symmetry)}$$

and $$\bar{z}_{\text{EL}} = z \qquad \bar{x}_{\text{EL}} = \frac{1}{3}x = \frac{1}{3}a\left(1 - \frac{z}{c}\right)$$

Then $$I_{zx} = \int dI_{zx} = \int_0^c z\left[\frac{1}{3}a\left(1 - \frac{z}{c}\right)\right]\left[\frac{1}{2}\rho ab\left(1 - \frac{z}{c}\right)^2 dz\right]$$

$$= \frac{1}{6}\rho a^2 b\int_0^c \left(z - 3\frac{z^2}{c} + 3\frac{z^3}{c^2} - \frac{z^4}{c^3}\right)dz$$

$$= \frac{m}{c}a\left[\frac{1}{2}z^2 - \frac{z^3}{c} + \frac{3}{4}\frac{z^4}{c^2} - \frac{1}{5}\frac{z^5}{c^3}\right]_0^c$$

or $$I_{zx} = \frac{1}{20}mac \blacktriangleleft$$

PROBLEM 9.162 (Continued)

(*b*) Because of the symmetry of the body, I_{xy} and I_{yz} can be deduced by considering the circular permutation of (x, y, z) and (a, b, c).

Thus,

$$I_{xy} = \frac{1}{20} mab \blacktriangleleft$$

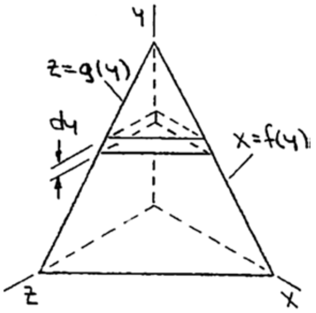
$$I_{yz} = \frac{1}{20} mbc \blacktriangleleft$$

Alternative solution for part *a*:

First divide the tetrahedron into a series of thin horizontal slices of thickness dy as shown.

Now $$x = -\frac{a}{b} y + a = a\left(1 - \frac{y}{b}\right)$$

and $$z = -\frac{c}{b} y + c = c\left(1 - \frac{y}{b}\right)$$



The mass dm of the slab is

$$dm = \rho dV = \rho\left(\frac{1}{2} xzdy\right) = \frac{1}{2}\rho ac\left(1 - \frac{y}{b}\right)^2 dy$$

Now $$dI_{zx} = \rho t dI_{zx,\text{area}}$$

where $$t = dy$$

and $dI_{zx,\text{area}} = \frac{1}{24} x^2 z^2$ from the results of Sample Problem 9.6.

Then $$dIzx = \rho(dy)\left\{\frac{1}{24}\left[a\left(1 - \frac{y}{b}\right)^2\right]\left[c\left(1 - \frac{y}{b}\right)\right]^2\right\}$$

$$= \frac{1}{24}\rho a^2 c^2 \left(1 - \frac{y}{b}\right)^4 dy = \frac{1}{4}\frac{m}{b} ac\left(1 - \frac{y}{b}\right)^4 dy$$

Finally, $$I_{zx} = \int dI_{zx} = \int_0^b \frac{1}{4}\frac{m}{b} ac\left(1 - \frac{y}{b}\right)^4 dy$$

$$= \frac{1}{4}\frac{m}{b} ac\left[\left(-\frac{b}{5}\right)\left(1 - \frac{y}{b}\right)^5\right]_0^b$$

or $$I_{zx} = \frac{1}{20} mac \blacktriangleleft$$

PROBLEM 9.162 (Continued)

Alternative solution for part *a*:

The equation of the included face of the tetrahedron is

$$\frac{x}{a}+\frac{y}{b}+\frac{z}{c}=1$$

so that $$y=b\left(1-\frac{x}{a}-\frac{z}{c}\right)$$

For an infinitesimal element of sides $dx, dy,$ and dz:

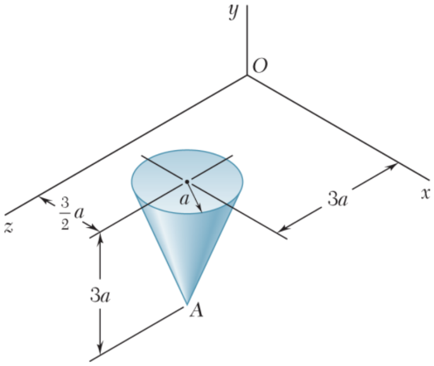
$$dm=\rho dV=\rho dydxdz$$

From part *a* $$x=a\left(1-\frac{z}{c}\right)$$

Now

$$\begin{aligned}
I_{zx}=\int zxdm &= \int_0^c\int_0^{a(1-z/c)}\int_0^{b(1-x/a-z/c)} zx(\rho dydxdz)\\
&= \rho\int_0^c\int_0^{a(1-z/c)} zx\left[b\left(1-\tfrac{x}{a}-\tfrac{z}{c}\right)\right]dxdz\\
&= \rho b\int_0^c z\left[\frac{1}{2}x^2-\frac{1}{3}\frac{x^3}{a}-\frac{1}{2}\frac{z}{c}x^2\right]_0^{a(1-z/c)} dz\\
&= \rho b\int_0^c z\left[\frac{1}{2}a^2\left(1-\frac{z}{c}\right)^2-\frac{1}{3a}a^3\left(1-\frac{z}{c}\right)^3-\frac{1}{2}\frac{z}{c}a^2\left(1-\frac{z}{c}\right)^2\right]dz\\
&= \rho b\int_0^c \frac{1}{6}a^2z\left(1-\frac{z}{c}\right)^3 dz\\
&= \frac{1}{6}\rho a^2b\int_0^c\left(z-3\frac{z^2}{c}+3\frac{z^3}{c^2}-\frac{z^4}{c^3}\right)dz\\
&= \frac{m}{c}a\left[\frac{1}{2}z^2-\frac{z^3}{c}+\frac{3}{4}\frac{z^4}{c^2}-\frac{1}{5}\frac{z^5}{c^3}\right]_0^c
\end{aligned}$$

or $I_{zx}=\dfrac{1}{20}mac$ ◀



PROBLEM 9.163

The homogeneous circular cone shown has a mass m. Determine the mass moment of inertia of the cone with respect to the line joining the origin O and Point A.

SOLUTION

First note that

$$d_{OA} = \sqrt{\left(\frac{3}{2}a\right)^2 + (-3a)^2 + (3a)^2} = \frac{9}{2}a$$

Then

$$\lambda_{OA} = \frac{1}{\frac{9}{2}a}\left(\frac{3}{2}a\mathbf{i} - 3a\mathbf{j} + 3a\mathbf{k}\right) = \frac{1}{3}(\mathbf{i} - 2\mathbf{j} + 2\mathbf{k})$$

For a rectangular coordinate system with origin at Point A and axes aligned with the given x, y, z axes, we have (using Figure 9.28)

$$I_x = I_z = \frac{3}{5}m\left[\frac{1}{4}a^2 + (3a)^2\right] \qquad I_y = \frac{3}{10}ma^2$$

$$= \frac{111}{20}ma^2$$

Also, symmetry implies $\quad I_{xy} = I_{yz} = I_{zx} = 0$

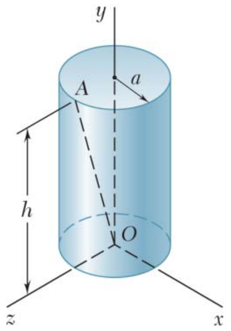
With the mass products of inertia equal to zero, Equation (9.46) reduces to

$$I_{OA} = I_x\lambda_x^2 + I_y\lambda_y^2 + I_z\lambda_z^2$$

$$= \frac{111}{20}ma^2\left(\frac{1}{3}\right)^2 + \frac{3}{10}ma^2\left(-\frac{2}{3}\right)^2 + \frac{111}{20}ma^2\left(\frac{2}{3}\right)^2$$

$$= \frac{193}{60}ma^2$$

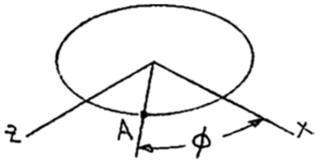
or $\quad I_{OA} = 3.22ma^2$ ◀



PROBLEM 9.164

The homogeneous circular cylinder shown has a mass *m*. Determine the mass moment of inertia of the cylinder with respect to the line joining the origin *O* and Point *A* that is located on the perimeter of the top surface of the cylinder.

SOLUTION



From Figure 9.28: $I_y = \frac{1}{2}ma^2$

and using the parallel-axis theorem

$$I_x = I_z = \frac{1}{12}m(3a^2 + h^2) + m\left(\frac{h}{2}\right)^2 = \frac{1}{12}m(3a^2 + 4h^2)$$

Symmetry implies $I_{xy} = I_{yz} = I_{zx} = 0$

For convenience, let Point *A* lie in the *yz* plane. Then

$$\lambda_{OA} = \frac{1}{\sqrt{h^2 + a^2}}(h\mathbf{j} + a\mathbf{k})$$

With the mass products of inertia equal to zero, Equation (9.46) reduces to

$$I_{OA} = \cancelto{0}{I_x\lambda_x^2} + I_y\lambda_y^2 + I_z\lambda_z^2$$

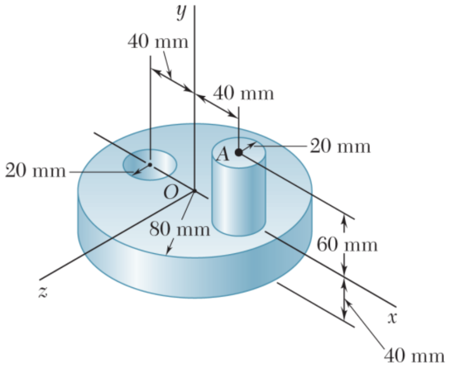
$$= \frac{1}{2}ma^2\left(\frac{h}{\sqrt{h^2 + a^2}}\right)^2 + \frac{1}{12}m(3a^2 + 4h^2)\left(\frac{a}{\sqrt{h^2 + a^2}}\right)^2$$

or $I_{OA} = \frac{1}{12}ma^2\frac{10h^2 + 3a^2}{h^2 + a^2}$ ◀

Note: For Point *A* located at an arbitrary point on the perimeter of the top surface, λ_{OA} is given by

$$\lambda_{OA} = \frac{1}{\sqrt{h^2 + a^2}}(a\cos\phi\mathbf{i} + h\mathbf{j} + a\sin\phi\mathbf{k})$$

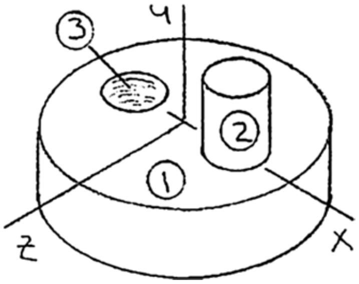
which results in the same expression for I_{OA}.



PROBLEM 9.165

Shown is the machine element of Problem 9.141. Determine its mass moment of inertia with respect to the line joining the origin *O* and Point *A*.

SOLUTION



First compute the mass of each component.

We have $$m = \rho_{\mathrm{ST}} V = \frac{0.284 \text{ lb/in}^3}{32.2 \text{ ft/s}^2} V = (0.008819 \text{ lb} \cdot \text{s}^2/\text{ft} \cdot \text{in}^3)V$$

Then

$$m_1 = (7850 \text{ kg/m}^3)[\pi(0.08 \text{ m})^2(0.04 \text{ m})] = 6.31334 \text{ kg}$$
$$m_2 = (7850 \text{ kg/m}^3)[\pi(0.02 \text{ m})^2(0.06 \text{ m})] = 0.59188 \text{ kg}$$
$$m_3 = (7850 \text{ kg/m}^3)[\pi(0.02 \text{ m})^2(0.04 \text{ m})] = 0.39458 \text{ kg}$$

Symmetry implies $$I_{yz} = I_{zx} = 0 \qquad (I_{xy})_1 = 0$$

and $$(\bar{I}_{x'y'})_2 = (\bar{I}_{x'y'})_3 = 0$$

Now
$$\begin{aligned} I_{xy} &= \Sigma(\bar{I}_{x'y'} + m\bar{x}\,\bar{y}) = m_2\bar{x}_2\bar{y}_2 - m_3\bar{x}_3\bar{y}_3 \\ &= [0.59188 \text{ kg } (0.04 \text{ m})(0.03 \text{ m})] - [0.39458 \text{ kg } (-0.04 \text{ m})(-0.02 \text{ m})] \\ &= (0.71026 - 0.31566) \times 10^{-3} \text{ kg} \cdot \text{m}^2 \\ &= 0.39460 \times 10^{-3} \text{ kg} \cdot \text{m}^2 \end{aligned}$$

PROBLEM 9.165 (Continued)

From the solution to Problem 9.141, we have

$$I_x = 13.98800 \times 10^{-3}\ \text{kg}\cdot\text{m}^2$$

$$I_y = 20.55783 \times 10^{-3}\ \text{kg}\cdot\text{m}^2$$

$$I_z = 14.30368 \times 10^{-3}\ \text{kg}\cdot\text{m}^2$$

By observation
$$\boldsymbol{\lambda}_{OA} = \frac{1}{\sqrt{13}}(2\mathbf{i} + 3\mathbf{j})$$

Substituting into Eq. (9.46)

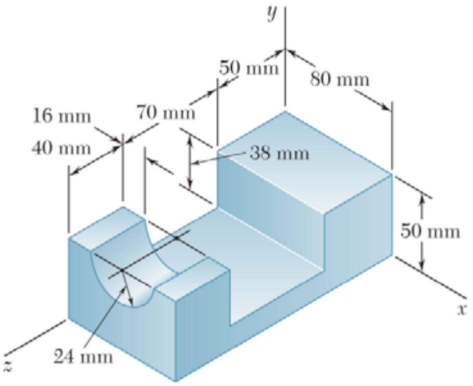
$$I_{OA} = I_x\lambda_x^2 + I_y\lambda_y^2 + \cancelto{0}{I_z\lambda_z^2} - 2I_{xy}\lambda_x\lambda_y - 2\cancelto{0}{I_{yz}}\lambda_y\lambda_z - 2\cancelto{0}{I_{zx}}\lambda_z\lambda_x$$

$$= \left[(13.98800)\left(\frac{2}{\sqrt{13}}\right)^2 + (20.55783)\left(\frac{3}{\sqrt{13}}\right)^2\right.$$

$$\left. - 2(0.39460)\left(\frac{2}{\sqrt{13}}\right)\left(\frac{2}{\sqrt{13}}\right)\right] \times 10^{-3}\ \text{kg}\cdot\text{m}^2$$

$$= (4.30400 + 14.23234 - 0.36425) \times 10^{-3}\ \text{kg}\cdot\text{m}^2$$

or $\quad I_{OA} = 18.17 \times 10^{-3}\ \text{kg}\cdot\text{m}^2$ ◀



PROBLEM 9.166

Determine the mass moment of inertia of the steel fixture of Problems 9.145 and 9.149 with respect to the axis through the origin that forms equal angles with the *x*, *y*, and *z* axes.

SOLUTION

From the solutions to Problems 9.145 and 9.149, we have

Problem 9.145: $I_x = 26.4325 \times 10^{-3}\ \text{kg}\cdot\text{m}^2$

$I_y = 31.1726 \times 10^{-3}\ \text{kg}\cdot\text{m}^2$

$I_z = 8.5773 \times 10^{-3}\ \text{kg}\cdot\text{m}^2$

Problem 9.149: $I_{xy} = 2.5002 \times 10^{-3}\ \text{kg}\cdot\text{m}^2$

$I_{yz} = 4.0627 \times 10^{-3}\ \text{kg}\cdot\text{m}^2$

$I_{zx} = 8.8062 \times 10^{-3}\ \text{kg}\cdot\text{m}^2$

From the problem statement it follows that

$$\lambda_x = \lambda_y = \lambda_z$$

Now $\lambda_x^2 + \lambda_y^2 + \lambda_z^2 = 1 \Rightarrow 3\lambda_x^2 = 1$

or $\lambda_x = \lambda_y = \lambda_z = \dfrac{1}{\sqrt{3}}$

Substituting into Eq. (9.46)

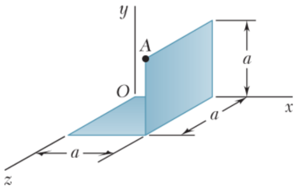
$$I_{OL} = I_x\lambda_x^2 + I_y\lambda_y^2 + I_z\lambda_z^2 - 2I_{xy}\lambda_x\lambda_y - 2I_{yz}\lambda_y\lambda_z - 2I_{zx}\lambda_z\lambda_x$$

Noting that $\lambda_x^2 = \lambda_y^2 = \lambda_z^2 = \lambda_x\lambda_y = \lambda_y\lambda_z = \lambda_z\lambda_x = \dfrac{1}{3}$

We have $I_{OL} = \dfrac{1}{3}[26.4325 + 31.1726 + 8.5773$

$-2(2.5002 + 4.0627 + 8.8062)] \times 10^{-3}\ \text{kg}\cdot\text{m}^2$

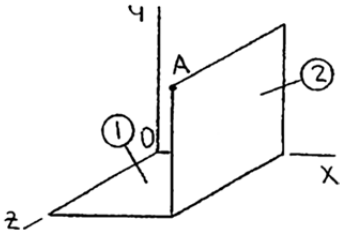
or $I_{OL} = 11.81 \times 10^{-3}\ \text{kg}\cdot\text{m}^2$ ◀



PROBLEM 9.167

The thin bent plate shown is of uniform density and weight W. Determine its mass moment of inertia with respect to the line joining the origin O and Point A.

SOLUTION



First note that

$$m_1 = m_2 = \frac{1}{2}\frac{W}{g}$$

and that

$$\lambda_{OA} = \frac{1}{\sqrt{3}}(\mathbf{i} + \mathbf{j} + \mathbf{k})$$

Using Figure 9.28 and the parallel-axis theorem, we have

$$I_x = (I_x)_1 + (I_x)_2$$

$$= \left[\frac{1}{12}\left(\frac{1}{2}\frac{W}{g}\right)a^2 + \frac{1}{2}\frac{W}{g}\left(\frac{a}{2}\right)^2\right]$$

$$+ \left\{\frac{1}{12}\left(\frac{1}{2}\frac{W}{g}\right)(a^2 + a^2) + \frac{1}{2}\frac{W}{g}\left[\left(\frac{a}{2}\right)^2 + \left(\frac{a}{2}\right)^2\right]\right\}$$

$$= \frac{1}{2}\frac{W}{g}\left[\left(\frac{1}{12} + \frac{1}{4}\right)a^2 + \left(\frac{1}{6} + \frac{1}{2}\right)a^2\right] = \frac{1}{2}\frac{W}{g}a^2$$

$$I_y = (I_y)_1 + (I_y)_2$$

$$= \left\{\frac{1}{12}\left(\frac{1}{2}\frac{W}{g}\right)(a^2 + a^2) + \frac{1}{2}\frac{W}{g}\left[\left(\frac{a}{2}\right)^2 + \left(\frac{a}{2}\right)^2\right]\right\}$$

$$+ \left\{\frac{1}{12}\left(\frac{1}{2}\frac{W}{g}\right)a^2 + \frac{1}{2}\frac{W}{g}\left[(a)^2 + \left(\frac{a}{2}\right)^2\right]\right\}$$

$$= \frac{1}{2}\frac{W}{g}\left[\left(\frac{1}{6} + \frac{1}{2}\right)a^2 + \left(\frac{1}{12} + \frac{5}{4}\right)a^2\right] = \frac{W}{g}a^2$$

$$I_z = (I_z)_1 + (I_z)_2$$

$$= \left[\frac{1}{12}\left(\frac{1}{2}\frac{W}{g}\right)a^2 + \frac{1}{2}\frac{W}{g}\left(\frac{a}{2}\right)^2\right]$$

$$+ \left\{\frac{1}{12}\left(\frac{1}{2}\frac{W}{g}\right)a^2 + \frac{1}{2}\frac{W}{g}\left[(a)^2 + \left(\frac{a}{2}\right)^2\right]\right\}$$

$$= \frac{1}{2}\frac{W}{g}\left[\left(\frac{1}{12} + \frac{1}{4}\right)a^2 + \left(\frac{1}{12} + \frac{5}{4}\right)a^2\right] = \frac{5}{6}\frac{W}{g}a^2$$

PROBLEM 9.167 (Continued)

Now observe that the centroidal products of inertia, $\bar{I}_{x'y'}, \bar{I}_{y'z'}$, and $\bar{I}_{z'x'}$, of both components are zero because of symmetry. Also, $\bar{y}_1 = 0$

Then

$$I_{xy} = \Sigma(\cancelto{0}{\bar{I}_{x'y'}} + m\bar{x}\,\bar{y}) = m_2\bar{x}_2\bar{y}_2 = \frac{1}{2}\frac{W}{g}(a)\left(\frac{a}{2}\right) = \frac{1}{4}\frac{W}{g}a^2$$

$$I_{yz} = \Sigma(\cancelto{0}{\bar{I}_{y'z'}} + m\bar{y}\,\bar{z}) = m_2\bar{y}_2\bar{z}_2 = \frac{1}{2}\frac{W}{g}\left(\frac{a}{2}\right)\left(\frac{a}{2}\right) = \frac{1}{8}\frac{W}{g}a^2$$

$$I_{zx} = \Sigma(\cancelto{0}{\bar{I}_{z'x'}} + m\bar{z}\,\bar{x}) = m_1\bar{z}_1\bar{x}_1 + m_2\bar{z}_2\bar{x}_2$$

$$= \frac{1}{2}\frac{W}{g}\left(\frac{a}{2}\right)\left(\frac{a}{2}\right) + \frac{1}{2}\frac{W}{g}\left(\frac{a}{2}\right)(a) = \frac{3}{8}\frac{W}{g}a^2$$

Substituting into Equation (9.46)

$$I_{OA} = I_x\lambda_x^2 + I_y\lambda_y^2 + I_z\lambda_z^2 - 2I_{xy}\lambda_x\lambda_y - 2I_{yz}\lambda_y\lambda_z - 2I_{zx}\lambda_z\lambda_x$$

Noting that

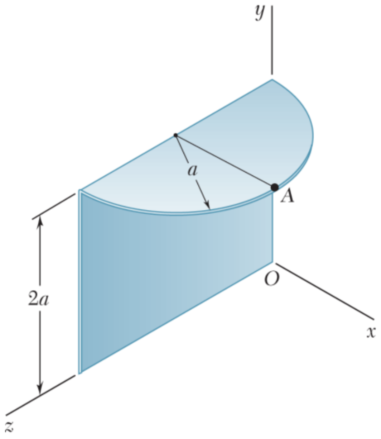
$$\lambda_x^2 = \lambda_y^2 = \lambda_z^2 = \lambda_x\lambda_y = \lambda_y\lambda_z = \lambda_z\lambda_x = \frac{1}{3}$$

We have

$$I_{OA} = \frac{1}{3}\left[\frac{1}{2}\frac{W}{g}a^2 + \frac{W}{g}a^2 + \frac{5}{6}\frac{W}{g}a^2 - 2\left(\frac{1}{4}\frac{W}{g}a^2 + \frac{1}{8}\frac{W}{g}a^2 + \frac{3}{8}\frac{W}{g}a^2\right)\right]$$

$$= \frac{1}{3}\left[\frac{14}{6} - 2\left(\frac{3}{4}\right)\right]\frac{W}{g}a^2$$

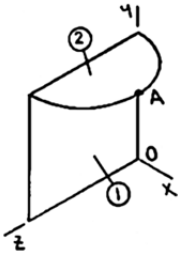
or $I_{OA} = \dfrac{5}{18}\dfrac{W}{g}a^2$ ◀



PROBLEM 9.168

A piece of sheet steel of thickness t and specific weight γ is cut and bent into the machine component shown. Determine the mass moment of inertia of the component with respect to the joining the origin O and Point A.

SOLUTION



First note that

$$\boldsymbol{\lambda}_{OA} = \frac{1}{\sqrt{6}}(\mathbf{i} + 2\mathbf{j} + \mathbf{k})$$

Next compute the mass of each component. We have

$$m = \rho V = \frac{\gamma}{g}(tA)$$

Then

$$m_1 = \frac{\gamma}{g}t(2a \times 2a) = 4\frac{\gamma t}{g}a^2$$

$$m_2 = \frac{\gamma}{g}t\left(\frac{\pi}{2} \times a^2\right) = \frac{\pi}{2}\frac{\gamma t}{g}a^2$$

Using Figure 9.28 for component 1 and the equations derived above (following the solution to Problem 9.134) for a semicircular plate for component 2, we have

$$\begin{aligned} I_x &= (I_x)_1 + (I_x)_2 \\ &= \left\{\frac{1}{12}\left(4\frac{\gamma t}{g}a^2\right)[(2a)^2 + (2a)^2] + 4\frac{\gamma t}{g}a^2(a^2 + a^2)\right\} \\ &\quad + \left\{\frac{1}{4}\left(\frac{\pi}{2}\frac{\gamma t}{g}a^2\right)a^2 + \frac{\pi}{2}\frac{\gamma t}{g}a^2[(2a)^2 + (a)^2]\right\} \\ &= 4\frac{\gamma t}{g}a^2\left(\frac{2}{3} + 2\right)a^2 + \frac{\pi}{2}\frac{\gamma t}{g}a^2\left(\frac{1}{4} + 5\right)a^2 \\ &= 18.91335\frac{\gamma t}{g}a^4 \end{aligned}$$

PROBLEM 9.168 (Continued)

$$
\begin{aligned}
I_y &= (I_y)_1 + (I_y)_2 \\
&= \left[\frac{1}{12}\left(4\frac{\gamma t}{g}a^2\right)(2a)^2 + 4\frac{\gamma t}{g}a^2(a^2)\right] \\
&\quad + \left\{\frac{\pi}{2}\frac{\gamma t}{g}a^2\left(\frac{1}{2}-\frac{16}{9\pi^2}\right)a^2 + \frac{\pi}{2}\frac{\gamma t}{g}a^2\left[\left(\frac{4a}{3\pi}\right)^2 + (a)^2\right]\Bigg]\right\} \\
&= 4\frac{\gamma t}{g}a^2\left(\frac{1}{3}+1\right)a^2 + \frac{\pi}{2}\frac{\gamma t}{g}a^2\left(\frac{1}{2}-\frac{16}{9\pi^2}+\frac{16}{9\pi^2}+1\right)a^2 \\
&= 7.68953\frac{\gamma t}{g}a^4
\end{aligned}
$$

$$
\begin{aligned}
I_z &= (I_z)_1 + (I_z)_2 \\
&= \left[\frac{1}{12}\left(4\frac{\gamma t}{g}a^2\right)(2a)^2 + 4\frac{\gamma t}{g}a^2(a^2)\right] \\
&\quad + \left\{\frac{\pi}{2}\frac{\gamma t}{g}a^2\left(\frac{1}{4}-\frac{16}{9\pi^2}\right)a^2 + \frac{\pi}{2}\frac{\gamma t}{g}a^2\left[\left(\frac{4a}{3\pi}\right)^2 + (2a)^2\right]\Bigg]\right\} \\
&= 4\frac{\gamma t}{g}a^2\left(\frac{1}{3}+1\right)a^2 + \frac{\pi}{2}\frac{\gamma t}{g}a^2\left(\frac{1}{4}-\frac{16}{9\pi^2}+\frac{16}{9\pi^2}+4\right)a^2 \\
&= 12.00922\frac{\gamma t}{g}a^4
\end{aligned}
$$

Now observe that the centroidal products of inertia, $\overline{I}_{x'y'}, \overline{I}_{y'z'}$, and $\overline{I}_{z'x'}$, of both components are zero because of symmetry. Also $\overline{x}_1 = 0$.

Then

$$
\begin{aligned}
I_{xy} &= \Sigma(\cancelto{0}{\overline{I}_{x'y'}} + m\overline{x}\,\overline{y}) = m_2\overline{x}_2\overline{y}_2 = \frac{\pi}{2}\frac{\gamma t}{g}a^2\left(\frac{4a}{3\pi}\right)(2a) \\
&= 1.33333\frac{\gamma t}{g}a^4
\end{aligned}
$$

$$
\begin{aligned}
I_{yz} &= \Sigma(\cancelto{0}{\overline{I}_{y'z'}} + m\overline{y}\,\overline{z}) = m_1\overline{y}_1\overline{z}_1 + m_2\overline{y}_2\overline{z}_2 \\
&= 4\frac{\gamma t}{g}a^2(a)(a) + \frac{\pi}{2}\frac{\gamma t}{g}a^2(2a)(a) \\
&= 7.14159\frac{\gamma t}{g}a^4
\end{aligned}
$$

$$
\begin{aligned}
I_{zx} &= \Sigma(\cancelto{0}{\overline{I}_{z'x'}} + m\overline{z}\,\overline{x}) = m_2\overline{z}_2\overline{x}_2 = \frac{\pi}{2}\frac{\gamma t}{g}a^2(a)\left(\frac{4a}{3\pi}\right) \\
&= 0.66667\frac{\gamma t}{g}a^4
\end{aligned}
$$

PROBLEM 9.168 (Continued)

Substituting into Eq. (9.46)

$$I_{OA} = I_x\lambda_x^2 + I_y\lambda_y^2 + I_z\lambda_z^2 - 2I_{xy}\lambda_x\lambda_y - 2I_{yz}\lambda_y\lambda_z - 2I_{zx}\lambda_z\lambda_x$$

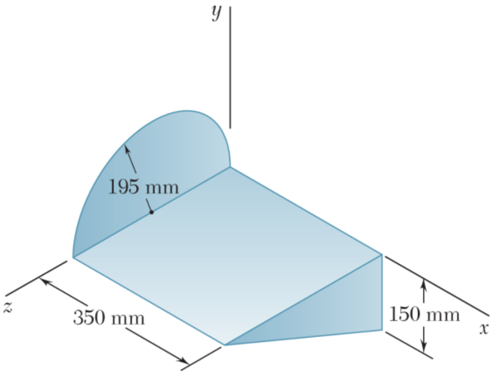
$$= 18.91335\frac{\gamma t}{g}a^4\left(\frac{1}{\sqrt{6}}\right)^2 + 7.68953\frac{\gamma t}{g}a^4\left(\frac{2}{\sqrt{6}}\right)^2$$

$$+12.00922\frac{\gamma t}{g}a^4\left(\frac{1}{\sqrt{6}}\right)^2 - 2\left(1.33333\frac{\gamma t}{g}a^4\right)\left(\frac{1}{\sqrt{6}}\right)\left(\frac{2}{\sqrt{6}}\right)$$

$$-2\left(7.14159\frac{\gamma t}{g}a^4\right)\left(\frac{2}{\sqrt{6}}\right)\left(\frac{2}{\sqrt{6}}\right) - 2\left(0.66667\frac{\gamma t}{g}a^4\right)\left(\frac{1}{\sqrt{6}}\right)\left(\frac{1}{\sqrt{6}}\right)$$

$$= (3.15223 + 5.12635 + 2.00154 - 0.88889 - 4.76106 - 0.22222)\frac{\gamma t}{g}a^4$$

or $I_{OA} = 4.41\frac{\gamma t}{g}a^4$ ◀



PROBLEM 9.169

Determine the mass moment of inertia of the machine component of Problems 9.136 and 9.155 with respect to the axis through the origin characterized by the unit vector $\boldsymbol{\lambda} = (-4\mathbf{i} + 8\mathbf{j} + \mathbf{k})/9$.

SOLUTION

From the solutions to Problems 9.136 and 9.155. We have

Problem 9.136:
$$I_x = 175.503 \times 10^{-3}\ \text{kg}\cdot\text{m}^2$$
$$I_y = 308.629 \times 10^{-3}\ \text{kg}\cdot\text{m}^2$$
$$I_z = 154.400 \times 10^{-3}\ \text{kg}\cdot\text{m}^2$$

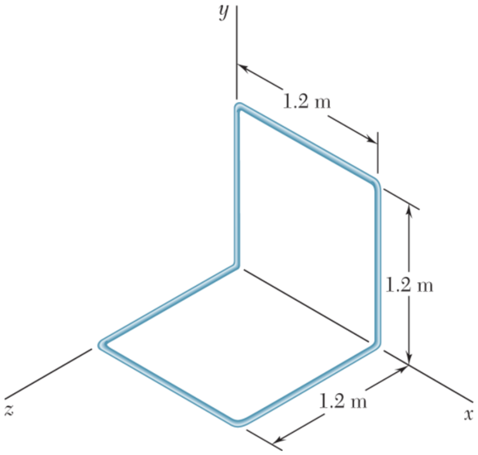
Problem 9.155:
$$I_{xy} = -8.0365 \times 10^{-3}\ \text{kg}\cdot\text{m}^2$$
$$I_{yz} = 12.8950 \times 10^{-3}\ \text{kg}\cdot\text{m}^2$$
$$I_{zx} = 94.0266 \times 10^{-3}\ \text{kg}\cdot\text{m}^2$$

Substituting into Eq. (9.46)

$$I_{OL} = I_x\lambda_x^2 + I_y\lambda_y^2 + I_z\lambda_z^2 - 2I_{xy}\lambda_x\lambda_y - 2I_{yz}\lambda_y\lambda_z - 2I_{zx}\lambda_z\lambda_x$$

$$= \left[175.503\left(-\frac{4}{9}\right)^2 + 308.629\left(\frac{8}{9}\right)^2 + 154.400\left(\frac{1}{9}\right)^2 \right.$$
$$-2(-8.0365)\left(-\frac{4}{9}\right)\left(\frac{8}{9}\right) - 2(12.8950)\left(\frac{8}{9}\right)\left(\frac{1}{9}\right)$$
$$\left. -2(94.0266)\left(\frac{1}{9}\right)\left(-\frac{4}{9}\right)\right] \times 10^{-3}\ \text{kg}\cdot\text{m}^2$$
$$= (34.6673 + 243.855 + 1.906 - 6.350$$
$$-2.547 + 9.287) \times 10^{-3}\ \text{kg}\cdot\text{m}^2$$

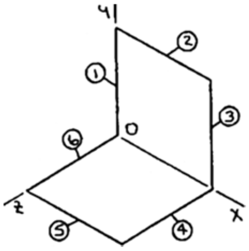
or $I_{OL} = 281 \times 10^{-3}\ \text{kg}\cdot\text{m}^2$ ◀



PROBLEM 9.170

For the wire figure of Problem 9.148, determine the mass moment of inertia of the figure with respect to the axis through the origin characterized by the unit vector $\boldsymbol{\lambda} = (-3\mathbf{i} - 6\mathbf{j} + 2\mathbf{k})/7$.

SOLUTION



First compute the mass of each component. We have

$$m = \left(\frac{m}{L}\right)L = 0.056 \text{ kg/m} \times 1.2 \text{ m}$$
$$= 0.0672 \text{ kg}$$

Now observe that the centroidal products of inertia, $\bar{I}_{x'y'}, \bar{I}_{y'z'}$, and $\bar{I}_{z'x'}$, for each component are zero because of symmetry.

Also

$$\bar{x}_1 = \bar{x}_6 = 0 \qquad \bar{y}_4 = \bar{y}_5 = \bar{y}_6 = 0 \qquad \bar{z}_1 = \bar{z}_2 = \bar{z}_3 = 0$$

Then
$$I_{xy} = \Sigma(\overset{0}{\bar{I}_{x'y'}} + m\bar{x}\,\bar{y}) = m_2\bar{x}_2\bar{y}_2 + m_3\bar{x}_3\bar{y}_3$$
$$= (0.0672 \text{ kg})(0.6 \text{ m})(1.2 \text{ m}) + (0.0672 \text{ kg})(1.2 \text{ m})(0.6 \text{ m})$$
$$= 0.096768 \text{ kg}\cdot\text{m}^2$$

$$I_{yz} = \Sigma(\overset{0}{\bar{I}_{y'z'}} + m\bar{y}\,\bar{z}) = 0$$

$$I_{zx} = \Sigma(\overset{0}{\bar{I}_{z'x'}} + m\bar{z}\,\bar{x}) = m_4\bar{z}_4\bar{x}_4 + m_5\bar{z}_5\bar{x}_5$$
$$= (0.0672 \text{ kg})(0.6 \text{ m})(1.2 \text{ m}) + (0.0672 \text{ kg})(1.2 \text{ m})(0.6 \text{ m})$$
$$= 0.096768 \text{ kg}\cdot\text{m}^2$$

From the solution to Problem 9.148, we have

$$I_x = 0.32258 \text{ kg}\cdot\text{m}^2$$
$$I_y = I_z = 0.41933 \text{ kg}\cdot\text{m}^2$$

PROBLEM 9.170 (Continued)

Substituting into Eq. (9.46)

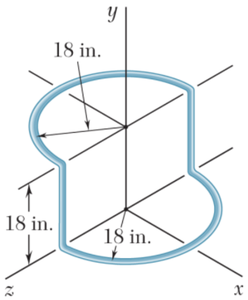
$$I_{OL} = I_x\lambda_x^2 + I_y\lambda_y^2 + I_z\lambda_z^2 - 2I_{xy}\lambda_x\lambda_y - 2\cancelto{0}{I_{yz}}\lambda_y\lambda_z - 2I_{zx}\lambda_z\lambda_x$$

$$= \left[0.32258\left(-\frac{3}{7}\right)^2 + 0.41933\left(-\frac{6}{7}\right)^2 + 0.41933\left(\frac{2}{7}\right)^2\right.$$

$$\left. - 2(0.096768)\left(-\frac{3}{7}\right)\left(-\frac{6}{7}\right) - 2(0.096768)\left(\frac{2}{7}\right)\left(-\frac{3}{7}\right)\right] \text{kg} \cdot \text{m}^2$$

$$I_{OL} = (0.059249 + 0.30808 + 0.034231 - 0.071095 + 0.023698)\ \text{kg} \cdot \text{m}^2$$

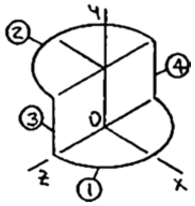
or $I_{OL} = 0.354\ \text{kg} \cdot \text{m}^2$ ◀



PROBLEM 9.171

For the wire figure of Problem 9.147, determine the mass moment of inertia of the figure with respect to the axis through the origin characterized by the unit vector $\boldsymbol{\lambda} = (-3\mathbf{i} - 6\mathbf{j} + 2\mathbf{k})/7$.

SOLUTION



First compute the mass of each component. We have

$$m = \rho_{\text{ST}} V = \frac{\gamma_{\text{ST}}}{g} AL$$

Then

$$m_1 = m_2 = \frac{490\ \text{lb/ft}^3}{32.2\ \text{ft/s}^2} \times \left[\frac{\pi}{4}\left(\frac{1}{8}\ \text{in.}\right)^2\right] \times (\pi \times 18\ \text{in.}) \times \left(\frac{1\ \text{ft}}{12\ \text{in.}}\right)^3$$

$$= 6.1112 \times 10^{-3}\ \text{lb} \cdot \text{s}^2/\text{ft}$$

$$m_3 = m_4 = \frac{490\ \text{lb/ft}^3}{32.2\ \text{ft/s}^2} \times \left[\frac{\pi}{4}\left(\frac{1}{8}\ \text{in.}\right)^2\right] \times 18\ \text{in.} \times \left(\frac{1\ \text{ft}}{12\ \text{in.}}\right)^3$$

$$= 1.9453\ \text{lb} \cdot \text{s}^2/\text{ft}$$

Now observe that the centroidal products of inertia, $\bar{I}_{x'y'}, \bar{I}_{y'z'}$, and $\bar{I}_{z'x'}$, for each component are zero because of symmetry.

Also $\qquad \bar{x}_3 = \bar{x}_4 = 0 \qquad \bar{y}_1 = 0 \qquad \bar{z}_1 = \bar{z}_2 = 0$

Then $\qquad I_{xy} = \Sigma(\cancelto{0}{\bar{I}_{x'y'}} + m\bar{x}\,\bar{y}) = m_2\bar{x}_2\bar{y}_2$

$$= (6.1112 \times 10^{-3}\ \text{lb} \cdot \text{s}^2/\text{ft})\left(-\frac{2 \times 18}{\pi}\ \text{in.}\right)(18\ \text{in.})\left(\frac{1\ \text{ft}}{12\ \text{in.}}\right)^2$$

$$= -8.75480 \times 10^{-3}\ \text{lb} \cdot \text{ft} \cdot \text{s}^2$$

$$I_{yz} = \Sigma(\cancelto{0}{\bar{I}_{y'z'}} + m\bar{y}\,\bar{z}) = m_3\bar{y}_3\bar{z}_3 + m_4\bar{y}_4\bar{z}_4$$

Now $\qquad m_3 = m_4, \qquad \bar{y}_3 = \bar{y}_4, \qquad \bar{z}_4 = -\bar{z}_3 \qquad I_{yz} = 0$

$$I_{zx} = \Sigma(\cancelto{0}{\bar{I}_{z'x'}} + m\bar{z}\,\bar{x}) \quad \text{or} \quad I_{zx} = 0$$

PROBLEM 9.171 (Continued)

From the solution to Problem 9.147, we have

$$I_x = 39.1721 \times 10^{-3}\ \text{lb} \cdot \text{ft} \cdot \text{s}^2$$

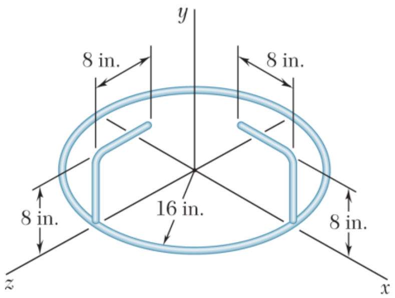
$$I_y = 36.2542 \times 10^{-3}\ \text{lb} \cdot \text{ft} \cdot \text{s}^2$$

$$I_z = 30.4184 \times 10^{-3}\ \text{lb} \cdot \text{ft} \cdot \text{s}^2$$

Substituting into Eq. (9.46)

$$\begin{aligned}
I_{OL} &= I_x\lambda_x^2 + I_y\lambda_y^2 + I_z\lambda_z^2 - 2I_{xy}\lambda_x\lambda_y - 2\cancelto{0}{I_{yz}}\lambda_y\lambda_z - 2\cancelto{0}{I_{zx}}\lambda_z\lambda_x \\
&= \left[39.1721\left(-\frac{3}{7}\right)^2 + 36.2542\left(-\frac{6}{7}\right)^2 + 30.4184\left(\frac{2}{7}\right)^2 \right. \\
&\quad \left. - 2(-8.75480)\left(-\frac{3}{7}\right)\left(-\frac{6}{7}\right)\right] \times 10^{-3}\ \text{lb} \cdot \text{ft} \cdot \text{s}^2 \\
&= (7.19488 + 26.6357 + 2.48313 + 6.43210) \times 10^{-3}\ \text{lb} \cdot \text{ft} \cdot \text{s}^2
\end{aligned}$$

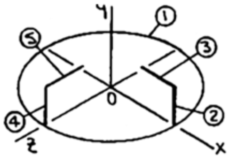
or $I_{OL} = 0.0427\ \text{lb} \cdot \text{ft} \cdot \text{s}^2$ ◀



PROBLEM 9.172

For the wire figure of Problem 9.146, determine the mass moment of inertia of the figure with respect to the axis through the origin characterized by the unit vector $\boldsymbol{\lambda} = (-3\mathbf{i} - 6\mathbf{j} + 2\mathbf{k})/7$.

SOLUTION



First compute the mass of each component. We have

$$m = \frac{W}{g} = \frac{1}{g}(W/L)_{\text{AL}}\,L$$

Then

$$m_1 = \frac{1}{32.2\ \text{ft/s}^2}(0.033\ \text{lb/ft})(2\pi \times 16\ \text{in.}) \times \frac{1\ \text{ft}}{12\ \text{in.}}$$

$$= 8.5857 \times 10^{-3}\ \text{lb}\cdot\text{s}^2/\text{ft}$$

$$m_2 = m_3 = m_4 = m_5 = \frac{1}{32.2\ \text{ft/s}^2}(0.033\ \text{lb/ft})(8\ \text{in.}) \times \frac{1\ \text{ft}}{12\ \text{in.}}$$

$$= 0.6832 \times 10^{-3}\ \text{lb}\cdot\text{ft/s}^2$$

Now observe that the centroidal products of inertia, $\bar{I}_{x'y'}, \bar{I}_{y'z'}$, and $\bar{I}_{z'x'}$, of each component are zero because of symmetry. Also

$$\bar{x}_1 = \bar{x}_4 = \bar{x}_5 = 0 \qquad \bar{y}_1 = 0 \qquad \bar{z}_1 = \bar{z}_2 = \bar{z}_3 = 0$$

Then

$$I_{xy} = \Sigma(\overset{0}{\cancel{\bar{I}_{x'y'}}} + m\bar{x}\,\bar{y}) = m_2\bar{x}_2\bar{y}_2 + m_3\bar{x}_3\bar{y}_3$$

$$= 0.6832 \times 10^{-3}\ \text{lb}\cdot\text{s}^2/\text{ft}\left(\frac{16}{12}\ \text{ft}\right)\left(\frac{4}{12}\ \text{ft}\right)$$

$$+ 0.6832 \times 10^{-3}\ \text{lb}\cdot\text{s}^2/\text{ft}\left(\frac{12}{12}\ \text{ft}\right)\left(\frac{8}{12}\ \text{ft}\right)$$

$$= (0.30364 + 0.45547) \times 10^{-3}\ \text{lb}\cdot\text{ft}\cdot\text{s}^2$$

$$= 0.75911 \times 10^{-3}\ \text{lb}\cdot\text{ft}\cdot\text{s}^2$$

Symmetry implies

$$I_{yz} = I_{xy} \qquad I_{vz} = 0.75911 \times 10^{-3}\ \text{lb}\cdot\text{ft}\cdot\text{s}^2$$

$$I_{zx} = \Sigma(\overset{0}{\cancel{\bar{I}_{z'x'}}} + m\bar{z}\,\bar{x}) = 0$$

PROBLEM 9.172 (Continued)

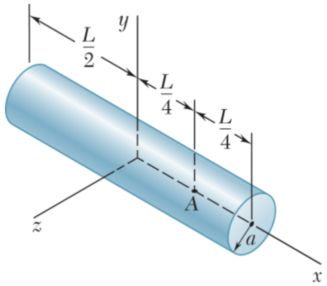
From the solution to Problem 9.146, we have

$$I_x = I_z = 10.3642 \times 10^{-3} \text{ lb} \cdot \text{ft} \cdot \text{s}^2$$
$$I_y = 19.1097 \times 10^{-3} \text{ lb} \cdot \text{ft} \cdot \text{s}^2$$

Substituting into Eq. (9.46)

$$\begin{aligned} I_{OL} &= I_x \lambda_x^2 + I_y \lambda_y^2 + I_z \lambda_z^2 - 2I_{xy}\lambda_x\lambda_y - 2I_{yz}\lambda_y\lambda_z - 2\cancelto{0}{I_{zx}}\lambda_z\lambda_x \\ &= \left[10.3642\left(-\frac{3}{7}\right)^2 + 19.1097\left(-\frac{6}{7}\right)^2 + 10.3642\left(\frac{2}{7}\right)^2 \right. \\ &\quad \left. - 2(0.75911)\left(-\frac{3}{7}\right)\left(-\frac{6}{7}\right) - 2(0.75911)\left(-\frac{6}{7}\right)\left(\frac{2}{7}\right) \right] \times 10^{-3} \text{ lb} \cdot \text{ft} \cdot \text{s}^2 \\ &= (1.90663 + 14.03978 + 0.84606 - 0.55771 + 0.37181) \times 10^{-3} \text{ lb} \cdot \text{ft} \cdot \text{s}^2 \end{aligned}$$

or $I_{OL} = 16.61 \times 10^{-3} \text{ lb} \cdot \text{ft} \cdot \text{s}^2$ ◀

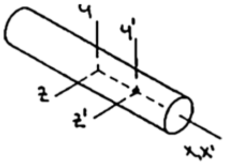


PROBLEM 9.173

For the homogeneous circular cylinder shown, of radius a and length L, determine the value of the ratio a/L for which the ellipsoid of inertia of the cylinder is a sphere when computed (*a*) at the centroid of the cylinder, (*b*) at Point A.

SOLUTION

(*a*) From Figure 9.28:



$$\bar{I}_x = \frac{1}{2}ma^2$$

$$\bar{I}_y = \bar{I}_z = \frac{1}{12}m(3a^2 + L^2)$$

Now observe that symmetry implies $I_{xy} = I_{yz} = I_{zx} = 0$

Using Eq. (9.48), the equation of the ellipsoid of inertia is then

$$I_x x^2 + I_y y^2 + I_z z^2 = 1: \quad \frac{1}{2}ma^2x^2 + \frac{1}{12}m(3a^2 + L^2)y^2 + \frac{1}{12}m(3a^2 + L^2) = 1$$

For the ellipsoid to be a sphere, the coefficients must be equal. Therefore

$$\frac{1}{2}ma^2 = \frac{1}{12}m(3a^2 + L^2) \qquad \text{or} \qquad \frac{a}{L} = \frac{1}{\sqrt{3}} \blacktriangleleft$$

(*b*) Using Figure 9.28 and the parallel-axis theorem, we have

$$I_{x'} = \frac{1}{2}ma^2$$

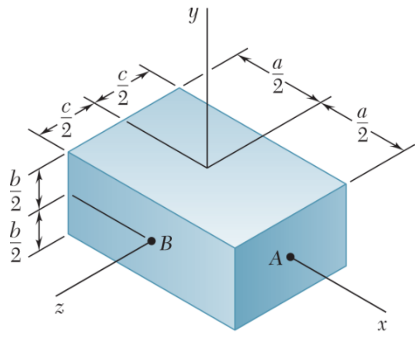
$$I_{y'} = I_{z'} = \frac{1}{12}m(3a^2 + L^2) + m\left(\frac{L}{4}\right)^2 = m\left(\frac{1}{4}a^2 + \frac{7}{48}L^2\right)$$

Now observe that symmetry implies

$$I_{x'y'} = I_{y'z'} = I_{z'x'} = 0$$

From Part *a* it then immediately follows that

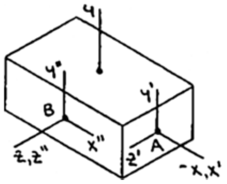
$$\frac{1}{2}ma^2 = m\left(\frac{1}{4}a^2 + \frac{7}{48}L^2\right) \qquad \text{or} \qquad \frac{a}{L} = \sqrt{\frac{7}{12}} \blacktriangleleft$$



PROBLEM 9.174

For the rectangular prism shown, determine the values of the ratios *b*/*a* and *c*/*a* so that the ellipsoid of inertia of the prism is a sphere when computed (*a*) at Point *A*, (*b*) at Point *B*.

SOLUTION



(*a*) Using Figure 9.28 and the parallel-axis theorem, we have at Point *A*

$$I_{x'} = \frac{1}{12}m(b^2 + c^2)$$

$$I_{y'} = \frac{1}{12}m(a^2 + c^2) + m\left(\frac{a}{2}\right)^2$$

$$= \frac{1}{12}m(4a^2 + c^2)$$

$$I_{z'} = \frac{1}{12}m(a^2 + b^2) + m\left(\frac{a}{2}\right)^2 = \frac{1}{12}m(4a^2 + b^2)$$

Now observe that symmetry implies

$$I_{x'y'} = I_{y'z'} = I_{z'x'} = 0$$

Using Eq. (9.48), the equation of the ellipsoid of inertia is then

$$I_{x'}x^2 + I_{y'}y^2 + I_{z'}z^2 = 1: \quad \frac{1}{12}m(b^2 + c^2)x^2 + \frac{1}{12}m(4a^2 + c^2)y^2 + \frac{1}{12}m(4a^2 + b^2)z^2 = 1$$

For the ellipsoid to be a sphere, the coefficients must be equal. Therefore

$$\frac{1}{12}m(b^2 + c^2) = \frac{1}{12}m(4a^2 + c^2)$$

$$= \frac{1}{12}m(4a^2 + b^2)$$

Then $\quad b^2 + c^2 = 4a^2 + c^2 \quad$ or $\quad \frac{b}{a} = 2$ ◀

and $\quad b^2 + c^2 = 4a^2 + b^2 \quad$ or $\quad \frac{c}{a} = 2$ ◀

PROBLEM 9.174 (Continued)

(*b*) Using Figure 9.28 and the parallel-axis theorem, we have at Point *B*

$$I_{x''} = \frac{1}{12}m(b^2 + c^2) + m\left(\frac{c}{2}\right)^2 = \frac{1}{12}m(b^2 + 4c^2)$$

$$I_{y''} = \frac{1}{12}m(a^2 + c^2) + m\left(\frac{c}{2}\right)^2 = \frac{1}{12}m(a^2 + 4c^2)$$

$$I_{z''} = \frac{1}{12}m(a^2 + b^2)$$

Now observe that symmetry implies

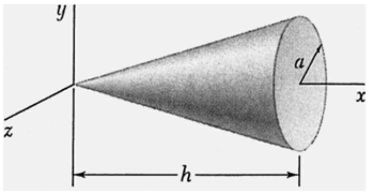
$$I_{x''y''} = I_{y''z''} = I_{z''x''} = 0$$

From part *a* it then immediately follows that

$$\frac{1}{12}m(b^2 + 4c^2) = \frac{1}{12}m(a^2 + 4c^2) = \frac{1}{12}m(a^2 + b^2)$$

Then $b^2 + 4c^2 = a^2 + 4c^2$ or $\frac{b}{a} = 1$ ◀

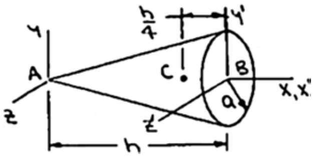
and $b^2 + 4c^2 = a^2 + b^2$ or $\frac{c}{a} = \frac{1}{2}$ ◀



PROBLEM 9.175

For the right circular cone of Sample Problem 9.11, determine the value of the ratio *a/h* for which the ellipsoid of inertia of the cone is a sphere when computed (*a*) at the apex of the cone, (*b*) at the center of the base of the cone.

SOLUTION



(*a*) From Sample Problem 9.11, we have at the apex *A*

$$I_x = \frac{3}{10}ma^2$$

$$I_y = I_z = \frac{3}{5}m\left(\frac{1}{4}a^2 + h^2\right)$$

Now observe that symmetry implies $I_{xy} = I_{yz} = I_{zx} = 0$

Using Eq. (9.48), the equation of the ellipsoid of inertia is then

$$I_x x^2 + I_y y^2 + I_z z^2 = 1: \quad \frac{3}{10}ma^2x^2 + \frac{3}{5}m\left(\frac{1}{4}a^2 + h^2\right)y^2 + \frac{3}{5}m\left(\frac{1}{4}a^2 + h^2\right)z^2 = 1$$

For the ellipsoid to be a sphere, the coefficients must be equal. Therefore,

$$\frac{3}{10}ma^2 = \frac{3}{5}m\left(\frac{1}{4}a^2 + h^2\right) \qquad \text{or} \qquad \frac{a}{h} = 2 \blacktriangleleft$$

(*b*) From Sample Problem 9.11, we have

$$I_{x'} = \frac{3}{10}ma^2$$

and at the centroid *C* $\quad I_{y''} = \frac{3}{20}m\left(a^2 + \frac{1}{4}h^2\right)$

Then $\quad I_{y'} = I_{z'} = \frac{3}{20}m\left(a^2 + \frac{1}{4}h^2\right) + m\left(\frac{h}{4}\right)^2 = \frac{1}{20}m(3a^2 + 2h^2)$

Now observe that symmetry implies

$$I_{x'y'} = I_{y'z'} = I_{z'x'} = 0$$

From Part *a* it then immediately follows that

$$\frac{3}{10}ma^2 = \frac{1}{20}m(3a^2 + 2h^2) \qquad \text{or} \qquad \frac{a}{h} = \sqrt{\frac{2}{3}} \blacktriangleleft$$

PROBLEM 9.176

Given an arbitrary body and three rectangular axes x, y, and z, prove that the mass moment of inertia of the body with respect to any one of the three axes cannot be larger than the sum of the mass moments of inertia of the body with respect to the other two axes. That is, prove that the inequality $I_x \le I_y + I_z$ and the two similar inequalities are satisfied. Further, prove that $I_y \ge \frac{1}{2} I_x$ if the body is a homogeneous solid of revolution, where x is the axis of revolution and y is a transverse axis.

SOLUTION

(i) To prove $I_y + I_z \ge I_x$

By definition

$$I_y = \int (z^2 + x^2)dm$$

$$I_z = \int (x^2 + y^2)dm$$

Then

$$I_y + I_z = \int (z^2 + x^2)dm + \int (x^2 + y^2)dm$$

$$= \int (y^2 + z^2)dm + 2\int x^2 dm$$

Now $\int (y^2 + z^2)dm = I_x$ and $\int x^2 dm \ge 0$

$$I_y + I_z \ge I_x \qquad \text{Q.E.D.}$$

The proofs of the other two inequalities follow similar steps.

(ii) If the x axis is the axis of revolution, then

$$I_y = I_z$$

and from part (i) $I_y + I_z \ge I_x$

or $2I_y \ge I_x$

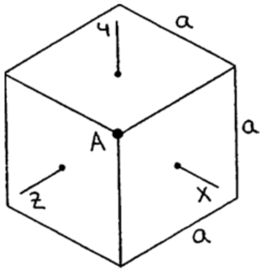
or

$$I_y \ge \frac{1}{2} I_x \qquad \text{Q.E.D.}$$

PROBLEM 9.177

Consider a cube of mass m and side a. (a) Show that the ellipsoid of inertia at the center of the cube is a sphere, and use this property to determine the moment of inertia of the cube with respect to one of its diagonals. (b) Show that the ellipsoid of inertia at one of the corners of the cube is an ellipsoid of revolution, and determine the principal moments of inertia of the cube at that point.

SOLUTION



(a) At the center of the cube have (using Figure 9.28)

$$I_x = I_y = I_z = \frac{1}{12}m(a^2 + a^2) = \frac{1}{6}ma^2$$

Now observe that symmetry implies

$$I_{xy} = I_{yz} = I_{zx} = 0$$

Using Equation (9.48), the equation of the ellipsoid of inertia is

$$\left(\frac{1}{6}ma^2\right)x^2 + \left(\frac{1}{6}ma^2\right)y^2 + \left(\frac{1}{6}ma^2\right)z^2 = 1$$

$$\text{or} \quad x^2 + y^2 + z^2 = \frac{6}{ma^2} \ (= R^2) \blacktriangleleft$$

which is the equation of a sphere.

Since the ellipsoid of inertia is a sphere, the moment of inertia with respect to any axis OL through the center O of the cube must always

be the same $\left(R = \dfrac{1}{\sqrt{I_{OL}}}\right)$.

$$I_{OL} = \frac{1}{6}ma^2 \blacktriangleleft$$

(b) The above sketch of the cube is the view seen if the line of sight is along the diagonal that passes through corner A. For a rectangular coordinate system at A and with one of the coordinate axes aligned with the diagonal, an ellipsoid of inertia at A could be constructed. If the cube is then rotated 120° about the diagonal, the mass distribution will remain unchanged. Thus, the ellipsoid will also remain unchanged after it is rotated. As noted at the end of Section 9.17, this is possible only if the ellipsoid is an ellipsoid of revolution, where the diagonal is both the axis of revolution and a principal axis.

It then follows that

$$I_{x'} = I_{OL} = \frac{1}{6}ma^2 \blacktriangleleft$$

In addition, for an ellipsoid of revolution, the two transverse principal moments of inertia are equal and any axis perpendicular to the axis of revolution is a principal axis. Then, applying the parallel-axis theorem between the center of the cube and corner A for any perpendicular axis

$$I_{y'} = I_{z'} = \frac{1}{6}ma^2 + m\left(\frac{\sqrt{3}}{2}a\right)^2$$

$$\text{or} \quad I_{y'} = I_{z'} = \frac{11}{12}ma^2 \blacktriangleleft$$

(*Note:* Part b can also be solved using the method of Section 9.18.)

PROBLEM 9.177 (Continued)

First note that at corner *A*

$$I_x = I_y = I_z = \frac{2}{3}ma^2$$

$$I_{xy} = I_{yz} = I_{zx} = \frac{1}{4}ma^2$$

Substituting into Equation (9.56) yields

$$k^3 - 2ma^2k^2 + \frac{55}{48}m^2a^6k - \frac{121}{864}m^3a^9 = 0$$

For which the roots are

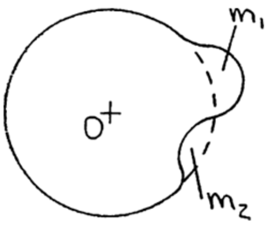
$$k_1 = \frac{1}{6}ma^2$$

$$k_2 = k_3 = \frac{11}{12}ma^2$$

PROBLEM 9.178

Given a homogeneous body of mass m and of arbitrary shape and three rectangular axes x, y, and z with origin at O, prove that the sum $I_x + I_y + I_z$ of the mass moments of inertia of the body cannot be smaller than the similar sum computed for a sphere of the same mass and the same material centered at O. Further, using the result of Problem 9.176, prove that if the body is a solid of revolution, where x is the axis of revolution, its mass moment of inertia I_y about a transverse axis y cannot be smaller than $3ma^2/10$, where a is the radius of the sphere of the same mass and the same material.

SOLUTION



(i) Using Equation (9.30), we have

$$I_x + I_y + I_z = \int (y^2 + z^2)dm + \int (z^2 + x^2)\,dm + \int (x^2 + y^2)dm$$

$$= 2\int (x^2 + y^2 + z^2)dm$$

$$= 2\int r^2 dm$$

where r is the distance from the origin O to the element of mass dm. Now assume that the given body can be formed by adding and subtracting appropriate volumes V_1 and V_2 from a sphere of mass m and radius a which is centered at O; it then follows that

$$m_1 = m_2 \ (m_{\text{body}} = m_{\text{sphere}} = m)$$

Then

$$(I_x + I_y + I_z)_{\text{body}} = (I_x + I_y + I_z)_{\text{sphere}} + (I_x + I_y + I_z)_{V_1} - (I_x + I_y + I_z)_{V_2}$$

or

$$(I_x + I_y + I_z)_{\text{body}} = (I_x + I_y + I_z)_{\text{sphere}} + 2\int_{m_1} r^2 dm - 2\int_{m_2} r^2 dm$$

Now, $m_1 = m_2$ and $r_1 \geq r_2$ for all elements of mass dm in volumes 1 and 2.

$$\int_{m_1} r^2 dm - \int_{m_2} r^2 dm \geq 0$$

so that

$$(I_x + I_y + I_z)_{\text{body}} \geq (I_x + I_y + I_z)_{\text{sphere}} \qquad \text{Q.E.D.}$$

PROBLEM 9.178 (Continued)

(ii) First note from Figure 9.28 that for a sphere

$$I_x = I_y = I_z = \frac{2}{5}ma^2$$

Thus $$(I_x + I_y + I_z)_{\text{sphere}} = \frac{6}{5}ma^2$$

For a solid of revolution, where the *x* axis is the axis of revolution, we have

$$I_y = I_z$$

Then, using the results of part (i)

$$(I_x + 2I_y)_{\text{body}} \geq \frac{6}{5}ma^2$$

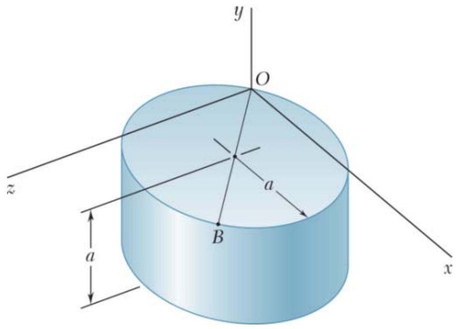
From Problem 9.178 we have $$I_y \geq \frac{1}{2}I_x$$

or $$(2I_y - I_x)_{\text{body}} \geq 0$$

Adding the last two inequalities yields

$$(4I_y)_{\text{body}} \geq \frac{6}{5}ma^2$$

or $$(I_y)_{\text{body}} \geq \frac{3}{10}ma^2 \quad \text{Q.E.D.}$$

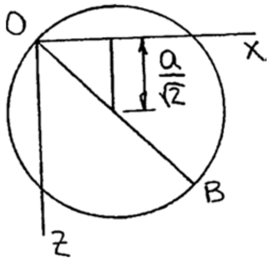


PROBLEM 9.179*

The homogeneous circular cylinder shown has a mass m, and the diameter OB of its top surface forms 45° angles with the x and z axes. (a) Determine the principal mass moments of inertia of the cylinder at the origin O. (b) Compute the angles that the principal axes of inertia at O form with the coordinate axes. (c) Sketch the cylinder, and show the orientation of the principal axes of inertia relative to the x, y, and z axes.

SOLUTION

(a) First compute the moments of inertia using Figure 9.28 and the parallel-axis theorem.



$$I_x = I_z = \frac{1}{12}m(3a^2 + a^2) + m\left[\left(\frac{a}{\sqrt{2}}\right)^2 + \left(\frac{a}{2}\right)^2\right] = \frac{13}{12}ma^2$$

$$I_y = \frac{1}{2}ma^2 + m(a)^2 = \frac{3}{2}ma^2$$

Next observe that the centroidal products of inertia are zero because of symmetry. Then

$$I_{xy} = \cancelto{0}{\bar{I}_{x'y'}} + m\bar{x}\,\bar{y} = m\left(\frac{a}{\sqrt{2}}\right)\left(-\frac{a}{2}\right) = -\frac{1}{2\sqrt{2}}ma^2$$

$$I_{yz} = \cancelto{0}{\bar{I}_{y'z'}} + m\bar{y}\,\bar{z} = m\left(-\frac{a}{2}\right)\left(\frac{a}{\sqrt{2}}\right) = -\frac{1}{2\sqrt{2}}ma^2$$

$$I_{zx} = \cancelto{0}{\bar{I}_{z'x'}} + m\bar{z}\,\bar{x} = m\left(\frac{a}{\sqrt{2}}\right)\left(\frac{a}{\sqrt{2}}\right) = \frac{1}{2}ma^2$$

Substituting into Equation (9.56)

$$K^3 - \left(\frac{13}{12} + \frac{3}{2} + \frac{13}{12}\right)ma^2K^2$$

$$+\left[\left(\frac{13}{12}\times\frac{3}{2}\right) + \left(\frac{3}{2}\times\frac{13}{12}\right) + \left(\frac{13}{12}\times\frac{13}{12}\right) - \left(-\frac{1}{2\sqrt{2}}\right)^2 - \left(-\frac{1}{2\sqrt{2}}\right)^2 - \left(\frac{1}{2}\right)^2\right](ma^2)^2K$$

$$-\left[\left(\frac{13}{12}\times\frac{3}{2}\times\frac{13}{12}\right) - \left(\frac{13}{12}\right)\left(-\frac{1}{2\sqrt{2}}\right)^2 - \left(\frac{3}{2}\right)\left(\frac{1}{2}\right)^2\right.$$

$$\left.-\left(\frac{13}{12}\right)\left(-\frac{1}{2\sqrt{2}}\right)^2 - 2\left(-\frac{1}{2\sqrt{2}}\right)\left(-\frac{1}{2\sqrt{2}}\right)\left(\frac{1}{2}\right)\right](ma^2)^3 = 0$$

Simplifying and letting $K = ma^2\zeta$ yields

$$\zeta^3 - \frac{11}{3}\zeta^2 + \frac{565}{144}\zeta - \frac{95}{96} = 0$$

Solving yields

$$\zeta_1 = 0.363383 \qquad \zeta_2 = \frac{19}{12} \qquad \zeta_3 = 1.71995$$

The principal moments of inertia are then

$K_1 = 0.363ma^2$ ◀

$K_2 = 1.583ma^2$ ◀

$K_3 = 1.720ma^2$ ◀

(*b*) To determine the direction cosines $\lambda_x, \lambda_y, \lambda_z$ of each principal axis, we use two of the equations of Equations (9.54) and (9.57).

Thus,

$$(I_x - K)\lambda_x - I_{xy}\lambda_y - I_{zx}\lambda_z = 0 \tag{9.54a}$$

$$-I_{zx}\lambda_x - I_{yz}\lambda_y + (I_z - K)\lambda_z = 0 \tag{9.54c}$$

$$\lambda_x^2 + \lambda_y^2 + \lambda_z^2 = 1 \tag{9.57}$$

(*Note:* Since $I_{xy} = I_{yz}$, Equations (9.54a) and (9.54c) were chosen to simplify the "elimination" of λ_y during the solution process.)

Substituting for the moments and products of inertia in Equations (9.54a) and (9.54c)

$$\left(\frac{13}{12}ma^2 - K\right)\lambda_x - \left(-\frac{1}{2\sqrt{2}}ma^2\right)\lambda_y - \left(\frac{1}{2}ma^2\right)\lambda_z = 0$$

$$-\left(\frac{1}{2}ma^2\right)\lambda_x - \left(-\frac{1}{2\sqrt{2}}ma^2\right)\lambda_y + \left(\frac{13}{12}ma^2 - K\right)\lambda_z = 0$$

or

$$\left(\frac{13}{12} - \zeta\right)\lambda_x + \frac{1}{2\sqrt{2}}\lambda_y - \frac{1}{2}\lambda_z = 0 \tag{i}$$

and

$$-\frac{1}{2}\lambda_x + \frac{1}{2\sqrt{2}}\lambda_y + \left(\frac{13}{12} - \zeta\right)\lambda_z = 0 \tag{ii}$$

Observe that these equations will be identical, so that one will need to be replaced, if

$$\frac{13}{12} - \zeta = -\frac{1}{2} \qquad \text{or} \qquad \zeta = \frac{19}{12}$$

Thus, a third independent equation will be needed when the direction cosines associated with K_2 are determined. Then for K_1 and K_3

Eq. (i) through Eq. (ii): $\left[\frac{13}{12}-\zeta-\left(-\frac{1}{2}\right)\right]\lambda_x+\left[-\frac{1}{2}-\left(\frac{13}{12}-\zeta\right)\right]\lambda_z=0$

or $\lambda_z=\lambda_x$

Substituting into Eq. (i): $\left(\frac{13}{12}-\zeta\right)\lambda_x+\frac{1}{2\sqrt{2}}\lambda_y-\frac{1}{2}\lambda_x=0$

or $\lambda_y=2\sqrt{2}\left(\zeta-\frac{7}{12}\right)\lambda_x$

Substituting into Equation (9.57):

$$\lambda_x^2+\left[2\sqrt{2}\left(\zeta-\frac{7}{12}\right)\lambda_x\right]^2+(\lambda_x)^2=1$$

or $$\left[2+8\left(\zeta-\frac{7}{12}\right)^2\right]\lambda_x^2=1 \qquad \text{(iii)}$$

$\mathbf{K}_1$: Substituting the value of ζ_1 into Eq. (iii):

$$\left[2+8\left(0.363383-\frac{7}{12}\right)^2\right](\lambda_x)_1^2=1$$

or $(\lambda_x)_1=(\lambda_z)_1=0.647249$

and then $(\lambda_y)_1=2\sqrt{2}\left(0.363383-\frac{7}{12}\right)(0.647249)$

$=-0.402662$

$(\theta_x)_1=(\theta_z)_1=49.7°\quad(\theta_y)_1=113.7°$ ◀

$\mathbf{K}_3$: Substituting the value of ζ_3 into Eq. (iii):

$$\left[2+8\left(1.71995-\frac{7}{12}\right)^2\right](\lambda_x)_3^2=1$$

or $(\lambda_x)_3=(\lambda_z)_3=0.284726$

and then $(\lambda_y)_3=2\sqrt{2}\left(1.71995-\frac{7}{12}\right)(0.284726)$

$=0.915348$

$(\theta_x)_3=(\theta_z)_3=73.5°\quad(\theta_y)_3=23.7°$ ◀

K$_2$: For this case, the set of equations to be solved consists of Equations (9.54a), (9.54b), and (9.57).

Now

$$-I_{xy}\lambda_x + (I_y - K)\lambda_y - I_{yz}\lambda_z = 0 \qquad (9.54b)$$

Substituting for the moments and products of inertia.

$$-\left(-\frac{1}{2\sqrt{2}}ma^2\right)\lambda_x + \left(\frac{3}{2}ma^2 - K\right)\lambda_y - \left(-\frac{1}{2\sqrt{2}}ma^2\right)\lambda_z = 0$$

or

$$\frac{1}{2\sqrt{2}}\lambda_x + \left(\frac{3}{2} - \xi\right)\lambda_y + \frac{1}{2\sqrt{2}}\lambda_z = 0 \qquad (iv)$$

Substituting the value of ξ_2 into Eqs. (i) and (iv):

$$\left(\frac{13}{12} - \frac{19}{12}\right)(\lambda_x)_2 + \frac{1}{2\sqrt{2}}(\lambda_y)_2 - \frac{1}{2}(\lambda_z)_2 = 0$$

$$\frac{1}{2\sqrt{2}}(\lambda_x)_2 + \left(\frac{3}{2} - \frac{19}{12}\right)(\lambda_y)_2 + \frac{1}{2\sqrt{2}}(\lambda_z)_2 = 0$$

or

$$-(\lambda_x)_2 + \frac{1}{\sqrt{2}}(\lambda_y)_2 - (\lambda_z)_2 = 0$$

and

$$(\lambda_x)_2 - \frac{\sqrt{2}}{6}(\lambda_y)_2 + (\lambda_z)_2 = 0$$

Adding yields

$$(\lambda_y)_2 = 0$$

and then

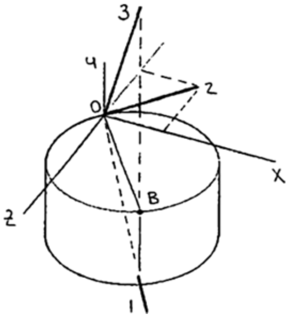
$$(\lambda_y)_2 = -(\lambda_x)_2$$

Substituting into Equation (9.57)

$$(\lambda_x)_2^2 + \overset{0}{\cancel{(\lambda_y)_2^2}} + (-\lambda_x)_2^2 = 1$$

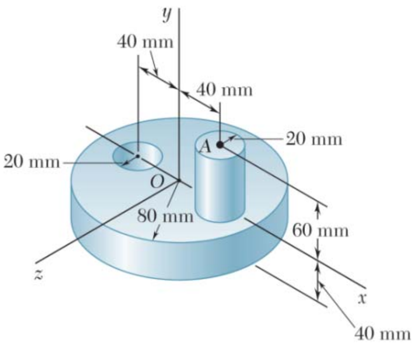
or

$$(\lambda_x)_2 = \frac{1}{\sqrt{2}} \quad \text{and} \quad (\lambda_z)_2 = -\frac{1}{\sqrt{2}}$$



$$(\theta_x)_2 = 45.0° \quad (\theta_y)_2 = 90.0° \quad (\theta_z)_2 = 135.0° \blacktriangleleft$$

(*c*) Principal axes 1 and 3 lie in the vertical plane of symmetry passing through Points *O* and *B*. Principal axis 2 lies in the *xz* plane.



PROBLEM 9.180

For the component described in Problem 9.165, determine (*a*) the principal mass moments of inertia at the origin, (*b*) the principal axes of inertia at the origin. Sketch the body and show the orientation of the principal axes of inertia relative to the *x*, *y*, and *z* axes.

SOLUTION

(*a*) From the solutions to Problems 9.141 and 9.165 we have

Problem 9.141:

$$I_x = 13.98800 \times 10^{-3}\ \text{kg}\cdot\text{m}^2$$
$$I_y = 20.55783 \times 10^{-3}\ \text{kg}\cdot\text{m}^2$$
$$I_z = 14.30368 \times 10^{-3}\ \text{kg}\cdot\text{m}^2$$

Problem 9.165:

$$I_{yz} = I_{zx} = 0$$
$$I_{xy} = 0.39460 \times 10^{-3}\ \text{kg}\cdot\text{m}^2$$

Eq. (9.55) then becomes

$$\begin{vmatrix} I_x - K & -I_{xy} & 0 \\ -I_{xy} & I_y - K & 0 \\ 0 & 0 & I_z - K \end{vmatrix} = 0 \quad \text{or} \quad (I_x - K)(I_y - K)(I_z - K) - (I_z - K)I_{xy}^2 = 0$$

Thus $\qquad I_z - K = 0 \qquad I_x I_y - (I_x + I_y)K + K^2 - I_{xy}^2 = 0$

Substituting: $\qquad K_1 = 14.30368 \times 10^{-3}\ \text{kg}\cdot\text{m}^2$

or $\qquad K_1 = 14.30 \times 10^{-3}\ \text{kg}\cdot\text{m}^2$ ◀

and

$$(13.98800 \times 10^{-3})(20.55783 \times 10^{-3}) - (13.98800 + 20.55783)(10^{-3})K + K^2 - (0.39460 \times 10^{-3})^2 = 0$$

or

$$K^2 - (34.54583 \times 10^{-3})K + 287.4072 \times 10^{-6} = 0$$

Solving yields $\qquad K_2 = 13.96438 \times 10^{-3}\ \text{kg}\cdot\text{m}^2$

or $\qquad K_2 = 13.96 \times 10^{-3}\ \text{kg}\cdot\text{m}^2$ ◀

and $\qquad K_3 = 20.58145 \times 10^{-3}\ \text{kg}\cdot\text{m}^2 \qquad$ or $\qquad K_3 = 20.6 \times 10^{-3}\ \text{kg}\cdot\text{m}^2$ ◀

PROBLEM 9.180 (Continued)

(*b*) To determine the direction cosines $\lambda_x, \lambda_y, \lambda_z$ of each principal axis, use two of the equations of Eq. (9.54) and Eq. (9.57). Then

K_1: Begin with Eqs. (9.54*a*) and (9.54*b*) with $I_{yz} = I_{zx} = 0.$

$$(I_x - K_1)(\lambda_x)_1 - I_{xy}(\lambda_y)_1 = 0$$
$$-I_{xy}(\lambda_x)_1 + (I_y - K_1)(\lambda_y)_1 = 0$$

Substituting:

$$[(13.98800 - 14.30368)\times 10^{-3}](\lambda_x)_1 - (0.39460\times 10^{-3})(\lambda_y)_1 = 0$$
$$-(0.39460\times 10^{-3})(\lambda_x)_1 + [(20.55783 - 14.30368)\times 10^{-3}](\lambda_y)_1 = 0$$

Adding yields $(\lambda_x)_1 = (\lambda_y)_1 = 0$

Then using Eq. (9.57) $\cancelto{0}{(\lambda_x)_1^2} + \cancelto{0}{(\lambda_y)_1^2} + (\lambda_z)_1^2 = 1$

or $(\lambda_z)_1 = 1$

$(\theta_x)_1 = 90.0° \quad (\theta_y)_1 = 90.0° \quad (\theta_z)_1 = 0°$ ◀

K_2: Begin with Eqs. (9.54*b*) and (9.54*c*) with $I_{yz} = I_{zx} = 0.$

$$-I_{xy}(\lambda_x)_2 + (I_y - K_2)(\lambda_y)_2 = 0 \qquad \text{(i)}$$
$$(I_z - K_2)(\lambda_z)_2 = 0$$

Now $I_z \neq K_2 \Rightarrow (\lambda_z)_2 = 0$

Substituting into Eq. (i):

$$-(0.39460\times 10^{-3})(\lambda_x)_z + [(20.55783 - 13.96438)\times 10^{-3}](\lambda_y)_2 = 0$$

or $(\lambda_y)_2 = 0.059847(\lambda_x)_2$

Using Eq. (9.57): $(\lambda_x)_2^2 + [0.05984](\lambda_x)_2]^2 + \cancelto{0}{(\lambda_z)_2^2} = 1$

or $(\lambda_x)_2 = 0.998214$

and $(\lambda_y)_2 = 0.059740$

$(\theta_x)_2 = 3.4° \qquad (\theta_y)_2 = 86.6° \qquad (\theta_z)_2 = 90.0°$ ◀

K_3: Begin with Eqs. (9.54*b*) and (9.54*c*) with $I_{yz} = I_{zx} = 0.$

$$-I_{xy}(\lambda_x)_3 + (I_y - K_3)(\lambda_y)_3 = 0 \qquad \text{(ii)}$$
$$(I_z - K_3)(\lambda_z)_3 = 0$$

PROBLEM 9.180 (Continued)

Now $$I_z \neq K_3 \Rightarrow (\lambda_z)_3 = 0$$

Substituting into Eq. (ii):

$$-(0.39460\times10^{-3})(\lambda_x)_3 + [(20.55783-20.58145)\times10^{-3}](\lambda_y)_3 = 0$$

or $$(\lambda_y)_3 = -16.70618(\lambda_x)_3$$

Using Eq. (9.57): $$(\lambda_x)_3^2 + [-16.70618(\lambda_x)_3]^2 + \cancelto{0}{(\lambda_z)_3^2} = 1$$

or $$(\lambda_x)_3 = -0.059751 \quad \text{(axes right-handed set } \Rightarrow \text{"\_")}$$

and $$(\lambda_y)_3 = 0.998211$$

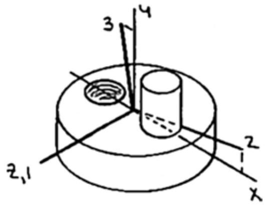
$$(\theta_x)_3 = 93.4^\circ \qquad (\theta_y)_3 = 3.43^\circ \qquad (\theta_z)_3 = 90.0^\circ \blacktriangleleft$$

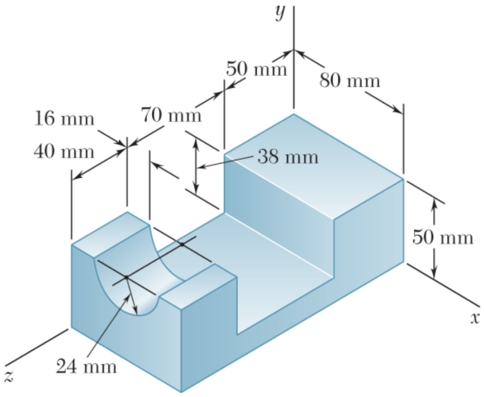
Note: Since the principal axes are orthogonal and $(\theta_z)_2 = (\theta_z)_3 = 90^\circ$, it follows that

$$|(\lambda_x)_2| = |(\lambda_y)_3| \qquad |(\lambda_y)_2| = |(\lambda_z)_3|$$

The differences in the above values are due to round-off errors.

(*c*) Principal axis 1 coincides with the *z* axis, while principal axes 2 and 3 lie in the *xy* plane.





PROBLEM 9.181*

For the component described in Problems 9.145 and 9.149, determine (*a*) the principal mass moments of inertia at the origin, (*b*) the principal axes of inertia at the origin. Sketch the body and show the orientation of the principal axes of inertia relative to the *x*, *y*, and *z* axes.

SOLUTION

(*a*) From the solutions to Problems 9.145 and 9.149, we have

Problem 9.145: $I_x = 26.4325\times10^{-3}\ \text{kg}\cdot\text{m}^2$ Problem 9.149: $I_{xy} = 2.5002\times10^{-3}\ \text{kg}\cdot\text{m}^2$

$I_y = 31.1726\times10^{-3}\ \text{kg}\cdot\text{m}^2$ $I_{yz} = 4.0627\times10^{-3}\ \text{kg}\cdot\text{m}^2$

$I_z = 8.5773\times10^{-3}\ \text{kg}\cdot\text{m}^2$ $I_{zx} = 8.8062\times10^{-3}\ \text{kg}\cdot\text{m}^2$

Substituting into Eq. (9.56):

$$\begin{aligned}
&K^3 - [(26.4325 + 31.1726 + 8.5773)(10^{-3})]K^2\\
&\quad + [(26.4325)(31.1726) + (31.1726)(8.5773) + (8.5773)(26.4325)\\
&\quad - (2.5002)^2 - (4.0627)^2 - (8.8062)^2](10^{-6})K\\
&\quad - [(26.4325)(31.1726)(8.5773) - (26.4325)(4.0627)^2\\
&\quad - (31.1726)(8.8062)^2 - (8.5773)(2.5002)^2\\
&\quad - 2(2.5002)(4.0627)(8.8062)](10^{-9}) = 0
\end{aligned}$$

or $$K^3 - (66.1824\times10^{-3})K^2 + (1217.76\times10^{-6})K - (3981.23\times10^{-9}) = 0$$

Solving yields

$K_1 = 4.1443\times10^{-3}\ \text{kg}\cdot\text{m}^2$ or $K_1 = 4.14\times10^{-3}\ \text{kg}\cdot\text{m}^2$ ◀

$K_2 = 29.7840\times10^{-3}\ \text{kg}\cdot\text{m}^2$ or $K_2 = 29.8\times10^{-3}\ \text{kg}\cdot\text{m}^2$ ◀

$K_3 = 32.2541\times10^{-3}\ \text{kg}\cdot\text{m}^2$ or $K_3 = 32.3\times10^{-3}\ \text{kg}\cdot\text{m}^2$ ◀

PROBLEM 9.181* (Continued)

(*b*) To determine the direction cosines $\lambda_x, \lambda_y, \lambda_z$ of each principal axis, use two of the equations of Eqs. (9.54) and Eq. (9.57). Then

K_1: Begin with Eqs. (9.54*a*) and (9.54*b*).

$$(I_x - K_1)(\lambda_x)_1 - I_{xy}(\lambda_y)_1 - I_{zx}(\lambda_z)_1 = 0$$
$$I_{xy}(\lambda_x)_1 + (I_y - K_1)(\lambda_y)_1 - I_{yz}(\lambda_z)_1 = 0$$

Substituting:

$$[(26.4325 - 4.1443)(10^{-3})](\lambda_x)_1 - (2.5002 \times 10^{-3})(\lambda_y)_1 - (8.8062 \times 10^{-3})(\lambda_z)_1 = 0$$

$$-(2.5002 \times 10^{-3})(\lambda_x)_1 + [(31.1726 - 4.1443)(10^{-3})](\lambda_y)_1 - (4.0627 \times 10^{-3})(\lambda_z)_1 = 0$$

Simplifying

$$8.9146(\lambda_x)_1 - (\lambda_y)_1 - 3.5222(\lambda_z)_1 = 0$$
$$-0.0925(\lambda_x)_1 + (\lambda_y)_1 - 0.1503(\lambda_z)_1 = 0$$

Adding and solving for $(\lambda_z)_1$:

$$(\lambda_z)_1 = 2.4022(\lambda_x)_1$$

and then

$$(\lambda_y)_1 = [8.9146 - 3.5222(2.4022)](\lambda_x)_1$$
$$= 0.45357(\lambda_x)_1$$

Now substitute into Eq. (9.57):

$$(\lambda_x)_1^2 + [0.45357(\lambda_x)_1]^2 + [2.4022(\lambda_x)_1]^2 = 1$$

or $(\lambda_x)_1 = 0.37861$

and $(\lambda_y)_1 = 0.17173$ $(\lambda_z)_1 = 0.90950$

$$(\theta_x)_1 = 67.8° \quad (\theta_y)_1 = 80.1° \quad (\theta_z)_1 = 24.6° \blacktriangleleft$$

K_2: Begin with Eqs. (9.54*a*) and (9.54*b*).

$$(I_x - K_2)(\lambda_x)_2 - I_{xy}(\lambda_y)_2 - I_{zx}(\lambda_z)_2 = 0$$
$$-I_{xy}(\lambda_x)_2 + (I_y - K_2)(\lambda_y)_2 - I_{yz}(\lambda_z)_2 = 0$$

Substituting:

$$[(26.4325 - 29.7840)(10^{-3})](\lambda_x)_2 - (2.5002 \times 10^{-3})(\lambda_y)_2 - (8.8062 \times 10^{-3})(\lambda_z)_2 = 0$$

$$-(2.5002 \times 10^{-3})(\lambda_x)_2 + [(31.1726 - 29.7840)(10^{-3})](\lambda_y)_2 - (4.0627 \times 10^{-3})(\lambda_z)_2 = 0$$

PROBLEM 9.181* (Continued)

Simplifying

$$-1.3405(\lambda_x)_2 - (\lambda_y)_2 - 3.5222(\lambda_z)_2 = 0$$
$$-1.8005(\lambda_x)_2 + (\lambda_y)_2 - 2.9258(\lambda_z)_2 = 0$$

Adding and solving for $(\lambda_z)_2$:

$$(\lambda_z)_2 = -0.48713(\lambda_x)_2$$

and then

$$(\lambda_y)_2 = [-1.3405 - 3.5222(-0.48713)](\lambda_x)_2$$
$$= 0.37527(\lambda_x)_2$$

Now substitute into Eq. (9.57):

$$(\lambda_x)_2^2 + [0.37527(\lambda_x)_2]^2 + [-0.48713(\lambda_x)_2]^2 = 1$$

or $(\lambda_x)_2 = 0.85184$

and $(\lambda_y)_2 = 0.31967$ $(\lambda_z)_2 = -0.41496$

$$(\theta_x)_1 = 31.6° \quad (\theta_y)_2 = 71.4° \quad (\theta_z)_2 = 114.5° \blacktriangleleft$$

K_3: Begin with Eqs. (9.54*a*) and (9.54*b*).

$$(I_x - K_3)(\lambda_x)_3 - I_{xy}(\lambda_y)_3 - I_{zx}(\lambda_z)_3 = 0$$
$$-I_{xy}(\lambda_x)_3 + (I_y - K_3)(\lambda_y)_3 - I_{yz}(\lambda_z)_3 = 0$$

Substituting:

$$[(26.4325 - 32.2541)(10^{-3})](\lambda_x)_3 - (2.5002 \times 10^{-3})(\lambda_y)_3 - (8.8062 \times 10^{-3})(\lambda_z)_3 = 0$$

$$-(2.5002 \times 10^{-3})(\lambda_x)_3 + [(31.1726 - 32.2541)(10^{-3})](\lambda_y)_3 - (4.0627 \times 10^{-3})(\lambda_z)_3 = 0$$

Simplifying

$$-2.3285(\lambda_x)_3 - (\lambda_y)_3 - 3.5222(\lambda_z)_3 = 0$$
$$2.3118(\lambda_x)_3 + (\lambda_y)_3 + 3.7565(\lambda_z)_3 = 0$$

Adding and solving for $(\lambda_z)_3$:

$$(\lambda_z)_3 = 0.071276(\lambda_x)_3$$

and then

$$(\lambda_y)_3 = [-2.3285 - 3.5222(0.071276)](\lambda_x)_3$$
$$= -2.5795(\lambda_x)_3$$

PROBLEM 9.181* (Continued)

Now substitute into Eq. (9.57):

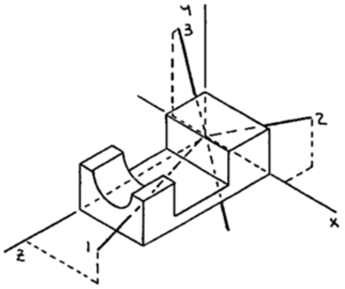
$$(\lambda_x)_3^2 + [-2.5795(\lambda_x)_3]^2 + [0.071276(\lambda_x)_3]^2 = 1 \qquad \text{(i)}$$

or $$(\lambda_x)_3 = 0.36134$$

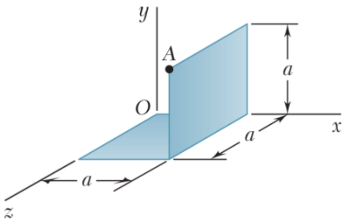
and $(\lambda_y)_3 = 0.93208$ $\qquad (\lambda_z)_3 = 0.025755$

$$(\theta_x)_3 = 68.8° \quad (\theta_y)_3 = 158.8° \quad (\theta_z)_3 = 88.5° \blacktriangleleft$$

(*c*) *Note:* Principal axis 3 has been labeled so that the principal axes form a right-handed set. To obtain the direction cosines corresponding to the labeled axis, the negative root of Eq. (i) must be chosen; that is, $(\lambda_x)_3 = -0.36134$.



Then $$(\theta_x)_3 = 111.2° \quad (\theta_y)_3 = 21.2° \quad (\theta_z)_3 = 91.5° \blacktriangleleft$$



PROBLEM 9.182*

For the component described in Problem 9.167, determine (*a*) the principal mass moments of inertia at the origin, (*b*) the principal axes of inertia at the origin. Sketch the body and show the orientation of the principal axes of inertia relative to the *x*, *y*, and *z* axes.

SOLUTION

(*a*) From the solution of Problem 9.167, we have

$$I_x = \frac{1}{2}\frac{W}{g}a^2 \qquad I_{xy} = \frac{1}{4}\frac{W}{g}a^2$$

$$I_y = \frac{W}{g}a^2 \qquad I_{yz} = \frac{1}{8}\frac{W}{g}a^2$$

$$I_z = \frac{5}{6}\frac{W}{g}a^2 \qquad I_{zx} = \frac{3}{8}\frac{W}{g}a^2$$

Substituting into Eq. (9.56):

$$K^3 - \left[\left(\frac{1}{2}+1+\frac{5}{6}\right)\left(\frac{W}{g}a^2\right)\right]K^2$$

$$+\left[\left(\frac{1}{2}\right)(1)+(1)\left(\frac{5}{6}\right)+\left(\frac{5}{6}\right)\left(\frac{1}{2}\right)-\left(\frac{1}{4}\right)^2-\left(\frac{1}{8}\right)^2-\left(\frac{3}{8}\right)^2\right]\left(\frac{W}{g}a^2\right)^2 K$$

$$-\left[\left(\frac{1}{2}\right)(1)\left(\frac{5}{6}\right)-\left(\frac{1}{2}\right)\left(\frac{1}{8}\right)^2-(1)\left(\frac{3}{8}\right)^2-\left(\frac{5}{6}\right)\left(\frac{1}{4}\right)^2-2\left(\frac{1}{4}\right)\left(\frac{1}{8}\right)\left(\frac{3}{8}\right)\right]\left(\frac{W}{g}a^2\right)^3=0$$

Simplifying and letting $K = \frac{W}{g}a^2K$ yields

$$K^3 - 2.33333K^2 + 1.53125K - 0.192708 = 0$$

Solving yields

$$K_1 = 0.163917 \quad K_2 = 1.05402 \quad K_3 = 1.11539$$

The principal moments of inertia are then $K_1 = 0.1639\frac{W}{g}a^2$ ◀

$K_2 = 1.054\frac{W}{g}a^2$ ◀

$K_3 = 1.115\frac{W}{g}a^2$ ◀

PROBLEM 9.182* (Continued)

(*b*) To determine the direction cosines $\lambda_x,\ \lambda_y,\ \lambda_z$ of each principal axis, use two of the equations of Eq. (9.54) and Eq. (9.57). Then

K_1: Begin with Eqs. (9.54*a*) and (9.54*b*).

$$(I_x - K_1)(\lambda_x)_1 - I_{xy}(\lambda_y)_1 - I_{zx}(\lambda_z)_1 = 0$$
$$-I_{xy}(\lambda_x)_1 + (I_y - K_2)(\lambda_y)_1 - I_{yz}(\lambda_z)_1 = 0$$

Substituting

$$\left[\left(\frac{1}{2} - 0.163917\right)\left(\frac{W}{g}a^2\right)\right](\lambda_x)_1 - \left(\frac{1}{4}\frac{W}{g}a^2\right)(\lambda_y)_1 - \left(\frac{3}{8}\frac{W}{g}a^2\right)(\lambda_z)_1 = 0$$

$$-\left(\frac{1}{4}\frac{W}{g}a^2\right)(\lambda_x)_1 + \left[(1 - 0.163917)\left(\frac{W}{g}a^2\right)\right](\lambda_y)_1 - \left(\frac{1}{8}\frac{W}{g}a^2\right)(\lambda_z)_1 = 0$$

Simplifying

$$1.34433(\lambda_x)_1 - (\lambda_y)_1 - 1.5(\lambda_z)_1 = 0$$

$$-0.299013(\lambda_x)_1 + (\lambda_y)_1 - 0.149507(\lambda_z)_1 = 0$$

Adding and solving for $(\lambda_z)_1$:

$$(\lambda_z)_1 = 0.633715(\lambda_x)_1$$

and then
$$(\lambda_y)_1 = [1.34433 - 1.5(0.633715)](\lambda_x)_1$$
$$= 0.393758(\lambda_x)_1$$

Now substitute into Eq. (9.57):

$$(\lambda_x)_1^2 + [0.393758(\lambda_x)_1]^2 + (0.633715(\lambda_x)_1]^2 = 1$$

or $(\lambda_x)_1 = 0.801504$

and $(\lambda_y)_1 = 0.315599$ $(\lambda_z)_1 = 0.507925$

$(\theta_x)_1 = 36.7°$ $(\theta_y)_1 = 71.6°$ $(\theta_z)_1 = 59.5°$ ◀

K_2: Begin with Eqs. (9.54*a*) and (9.54*b*):

$$(I_x - k_2)(\lambda_x)_2 - I_{xy}(\lambda_y)_2 - I_{zx}(\lambda_z)_2 = 0$$
$$-I_{xy}(\lambda_x)_2 + (I_y - k_2)(\lambda_y)_2 - I_{yz}(\lambda_z)_2 = 0$$

PROBLEM 9.182* (Continued)

Substituting

$$\left[\left(\frac{1}{2}-1.05402\right)\left(\frac{W}{g}a^2\right)\right](\lambda_x)_2-\left(\frac{1}{4}\frac{W}{g}a^2\right)(\lambda_y)_2-\left(\frac{3}{8}\frac{W}{g}a^2\right)(\lambda_z)_2=0$$

$$-\left(\frac{1}{4}\frac{W}{g}a^2\right)(\lambda_x)_2+\left[(1-1.05402)\left(\frac{W}{g}a^2\right)\right](\lambda_y)_2-\left(\frac{1}{8}\frac{W}{g}a^2\right)(\lambda_z)_2=0$$

Simplifying

$$-2.21608(\lambda_x)_2-(\lambda_y)_2-1.5(\lambda_z)_2=0$$

$$4.62792(\lambda_x)_2+(\lambda_y)_2+2.31396(\lambda_z)_2=0$$

Adding and solving for $(\lambda_z)_2$

$$(\lambda_z)_2=-2.96309(\lambda_x)_2$$

and then

$$(\lambda_y)_2=[-2.21608-1.5(-2.96309)](\lambda_x)_2$$

$$=2.22856(\lambda_x)_2$$

Now substitute into Eq. (9.57):

$$(\lambda_x)_2^2+[2.22856(\lambda_x)_2]^2+[-2.96309(\lambda_x)_2]^2=1$$

or $(\lambda_x)_2=0.260410$

and $(\lambda_y)_2=0.580339$ $(\lambda_z)_2=-0.771618$

$$(\theta_x)_2=74.9° \quad (\theta_y)_2=54.5° \quad (\theta_z)_2=140.5° \blacktriangleleft$$

K_3: Begin with Eqs. (9.54*a*) and (9.54*b*):

$$(I_x-K_3)(\lambda_x)_3-I_{xy}(\lambda_y)_3-I_{zx}(\lambda_z)_3=0$$

$$-I_{xy}(\lambda_x)_3+(I_y-K_3)(\lambda_y)_3-I_{yz}(\lambda_z)_3=0$$

Substituting

$$\left[\left(\frac{1}{2}-1.11539\right)\left(\frac{W}{g}a^2\right)\right](\lambda_x)_3-\left(\frac{1}{4}\frac{W}{g}a^2\right)(\lambda_y)_3-\left(\frac{3}{8}\frac{W}{g}a^2\right)(\lambda_z)_3=0$$

$$-\left(\frac{1}{4}\frac{W}{g}a^2\right)(\lambda_x)_3+\left[(1-1.11539)\left(\frac{W}{g}a^2\right)\right](\lambda_y)_3-\left(\frac{1}{8}\frac{W}{g}a^2\right)(\lambda_z)_3=0$$

Simplifying

$$-2.46156(\lambda_x)_3-(\lambda_y)_3-1.5(\lambda_z)_3=0$$

$$2.16657(\lambda_x)_3+(\lambda_y)_3+1.08328(\lambda_z)_3=0$$

PROBLEM 9.182* (Continued)

Adding and solving for $(\lambda_z)_3$

$$(\lambda_z)_3 = -0.707885(\lambda_x)_3$$

and then

$$\begin{aligned}(\lambda_y)_3 &= [-2.46156 - 1.5(-0.707885)](\lambda_x)_3 \\ &= -1.39973(\lambda_x)_3\end{aligned}$$

Now substitute into Eq. (9.57):

$$(\lambda_x)_3^2 + [-1.39973(\lambda_x)_3]^2 + [-0.707885(\lambda_x)_3]^2 = 1 \qquad \text{(i)}$$

or

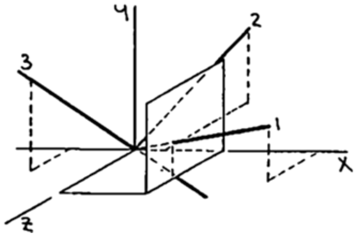
$$(\lambda_x)_3 = 0.537577$$

and

$$(\lambda_y)_3 = -0.752463 \qquad (\lambda_z)_3 = -0.380543$$

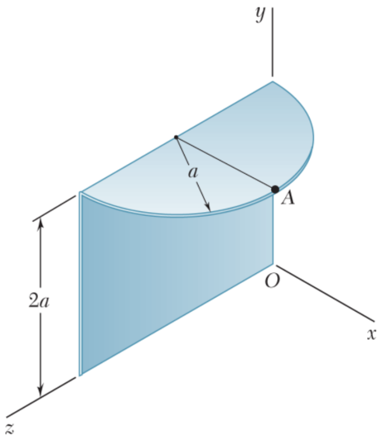
$$(\theta_x)_3 = 57.5° \quad (\theta_y)_3 = 138.8° \quad (\theta_z)_3 = 112.4° \blacktriangleleft$$

(*c*) *Note:* Principal axis 3 has been labeled so that the principal axes form a right-handed set. To obtain the direction cosines corresponding to the labeled axis, the negative root of Eq. (i) must be chosen; that is, $(\lambda_x)_3 = -0.537577$.



Then

$$(\theta_x)_3 = 122.5° \quad (\theta_y)_3 = 41.2° \quad (\theta_z)_3 = 67.6° \blacktriangleleft$$



PROBLEM 9.183*

For the component described in Problem 9.168, determine (*a*) the principal mass moments of inertia at the origin, (*b*) the principal axes of inertia at the origin. Sketch the body and show the orientation of the principal axes of inertia relative to the *x*, *y*, and *z* axes.

SOLUTION

(*a*) From the solution to Problem 9.168, we have

$$I_x = 18.91335\frac{\gamma t}{g}a^4 \qquad I_{xy} = 1.33333\frac{\gamma t}{g}a^4$$

$$I_y = 7.68953\frac{\gamma t}{g}a^4 \qquad I_{yz} = 7.14159\frac{\gamma t}{g}a^4$$

$$I_z = 12.00922\frac{\gamma t}{g}a^4 \qquad I_{zx} = 0.66667\frac{\gamma t}{g}a^4$$

Substituting into Eq. (9.56):

$$K^3 - \left[(18.91335 + 7.68953 + 12.00922)\left(\frac{\gamma t}{g}a^4\right)\right]K^2$$

$$+[(18.91335)(7.68953) + (7.68953)(12.00922) + (12.00922)(18.91335)$$

$$-(1.33333)^2 - (7.14159)^2 + (0.66667)^2]\left(\frac{\gamma t}{g}a^4\right)^2 K$$

$$-[(18.91335)(7.68953)(12.00922) - (18.91335)(7.14159)^2$$

$$-(7.68953)(0.66667)^2 - (12.00922)(1.33333)^2$$

$$-2(1.33333)(7.14159)(0.66667)]\left(\frac{\gamma t}{g}a^4\right)^3 = 0$$

Simplifying and letting

$$K = \frac{\gamma t}{g}a^4 K \quad \text{yields}$$

$$K^3 - 38.61210K^2 + 411.69009K - 744.47027 = 0$$

PROBLEM 9.183* (Continued)

Solving yields

$$K_1 = 2.25890 \quad K_2 = 17.27274 \quad K_3 = 19.08046$$

The principal moments of inertia are then $K_1 = 2.26\dfrac{\gamma t}{g}a^4$ ◀

$$K_2 = 17.27\frac{\gamma t}{g}a^4 \blacktriangleleft$$

$$K_3 = 19.08\frac{\gamma t}{g}a^4 \blacktriangleleft$$

(*b*) To determine the direction cosines $\lambda_x,\ \lambda_y,\ \lambda_z$ of each principal axis, use two of the equations of Eq. (9.54) and Eq. (9.57). Then

K_1: Begin with Eqs. (9.54*a*) and (9.54*b*):

$$(I_x - K_1)(\lambda_x)_1 - I_{xy}(\lambda_y)_1 - I_{zx}(\lambda_z)_1 = 0$$
$$-I_{xy}(\lambda_x)_1 + (I_y - K_2)(\lambda_y)_1 - I_{yz}(\lambda_z)_1 = 0$$

Substituting

$$\left[(18.91335 - 2.25890)\left(\frac{\gamma t}{g}a^4\right)\right](\lambda_x)_1 - \left(1.33333\frac{\gamma t}{a}a^4\right)(\lambda_y)_1 - \left(0.66667\frac{\gamma t}{g}a^4\right)(\lambda_z)_1 = 0$$

$$-\left(1.33333\frac{\gamma t}{g}a^4\right)(\lambda_x)_1 + \left[(7.68953 - 2.25890)\left(\frac{\gamma t}{g}a^4\right)\right](\lambda_y)_1 - \left(7.14159\frac{\gamma t}{g}a^4\right)(\lambda_z)_1 = 0$$

Simplifying

$$12.49087(\lambda_x)_1 - (\lambda_y)_1 - 0.5(\lambda_z)_1 = 0$$
$$-0.24552(\lambda_x)_1 + (\lambda_y)_1 - 1.31506(\lambda_z)_1 = 0$$

Adding and solving for $(\lambda_z)_1$

$$(\lambda_z)_1 = 6.74653(\lambda_x)_1$$

and then
$$(\lambda_y)_1 = [12.49087 - (0.5)(6.74653)](\lambda_x)_1$$
$$= 9.11761(\lambda_x)_1$$

Now substitute into Eq. (9.57): $(\lambda_x)_1^2 + [9.11761(\lambda_x)_1]^2 + [6.74653(\lambda_x)_1]^2 = 1$

or $(\lambda_x)_1 = 0.087825$

and $(\lambda_y)_1 = 0.80075 \qquad (\lambda_z)_1 = 0.59251$

$$(\theta_x)_1 = 85.0° \quad (\theta_y)_1 = 36.8° \quad (\theta_z)_1 = 53.7° \blacktriangleleft$$

PROBLEM 9.183* (Continued)

K_2: Begin with Eqs. (9.54*a*) and (9.54*b*):

$$(I_x - K_2)(\lambda_x)_2 - I_{xy}(\lambda_y)_2 - I_{zx}(\lambda_z)_2 = 0$$
$$-I_{xy}(\lambda_x)_2 + (I_y - K_2)(\lambda_y)_2 - I_{yz}(\lambda_z)_2 = 0$$

Substituting

$$[(18.91335 - 17.27274)\left(\frac{\gamma t}{g}a^4\right)(\lambda_x)_2 - \left(1.33333\frac{\gamma t}{g}a^4\right)(\lambda_y)_2 - \left(0.66667\frac{\gamma t}{g}a^4\right)(\lambda_z)_2 = 0$$
$$-\left(1.33333\frac{\gamma t}{g}a^4\right)(\lambda_x)_2 + \left[(7.68953 - 17.27274)\left(\frac{\gamma t}{g}a^4\right)\right](\lambda_y)_2 - \left(7.14159\frac{\gamma t}{g}a^4\right)(\lambda_z)_2 = 0$$

Simplifying

$$1.23046(\lambda_x)_2 - (\lambda_y)_2 - 0.5(\lambda_z)_2 = 0$$
$$0.13913(\lambda_x)_2 + (\lambda_y)_2 + 0.74522(\lambda_z)_2 = 0$$

Adding and solving for $(\lambda_z)_2$

$$(\lambda_z)_2 = -5.58515(\lambda_x)_2$$

and then $(\lambda_y)_2 = [1.23046 - (0.5)(-5.58515)](\lambda_x)_2$

$$= 4.02304\,(\lambda_x)_2$$

Now substitute into Eq. (9.57):

$$(\lambda_x)_2^2 + [4.02304(\lambda_x)_2]^2 + [-5.58515(\lambda_x)_2]^2 = 1$$

or $(\lambda_x)_2 = 0.14377$

and $(\lambda_y)_2 = 0.57839 \qquad (\lambda_z)_2 = -0.80298$

$$(\theta_x)_2 = 81.7° \quad (\theta_y)_2 = 54.7° \quad (\theta_z)_2 = 143.4° \blacktriangleleft$$

K_3: Begin with Eqs. (9.54*a*) and (9.54*b*):

$$(I_x - K_3)(\lambda_x)_3 - I_{xy}(\lambda_y)_3 - I_{zx}(\lambda_z)_3 = 0$$
$$-I_{xy}(\lambda_x)_3 + (I_y - K_3)(\lambda_y)_3 - I_{yz}(\lambda_y)_3 = 0$$

Substituting

$$[(18.91335 - 19.08046)\left(\frac{\gamma t}{g}a^4\right)(\lambda_x)_3 - \left(1.33333\frac{\gamma t}{g}a^4\right)(\lambda_y)_3 - \left(0.66667\frac{\gamma t}{g}a^4\right)(\lambda_z)_3 = 0$$
$$-\left(1.33333\frac{\gamma t}{g}a^4\right)(\lambda_x)_3 + \left[(7.68953 - 19.08046)\left(\frac{\gamma t}{g}a^4\right)\right](\lambda_y)_3 - \left(7.14159\frac{\gamma t}{g}a^4\right)(\lambda_z)_3 = 0$$

PROBLEM 9.183* (Continued)

Simplifying

$$-0.12533(\lambda_x)_3 - (\lambda_y)_3 - 0.5(\lambda_z)_3 = 0$$
$$0.11705(\lambda_x)_3 + (\lambda_y)_3 + 0.62695(\lambda_z)_3 = 0$$

Adding and solving for $(\lambda_z)_3$

$$(\lambda_z)_3 = 0.06522(\lambda_x)_3$$

and then
$$(\lambda_y)_3 = [-0.12533 - (0.5)(0.06522)](\lambda_x)_3$$
$$= -0.15794(\lambda_x)_3$$

Now substitute into Eq. (9.57):

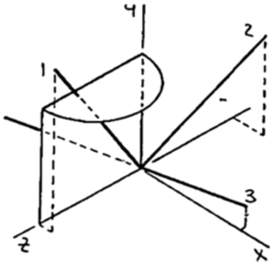
$$(\lambda_x)_3^2 + [-0.15794(\lambda_x)_3]^2 + [0.06522(\lambda_x]_3]^2 = 1 \qquad \text{(i)}$$

or
$$(\lambda_x)_3 = 0.98571$$

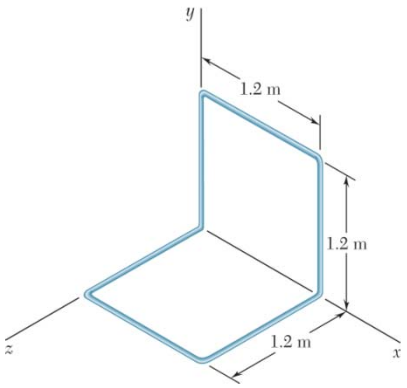
and
$$(\lambda_y)_3 = -0.15568 \qquad (\lambda_z)_3 = 0.06429$$

$$(\theta_x)_3 = 9.7° \quad (\theta_y)_3 = 99.0° \quad (\theta_z)_3 = 86.3° ◀$$

(*c*) *Note:* Principal axis 3 has been labeled so that the principal axes form a right-handed set. To obtain the direction cosines corresponding to the labeled axis, the negative root of Eq. (i) must be chosen; that is, $(\lambda_x)_3 = -0.98571$.



Then
$$(\theta_x)_3 = 170.3° \quad (\theta_y)_3 = 81.0° \quad (\theta_z)_3 = 93.7° ◀$$



PROBLEM 9.184*

For the component described in Problems 9.148 and 9.170, determine (*a*) the principal mass moments of inertia at the origin, (*b*) the principal axes of inertia at the origin. Sketch the body and show the orientation of the principal axes of inertia relative to the *x*, *y*, and *z* axes.

SOLUTION

(*a*) From the solutions to Problems 9.148 and 9.170. We have

$$I_x = 0.32258\ \text{kg}\cdot\text{m}^2 \qquad I_y = I_z = 0.41933\ \text{kg}\cdot\text{m}^2$$

$$I_{xy} = I_{zx} = 0.096768\ \text{kg}\cdot\text{m}^2 \qquad I_{yz} = 0$$

Substituting into Eq. (9.56) and using

$$I_y = I_z \qquad I_{xy} = I_{zx} \qquad I_{yz} = 0$$

$$\begin{aligned}K^3 &- [0.32258 + 2(0.41933)]K^2\\ &+ [2(0.32258)(0.41933) + (0.41933)^2 - 2(0.096768)^2]K\\ &- [(0.32258)(0.41933)^2 - 2(0.41933)(0.096768)^2] = 0\end{aligned}$$

Simplifying

$$K^3 - 1.16124K^2 + 0.42764K - 0.048869 = 0$$

Solving yields

$$K_1 = 0.22583\ \text{kg}\cdot\text{m}^2 \qquad \text{or} \qquad K_1 = 0.226\ \text{kg}\cdot\text{m}^2 \blacktriangleleft$$

$$K_2 = 0.41920\ \text{kg}\cdot\text{m}^2 \qquad \text{or} \qquad K_2 = 0.419\ \text{kg}\cdot\text{m}^2 \blacktriangleleft$$

$$K_3 = 0.51621\ \text{kg}\cdot\text{m}^2 \qquad \text{or} \qquad K_3 = 0.516\ \text{kg}\cdot\text{m}^2 \blacktriangleleft$$

(*b*) To determine the direction cosines λ_x, λ_y, λ_z of each principal axis, use two of the equations of Eqs. (9.54) and (9.57). Then

K_1: Begin with Eqs. (9.54*b*) and (9.54*c*):

$$-I_{xy}(\lambda_x)_1 + (I_y - K_1)(\lambda_y)_1 - \cancelto{0}{I_{yz}}(\lambda_z)_3 = 0$$

$$-I_{zx}(\lambda_x)_1 - \cancelto{0}{I_{yz}}(\lambda_y)_1 + (I_z - K_1)(\lambda_z)_3 = 0$$

PROBLEM 9.184* (Continued)

Substituting

$$-(0.096768)(\lambda_x)_1 + (0.41933 - 0.22583)(\lambda_y)_1 = 0$$
$$-(0.096768)(\lambda_x)_1 + (0.41933 - 0.22583)(\lambda_z)_1 = 0$$

Simplifying yields

$$(\lambda_y)_1 = (\lambda_z)_1 = 0.50009(\lambda_x)_1$$

Now substitute into Eq. (9.54):

$$(\lambda_x)^2 + 2[0.50009(\lambda_x)_1]^2 = 1$$

or $$(\lambda_x)_1 = 0.81645$$

and $$(\lambda_y)_1 = (\lambda_z)_1 = 0.40830$$

$$(\theta_x)_1 = 35.3° \quad (\theta_y)_1 = (\theta_z)_1 = 65.9° \blacktriangleleft$$

$K_2:$ Begin with Eqs. (9.54*a*) and (9.54*b*)

$$(I_x - K_2)(\lambda_x)_2 - I_{xy}(\lambda_y)_2 - I_{zx}(\lambda_z)_2 = 0$$
$$-I_{xy}(\lambda_x)_2 + (I_y - K_2)(\lambda_y)_2 - \cancelto{0}{I_{yz}}(\lambda_z)_2 = 0$$

Substituting

$$(0.32258 - 0.41920)(\lambda_x)_2 - (0.096768)(\lambda_y)_2 - (0.096768)(\lambda_z)_2 = 0 \qquad \text{(i)}$$
$$-(0.96768)(\lambda_x)_2 + (0.41933 - 0.41920)(\lambda_y)_2 = 0 \qquad \text{(ii)}$$

Eq. (ii) $\Rightarrow (\lambda_x)_2 = 0$

and then Eq. (i) $\Rightarrow (\lambda_z)_2 = -(\lambda_y)_2$

Now substitute into Eq. (9.57):

$$\cancelto{0}{(\lambda_x)_2^2} + (\lambda_y)_2^2 + [-(\lambda_y)_2]^2 = 1$$

or $$(\lambda_y)_2 = \frac{1}{\sqrt{2}}$$

and $$(\lambda_z)_2 = -\frac{1}{\sqrt{2}}$$

$$(\theta_x)_2 = 90.0° \quad (\theta_y)_2 = 45.0° \quad (\theta_z)_2 = 135.0° \blacktriangleleft$$

PROBLEM 9.184* (Continued)

K_3: Begin with Eqs. (9.54*b*) and (9.54*c*):

$$I_{xy}(\lambda_x)_3 + (I_y - K_3)(\lambda_y)_3 + \cancelto{0}{I_{yz}}(\lambda_z)_3 = 0$$

$$-I_{zx}(\lambda_x)_3 - \cancelto{0}{I_{yz}}(\lambda_y)_3 + (I_z - K_3)(\lambda_z)_3 = 0$$

Substituting

$$-(0.096768)(\lambda_x)_3 + (0.41933 - 0.51621)(\lambda_y)_3 = 0$$

$$-(0.096768)(\lambda_x)_3 + (0.41933 - 0.51621)(\lambda_z)_3 = 0$$

Simplifying yields

$$(\lambda_y)_3 = (\lambda_z)_3 = -(\lambda_x)_3$$

Now substitute into Eq. (9.57):

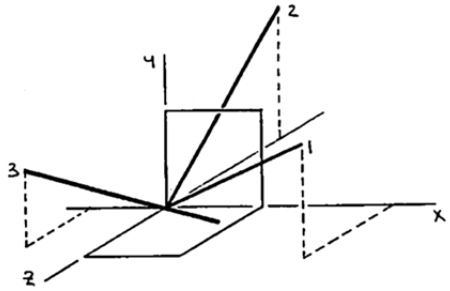
$$(\lambda_x)_3^2 + 2[-(\lambda_x)_3]^2 = 1 \tag{i}$$

or
$$(\lambda_x)_3 = \frac{1}{\sqrt{3}}$$

and
$$(\lambda_y)_3 = (\lambda_z) = -\frac{1}{\sqrt{3}}$$

$$(\theta_x)_3 = 54.7° \quad (\theta_y)_3 = (\theta_z)_3 = 125.3° \blacktriangleleft$$

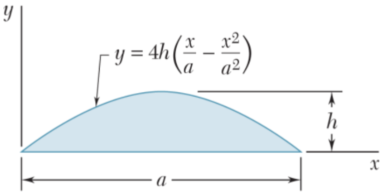
(*c*)



Note: Principal axis 3 has been labeled so that the principal axes form a right-handed set. To obtain the direction cosines corresponding to the labeled axis, the negative root of Eq. (i) must be chosen;

That is,
$$(\lambda_x)_3 = -\frac{1}{\sqrt{3}}$$

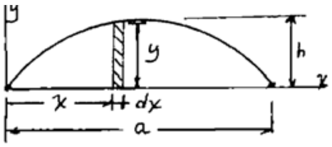
Then
$$(\theta_x)_3 = 125.3° \qquad (\theta_y)_3 = (\theta_z)_3 = 54.7° \blacktriangleleft$$



PROBLEM 9.185

Determine by direct integration the moments of inertia of the shaded area with respect to the *x* and *y* axes.

SOLUTION



$$y = 4h\left(\frac{x}{a} - \frac{x^2}{a^2}\right)$$

$$dI_x = \frac{1}{3}y^3dx = \frac{1}{3}\left[4h\left(\frac{x}{a} - \frac{x^2}{a^2}\right)\right]^3 dx$$

$$I_x = \int dI_x = \frac{64h^3}{3}\int_0^a \left(\frac{x^3}{a^3} - 3\frac{x^4}{a^4} + 3\frac{x^5}{a^5} - \frac{x^6}{a^6}\right)dx$$

$$= \frac{64h^3}{3}\left|\frac{1}{4}\frac{x^4}{a^3} - \frac{3}{5}\frac{x^5}{a^4} + \frac{1}{2}\frac{x^6}{a^5} - \frac{1}{7}\frac{x^7}{a^6}\right|_0^a$$

$$= \frac{64h^3}{3}a\left(\frac{1}{4} - \frac{3}{5} + \frac{1}{2} - \frac{1}{7}\right) = \frac{64h^3}{3}a\left(\frac{3}{420}\right)$$

$$I_x = \frac{16}{105}ah^3 \blacktriangleleft$$

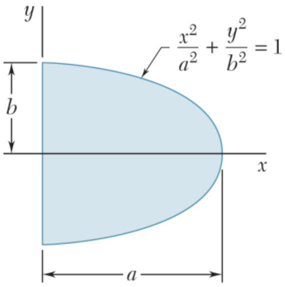
$$y = 4h\left(\frac{x}{a} - \frac{x^2}{a^2}\right)$$

$$dA = ydx$$

$$dI_y = x^2dA = 4hx^2\left(\frac{x}{a} - \frac{x^2}{a^2}\right)dx$$

$$I_y = 4h\int_0^a \left(\frac{x^3}{a} - \frac{x^4}{a^2}\right)dx$$

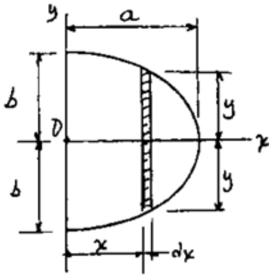
$$I_y = 4h\left[\frac{x^4}{4a} - \frac{x^5}{5a^2}\right]_0^a = 4h\left(\frac{a^3}{4} - \frac{a^3}{5}\right) \qquad I_y = \frac{1}{5}ha^3 \blacktriangleleft$$



PROBLEM 9.186

Determine the moment of inertia and the radius of gyration of the shaded area shown with respect to the y axis.

SOLUTION



$$\frac{x^2}{a^2}+\frac{y^2}{b^2}=1$$

$$y=b\sqrt{1-\frac{x^2}{a^2}}$$

$$dA=2y\,dx$$

$$dI_y=x^2dA=2x^2y\,dx$$

$$I_y=\int dI_y=\int_0^a 2x^2y\,dx=2b\int_0^a x^2\sqrt{1-\frac{x^2}{a^2}}\,dx$$

Set: $x=a\sin\theta \qquad dx=a\cos\theta\,d\theta$

$$I_y=2b\int_0^{\pi/2}a^2\sin^2\theta\sqrt{1-\sin^2\theta}\quad a\cos\theta\,d\theta$$

$$=2a^3b\int_0^{\pi/2}\sin^2\theta\cos^2\theta\,d\theta=2a^3b\int_0^{\pi/2}\frac{1}{4}\sin^2 2\theta\,d\theta$$

$$=\frac{1}{2}a^3b\int_0^{\pi/2}\frac{1}{2}(1-\cos 4\theta)d\theta=\frac{1}{4}a^3b\left|\theta-\frac{1}{4}\sin 4\theta\right|_0^{\pi/2}$$

$$=\frac{1}{4}a^3b\left[\frac{\pi}{2}-0\right]=\frac{\pi}{8}a^3b$$

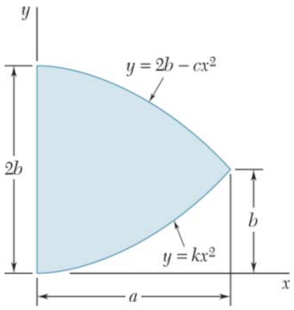
$$I_y=\frac{1}{8}\pi a^3b \blacktriangleleft$$

From solution of Problem 9.16: $A=\frac{1}{2}\pi ab$

Thus:

$$I_y=k_y^2A \quad k_y^2=\frac{I_y}{A}=\frac{\frac{1}{8}\pi a^3b}{\frac{1}{2}\pi ab}=\frac{1}{4}a^2$$

$$k_y=\frac{1}{2}a \blacktriangleleft$$



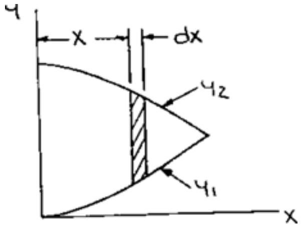
PROBLEM 9.187

Determine the moment of inertia and the radius of gyration of the shaded area shown with respect to the *x* axis.

SOLUTION

At $x = a_1,\ y_1 = y_2 = b$: $\quad y_1:\quad b = ka^2 \quad \text{or} \quad k = \dfrac{b}{a^2}$

$$y_2:\quad b = 2b - ca^2 \quad \text{or} \quad c = \frac{b}{a^2}$$



Then $$y_1 = \frac{b}{a^2}x^2 \quad y_2 = b\left(2 - \frac{x^2}{a^2}\right)$$

Now $$dA = (y_2 - y_1)dx = \left[b\left(2 - \frac{x^2}{a^2}\right) - \frac{b}{a^2}x^2\right]dx = \frac{2b}{a^2}(a^2 - x^2)dx$$

Then $$A = \int dA = \int_0^a \frac{2b}{a^2}(a^2 - x^2)dx = \frac{2b}{a^2}\left[a^2x - \frac{1}{3}x^3\right]_0^a = \frac{4}{3}ab$$

Now $$dI_x = \left(\frac{1}{3}y_2^3 - \frac{1}{3}y_1^3\right)dx = \frac{1}{3}\left\{\left[b\left(2 - \frac{x^2}{a^2}\right)\right]^3 - \left[\frac{b}{a^2}x^2\right]^3\right\}dx$$

$$= \frac{1}{3}\frac{b^3}{a^6}(8a^6 - 12a^4x^2 + 6a^2x^4 - x^6 - x^6)dx$$

$$= \frac{2}{3}\frac{b^3}{a^6}(4a^6 - 6a^4x^2 + 3a^2x^4 - x^6)dx$$

Then $$I_x = \int dI_x = \int_0^a \frac{2}{3}\frac{b^3}{a^6}(4a^6 - 6a^4x^2 + 3a^2x^4 - x^6)dx$$

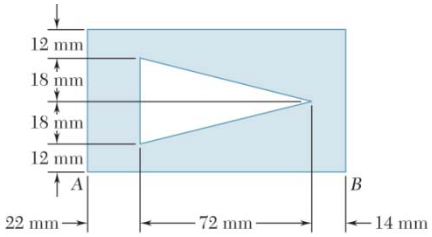
$$= \frac{2}{3}\frac{b^3}{a^6}\left[4a^6x - 2a^4x^3 + \frac{3}{5}a^6x^5 - \frac{1}{7}x^7\right]_0^a$$

$$= \frac{172}{105}ab^3$$

or $I_x = 1.638ab^3$ ◀

and $$k_x^2 = \frac{I_x}{A} = \frac{\frac{172}{105}ab^3}{\frac{4}{3}ab} = \frac{43}{35}b^2$$

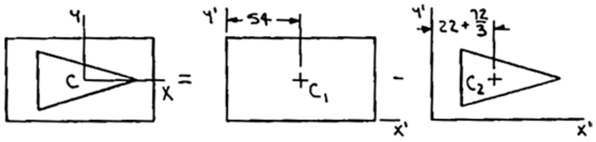
or $k_x = 1.108b$ ◀



PROBLEM 9.188

Determine the moments of inertia $\bar{I}_x$ and $\bar{I}_y$ of the area shown with respect to centroidal axes respectively parallel and perpendicular to side *AB*.

SOLUTION



Dimensions in mm

First locate centroid *C* of the area.

Symmetry implies $\bar{Y} = 30$ mm.

	A, mm^2	$\bar{x}$, mm	$\bar{x}A$, mm^3
1	$108 \times 60 = 6480$	54	349,920
2	$-\frac{1}{2} \times 72 \times 36 = -1296$	46	–59,616
Σ	5184		290,304

Then $$\bar{X}\,\Sigma A = \Sigma \bar{x}A: \quad \bar{X}(5184 \text{ mm}^2) = 290{,}304 \text{ mm}^3$$

or $$\bar{X} = 56.0 \text{ mm}$$

Now $$\bar{I}_x = (I_x)_1 - (I_x)_2$$

where $$(I_x)_1 = \frac{1}{12}(108 \text{ mm})(60 \text{ mm})^3 = 1.944 \times 10^6 \text{ mm}^4$$

$$(I_x)_2 = 2\left[\frac{1}{36}(72 \text{ mm})(18 \text{ mm})^3 + \left(\frac{1}{2} \times 72 \text{ mm} \times 18 \text{ mm}\right)(6 \text{ mm})^2\right]$$

$$= 2(11{,}664 + 23{,}328) \text{ mm}^4 = 69.984 \times 10^3 \text{ mm}^4$$

[$(I_x)_2$ is obtained by dividing A_2 into]

Then $$\bar{I}_x = (1.944 - 0.069984) \times 10^6 \text{ mm}^4$$

or $$\bar{I}_x = 1.874 \times 10^6 \text{ mm}^4 \blacktriangleleft$$

PROBLEM 9.188 (Continued)

Also $$\bar{I}_y = (I_y)_1 - (I_y)_2$$

where $$(I_y)_1 = \frac{1}{12}(60\text{ mm})(108\text{ mm})^3 + (6480\text{ mm}^2)[(56.54)\text{ mm}]^2$$

$$= (6,298,560 + 25,920)\text{ mm}^4 = 6.324\times 10^6\text{ mm}^4$$

$$(I_y)_2 = \frac{1}{36}(36\text{ mm})(72\text{ mm})^3 + (1296\text{ mm}^2)[(56-46)\text{ mm}]^2$$

$$= (373,248 + 129,600)\text{ mm}^4 = 0.502\times 10^6\text{ mm}^4$$

Then $$\bar{I}_y = (6.324 - 0.502)10^6\text{ mm}^4$$

or $\bar{I}_y = 5.82\times 10^6\text{ mm}^4$ ◀

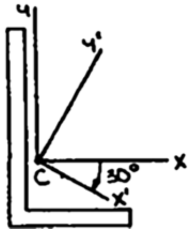
PROBLEM 9.192

For the L5 × 3 × $\frac{1}{2}$-in. angle cross section shown, use Mohr's circle to determine (*a*) the moments of inertia and the product of inertia with respect to new centroidal axes obtained by rotating the *x* and *y* axes 30° clockwise, (*b*) the orientation of the principal axes through the centroid and the corresponding values of the moments of inertia.

SOLUTION

From Figure 9.13*a*:



$$\bar{I}_x = 9.43\text{ in}^4 \qquad \bar{I}_y = 2.55\text{ in}^4$$

From the solution to Problem 9.191

$$\bar{I}_{xy} = -2.81235\text{ in}^4$$

The Mohr's circle is defined by the diameter *XY*, where

$$X(9.43 - 2.81235), \qquad Y(2.55,\ 2.81235)$$

Now

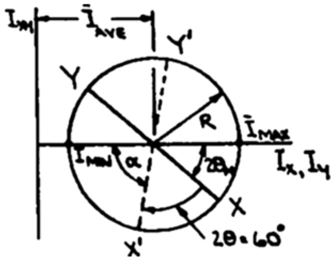
$$\bar{I}_{\text{ave}} = \frac{1}{2}(\bar{I}_x + \bar{I}_y) = \frac{1}{2}(9.43 + 2.55) = 5.99\text{ in}^4$$

and

$$R = \sqrt{\left[\frac{1}{2}(\bar{I}_x - \bar{I}_y)\right]^2 + \bar{I}_{xy}^2} = \sqrt{\left[\frac{1}{2}(9.43 - 2.55)\right]^2 + (-2.81235)^2}$$

$$= 4.4433\text{ in}^4$$

The Mohr's circle is then drawn as shown.



I_xy
Ī_AVE
Y'
Y
R
Ī_MAX
I_MIN
α
2θ_M
I_x, I_y
X
X'
2θ = 60°

$$\tan 2\theta_m = -\frac{2\bar{I}_{xy}}{\bar{I}_x - \bar{I}_y}$$

$$= -\frac{2(-2.81235)}{9.43 - 2.55}$$

$$= 0.81754$$

or

$$2\theta_m = 39.267°$$

and

$$\theta_m = 19.6335°$$

Then

$$\alpha = 180° - (39.267° + 60°)$$

$$= 80.733°$$

PROBLEM 9.192 (Continued)

(*a*) We have $\bar{I}_{x'} = \bar{I}_{\text{ave}} - R\cos\alpha = 5.99 - 4.4433\cos 80.733°$

or $\bar{I}_{x'} = 5.27\text{ in}^4$ ◀

$\bar{I}_{y'} = \bar{I}_{\text{ave}} + R\cos\alpha = 5.99 + 4.4433\cos 80.733°$

or $\bar{I}_{y'} = 6.71\text{ in}^4$ ◀

$\bar{I}_{x'y'} = -R\sin\alpha = -4.4433\sin 80.733°$

or $\bar{I}_{x'y'} = -4.39\text{ in}^4$ ◀

(*b*) First observe that the principal axes are obtained by rotating the *xy* axes through

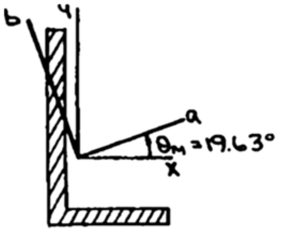
19.63° counterclockwise ◀

about *C*.

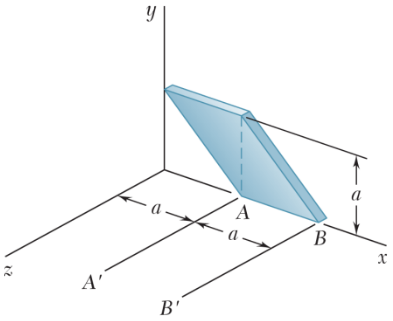
Now $\bar{I}_{\text{max, min}} = \bar{I}_{\text{ave}} \pm R = 5.99 \pm 4.4433$

or $\bar{I}_{\text{max}} = 10.43\text{ in}^4$ ◀

$\bar{I}_{\text{min}} = 1.547\text{ in}^4$ ◀



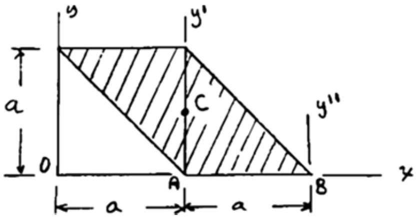
From the Mohr's circle it is seen that the *a* axis corresponds to $\bar{I}_{\text{max}}$ and the *b* axis corresponds to $\bar{I}_{\text{min}}$.



PROBLEM 9.193

A thin plate of mass m was cut in the shape of a parallelogram as shown. Determine the mass moment of inertia of the plate with respect to (*a*) the x axis, (*b*) the axis BB', which is perpendicular to the plate.

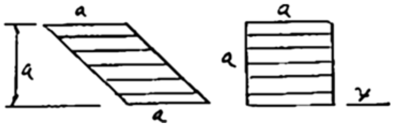
SOLUTION



$$\text{mass} = m = \rho t A$$

$$I_{\text{mass}} = \rho t I_{\text{area}} = \frac{m}{A} I_{\text{area}}$$

(*a*) Consider parallelogram as made of horizontal strips and slide strips to form a square since distance from each strip to x axis is unchanged.



$$I_{x,\text{area}} = \frac{1}{3}a^4$$

$$I_{x,\text{mass}} = \frac{m}{A} I_{x,\text{area}} = \frac{m}{a^2}\left(\frac{1}{3}a^4\right) \qquad I_x = \frac{1}{3}ma^2 \blacktriangleleft$$

(*b*) For centroidal axis y':

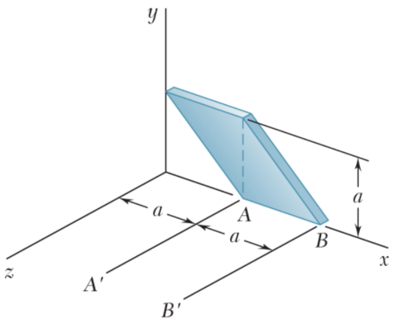
$$\bar{I}_{y',\text{area}} = 2\left[\frac{1}{12}a^4\right] = \frac{1}{6}a^4$$

$$\bar{I}_{y',\text{mass}} = \frac{m}{A} I_{y',\text{area}} = \frac{m}{a^2}\left(\frac{1}{6}a^4\right) = \frac{1}{6}ma^2$$

$$I_{y''} = \bar{I}_{y'} + ma^2 = \frac{1}{6}ma^2 + ma^2 = \frac{7}{6}ma^2$$

For axis $BB' \perp$ to plate, Eq. (9.38):

$$I_{BB'} = I_x + I_{y''} = \frac{1}{3}ma^2 + \frac{7}{6}ma^2 \qquad I_{BB'} = \frac{3}{2}ma^2 \blacktriangleleft$$



PROBLEM 9.194

A thin plate of mass *m* was cut in the shape of a parallelogram as shown. Determine the mass moment of inertia of the plate with respect to (*a*) the *y* axis, (*b*) the axis *AA*′, which is perpendicular to the plate.

SOLUTION

See sketch of solution of Problem 9.117.

(*a*) From part *b* of solution of Problem 9.117:

$$\bar{I}_{y'} = \frac{1}{6}ma^2$$

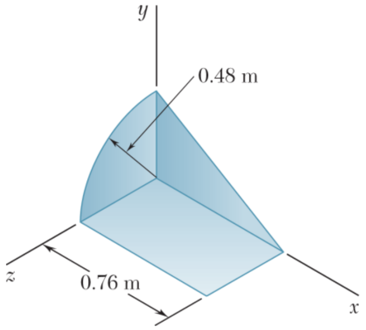
$$I_y = \bar{I}_{y'} + ma^2 = \frac{1}{6}ma^2 + ma^2 \qquad I_y = \frac{7}{6}ma^2 \blacktriangleleft$$

(*b*) From solution of Problem 9.115:

$$\bar{I}_{y'} = \frac{1}{6}ma^2 \quad \text{and} \quad I_x = \frac{1}{3}ma^2$$

Eq. (9.38): $I_{AA'} = \bar{I}_{y'} + I_x$

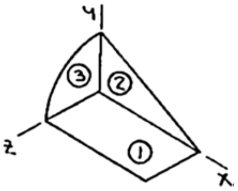
$$= \frac{1}{6}ma^2 + \frac{1}{3}ma^2 \qquad I_{AA'} = \frac{1}{2}ma^2 \blacktriangleleft$$



PROBLEM 9.195

A 2-mm thick piece of sheet steel is cut and bent into the machine component shown. Knowing that the density of steel is 7850 kg/m^3, determine the mass moment of inertia of the component with respect to each of the coordinate axes.

SOLUTION



First compute the mass of each component. We have

$$m = \rho_{ST} V = \rho_{ST} t A$$

Then

$$m_1 = (7850\text{ kg/m}^3)(0.002\text{ m})(0.76 \times 0.48)\text{ m}^2$$
$$= 5.72736\text{ kg}$$

$$m_2 = (7850\text{ kg/m}^3)(0.002\text{ m})\left(\frac{1}{2} \times 0.76 \times 0.48\right)\text{m}^2$$
$$= 2.86368\text{ kg}$$

$$m_3 = (7850\text{ kg/m}^3)(0.002\text{ m})\left(\frac{\pi}{4} \times 0.48^2\right)\text{m}^2$$
$$= 2.84101\text{ kg}$$

Using Figure 9.28 for component 1 and the equations derived above for components 2 and 3, we have

$$I_x = (I_x)_1 + (I_x)_2 + (I_x)_3$$
$$= \left[\frac{1}{12}(5.72736\text{ kg})(0.48\text{ m})^2 + (5.72736\text{ kg})\left(\frac{0.48}{2}\text{ m}\right)^2\right]$$
$$+ \left[\frac{1}{18}(2.86368\text{ kg})(0.48\text{ m})^2 + (2.86368\text{ kg})\left(\frac{0.48}{3}\text{ m}\right)^2\right] + \left[\frac{1}{2}(2.84101\text{ kg})(0.48\text{ m})^2\right]$$
$$= [(0.109965 + 0.329896) + (0.036655 + 0.073310) + (0.327284)]\text{ kg} \cdot \text{m}^2$$
$$= (0.439861 + 0.109965 + 0.327284)\text{ kg} \cdot \text{m}^2$$

or $I_x = 0.877\text{ kg} \cdot \text{m}^2$ ◀

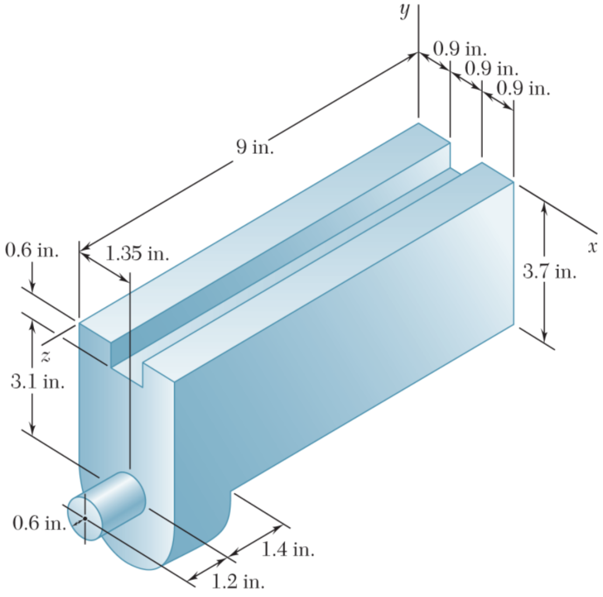
&\quad + (0.163642)]\text{ kg}\cdot\text{m}^2 \\
&= (1.102708 + 0.385643 + 0.163642)\text{ kg}\cdot\text{m}^2
\end{aligned}
$$

or $I_z = 1.652\text{ kg}\cdot\text{m}^2$ ◀



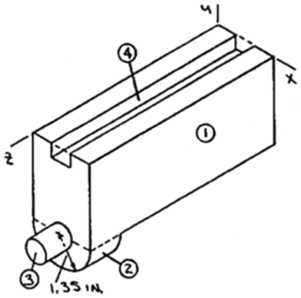
PROBLEM 9.196

Determine the mass moment of inertia of the steel machine element shown with respect to the *z* axis. (The specific weight of steel is $490\ \text{lb/ft}^3$.)

SOLUTION

First compute the mass of each component. We have

$$m = \rho_{\text{ST}} V = \frac{\gamma_{\text{ST}}}{g} V$$



Then

$$m_1 = \frac{490\ \text{lb/ft}^3}{32.2\ \text{ft/s}^2} \times (2.7 \times 3.7 \times 9)\ \text{in}^3 \times \left(\frac{1\ \text{ft}}{12\ \text{in.}}\right)^3$$
$$= 791.780 \times 10^{-3}\ \text{lb} \cdot \text{s}^2/\text{ft}$$

$$m_2 = \frac{490\ \text{lb/ft}^3}{32.2\ \text{ft/s}^2} \times \left(\frac{\pi}{2} \times 1.35^2 \times 1.4\right)\ \text{in}^3 \times \left(\frac{1\ \text{ft}}{12\ \text{in.}}\right)^3$$
$$= 35.295 \times 10^{-3}\ \text{lb} \cdot \text{s}^2/\text{ft}$$

$$m_3 = \frac{490\ \text{lb/ft}^3}{32.2\ \text{ft/s}^2} \times (\pi \times 0.6^2 \times 1.2)\ \text{in}^3 \times \left(\frac{1\ \text{ft}}{12\ \text{in.}}\right)^3$$
$$= 11.952 \times 10^{-3}\ \text{lb} \cdot \text{s}^2/\text{ft}$$

$$m_4 = \frac{490\ \text{lb/ft}^3}{32.2\ \text{ft/s}^2} \times (0.9 \times 0.6 \times 9)\ \text{in}^3 \times \left(\frac{1\ \text{ft}}{12\ \text{in.}}\right)^3 = 42.799 \times 10^{-3}\ \text{lb} \cdot \text{s}^2/\text{ft}$$

The mass moments of inertia are now computed using Figure 9.28 (components 1, 3, and 4) and the equations derived above (component 2).

PROBLEM 9.196 (Continued)

Find: I_z

We have

$$I_z = (I_z)_1 + (I_z)_2 + (I_z)_3 - (I_z)_4$$

$$= \left\{ \frac{1}{12}(791.780\times 10^{-3}\text{ lb}\cdot\text{s}^2/\text{ft})[(2.7)^2 + (3.7)^2]\text{ in}^2 \right.$$

$$\left. + (791.780\text{ lb}\cdot\text{s}^2/\text{ft})\left[\left(\frac{2.7}{2}\right)^2 + \left(\frac{3.7}{2}\right)^2\right]\text{ in}^2 \right\}\times\left(\frac{1\text{ ft}}{12\text{ in.}}\right)^2$$

$$+ \left\{ (35.295\times 10^{-3}\text{ lb}\cdot\text{s}^2/\text{ft})\left(\frac{1}{2} - \frac{16}{9\pi^2}\right)(1.35\text{ in.})^2 \right.$$

$$\left. +(35.295\times 10^{-3}\text{ lb}\cdot\text{s}^2/\text{ft})\left[(1.35)^2 + \left(3.7 + \frac{4\times 1.35}{3\pi}\right)^2\right]\text{ in}^2 \right\}\times\left(\frac{1\text{ ft}}{12\text{ in.}}\right)^2$$

$$+ \left\{ \frac{1}{12}(11.952\times 10^{-3}\text{ lb}\cdot\text{s}^2/\text{ft})(0.6\text{ in.})^2 \right.$$

$$\left. +(11.952\times 10^{-3}\text{ lb}\cdot\text{s}^2/\text{ft})[(1.35)^2 + (3.7)^2]\text{ in}^2 \right\}\times\left(\frac{1\text{ ft}}{12\text{ in.}}\right)^2$$

$$- \left\{ \frac{1}{12}(42.799\times 10^{-3}\text{ lb}\cdot\text{s}^2/\text{ft})[(0.9)^2 + (0.6)^2]\text{ in}^2 \right.$$

$$\left. +(42.799\times 10^{-3}\text{ lb}\cdot\text{s}^2/\text{ft})\left[(1.35)^2 + \left(\frac{0.6}{2}\right)^2\right]\text{ in}^2 \right\}\times\left(\frac{1\text{ ft}}{12\text{ in.}}\right)^2$$

$$I_z = [(9.6132 + 28.8395) + (0.1429 + 4.9219)$$

$$+ (0.0149 + 1.2875) - (0.0290 + 0.5684)]\times 10^{-3}\text{ lb}\cdot\text{ft}\cdot\text{s}^2$$

$$= (38.4527 + 5.0648 + 1.3024 - 0.5974)\times 10^{-3}\text{ lb}\cdot\text{ft}\cdot\text{s}^2$$

or $I_z = 0.0442\text{ lb}\cdot\text{ft}\cdot\text{s}^2$ ◀

Assume $\delta y_A \uparrow$:

$$\delta y_C = \frac{8\text{ in.}}{16\text{ in.}}\delta y_A; \quad \delta y_C = \frac{1}{2}\delta y_A \downarrow$$

Since bar *CD* move in translation

$$\delta y_E = \delta y_F = \delta y_C$$

or

$$\delta y_E = \delta y_F = \frac{1}{2} y_A \downarrow$$

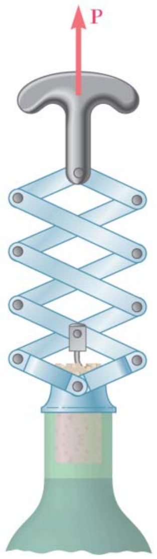
Virtual Work:

$$\delta U = 0: \quad -P\delta y_A + (100\text{ lb})\delta y_E + (150\text{ lb})\delta y_F = 0$$

$$-P\delta y_A + 100\left(\frac{1}{2}\delta y_A\right) + 150\left(\frac{1}{2}\delta y_A\right) = 0$$

$$P = 125\text{ lb}$$

$$\mathbf{P} = 125.0\text{ lb} \downarrow \blacktriangleleft$$



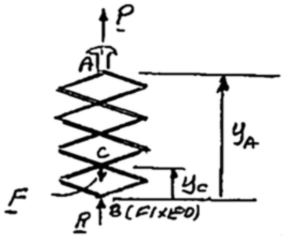
PROBLEM 10.8

Knowing that the maximum friction force exerted by the bottle on the cork is 60 lb, determine (*a*) the force **P** that must be applied to the corkscrew to open the bottle, (*b*) the maximum force exerted by the base of the corkscrew on the top of the bottle.

SOLUTION

From sketch $y_A = 4y_C$

Thus $\delta y_A = 4\delta y_C$



(*a*) Virtual Work:

$$\delta U = 0: \quad P\delta y_A - F\delta y_C = 0$$

$$P(4\delta y_C) - F\delta y_C = 0$$

$$P = \frac{1}{4}F$$

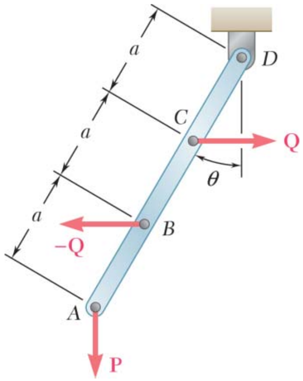
$$F = 60 \text{ lb}: \quad P = \frac{1}{4}(60 \text{ lb}) = 15 \text{ lb}$$

$$\mathbf{P} = 15.00 \text{ lb} \uparrow \blacktriangleleft$$

(*b*) Free body: Corkscrew

$$+\!\uparrow \Sigma F_y = 0 \quad R + P - F = 0; \quad R + 15 \text{ lb} - 60 \text{ lb} = 0$$

On corkscrew: $\mathbf{R} = 45 \text{ lb} \uparrow$, On bottle: $\mathbf{R} = 45.0 \text{ lb} \downarrow \blacktriangleleft$



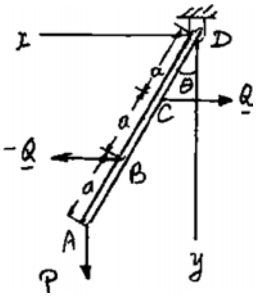
PROBLEM 10.9

Rod *AD* is acted upon by a vertical force **P** at end *A*, and by two equal and opposite horizontal forces of magnitude *Q* at points *B* and *C*. Derive an expression for the magnitude *Q* of the horizontal forces required for equilibrium.

SOLUTION

We have

$$x_C = a\sin\theta$$
$$\delta x_C = a\cos\theta\delta\theta$$
$$x_B = 2a\sin\theta$$
$$\delta x_B = 2a\cos\theta\delta\theta$$
$$y_A = 3a\cos\theta$$
$$\delta y_A = -3a\sin\theta\delta\theta$$

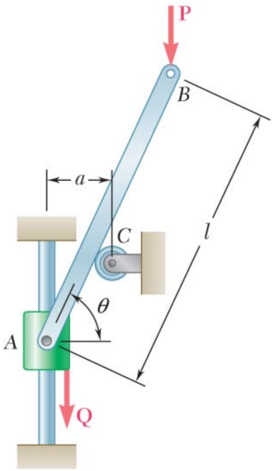


Virtual Work: We note that **P** tends to increase y_A and −**Q** tends to increase x_B, while **Q** tends to decrease x_C. Therefore

$$\delta U = P\delta y_A + Q\delta x_B - Q\delta x_C = 0$$
$$= P(-3a\sin\theta\delta\theta) + Q(2a\cos\theta\delta\theta) - Q(a\cos\theta\delta\theta) = 0$$

$$Q\cos\theta = 3P\sin\theta'$$

$$Q = 3P\tan\theta \blacktriangleleft$$

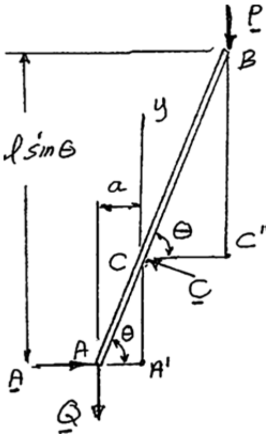


PROBLEM 10.10

The slender rod *AB* is attached to a collar *A* and rests on a small wheel at *C*. Neglecting the radius of the wheel and the effect of friction, derive an expression for the magnitude of the force **Q** required to maintain the equilibrium of the rod.

SOLUTION

For $\Delta AA'C$:



$$A'C = a\tan\theta$$

$$y_A = -(A'C) = -a\tan\theta$$

$$\delta y_A = -\frac{a}{\cos^2\theta}\delta\theta$$

For $\Delta CC'B$:

$$BC' = l\sin\theta - A'C$$

$$= l\sin\theta - a\tan\theta$$

$$y_B = BC' = l\sin\theta - a\tan\theta$$

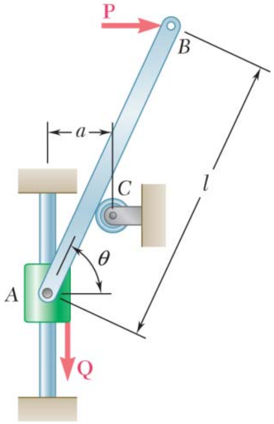
$$\delta y_B = l\cos\theta\delta\theta - \frac{a}{\cos^2\theta}\delta\theta$$

Virtual Work: $\delta U = 0$: $Q\delta y_A - P\delta y_B = 0$

$$-Q\left(-\frac{a}{\cos^2\theta}\right)\delta\theta - P\left(l\cos\theta - \frac{a}{\cos^2\theta}\right)\delta\theta = 0$$

$$Q\left(\frac{a}{\cos^2\theta}\right) = P\left(l\cos\theta - \frac{a}{\cos^2\theta}\right)$$

$$Q = P\left(\frac{l}{a}\cos^3\theta - 1\right) \blacktriangleleft$$

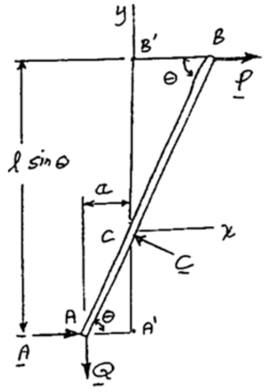


PROBLEM 10.11

The slender rod *AB* is attached to a collar *A* and rests on a small wheel at *C*. Neglecting the radius of the wheel and the effect of friction, derive an expression for the magnitude of the force **Q** required to maintain the equilibrium of the rod.

SOLUTION

For $\Delta AA'C$:



$$A'C = a\tan\theta$$

$$y_A = -(A'C) = -a\tan\theta$$

$$\delta y_A = -\frac{a}{\cos^2\theta}\delta\theta$$

For $\Delta BB'C$:

$$B'C = l\sin\theta - A'C$$

$$= l\sin\theta - a\tan\theta$$

$$BB' = \frac{B'C}{\tan\theta} = \frac{l\sin\theta - a\tan\theta}{\tan\theta}$$

$$x_B = BB' = l\cos\theta - a$$

$$\delta x_B = -l\sin\theta\delta\theta$$

Virtual Work:

$$\delta U = 0: \quad P\delta x_B - Q\delta y_A = 0$$

$$P(-l\sin\theta\delta\theta) - Q\left(-\frac{a}{\cos^2\theta}\delta\theta\right) = 0$$

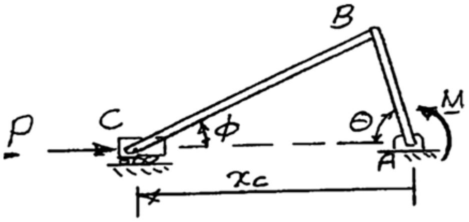
PROBLEM 10.21

A 4-kN force **P** is applied as shown to the piston of the engine system. Knowing that $AB = 50$ mm and $BC = 200$ mm, determine the couple **M** required to maintain the equilibrium of the system when (*a*) $\theta = 30°$, (*b*) $\theta = 150°$.

SOLUTION

Analysis of the geometry:



Law of sines

$$\frac{\sin\phi}{AB} = \frac{\sin\theta}{BC}$$

$$\sin\phi = \frac{AB}{BC}\sin\theta \qquad (1)$$

Now

$$x_C = AB\cos\theta + BC\cos\phi$$

$$\delta x_C = -AB\sin\theta\delta\theta - BC\sin\phi\delta\phi \qquad (2)$$

Now, from Equation (1) $$\cos\phi\delta\phi = \frac{AB}{BC}\cos\theta\delta\theta$$

or $$\delta\phi = \frac{AB}{BC}\frac{\cos\theta}{\cos\phi}\delta\theta \qquad (3)$$

From Equation (2)

$$\delta x_C = -AB\sin\theta\delta\theta - BC\sin\phi\left(\frac{AB}{BC}\frac{\cos\theta}{\cos\phi}\delta\theta\right)$$

or $$\delta x_C = -\frac{AB}{\cos\phi}(\sin\theta\cos\phi + \sin\phi\cos\theta)\delta\theta$$

Then $$\delta x_C = -\frac{AB\sin(\theta+\phi)}{\cos\phi}\delta\theta$$

PROBLEM 10.21 (Continued)

Virtual Work:

$$\delta U = 0{:}\quad -P\delta x_C - M\,\delta\theta = 0$$

$$-P\left[-\frac{AB\sin(\theta+\phi)}{\cos\phi}\delta\theta\right] - M\,\delta\theta = 0$$

Thus,

$$M = AB\frac{\sin(\theta+\phi)}{\cos\phi}P \qquad (4)$$

(*a*) $P = 4\text{ kN},\quad \theta = 30°$

Eq. (1): $\sin\phi = \dfrac{50\text{ mm}}{200\text{ mm}}\sin 30° \qquad \phi = 7.181°$

Eq. (4): $M = (0.05\text{ m})\dfrac{\sin(30°+7.181°)}{\cos 7.818°}(4\text{ kN})$ $\qquad$ $\mathbf{M} = 121.8\text{ N}\cdot\text{m}$ ↺ ◀

(*b*) $P = 4\text{ kN},\quad \theta = 150°$

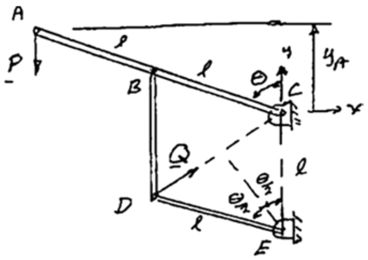
PROBLEM 10.12 Knowing that the line of action of the force **Q** passes through Point C, derive an expression for the magnitude of **Q** required to maintain equilibrium.

SOLUTION

From geometry



$$y_A = 2l\cos\theta, \quad \delta y_A = -2l\sin\theta\delta\theta$$

$$CD = 2l\sin\frac{\theta}{2}, \quad \delta(CD) = l\cos\frac{\theta}{2}\delta\theta$$

Virtual Work:

$$\delta U = 0: \quad -P\delta y_A - Q\delta(CD) = 0$$

$$-P(-2l\sin\theta\delta\theta) - Q\left(l\cos\frac{\theta}{2}\delta\theta\right) = 0$$

or

$$Q = 2P\frac{\sin\theta}{\cos\left(\frac{\theta}{2}\right)}$$

with

$$P = 80\text{ N}, \quad Q = 100\text{ N}$$

$$(100\text{ N}) = 2(80\text{ N})\frac{\sin\theta}{\cos\left(\frac{\theta}{2}\right)}$$

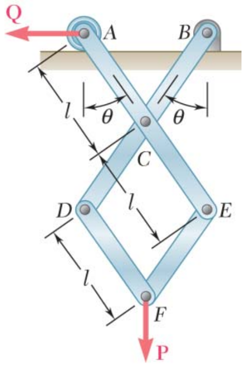
$$\frac{\sin\theta}{\cos\left(\frac{\theta}{2}\right)} = 0.625$$

or

$$\frac{2\sin\left(\frac{\theta}{2}\right)\cos\left(\frac{\theta}{2}\right)}{\cos\left(\frac{\theta}{2}\right)} = 0.625$$

$$\theta = 36.42° \qquad \theta = 36.4° \blacktriangleleft$$

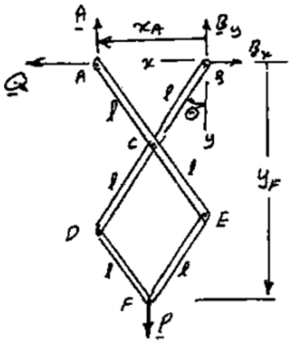
(Additional solutions discarded as not applicable are $\theta = \pm 180°$)



PROBLEM 10.28

Determine the value of θ corresponding to the equilibrium position of the mechanism of Prob. 10.14 when $P = 270$ N and $Q = 960$ N.

SOLUTION



Virtual Work:

$$x_A = 2l\sin\theta, \quad \delta x_A = 2l\cos\theta\delta\theta$$

$$y_F = 3l\cos\theta, \quad \delta y_F = -3l\sin\theta\delta\theta$$

$$\delta U = 0: \qquad Q\delta x_A + P\delta y_F = 0$$

$$\delta U = 0: \qquad Q\delta\theta x_A + P\delta y_F = 0$$

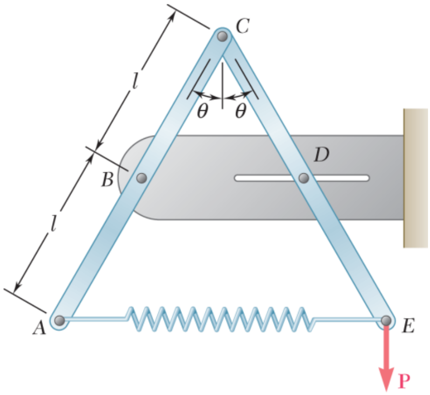
$$Q(2l\cos\theta\delta\theta) + P(-3l\sin\theta\delta\theta) = 0$$

$$Q = \frac{3}{2}P\tan\theta$$

Data: $P = 270$ N, $Q = 960$ N

$$(960\text{ N}) = \frac{3}{2}(270\text{ N})\tan\theta$$

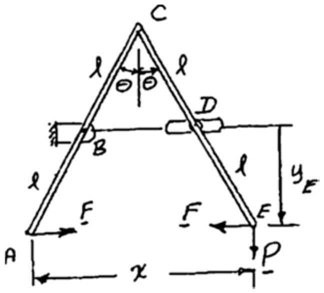
$\theta = 67.1°$ ◀



PROBLEM 10.29

Two rods *AC* and *CE* are connected by a pin at *C* and by a spring *AE*. The constant of the spring is *k*, and the spring is unstretched when $\theta = 30°$. For the loading shown, derive an equation in *P*, *θ*, *l*, and *k* that must be satisfied when the system is in equilibrium.

SOLUTION



$$y_E = l\cos\theta$$

$$\delta y_E = -l\sin\theta\,\delta\theta$$

Spring:

Unstretched length = $2l$

$$x = 2(2l\sin\theta) = 4l\sin\theta$$

$$\delta x = 4l\cos\theta\delta\theta$$

$$F = k(x - 2l)$$

$$F = k(4l\sin\theta - 2l)$$

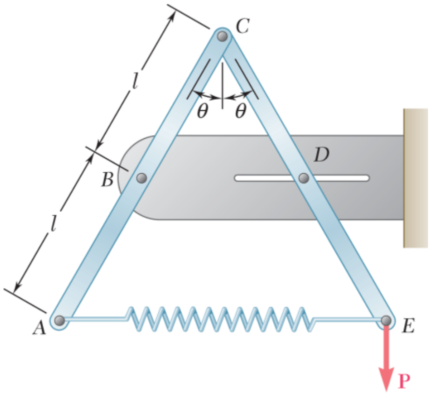
Virtual Work:

$$\delta U = 0: \quad P\delta y_E - F\delta x = 0$$

$$P(-l\sin\theta\,\delta\theta) - k(4l\sin\theta - 2l)(4l\cos\theta\,\delta\theta) = 0$$

$$-P\sin\theta - 8kl(2\sin\theta - 1)\cos\theta = 0$$

or $$\frac{P}{8kl} = (1 - 2\sin\theta)\frac{\cos\theta}{\sin\theta} \qquad \frac{P}{8kl} = \frac{1 - 2\sin\theta}{\tan\theta} \blacktriangleleft$$



PROBLEM 10.30

Two rods *AC* and *CE* are connected by a pin at *C* and by a spring *AE*. The constant of the spring is 1.5 lb/in., and the spring is unstretched when $\theta = 30°$. Knowing that $l = 10$ in. and neglecting the weight of the rods, determine the value of θ corresponding to equilibrium when $P = 40$ lb.

SOLUTION

From the analysis of Problem 10.29

$$\frac{P}{8kl} = \frac{1-2\sin\theta}{\tan\theta}$$

Then with

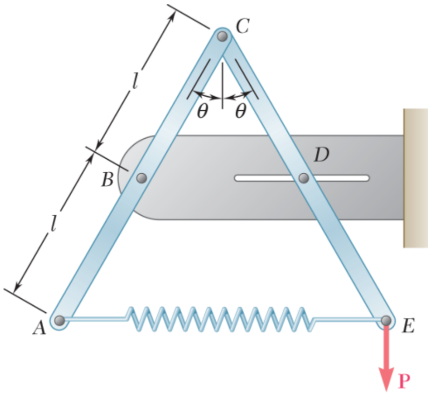
$$P = 160 \text{ N}, \; l = 0.2 \text{ m, and } k = 300 \text{ N/m}$$

$$\frac{160 \text{ N}}{8(300 \text{ N/m})(0.2 \text{ m})} = \frac{1-2\sin\theta}{\tan\theta}$$

or

$$\frac{1-2\sin\theta}{\tan\theta} = \frac{1}{3} = 0.3333$$

Solving numerically $\theta = 25.0°$ ◀

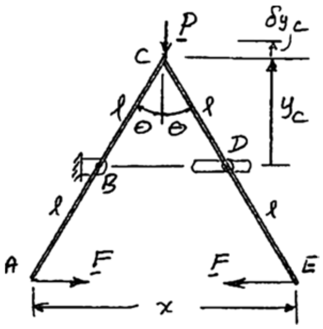


PROBLEM 10.31

Solve Problem 10.30 assuming that force **P** is moved to *C* and acts vertically downward.

PROBLEM 10.30 Two rods *AC* and *CE* are connected by a pin at *C* and by a spring *AE*. The constant of the spring is 1.5 lb/in., and the spring is unstretched when $\theta = 30°$. Knowing that $l = 10$ in. and neglecting the weight of the rods, determine the value of θ corresponding to equilibrium when $P = 40$ lb.

SOLUTION



$$y_C = l\cos\theta, \quad \delta y_C = -l\sin\theta\delta\theta$$

Spring:

$$\text{Unstretched length} = 2l$$

$$x = 2(2l\sin\theta) = 4l\sin\theta$$

$$\delta x = 4l\cos\theta\delta\theta$$

$$F = k(x - 2l)$$

$$F = k(4l\sin\theta - 2l)$$

Virtual Work:

$$\delta U = 0: \quad -P\delta y_C - F\delta x$$

$$-P(-l\sin\theta\delta\theta) - k(4l\sin\theta - 2l)(4l\cos\theta\delta\theta) = 0$$

$$P\sin\theta - 8kl(2\sin\theta - 1)\cos\theta = 0$$

or

$$\frac{P}{8kl} = (2\sin\theta - 1)\frac{\cos\theta}{\sin\theta}$$

with

$$l = 200 \text{ mm}, \ k = 300 \text{ N/m, and } P = 160 \text{ N}$$

$$\frac{(160 \text{ N})}{8(300 \text{ N/m})(0.2)} = (2\sin\theta - 1)\frac{\cos\theta}{\sin\theta}$$

or

$$(2\sin\theta - 1)\frac{\cos\theta}{\sin\theta} = \frac{1}{3}$$

Solving numerically $\theta = 39.65°$

and $\theta = 68.96°$ $\qquad \theta = 39.7°$ ◀

$$y_C = \frac{x}{6} \qquad \therefore\ \delta y_C = \frac{1}{6}\delta x$$

Linear Spring: $F_{SP} = ks = (5000\text{ N/m})(x - 0.30\text{ m})$

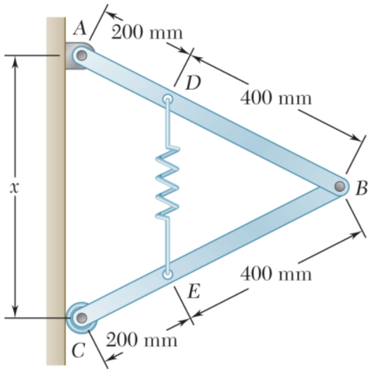
Virtual Work: $\delta U = 0$

$$\delta U = -F_{SP}\delta x + P\delta y_C = 0$$

$$-(5000\text{ N/m})(x - 0.30\text{ m})\delta x + (900\text{ N})\left(\frac{1}{6}\delta x\right) = 0$$

$$-5000x + 1500 + 150 = 0$$

$x = 0.330$ m $\qquad$ or $x = 330$ mm ◀

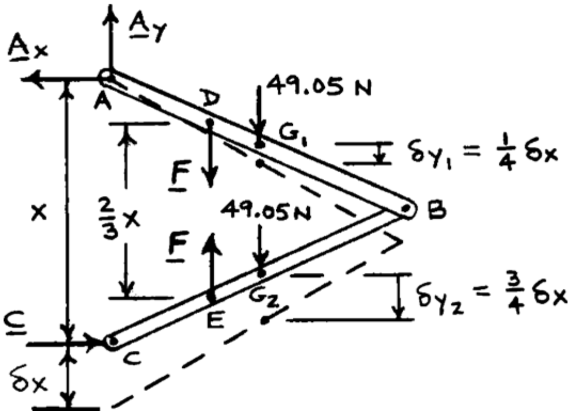


PROBLEM 10.34

Two 5-kg bars *AB* and *BC* are connected by a pin at *B* and by a spring *DE*. Knowing that the spring is 150 mm long when unstretched and that the constant of the spring is 1 kN/m, determine the value of *x* corresponding to equilibrium.

SOLUTION

First note: $W_{\text{bar}} = (5\text{ kg})(9.81\text{ m/s}^2) = 49.05\text{ N}$



During the virtual displacement, Points *D* and *E* move apart a distance $\delta(DE) = \frac{2}{3}\delta x$ and the total work done by the forces exerted at *D* and *E* is $-F\left(\frac{2}{3}\delta x\right)$

$$\delta U = 0: \quad -F\left(\frac{2}{3}\delta x\right) + 49.05\text{ N}\left(\frac{1}{4}\delta x\right) + 49.05\text{ N}\left(\frac{3}{4}\delta x\right) = 0$$

$$F = 73.575\text{ N}$$

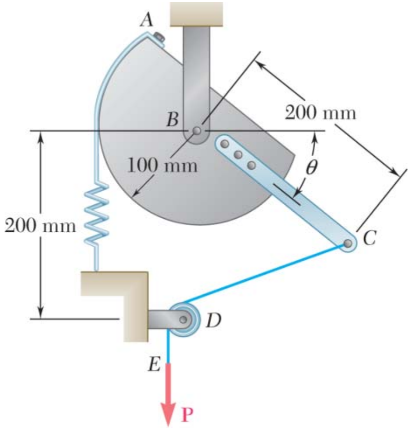
For $F = 73.575$ N, elongation of spring is

$$\frac{F}{k} = \frac{73.575\text{ N}}{1000\text{ N/m}} = 73.575\times 10^{-3}\text{m}$$

$$= 73.575\text{ mm}$$

Since undeformed length of spring is 150 mm, total length is

$$DE = \frac{2}{3}x = 150\text{ mm} + 73.575\text{ mm} \qquad x = 335\text{ mm} \blacktriangleleft$$



PROBLEM 10.35

A vertical force **P** of magnitude 150 N is applied to end *E* of cable *CDE*, which passes over a small pulley *D* and is attached to the mechanism at *C*. The constant of the spring is $k = 4$ kN/m, and the spring is unstretched when $\theta = 0$. Neglecting the weight of the mechanism and the radius of the pulley, determine the value of θ corresponding to equilibrium.

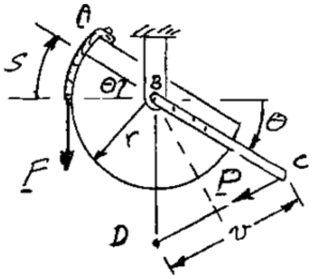
SOLUTION

$$l = BC = 0.2 \text{ m}$$

$$r = 0.1 \text{ m}$$

$< CBD = 90° - \theta$

$$v = 2l\sin\left(45° - \frac{\theta}{2}\right)$$



$$\delta v = -l\cos\left(45° - \frac{\theta}{2}\right)\delta\theta$$

$$s = r\theta \quad \delta s = r\delta\theta$$

$$F = ks = kr\theta$$

Virtual Work: $\delta U = 0: \quad -P\delta v - F\delta s = 0$

$$-P\left[-l\cos\left(45° - \frac{\theta}{2}\right)\right]\delta\theta - kr\theta(r\delta\theta) = 0$$

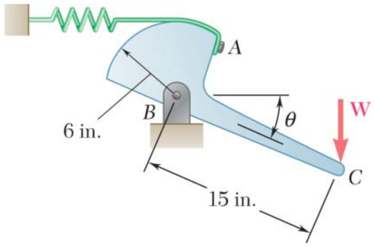
$$\frac{Pl}{kr^2} = \frac{\theta}{\cos\left(45° - \frac{\theta}{2}\right)}$$

$$\frac{Pl}{kr^2} = \frac{(150 \text{ N})(0.2 \text{ m})}{(4000 \text{ N/m})(0.1 \text{ m})^2} = 0.75$$

$$0.75 = \frac{\theta}{\cos\left(45° - \frac{\theta}{2}\right)}$$

$$\theta = 0.67623 \text{ rad} = 38.745°$$

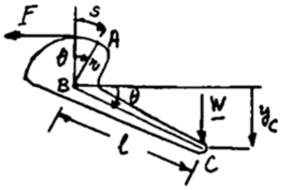
$\theta = 38.7°$ ◀



PROBLEM 10.36

A load **W** of magnitude 72 lb is applied to the mechanism at *C*. Neglecting the weight of the mechanism, determine the value of θ corresponding to equilibrium. The constant of the spring is $k = 20$ lb/in., and the spring is unstretched when $\theta = 0$.

SOLUTION



$$s = r\theta$$

$$\delta s = r\delta\theta$$

$$F = ks = kr\theta$$

$$y_C = l\sin\theta$$

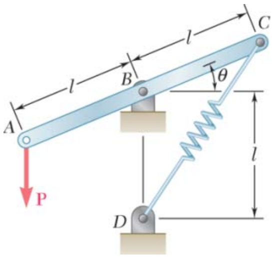
$$\delta y_C = l\cos\theta\delta\theta$$

Virtual Work: $\delta U = -F\delta s + W\delta y_C = 0$

$$-kr\theta(r\delta\theta) + W(l\cos\theta\delta\theta) = 0$$

$$\frac{\theta_C}{\cos\theta} = \frac{Wl}{kr^2} = \frac{(72\text{ lb})(15\text{ in.})}{(20\text{ lb/in.})(6\text{ in.})^2} = 1.500$$

Solving by trial and error: $\theta = 0.91486$ rad $\qquad \theta = 52.4° ◀$

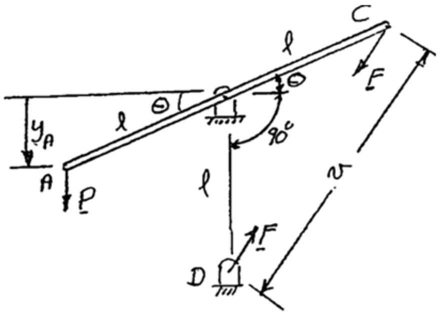


PROBLEM 10.37

Knowing that the constant of spring *CD* is *k* and that the spring is unstretched when rod *ABC* is horizontal, determine the value of *θ* corresponding to equilibrium for the data indicated.

$$P = 300 \text{ N}, \quad l = 400 \text{ mm}, \quad k = 5 \text{ kN/m}.$$

SOLUTION



$$y_A = l\sin\theta$$

$$\delta y_A = l\cos\theta\delta\theta$$

Spring: $v = CD$

Unstretched when $\theta = 0$

so that $v_0 = \sqrt{2}l$

For θ: $v = 2l\sin\left(\frac{90^\circ + \theta}{2}\right)$

$$\delta v = l\cos\left(45^\circ + \frac{\theta}{2}\right)\delta\theta$$

Stretched length: $s = v - v_0 = 2l\sin\left(45^\circ + \frac{\theta}{2}\right) - \sqrt{2}l$

Then $F = ks = kl\left[2\sin\left(45^\circ + \frac{\theta}{2}\right) - \sqrt{2}\right]$

Virtual Work:

$$\delta U = 0: \quad P\delta y_A - F\delta v = 0$$

$$Pl\cos\theta\delta\theta - kl\left[2\sin\left(45^\circ + \frac{\theta}{2}\right) - \sqrt{2}\right]l\cos\left(45^\circ + \frac{\theta}{2}\right)\delta\theta = 0$$

or $\frac{P}{kl} = \frac{1}{\cos\theta}\left[2\sin\left(45^\circ + \frac{\theta}{2}\right)\cos\left(45^\circ + \frac{\theta}{2}\right) - \sqrt{2}\cos\left(45^\circ + \frac{\theta}{2}\right)\right]$

$$= \frac{1}{\cos\theta}\left[2\sin\left(45^\circ + \frac{\theta}{2}\right)\cos\left(45^\circ + \frac{\theta}{2}\right)\cos\theta - \sqrt{2}\cos\left(45^\circ + \frac{\theta}{2}\right)\right]$$

$$= 1 - \sqrt{2}\frac{\cos\left(45^\circ \frac{\theta}{2}\right)}{\cos\theta}$$

PROBLEM 10.37 (Continued)

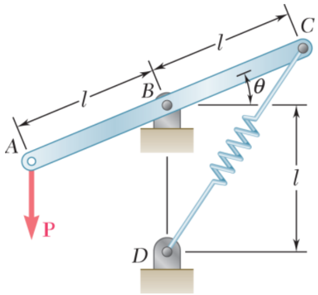
Now, with $P = 300\text{ N}, \quad l = 400\text{ mm}, \quad \text{and} \quad k = 5\text{ kN/m}$

$$\frac{(300\text{ N})}{(5000\text{ N/m})(0.4\text{ m})} = 1 - \sqrt{2}\,\frac{\cos\left(45° + \frac{\theta}{2}\right)}{\cos\theta}$$

or

$$\frac{\cos\left(45° + \frac{\theta}{2}\right)}{\cos\theta} = 0.60104$$

Solving numerically $\theta = 22.6°$ ◀



PROBLEM 10.38

Knowing that the constant of spring *CD* is k and that the spring is unstretched when rod *ABC* is horizontal, determine the value of θ corresponding to equilibrium for the data indicated.

$$P = 75 \text{ lb}, \quad l = 15 \text{ in.}, \quad k = 20 \text{ lb/in.}$$

SOLUTION

From the analysis of Problem 10.37, we have

$$\frac{P}{kl} = 1 - \sqrt{2}\frac{\cos\left(45^\circ + \frac{\theta}{2}\right)}{\cos\theta}$$

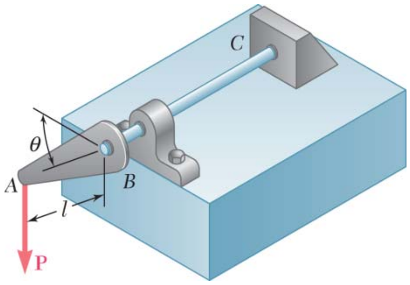
with $P = 75 \text{ lb}, \quad l = 15 \text{ in.} \quad \text{and} \quad k = 20 \text{ lb/in.}$

$$\frac{(75 \text{ lb})}{(20 \text{ lb/in.})(15 \text{ in.})} = 1 - \sqrt{2}\frac{\cos\left(45^\circ + \frac{\theta}{2}\right)}{\cos\theta}$$

or

$$\frac{\cos\left(45^\circ + \frac{\theta}{2}\right)}{\cos\theta} = 0.53033$$

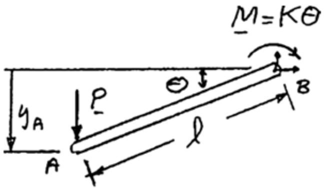
Solving numerically $\theta = 51.1^\circ$ ◀



PROBLEM 10.39

The lever *AB* is attached to the horizontal shaft *BC* that passes through a bearing and is welded to a fixed support at *C*. The torsional spring constant of the shaft *BC* is *K*; that is, a couple of magnitude *K* is required to rotate end *B* through 1 rad. Knowing that the shaft is untwisted when *AB* is horizontal, determine the value of θ corresponding to the position of equilibrium when $P = 100$ N, $l = 250$ mm, and $K = 12.5$ N · m/rad.

SOLUTION



We have

$$y_A = l\sin\theta$$

$$\delta y_A = l\cos\theta\delta\theta$$

Virtual Work:

$$\delta U = 0: \quad P\delta y_A - M\delta\theta = 0$$

$$Pl\cos\theta\delta\theta - K\theta\delta\theta = 0$$

or

$$\frac{\theta}{\cos\theta} = \frac{Pl}{K} \qquad (1)$$

with

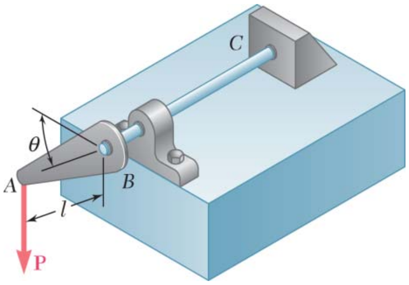
$$P = 100\text{ N}, \quad l = 250\text{ mm} \quad \text{and} \quad K = 12.5\text{ N}\cdot\text{m/rad}$$

$$\frac{\theta}{\cos\theta} = \frac{(100\text{ N})(0.250\text{ m})}{12.5\text{ N}\cdot\text{m/rad}}$$

or

$$\frac{\theta}{\cos\theta} = 2.0000$$

Solving numerically $\theta = 59.0°$ ◀



PROBLEM 10.40

Solve Problem 10.39 assuming that $P = 350$ N, $l = 250$ mm, and $K = 12.5$ N · m/rad. Obtain answers in each of the following quadrants: $0 < \theta < 90°$, $270° < \theta < 360°$, $360° < \theta < 450°$.

PROBLEM 10.39 The lever *AB* is attached to the horizontal shaft *BC* that passes through a bearing and is welded to a fixed support at *C*. The torsional spring constant of the shaft *BC* is *K*; that is, a couple of magnitude *K* is required to rotate end *B* through 1 rad. Knowing that the shaft is untwisted when *AB* is horizontal, determine the value of θ corresponding to the position of equilibrium when $P = 100$ N, $l = 250$ mm, and $K = 12.5$ N · m/rad.

SOLUTION

Using Equation (1) of Problem 10.39 and

$$P = 350 \text{ N}, \quad l = 250 \text{ mm} \quad \text{and} \quad K = 12.5 \text{ N} \cdot \text{m/rad}$$

We have

$$\frac{\theta}{\cos\theta} = \frac{(350 \text{ N})(0.250 \text{ m})}{12.5 \text{ N} \cdot \text{m/rad}}$$

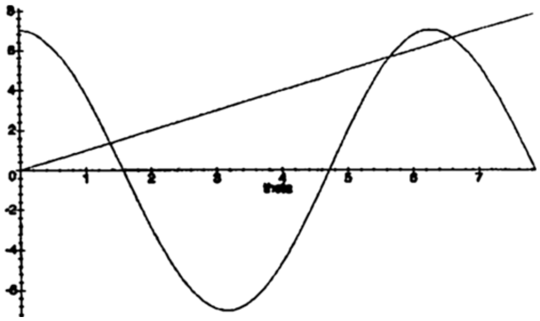
or

$$\frac{\theta}{\cos\theta} = 7 \quad \text{or} \quad \theta = 7\cos\theta \qquad (1)$$

The solutions to this equation can be shown graphically using any appropriate graphing tool, such as Maple, with the command: plot ({theta, 7 * cos(theta)}, t = 0.5 * Pi/2);

Thus, we plot $y = \theta$ and $y = 7\cos\theta$ in the range

$$0 \le \theta \le \frac{5\pi}{2}$$



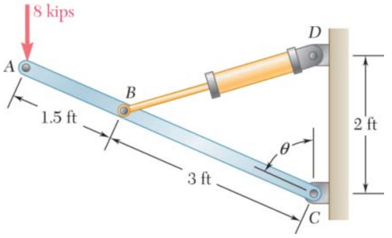
PROBLEM 10.40 (Continued)

We observe that there are three points of intersection, which implies that Equation (1) has three roots in the specified range of θ.

$$0 \le \theta \le 90°\left(\frac{\pi}{2}\right); \quad \theta = 1.37333 \text{ rad}, \quad \theta = 78.69° \qquad \theta = 78.7° \blacktriangleleft$$

$$270 \le \theta \le 360°\left(\frac{3\pi}{2} \le \theta \le 2\pi\right); \quad \theta = 5.65222 \text{ rad}, \quad \theta = 323.85° \qquad \theta = 324° \blacktriangleleft$$

$$360 \le \theta \le 450°\left(2\pi \le \theta \le \frac{5\pi}{2}\right); \quad \theta = 6.61597 \text{ rad}, \quad \theta = 379.07 \qquad \theta = 379° \blacktriangleleft$$

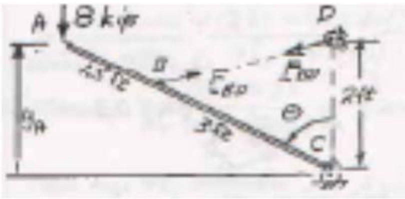


PROBLEM 10.41

The position of boom *ABC* is controlled by the hydraulic cylinder *BD*. For the loading shown, determine the force exerted by the hydraulic cylinder on pin *B* when $\theta = 70°$.

SOLUTION

We have



$$y_A = (4.5\,\text{ft})\cos\theta \qquad \delta y_A = -4.5\sin\theta\delta\theta$$

$$\begin{aligned}(BD)^2 &= (BC)^2 + (CD)^2 - 2(BC)(CD)\cos\theta \\ &= (3)^2 + (2)^2 - 2(3)(2)\cos\theta\end{aligned}$$

$$(BD)^2 = 13 - 12\cos\theta \tag{1}$$

Differentiating: $2(BD)\delta(BD) = 12\sin\theta\delta\theta$

$$\delta(BD) = \frac{6}{BD}\sin\theta\delta\theta \tag{2}$$

Virtual Work: Noting that **P** tends to decrease y_A and $\mathbf{F}_{BD}$ tends to increase *BD*, write

$$\delta U = -P\delta y_A + F_{BD}\delta(BD) = 0$$

$$-8\text{ kips}(-4.5\sin\theta\delta\theta) + F_{BD}\left(-\frac{6}{BD}\sin\theta\delta\theta\right) = 0$$

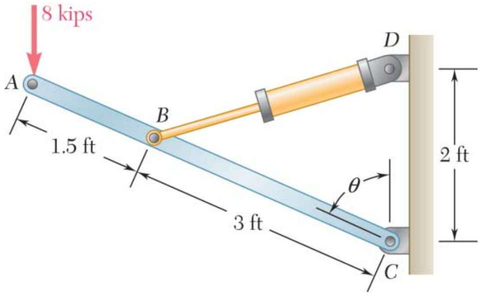
$$F_{BD} = \frac{36(BD)\sin\theta}{6\sin\theta}$$

or, $$F_{BD} = 6\text{ kips}(BD) \tag{3}$$

Making $\theta = 70°$ in Eq. (1), we have

$$(BD)^2 = 13 - 12\cos 70° = 8.8958$$
$$BD = 2.9826\text{ ft}$$

Carrying into Eq. (3): $F_{BD} = 6(2.9826) = 17.8956$ kips $\qquad F_{BD} = 17.90$ kips ◀



PROBLEM 10.42

The position of boom *ABC* is controlled by the hydraulic cylinder *BD*. For the loading shown, determine the largest allowable value of the angle θ if the maximum force that the cylinder can exert on pin *B* is 25 kips.

SOLUTION

(*a*) See solution of Problem 10.41 for the derivation of Eq. (3):

$$F_{BD} = (6\text{ kips})(BD) \blacktriangleleft$$

(*b*) For $(F_{BD})_{\max} = 25\text{ kips},$ we have

$$25\text{ kips} = (6\text{ kips})(BD)$$

$$BD = 4.1667\text{ ft}$$

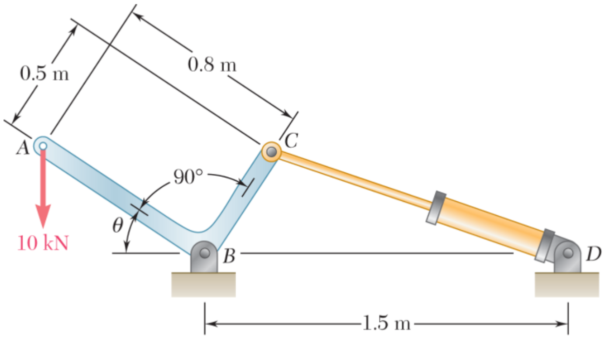
Carrying this value into Eq. (1) of Problem 10.41, write

$$(BD)^2 = 13 - 12\cos\theta$$

$$(4.1667)^2 = 13 - 12\cos\theta$$

$$\cos\theta = -0.36343$$

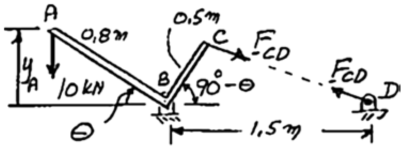
$$\theta = 111.3° \blacktriangleleft$$



PROBLEM 10.43

The position of member *ABC* is controlled by the hydraulic cylinder *CD*. For the loading shown, determine the force exerted by the hydraulic cylinder on pin *C* when $\theta = 55°$.

SOLUTION



$$y_A = (0.8\text{ m})\sin\theta$$

$$\delta y_A = 0.8\cos\theta\delta\theta$$

$$CD^2 = BC^2 + BD^2 - 2(BC)(BD)\cos(90° - \theta)$$

$$CD^2 = 0.5^2 + 1.5^2 - 2(0.5)(1.5)\sin\theta$$

$$CD^2 = 2.5 - 1.5\sin\theta \qquad (1)$$

$$2(CD)(\delta_{CD}) = -1.5\cos\theta\delta\theta \qquad \delta_{CD} = -\frac{3\cos\theta}{4CD}\delta\theta$$

Virtual Work: $\delta U = 0\text{:} \quad -(10\text{ kN})\delta y_A - F_{CD}\delta_{CD} = 0$

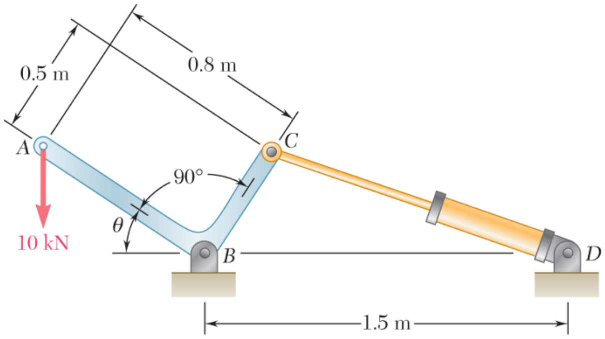
$$-10(0.8\cos\theta\delta\theta) - F_{CD}\left(-\frac{3\cos\theta}{4CD}\delta\theta\right) = 0$$

$$F_{CD} = \frac{32}{3}CD \qquad (2)$$

For $\theta = 55°$:

Eq. (1): $CD^2 = 2.5 - 1.5\sin 55° = 1.2713; \quad CD = 1.1275\text{ m}$

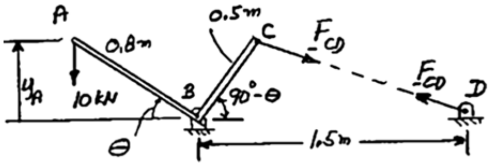
Eq. (2): $F_{CD} = \frac{32}{3}CD = \frac{32}{3}(1.1275) = 12.027\text{ kN}$ $\qquad \mathbf{F}_{CD} = 12.03\text{ kN}$ ↘ ◀



PROBLEM 10.44

The position of member *ABC* is controlled by the hydraulic cylinder *CD*. Determine the angle θ knowing that the hydraulic cylinder exerts a 15-kN force on pin *C*.

SOLUTION



$$y_A = (0.8\text{ m})\sin\theta$$

$$\delta y_A = 0.8\cos\theta\delta\theta$$

$$CD^2 = BC^2 + BD^2 - 2(BC)(BD)\cos(90° - \theta)$$

$$CD^2 = 0.5^2 + 1.5^2 - 2(0.5)(1.5)\sin\theta$$

$$CD^2 = 2.5 - 1.5\sin\theta \qquad (1)$$

$$2(CD)(\delta_{CD}) = -1.5\cos\theta\delta\theta; \qquad \delta_{CD} = -\frac{3\cos\theta}{4CD}\delta\theta$$

Virtual Work:

$$\delta U = 0: \quad -(10\text{ kN})\delta y_A - F_{CD}\delta_{CD} = 0$$

$$-10(0.8\cos\theta\delta\theta) - F_{CD}\left(-\frac{3\cos\theta}{4CD}\delta\theta\right) = 0$$

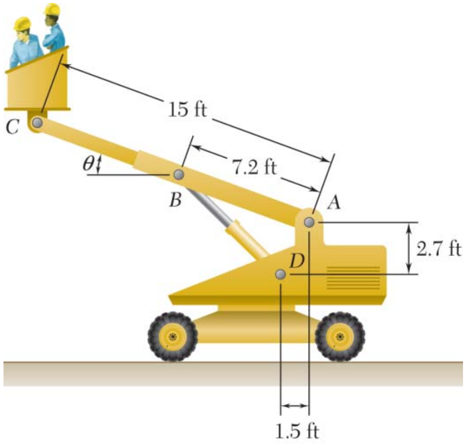
$$F_{CD} = \frac{32}{3}CD \qquad (2)$$

For $F_{CD} = 15\text{ kN}$:

Eq. (2): $15\text{ kN} = \frac{32}{3}CD$: $\qquad CD = \frac{45}{32} = 1.40625\text{ m}$

Eq. (1): $(1.40625)^2 = 2.5 - 1.5\sin\theta$: $\qquad \sin\theta = 0.34831$

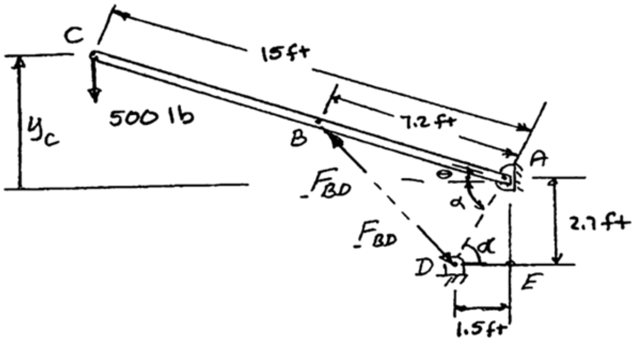
$\theta = 20.38°$ $\qquad \theta = 20.4°$ ◀



PROBLEM 10.45

The telescoping arm *ABC* is used to provide an elevated platform for construction workers. The workers and the platform together weigh 500 lb and their combined center of gravity is located directly above *C*. For the position when $\theta = 20°$, determine the force exerted on pin *B* by the single hydraulic cylinder *BD*.

SOLUTION



In ΔADE:

$$\tan\alpha = \frac{AE}{DE} = \frac{2.7 \text{ ft}}{1.5 \text{ ft}}$$

$$\alpha = 60.945°$$

$$AD = \frac{2.7 \text{ ft}}{\sin 60.945°} = 3.0887 \text{ m}$$

From the geometry:

$$y_C = (15 \text{ ft})\sin\theta$$

$$\delta y_C = (15 \text{ ft})\cos\theta\delta\theta$$

Then, in triangle *BAD*: Angle $BAD = \alpha + \theta$

Law of cosines:

$$BD^2 = AB^2 + AD^2 - 2(AB)(AD)\cos(\alpha + \theta)$$

or

$$BD^2 = (7.2 \text{ ft})^2 + (3.0887 \text{ ft})^2 - 2(7.2 \text{ ft})(3.0887 \text{ ft})\cos(\alpha + \theta)$$

$$BD^2 = 61.380 \text{ ft}^2 - (44.477\cos(\alpha + \theta)) \text{ ft}^2 \quad (1)$$

PROBLEM 10.45 (Continued)

And then

$$2(BD)(\delta BD) = (44.477\sin(\alpha+\theta))\delta\theta$$

$$\delta BD = \frac{44.477\sin(\alpha+\theta)}{2(BD)}\delta\theta$$

Virtual Work: $\delta U = 0{:}\quad -P\delta y_C + F_{BD}\delta BD = 0$

Substituting $-(500\text{ lb})(15\text{ ft})\cos\theta\delta\theta + F_{BD}\left[\frac{(44.477\text{ ft}^2)\sin(\alpha+\theta)}{2(BD)}\delta\theta\right] = 0$

or $F_{BD} = \left[337.25\frac{\cos\theta}{\sin(\alpha+\theta)}BD\right]\text{ lb/ft}$ (2)

Now, with $\theta = 20°$ and $\alpha = 60.945°$

Equation (1):

$$BD^2 = 61.380 - 44.477\cos(60.945° + 20°)$$

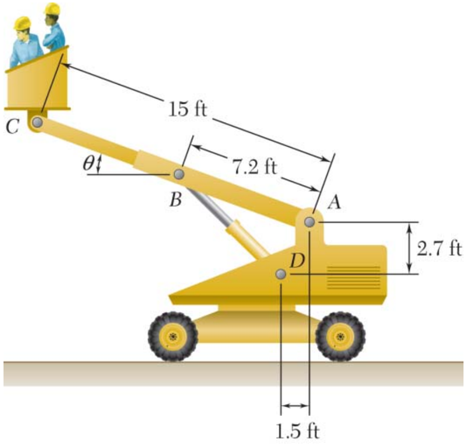
$$BD^2 = 54.380$$

$$BD = 7.3743\text{ ft}$$

Equation (2):

$$F_{BD} = \left[337.25\frac{\cos 20°}{\sin(60.945° + 20°)}(7.3743\text{ ft})\right]\text{ lb/ft}$$

or $F_{BD} = 2366\text{ lb}$ $\mathbf{F}_{BD} = 2370\text{ lb}$ ↖ ◀



PROBLEM 10.46

Solve Problem 10.45 assuming that the workers are lowered to a point near the ground so that $\theta = -20°$.

PROBLEM 10.45 The telescoping arm *ABC* is used to provide an elevated platform for construction workers. The workers and the platform together weigh 500 lb and their combined center of gravity is located directly above *C*. For the position when $\theta = 20°$, determine the force exerted on pin *B* by the single hydraulic cylinder *BD*.

SOLUTION

Using the figure and analysis of Problem 10.45, including Equations (1) and (2), and with $\theta = -20°$, we have

Equation (1):

$$BD^2 = 61.380 - 44.477\cos(60.945° - 20°)$$

$$BD^2 = 27.785$$

$$BD = 5.2711 \text{ ft}$$

Equation (2):

$$F_{BD} = 337.25\frac{\cos(-20°)}{\sin(60.945° - 20°)}(5.2711)$$

$$F_{BD} = 2549 \text{ lb}$$

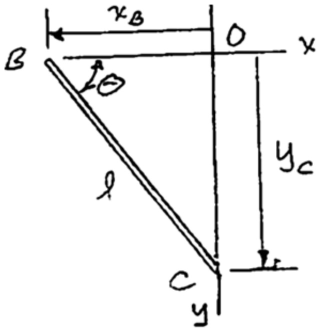
PROBLEM 10.47

Denoting by μ_s the coefficient of static friction between collar *C* and the vertical rod, derive an expression for the magnitude of the largest couple **M** for which equilibrium is maintained in the position shown. Explain what happens if $\mu_s \geq \tan\theta$.

SOLUTION



x_B
O
x
B
θ
y_C
l
C
y

Member *BC*: We have

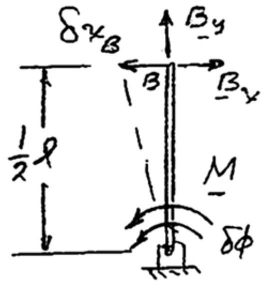
$$x_B = l\cos\theta$$

$$\delta x_B = -l\sin\theta\delta\theta \qquad (1)$$

and

$$y_C = l\sin\theta$$

$$\delta y_C = l\cos\theta\delta\theta \qquad (2)$$



δx_B
B_y
B
B_x
$\frac{1}{2}l$
M
$\delta\phi$

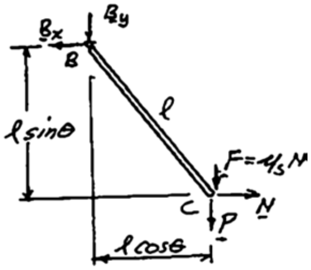
Member *AB*: We have

$$\delta x_B = \frac{1}{2}l\delta\phi$$

Substituting from Equation (1),

$$-l\sin\theta\delta\theta = \frac{1}{2}l\delta\phi$$

or $$\delta\phi = -2\sin\theta\delta\theta \qquad (3)$$



B_x
B_y
B
l
$l\sin\theta$
$F=\mu_s N$
C
P
N
$l\cos\theta$

Free body of rod *BC*

For $M_{\max}$, motion of collar *C* impends upward

$$+\circlearrowright \Sigma M_B = 0: \quad Nl\sin\theta - (P + \mu_s N)(l\cos\theta) = 0$$

$$N\tan\theta - \mu_s N = P$$

$$N = \frac{P}{\tan\theta - \mu_s}$$

PROBLEM 10.47 (Continued)

Virtual Work:

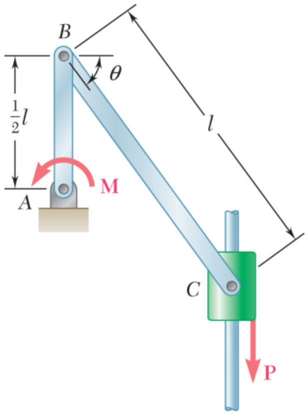
$$\delta U = 0: \quad M\,\delta\phi + (P + \mu_s N)\delta y_C = 0$$

$$M(-2\sin\theta\delta\theta) + (P + \mu_s N)l\cos\theta\delta\theta = 0$$

$$M_{\max} = \frac{(P + \mu_s N)}{2\tan\theta}l = \frac{P + \mu_s \frac{P}{\tan\theta - \mu_s}}{2\tan\theta}l$$

$$\text{or} \quad M_{\max} = \frac{Pl}{2(\tan\theta - \mu_s)} \quad \blacktriangleleft$$

If $\mu_s = \tan\theta,\ M = \infty,$ system becomes *self-locking*.



PROBLEM 10.48

Knowing that the coefficient of static friction between collar C and the vertical rod is 0.40, determine the magnitude of the largest and smallest couple **M** for which equilibrium is maintained in the position shown, when $\theta = 35°$, $l = 600$ mm, and $P = 300$ N.

SOLUTION

From the analysis of Problem 10.50, we have

$$M_{\max} = \frac{Pl}{2(\tan\theta + \mu_s)}$$

With $\theta = 35°, \quad l = 0.6\text{ m}, \quad P = 300\text{ N}$

$$M_{\max} = \frac{(300\text{ N})(0.6\text{ m})}{2(\tan 35° - 0.4)}$$

$$= 299.80\text{ N}\cdot\text{m} \qquad M_{\max} = 300\text{ N}\cdot\text{m} \blacktriangleleft$$

For $M_{\min}$, motion of C impends downward and F acts upward. The equations of Problem 10.50 can still be used if we replace μ_s by $-\mu_s$. Then

$$M_{\min} = \frac{Pl}{2(\tan\theta + \mu_s)}$$

Substituting,

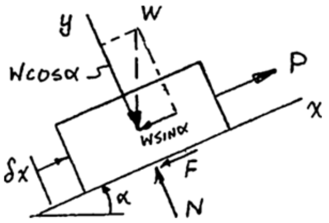
$$M_{\min} = \frac{(300\text{ N})(0.6\text{ m})}{2(\tan 35° + 0.4)}$$

$$= 81.803\text{ N}\cdot\text{m} \qquad M_{\min} = 81.8\text{ N}\cdot\text{m} \blacktriangleleft$$

PROBLEM 10.49

A block of weight W is pulled up a plane forming an angle α with the horizontal by a force **P** directed along the plane. If μ is the coefficient of friction between the block and the plane, derive an expression for the mechanical efficiency of the system. Show that the mechanical efficiency cannot exceed $\frac{1}{2}$ if the block is to remain in place when the force **P** is removed.

SOLUTION



$$\text{Input work} = P\delta x$$

$$\text{Output work} = (W\sin\alpha)\delta x$$

Efficiency:

$$\eta = \frac{W\sin\alpha\delta x}{P\delta x} \quad \text{or} \quad \eta = \frac{W\sin\alpha}{P} \qquad (1)$$

$$+\nearrow \Sigma F_x = 0\text{:} \quad P - F - W\sin\alpha = 0 \quad \text{or} \quad P = W\sin\alpha + F \qquad (2)$$

$$+\nwarrow \Sigma F_y = 0\text{:} \quad N - W\cos\alpha = 0 \quad \text{or} \quad N = W\cos\alpha$$

$$F = \mu N = \mu W\cos\alpha$$

Equation (2): $$P = W\sin\alpha + \mu W\cos\alpha = W(\sin\alpha + \mu\cos\alpha)$$

Equation (1): $$\eta = \frac{W\sin\alpha}{W(\sin\alpha + \mu\cos\alpha)} \quad \text{or} \quad \eta = \frac{1}{1 + \mu\cot\alpha}$$

If block is to remain in place when $P = 0$, we know (see Chapter 8) that $\phi_s \geq \alpha$ or, since

$$\mu = \tan\phi_s, \quad \mu \geq \tan\alpha$$

Multiply by $\cot\alpha$: $$\mu\cot\alpha \geq \tan\alpha\cot\alpha = 1$$

Add 1 to each side: $$1 + \mu\cot\alpha \geq 2$$

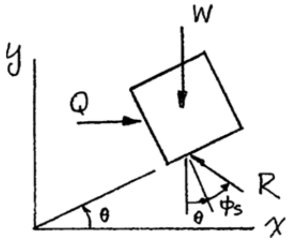
Recalling the expression for η, we find $$\eta \geq \frac{1}{2} \blacktriangleleft$$

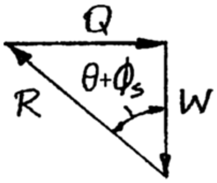
PROBLEM 10.50

Derive an expression for the mechanical efficiency of the jack discussed in Section 8.6. Show that if the jack is to be self-locking, the mechanical efficiency cannot exceed $\frac{1}{2}$.

SOLUTION

Recall Figure 8.9*a*. Draw force triangle





$$Q = W\tan(\theta + \phi_s)$$

$$y = x\tan\theta \text{ so that } \delta y = \delta x\tan\theta$$

$$\text{Input work} = Q\delta x = W\tan(\theta + \phi_s)\delta x$$

$$\text{Output work} = W\delta y = W(\delta x)\tan\theta$$

Efficiency:
$$\eta = \frac{W\tan\theta\delta x}{W\tan(\theta + \phi_s)\delta x}; \qquad \eta = \frac{\tan\theta}{\tan(\theta + \phi_s)} \blacktriangleleft$$

From Page 432, we know the jack is self-locking if

$$\phi \geq \theta$$

Then
$$\theta + \phi_s \geq 2\theta$$

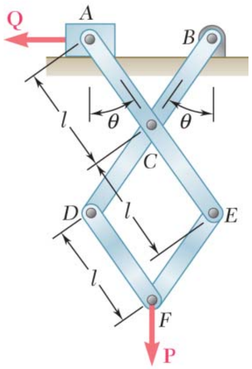
so that
$$\tan(\theta + \phi_s) \geq \tan 2\theta$$

From above
$$\eta = \frac{\tan\theta}{\tan(\theta + \phi_s)}$$

It then follows that
$$\eta \leq \frac{\tan\theta}{\tan 2\theta}$$

But
$$\tan 2\theta = \frac{2\tan\theta}{1 - \tan^2\theta}$$

Then
$$\eta \leq \frac{\tan\theta(1 - \tan^2\theta)}{2\tan\theta} = \frac{1 - \tan^2\theta}{2} \qquad \eta \leq \frac{1}{2} \blacktriangleleft$$



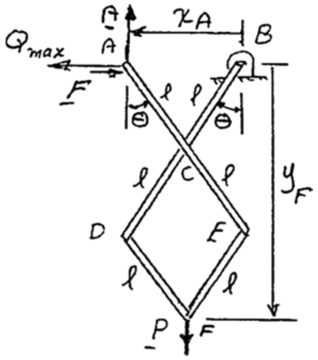
PROBLEM 10.51

Denoting by μ_s the coefficient of static friction between the block attached to rod *ACE* and the horizontal surface, derive expressions in terms of P, μ_s, and θ for the largest and smallest magnitude of the force **Q** for which equilibrium is maintained.

SOLUTION

For the linkage:

$$+\circlearrowleft \Sigma M_B = 0: \quad -x_A + \frac{x_A}{2}P = 0 \quad \text{or} \quad \mathbf{A} = \frac{P}{2}\uparrow$$



Then:

$$F = \mu_s A = \mu_s \frac{P}{2} = \frac{1}{2}\mu_s P$$

Now

$$x_A = 2l\sin\theta$$
$$\delta x_A = 2l\cos\theta\delta\theta$$

and

$$y_F = 3l\cos\theta$$
$$\delta y_F = -3l\sin\theta\delta\theta$$

Virtual Work:

$$\delta U = 0: \quad (Q_{\max} - F)\delta x_A + P\delta y_F = 0$$

$$\left(Q_{\max} - \frac{1}{2}\mu_s P\right)(2l\cos\theta\delta\theta) + P(-3l\sin\theta\delta\theta) = 0$$

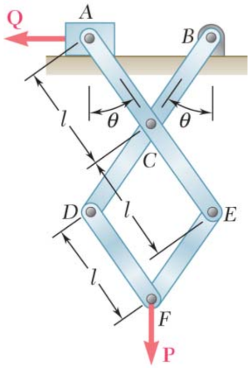
or

$$Q_{\max} = \frac{3}{2}P\tan\theta + \frac{1}{2}\mu_s P$$

$$Q_{\max} = \frac{P}{2}(3\tan\theta + \mu_s) \blacktriangleleft$$

For $Q_{\min}$, motion of *A* impends to the right and **F** acts to the left. We change μ_s to $-\mu_s$ and find

$$Q_{\min} = \frac{P}{2}(3\tan\theta - \mu_s) \blacktriangleleft$$



PROBLEM 10.52

Knowing that the coefficient of static friction between the block attached to rod *ACE* and the horizontal surface is 0.15, determine the magnitude of the largest and smallest force **Q** for which equilibrium is maintained when $\theta = 30°$, $l = 0.2$ m, and $P = 40$ N.

SOLUTION

Using the results of Problem 10.48 with

$$\theta = 30°$$
$$l = 0.2 \text{ m}$$
$$P = 40 \text{ N}, \quad \text{and} \quad \mu_s = 0.15$$

We have

$$Q_{\max} = \frac{P}{2}(3\tan\theta + \mu_s)$$
$$= \frac{(40 \text{ N})}{2}(3\tan 30° + 0.15)$$
$$= 37.64 \text{ N}$$

$Q_{\max} = 37.6$ N ◀

and

$$Q_{\min} = \frac{P}{2}(3\tan\theta - \mu_s)$$
$$= \frac{(40 \text{ N})}{2}(3\tan 30° - 0.15)$$
$$= 31.64 \text{ N}$$

$Q_{\min} = 31.6$ N ◀

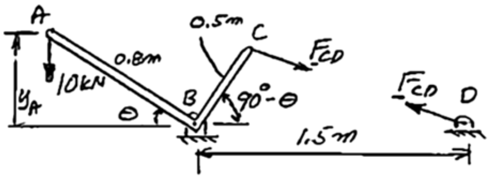
PROBLEM 10.55

Referring to Problem 10.43 and using the value found for the force exerted by the hydraulic cylinder *CD*, determine the change in the length of *CD* required to raise the 10-kN load by 15 mm.

PROBLEM 10.43 The position of member *ABC* is controlled by the hydraulic cylinder *CD*. For the loading shown, determine the force exerted by the hydraulic cylinder on pin *C* when $\theta = 55°$.

SOLUTION



Virtual Work: Assume both δy_A and δ_{CD} increase

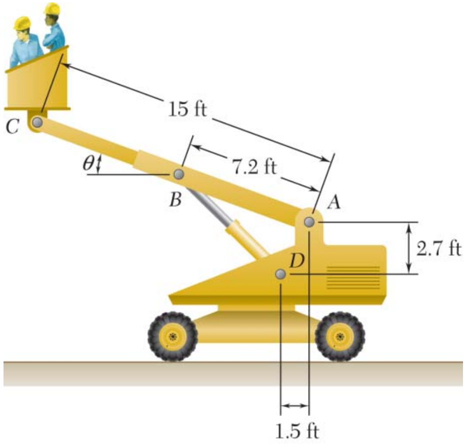
$$\delta U = 0: \quad -(10 \text{ kN})\delta y_A - F_{CD}\delta_{CD} = 0$$

Substitute: $\delta y_A = 15 \text{ mm} \quad \text{and} \quad F_{CD} = 12.03 \text{ kN}$

$$-(10 \text{ kN})(15 \text{ mm}) - (12.03 \text{ kN})\delta_{CD} = 0$$

$$\delta_{CD} = -12.47 \text{ mm}$$

The negative sign indicates that *CD* shortened $\delta_{CD} = 12.47$ mm shorter ◀

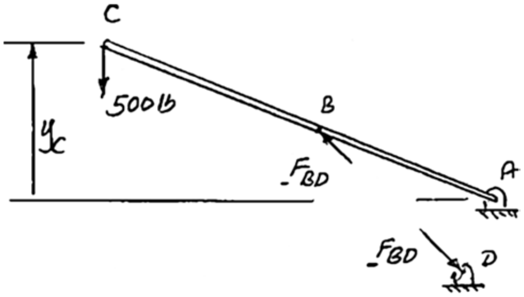


PROBLEM 10.56

Referring to Problem 10.45 and using the value found for the force exerted by the hydraulic cylinder *BD*, determine the change in the length of *BD* required to raise the platform attached at *C* by 2.5 in.

PROBLEM 10.45 The telescoping arm *ABC* is used to provide an elevated platform for construction workers. The workers and the platform together weigh 500 lb and their combined center of gravity is located directly above *C*. For the position when $\theta = 20°$, determine the force exerted on pin *B* by the single hydraulic cylinder *BD*.

SOLUTION



Virtual Work: Assume both δy_C and δ_{BD} increase

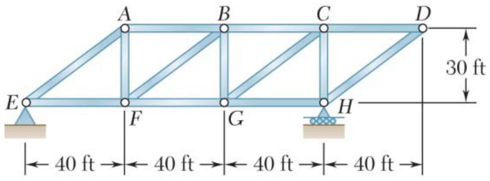
$$\delta U = 0: \quad -(500\text{ lb})\delta y_C + F_{BD}\delta_{BD} = 0$$

Substitute: $\delta y_C = 2.5\text{ in.}$ and $F_{BD} = 2370\text{ lb}$

$$-(500\text{ lb})(2.5\text{ in.}) + (2370\text{ lb})\delta_{BD} = 0$$

$$\delta_{BD} = +0.527\text{ in.}$$

The positive sign indicates that cylinder *BD* increases in length $\delta_{BD} = 0.527$ in. longer ◀

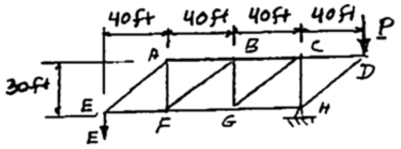


PROBLEM 10.57

Determine the vertical movement of joint D if the length of member BF is increased by 1.5 in. (*Hint:* Apply a vertical load at joint D, and, using the methods of Chapter 6, compute the force exerted by member BF on joints B and F. Then apply the method of virtual work for a virtual displacement resulting in the specified increase in length of member BF. This method should be used only for small changes in the lengths of members.)

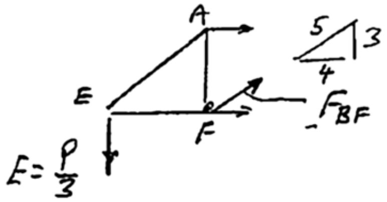
SOLUTION

Apply vertical load P at D.



$$+\circlearrowleft \Sigma M_H = 0: \quad -P(40 \text{ ft}) + E(120 \text{ ft}) = 0$$

$$\mathbf{E} = \frac{P}{3}\downarrow$$



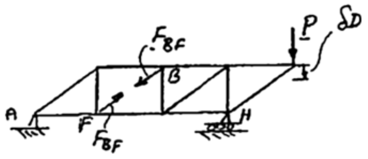
$$+\uparrow \Sigma F_y = 0: \quad \frac{3}{5}F_{BF} - \frac{P}{3} = 0$$

$$F_{BF} = \frac{5}{9}P$$

Virtual Work:

We remove member BF and replace it with forces $\mathbf{F}_{BF}$ and $-\mathbf{F}_{BF}$ at pins F and B, respectively. Denoting the virtual displacements of Points B and F as $\delta\mathbf{r}_B$ and $\delta\mathbf{r}_F$, respectively, and noting that $\mathbf{P}$ and $\overrightarrow{\delta D}$ have the same direction, we have

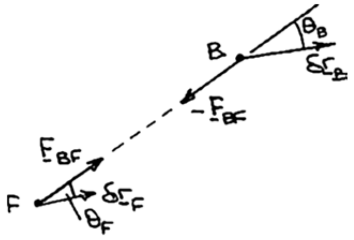
Virtual Work:



$$\delta U = 0: \qquad P\delta D + \mathbf{F}_{BF} \cdot \delta\mathbf{r}_F + (-\mathbf{F}_{BF}) \cdot \delta\mathbf{r}_B = 0$$

$$P\delta D + F_{BF}\delta r_F \cos\theta_F - F_{BF}\delta r_B \cos\theta_B = 0$$

$$P\delta D - F_{BF}(\delta r_B \cos\theta_B - \delta r_F \cos\theta_F) = 0$$



where $(\delta r_B \cos\theta_B - \delta r_F \cos\theta_F) = \delta_{BF}$, which is the change in length of member BF. Thus,

$$P\delta D - F_{BF}\delta_{BF} = 0$$

$$P\delta D - \left(\frac{5}{9}P\right)(1.5 \text{ in.}) = 0$$

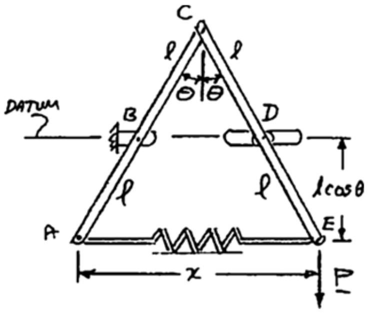
PROBLEM 10.59

Using the method of Section 10.8, solve Problem 10.29.

PROBLEM 10.29 Two rods *AC* and *CE* are connected by a pin at *C* and by a spring *AE*. The constant of the spring is *k*, and the spring is unstretched when $\theta = 30°$. For the loading shown, derive an equation in *P*, *θ*, *l*, and *k* that must be satisfied when the system is in equilibrium.

SOLUTION



Spring: $AE = x = 2(2l\sin\theta) = 4l\sin\theta$

Unstretched length: $x_0 = 4l\sin 30° = 2l$

Deflection of spring

$$s = x - x_0$$

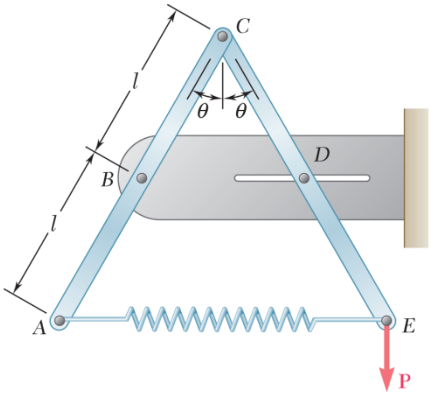
$$s = 2l(2\sin\theta - 1)$$

$$V = \frac{1}{2}ks^2 + Py_E$$

$$V = \frac{1}{2}k\left[2l(2\sin\theta - 1)\right]^2 + P(-l\cos\theta)$$

$$\frac{dV}{d\theta} = 4kl^2(2\sin\theta - 1)2\cos\theta + Pl\sin\theta = 0$$

$$(2\sin\theta - 1)\frac{\cos\theta}{\sin\theta} + \frac{P}{8kl} = 0 \qquad \frac{P}{8kl} = \frac{1 - 2\sin\theta}{\tan\theta} \blacktriangleleft$$



PROBLEM 10.60

Using the method of Section 10.8, solve Problem 10.30.

PROBLEM 10.30 Two rods *AC* and *CE* are connected by a pin at *C* and by a spring *AE*. The constant of the spring is 1.5 lb/in., and the spring is unstretched when $\theta = 30°$. Knowing that $l = 10$ in. and neglecting the weight of the rods, determine the value of θ corresponding to equilibrium when $P = 40$ lb.

SOLUTION

Using the result of Problem 10.59, with

$$P = 40 \text{ lb}$$

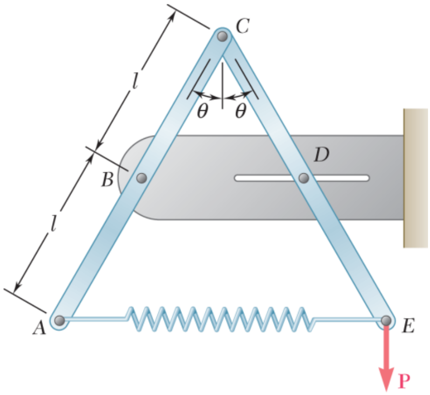
$$l = 10 \text{ in.} \quad \text{and} \quad k = 1.5 \text{ lb/in.}$$

$$\frac{P}{8kl} = \frac{1 - 2\sin\theta}{\tan\theta}$$

or
$$\frac{1 - 2\sin\theta}{\tan\theta} = \frac{40 \text{ lb}}{8(1.5 \text{ lb/in.})(10 \text{ in.})}$$

$$= \frac{1}{3}$$

Solving numerically, $\theta = 25.0°$ ◀

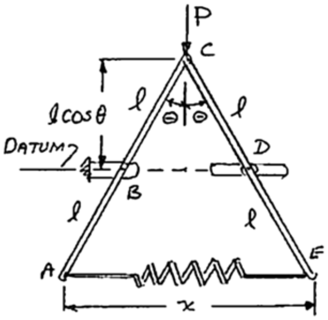


PROBLEM 10.61

Using the method of Section 10.8, solve Problem 10.31.

PROBLEM 10.31 Solve Problem 10.30 assuming that force **P** is moved to *C* and acts vertically downward.

SOLUTION



Spring: $AE = x = 2(2l\sin\theta) = 4l\sin\theta$

Unstretched length: $x_0 = 4l\sin 30° = 2l$

Deflection of spring

$$s = x - x_0$$

$$s = 2l(2\sin\theta - 1)$$

$$V = \frac{1}{2}ks^2 + Py_C$$

$$= \frac{1}{2}k[2l(2\sin\theta - 1)]^2 + P(l\cos\theta)$$

$$V = 2kl^2(2\sin\theta - 1)^2 + Pl\cos\theta$$

$$\frac{dV}{d\theta} = 4kl^2(2\sin\theta - 1)2\cos\theta - Pl\sin\theta = 0$$

$$(1 - 2\sin\theta)\frac{\cos\theta}{\sin\theta} + \frac{P}{8kl} = 0$$

$$\frac{P}{8kl} = \frac{2\sin\theta - 1}{\tan\theta}$$

with $P = 40\text{ lb}, \quad l = 10\text{ in.} \quad \text{and} \quad k = 1.5\text{ lb/in.}$

We have

$$\frac{(40\text{ lb})}{8(1.5\text{ lb/in.})(10\text{ in.})} = \frac{2\sin\theta - 1}{\tan\theta}$$

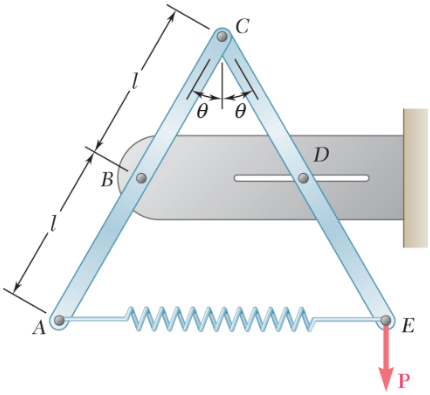
or

$$\frac{2\sin - 1}{\tan\theta} = \frac{1}{3}$$

Solving numerically $\theta = 39.65°$ and $68.96°$

$\theta = 39.7°$

$\theta = 69.0°$ ◀

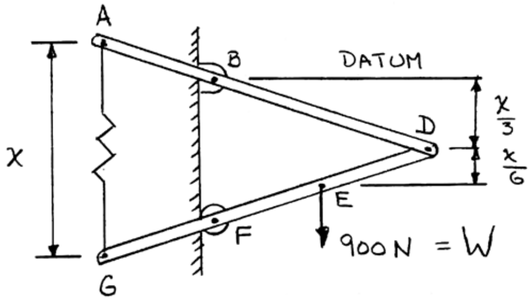


PROBLEM 10.62

Using the method of Sec. 10.8, solve Prob. 10.30.

Problem 10.30: Two bars *AD* and *DG* are connected by a pin at *D* and by a spring *AG*. Knowing that the spring is 300 mm long when unstretched and that the constant of the spring is 5 kN/m, determine the value of *x* corresponding to equilibrium when a 900-N load is applied at *E* as shown.

SOLUTION



Spring: $s = x - 0.3$ m

$$y_E = -\frac{x}{3} - \frac{x}{6} = -\frac{x}{2}$$

Potential Energy:

$$V = \frac{1}{2}ks^2 + Wy_E$$

$$= \frac{1}{2}k(x-0.3)^2 - W\left(\frac{x}{2}\right)$$

For equilibrium:

$$\frac{dV}{dx} = k(x-0.3) - \frac{1}{2}W = 0$$

$$(5000\text{ N/m})(x-0.3)\text{m} - \frac{1}{2}(900\text{ N}) = 0$$

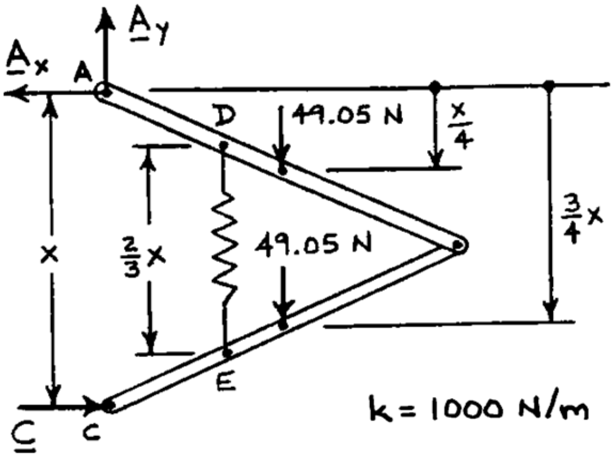
PROBLEM 10.33 Two 5-kg bars *AB* and *BC* are connected by a pin at *B* and by a spring *DE*. Knowing that the spring is 150 mm long when unstretched and that the constant of the spring is 1 kN/m, determine the value of *x* corresponding to equilibrium.

SOLUTION

First note: $W_{\text{bar}} = (5\text{ kg})(9.81\text{ m/s}^2) = 49.05\text{ N}$



A_y
A_x
A
D
49.05 N
x/4
3/4 x
x
2/3 x
49.05 N
E
C
C
k = 1000 N/m

Since unstretched length of spring is 150 mm, or 0.15 m, we have

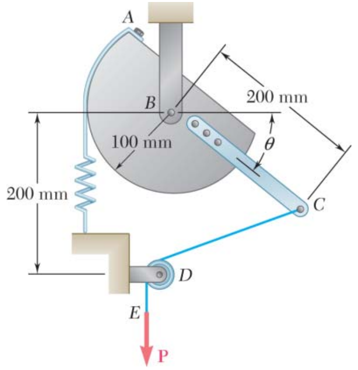
$$\Delta_S = \frac{2}{3}x - 0.15$$

$$\mathbf{V} = \frac{1}{2}k\Delta_S^2 - (49.05\text{ N})\frac{x}{4} - (49.05\text{ N})\frac{3x}{4}$$

$$V = \frac{1}{2}(1000\text{ N/m})\left(\frac{2}{3}x - 0.15\right)^2 - 12.2625x - 36.7875x$$

$$\frac{dV}{dx} = 1000\left(\frac{2}{3}x - 0.15\right)\frac{2}{3} - 12.2625 - 36.7875 = 0$$

$x = 0.335\text{ m}$ $\qquad$ $x = 335\text{ mm}$ ◀

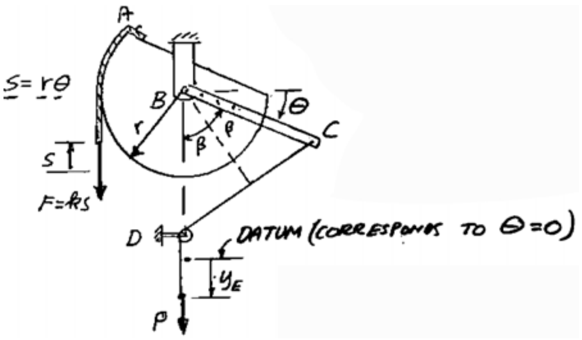


PROBLEM 10.64

Using the method of Section 10.8, solve Problem 10.35.

PROBLEM 10.35 A vertical force **P** of magnitude 150 N is applied to end *E* of cable *CDE*, which passes over a small pulley *D* and is attached to the mechanism at *C*. The constant of the spring is *k* = 4 kN/m, and the spring is unstretched when $\theta = 0$. Neglecting the weight of the mechanism and the radius of the pulley, determine the value of θ corresponding to equilibrium.

SOLUTION



$$\beta = \frac{1}{2}(90° - \theta) = 45° - \frac{\theta}{2}$$

$$BC = BD = l$$

$$CD = 2l\sin\beta = 2l\sin\left(45 - \frac{\theta}{2}\right)$$

For $\theta = 0$: $(CD)_0 = 2l\sin 45 = \sqrt{2}\,l$

$$y_E = (CD)_0 - CD$$

$$= \sqrt{2}\,l - 2l\sin\left(45° - \frac{\theta}{2}\right)$$

Potential energy:

$$V = \frac{1}{2}ks^2 - Py_E$$

$$V = \frac{1}{2}k(r\theta)^2 - P\left[\sqrt{2}l - 2l\sin\left(45° - \frac{\theta}{2}\right)\right]$$

$$\frac{dV}{d\theta} = kr^2\theta + 2Pl\cos\left(45° - \frac{\theta}{2}\right)\left(-\frac{1}{2}\right) = 0$$

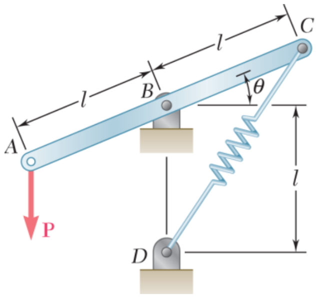
$$\frac{Pl}{kr^2} = \frac{\theta}{\cos\left(45° - \frac{\theta}{2}\right)}$$

$$\frac{Pl}{kr^2} = \frac{(150\text{ N})(0.2\text{ m})}{(4000\text{ N/m})(0.1\text{ m})^2} = 0.75$$

$$0.75 = \frac{\theta}{\cos\left(45° - \frac{\theta}{2}\right)}$$

Solve by trial and error: $\theta = 0.67623$ rad

$\theta = 38.745°$ $\theta = 38.7°$ ◀



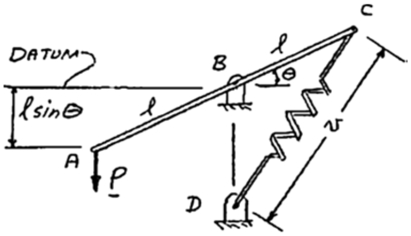
PROBLEM 10.65

Using the method of Section 10.8, solve Problem 10.37.

PROBLEM 10.37 and 10.38 Knowing that the constant of spring *CD* is *k* and that the spring is unstretched when rod *ABC* is horizontal, determine the value of θ corresponding to equilibrium for the data indicated.

PROBLEM 10.37 $P = 300$ N, $l = 400$ mm, $k = 5$ kN/m.

SOLUTION



Spring

$$v = 2l\sin\left(\frac{90° + \theta}{2}\right)$$

$$v = 2l\sin\left(45° + \frac{\theta}{2}\right)$$

Unstretched $(\theta = 0)$

$$v_0 = 2l\sin 45° = \sqrt{2}l$$

Deflection of spring

$$s = v - v_0 = 2l\sin\left(45° + \frac{\theta}{2}\right) - \sqrt{2}l$$

$$V = \frac{1}{2}ks^2 + Py_A = \frac{1}{2}kl^2\left[2\sin\left(45° + \frac{\theta}{2}\right) - \sqrt{2}\right]^2 + P(-l\sin\theta)$$

$$\frac{dV}{d\theta} = kl^2\left[2\sin\left(45° + \frac{\theta}{2}\right) - \sqrt{2}\right]\cos\left(45° + \frac{\theta}{2}\right) - Pl\cos\theta = 0$$

$$\left[2\sin\left(45° + \frac{\theta}{2}\right)\cos\left(45° + \frac{\theta}{2}\right) - \sqrt{2}\cos\left(45° + \frac{\theta}{2}\right)\right] = \frac{P}{kl}\cos\theta$$

$$\cos\theta - \sqrt{2}\cos\left(45° + \frac{\theta}{2}\right) = \frac{P}{kl}\cos\theta$$

Divide each member by cos θ

$$1 - \sqrt{2}\frac{\cos\left(45° + \frac{\theta}{2}\right)}{\cos\theta} = \frac{P}{kl}$$

Then with $P = 300$ N, $l = 0.4$ m and $k = 5000$ N/m

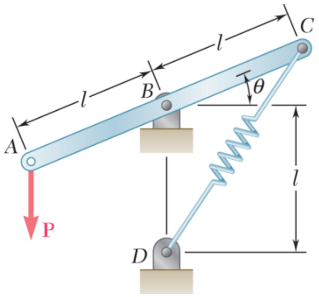
$$1 - \sqrt{2}\frac{\cos\left(45° + \frac{\theta}{2}\right)}{\cos\theta} = \frac{300 \text{ N}}{(5000 \text{ N/m})(0.4 \text{ m})}$$

$$= 0.15$$

or

$$\frac{\cos\left(45° + \frac{\theta}{2}\right)}{\cos\theta} = 0.60104$$

Solving numerically $\theta = 22.6°$ ◀



PROBLEM 10.66

Using the method of Section 10.8, solve Problem 10.38.

PROBLEM 10.37 and 10.38 Knowing that the constant of spring *CD* is *k* and that the spring is unstretched when rod *ABC* is horizontal, determine the value of θ corresponding to equilibrium for the data indicated.

PROBLEM 10.38 $P = 75$ lb, $l = 15$ in., $k = 20$ lb/in.

SOLUTION

Using the results of Problem 10.65 with $P = 75$ lb, $l = 15$ in. and $k = 20$ lb/in., we have

$$1-\sqrt{2}\frac{\cos\left(45^\circ+\frac{\theta}{2}\right)}{\cos\theta}=\frac{P}{kl}$$

$$=\frac{75\text{ lb}}{(20\text{ lb/in.})(15\text{ in.})}$$

$$=0.25$$

or
$$\frac{\cos\left(45^\circ+\frac{\theta}{2}\right)}{\cos\theta}=0.53033$$

Solving numerically $\theta = 51.058^\circ$ $\theta = 51.1^\circ$ ◀

Designate vertical distance between link AC and DG as b.

We have
$$y_A = b - u, \quad y_C = b + 2u, \quad y_D = -u, \quad y_E = -\frac{1}{2}u, \quad y_G = +\frac{1}{2}u$$

$$V = (80\text{ N})y_A + P(y_C) + (60\text{ N})y_D + (20\text{ N})y_E + (40\text{ N})y_G$$

$$V = 80(\text{b}-u) + P(b+2u) + 60(-u) + 20\left(-\frac{1}{2}u\right) + 40\left(\frac{1}{2}u\right)$$

$$\frac{dV}{du} = -80 + 2P - 60 - 10 + 20 = 0$$

$$P = 65\text{ N}$$

Substituting $P = 270\text{ N}$ in the expression for V, we have

$$V = (80 + 65)b + (-80 + 130 - 60 - 10 + 20)u$$

$$V = 145b$$

Thus V is constant

and equilibrium is neutral ◀

$$y_A = 2u$$

$$y_E = -u$$

$$y_F = -u$$

$$V = Py_A + (100 \text{ lb})y_E + (150 \text{ lb})y_F$$

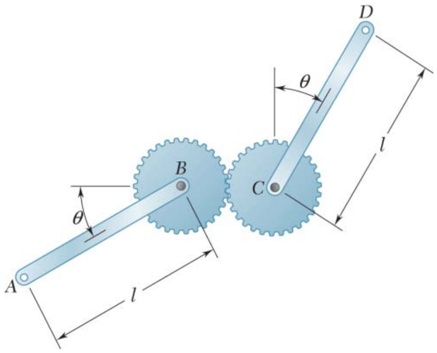
$$V = P(2u) + (100 \text{ lb})(-u) + (150 \text{ lb})(-u)$$

$$\frac{dV}{du} = 2P - 100 - 150 = 0$$

$$P = 125 \text{ lb}$$

Now, substitute $P = 125$ lb in expression for *V*, making $V = 0$. Thus, *V* is constant and

equilibrium is neutral. ◀



PROBLEM 10.69

Two uniform rods, each of mass *m*, are attached to gears of equal radii as shown. Determine the positions of equilibrium of the system and state in each case whether the equilibrium is stable, unstable, or neutral.

SOLUTION

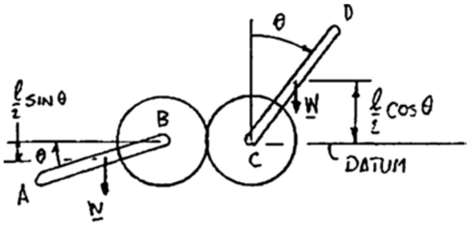
Potential energy

$$V = W\left(-\frac{l}{2}\sin\theta\right) + W\left(\frac{l}{2}\cos\theta\right) \quad W = mg$$

$$= W\frac{l}{2}(\cos\theta - \sin\theta)$$

$$\frac{dV}{d\theta} = \frac{Wl}{2}(-\sin\theta - \cos\theta)$$

$$\frac{d^2V}{d\theta^2} = \frac{Wl}{2}(\sin\theta - \cos\theta)$$



For equilibrium: $\frac{dV}{d\theta} = 0: \quad \sin\theta = -\cos\theta$

or $\tan\theta = -1$

Thus $\theta = -45.0°$ and $\theta = 135.0°$

Stability:

At $\theta = -45.0°$:

$$\frac{d^2V}{d\theta^2} = \frac{Wl}{2}[\sin(-45°) - \cos 45°]$$

$$= \frac{Wl}{2}\left(-\frac{\sqrt{2}}{2} - \frac{\sqrt{2}}{2}\right) < 0$$

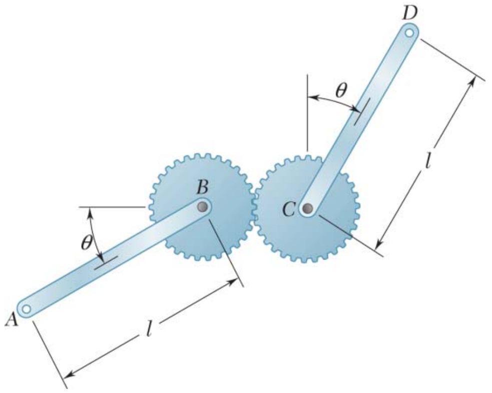
$\theta = -45.0°$, Unstable ◀

At $\theta = 135.0°$:

$$\frac{d^2V}{d\theta^2} = \frac{Wl}{2}(\sin 135° - \cos 135°)$$

$$= \frac{Wl}{2}\left(\frac{\sqrt{2}}{2} + \frac{\sqrt{2}}{2}\right) > 0$$

$\theta = 135.0°$, Stable ◀



PROBLEM 10.70

Two uniform rods, *AB* and *CD*, are attached to gears of equal radii as shown. Knowing that $W_{AB} = 8\text{ lb}$ and $W_{CD} = 4\text{ lb}$, determine the positions of equilibrium of the system and state in each case whether the equilibrium is stable, unstable, or neutral.

SOLUTION

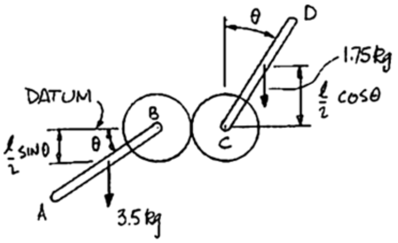
Potential energy

$$V = (3.5\text{ kg}\times 9.81\text{ m/s}^2)\left(-\frac{l}{2}\sin\theta\right) + (1.75\text{ kg}\times 9.81\text{ m/s}^2)\left(\frac{l}{2}\cos\theta\right)$$

$$= (8.5838\text{ N})l(-2\sin\theta + \cos\theta)$$

$$\frac{dV}{d\theta} = (8.5838\text{ N})l(-2\cos\theta - \sin\theta)$$

$$\frac{d^2V}{d\theta^2} = (8.5838\text{ N})l(2\sin\theta - \cos\theta)$$



Equilibrium: $\frac{dV}{d\theta} = 0$: $\quad -2\cos\theta - \sin\theta = 0$

or $\tan\theta = -2$

Thus $\theta = -63.4°$ and $116.6°$

Stability:

At $\theta = -63.4°$:

$$\frac{d^2V}{d\theta^2} = (8.5838\text{ N})l[2\sin(-63.4°) - \cos(-63.4°)]$$

$$= (8.5838\text{ N})l(-1.788 - 0.448) < 0$$

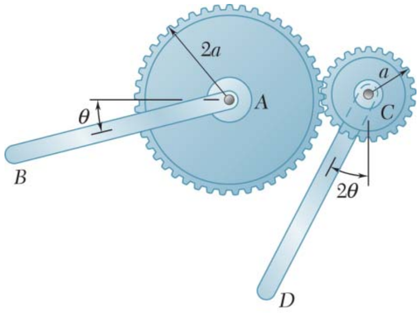
$\theta = -63.4°$, Unstable ◀

At $\theta = 116.6°$:

$$\frac{d^2V}{d\theta^2} = (8.5838\text{ N})l[2\sin(116.6°) - \cos(116.6°)]$$

$$= (8.5838\text{ N})l(1.788 + 0.447) > 0$$

$\theta = 116.6°$, Stable ◀



PROBLEM 10.71

Two uniform rods *AB* and *CD*, of the same length *l*, are attached to gears as shown. Knowing that rod *AB* weighs 3 lb and that rod *CD* weighs 2 lb, determine the positions of equilibrium of the system and state in each case whether the equilibrium is stable, unstable, or neutral.

SOLUTION

$$V = -W_{AB}\left(\frac{l}{2}\sin\theta\right) - W_{CD}\left(\frac{l}{2}\cos 2\theta\right)$$

$$\frac{dV}{d\theta} = -\frac{1}{2}W_{AB}l\cos\theta + W_{CD}l\sin 2\theta$$

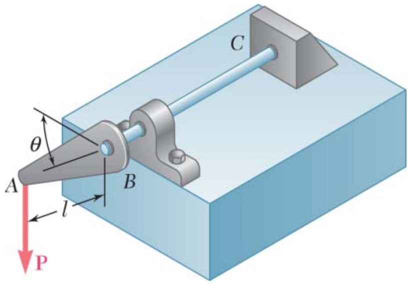
PROBLEM 10.73



Using the method of Section 10.8, solve Problem 10.39. Determine whether the equilibrium is stable, unstable, or neutral. (*Hint:* The potential energy corresponding to the couple exerted by a torsion spring is $\frac{1}{2}K\theta^2$, where K is the torsional spring constant and θ is the angle of twist.)

PROBLEM 10.39 The lever AB is attached to the horizontal shaft BC that passes through a bearing and is welded to a fixed support at C. The torsional spring constant of the shaft BC is K; that is, a couple of magnitude K is required to rotate end B through 1 rad. Knowing that the shaft is untwisted when AB is horizontal, determine the value of θ corresponding to the position of equilibrium when $P = 100$ N, $l = 250$ mm, and $K = 12.5 \text{ N}\cdot\text{m/rad}$.

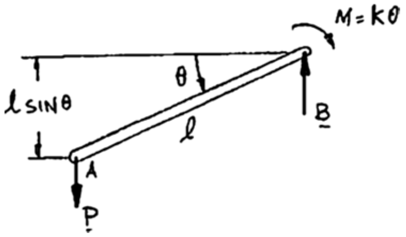
SOLUTION

Potential energy

$$V = \frac{1}{2}K\theta^2 - Pl\sin\theta$$

$$\frac{dV}{d\theta} = K\theta - Pl\cos\theta$$

$$\frac{d^2V}{d\theta^2} = K + Pl\sin\theta$$



Equilibrium:

$$\frac{dV}{d\theta} = 0: \quad \cos\theta = \frac{K}{Pl}\theta$$

For

$$P = 100 \text{ N}, \quad l = 0.25 \text{ m.}, \quad K = 12.5 \text{ N}\cdot\text{m/rad}$$

$$\cos\theta = \frac{12.5 \text{ N}\cdot\text{m/rad}}{(100)(0.25 \text{ m})}\theta$$

$$= 0.500\theta$$

Solving numerically, we obtain

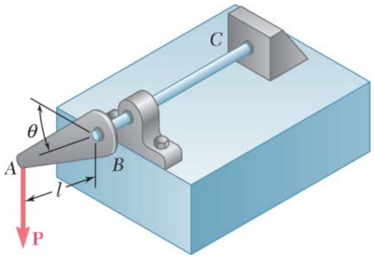
$$\theta = 1.02967 \text{ rad} = 59.000°$$

$\theta = 59.0°$ ◀

Stability

$$\frac{d^2V}{d\theta^2} = (12.5 \text{ N}\cdot\text{m/rad}) + (100 \text{ N})(0.25 \text{ m})\sin 59.0° > 0$$

Stable ◀

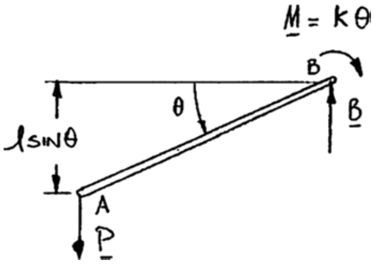


PROBLEM 10.74

In Problem 10.40, determine whether each of the positions of equilibrium is stable, unstable, or neutral. (See hint for Problem 10.73.)

PROBLEM 10.40 Solve Problem 10.39 assuming that $P = 350$ N, $l = 250$ mm, and $K = 12.5\ \text{N}\cdot\text{m/rad}$. Obtain answers in each of the following quadrants: $0 < \theta < 90°$, $270° < \theta < 360°$, $360° < \theta < 450°$.

SOLUTION



Potential energy $$V = \frac{1}{2}K\theta^2 - Pl\sin\theta$$

$$\frac{dV}{d\theta} = K\theta - Pl\cos\theta$$

$$\frac{d^2V}{d\theta^2} = K + Pl\sin\theta$$

Equilibrium $$\frac{dV}{d\theta} = 0: \quad \cos\theta = \frac{K}{Pl}\theta$$

For $P = 350\ \text{N}, \quad l = 0.250\ \text{m} \quad \text{and} \quad K = 12.5\ \text{N}\cdot\text{m/rad}$

$$\cos\theta = \frac{12.5\ \text{N}\cdot\text{m/rad}}{(350\ \text{N})(0.250\ \text{m})}\theta$$

or $$\cos\theta = \frac{\theta}{7}$$

Solving numerically $\theta = 1.37333$ rad, 5.652 rad, and 6.616 rad

or $\theta = 78.7°$, 323.8°, 379.1°

Stability at $\theta = 78.7°$: $$\frac{d^2V}{d\theta^2} = (12.5\ \text{N}\cdot\text{m/rad}) + (350\ \text{N})(0.250\ \text{m})\sin 78.7°$$

$$= 98.304 > 0$$

$\theta = 78.7°$, Stable ◀

At $\theta = 323.8°$: $$\frac{d^2V}{d\theta^2} = (12.5\ \text{N}\cdot\text{m/rad}) + (350\ \text{N})(0.250\ \text{m})\sin 323.8°$$

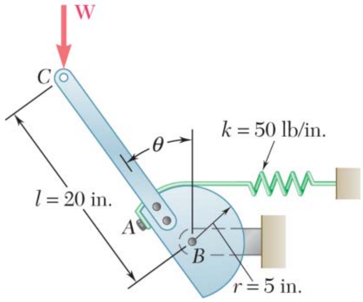
$$= -39.178\ \text{N}\cdot\text{m} < 0$$

$\theta = 324°$, Unstable ◀

At At $\theta = 379.1°$: $$\frac{d^2V}{d\theta^2} = (12.5\ \text{N}\cdot\text{m/rad}) + (350\ \text{N})(0.250\ \text{m})\sin 379.1°$$

$$= 44.132\ \text{N}\cdot\text{m} > 0$$

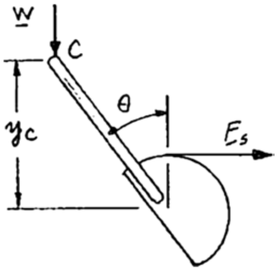
$\theta = 379°$, Stable ◀



PROBLEM 10.75

A load **W** of magnitude 100 lb is applied to the mechanism at *C*. Knowing that the spring is unstretched when $\theta = 15°$, determine that value of θ corresponding to equilibrium and check that the equilibrium is stable.

SOLUTION



We have $$y_C = l\cos\theta$$

$$V = \frac{1}{2}k[r(\theta-\theta_0)]^2 + Wy_C \quad \theta_0 = 15° = \frac{\pi}{12}\text{rad}$$

$$= \frac{1}{2}kr^2(\theta-\theta_0)^2 + Wl\cos\theta$$

$$\frac{dV}{d\theta} = kr^2(\theta-\theta_0) - Wl\sin\theta$$

Equilibrium $$\frac{dV}{d\theta} = 0: \quad kr^2(\theta-\theta_0) - wl\sin\theta = 0 \tag{1}$$

with $W = 100$ lb, $R = 50$ lb./in., $l = 20$ in., and $r = 5$ in.

$$(50\text{ lb./in.})(25\text{ in.}^2)\left(\theta - \frac{\pi}{12}\right) - (100\text{ lb})(20\text{ in.})\sin\,\theta = 0$$

or $$0.625\theta - \sin\theta = 0.16362$$

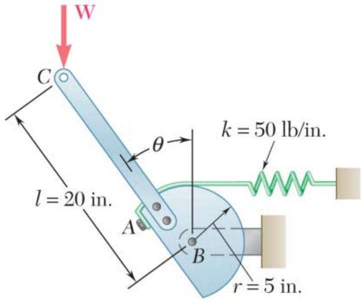
Solving numerically $$\theta = 1.8145\text{ rad} = 103.97°$$

$\theta = 104.0°$ ◀

Stability $$\frac{d^2V}{d\theta^2} = kr^2 - Wl\cos\theta \tag{2}$$

or $$= 1250 - 2000\cos\theta$$

For $\theta = 104.0°$: $= 1734\text{ in.}\cdot\text{lb} > 0$ Stable ◀



PROBLEM 10.76

A load **W** of magnitude 100 lb is applied to the mechanism at *C*. Knowing that the spring is unstretched when $\theta = 30°$, determine that value of θ corresponding to equilibrium and check that the equilibrium is stable.

SOLUTION

Using the solution of Problem 10.75, particularly Equation (1), with 15° replaced by $30°\left(\frac{\pi}{6}\text{ rad}\right)$:

For equilibrium $$kr^2\left(\theta - \frac{\pi}{6}\right) - Wl\sin\theta = 0$$

With $k = 50$ lb/in., $W = 100$ lb, $r = 5$ in., and $l = 20$ in.

$$(50\text{ lb/in.})(25\text{ in.}^2)\left(\theta - \frac{\pi}{6}\right) - (100\text{ lb})(20\text{ in.})\sin\theta = 0$$

or $$1250\theta - 654.5 - 200\sin\theta = 0$$

Solving numerically, $$\theta = 1.9870\text{ rad } = 113.8°$$

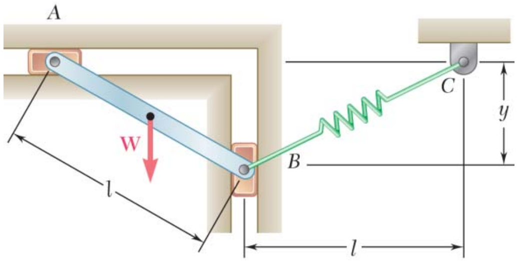
$\theta = 113.8°$ ◀

Stability: Equation (2), Problem 75:

$$\frac{d^2V}{d\theta^2} = kr^2 - Wl\cos\theta$$

or $$= 1250 - 2000\cos\theta$$

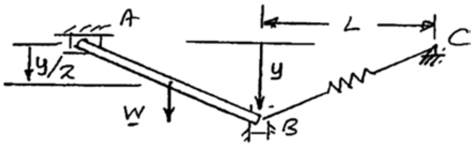
For $\theta = 113.8°$: $$= 2057\text{ in.}\cdot\text{lb} > 0$$ Stable ◀



PROBLEM 10.77

A slender rod *AB*, of weight *W*, is attached to two blocks *A* and *B* that can move freely in the guides shown. Knowing that the spring is unstretched when $y = 0$, determine the value of y corresponding to equilibrium when $W = 80$ N, $l = 500$ mm, and $k = 600$ N/m.

SOLUTION



Deflection of spring = *s*, where

$$s = \sqrt{l^2 + y^2} - l$$

$$\frac{ds}{dy} = \frac{y}{\sqrt{l^2 - y^2}}$$

Potential energy:

$$V = \frac{1}{2}ks^2 - W\frac{y}{2}$$

$$\frac{dV}{dy} = ks\frac{ds}{dy} - \frac{1}{2}W$$

$$\frac{dV}{dy} = k\left(\sqrt{l^2 + y^2} - l\right)\frac{y}{\sqrt{l^2 + y^2}} - \frac{1}{2}W$$

$$= k\left(1 - \frac{l}{\sqrt{l^2 + y^2}}\right)y - \frac{1}{2}W$$

Equilibrium

$$\frac{dV}{dy} = 0: \quad \left(1 - \frac{l}{\sqrt{l^2 + y^2}}\right)y = \frac{1}{2}\frac{W}{k}$$

Now $W = 80$ N, $l = 0.500$ m, and $k = 600$ N/m

Then

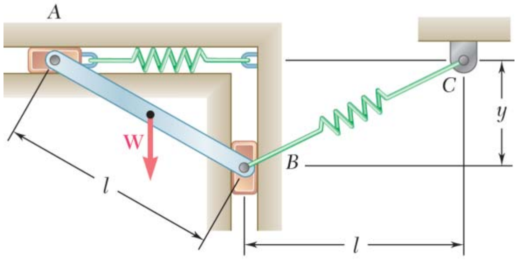
$$\left(1 - \frac{0.500 \text{ m}}{\sqrt{(0.500)^2 + y^2}}\right)y = \frac{1}{2}\frac{(80 \text{ N})}{(600 \text{ N/m})}$$

or

$$\left(1 - \frac{0.500}{\sqrt{0.25 + y^2}}\right)y = 0.066667$$

Solving numerically, $y = 0.357$ m

$y = 357$ mm ◀

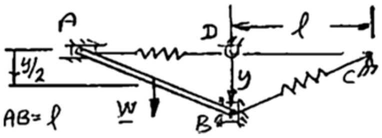


PROBLEM 10.78

A slender rod AB, of weight W, is attached to two blocks A and B that can move freely in the guides shown. Knowing that both springs are unstretched when $y = 0$, determine the value of y corresponding to equilibrium when $W = 80$ N, $l = 550$ mm, and $k = 600$ N/m.

SOLUTION

Spring deflections



$$S_{AD} = l - \sqrt{l^2 - y^2}$$

$$S_{BC} = \sqrt{l^2 + y^2} - l$$

$$V = \frac{1}{2}kS_{AD}^2 + \frac{1}{2}kS_{BC}^2 - W\frac{y}{2}$$

$$V = \frac{1}{2}k\left(l - \sqrt{l^2 - y^2}\right)^2 + \frac{1}{2}k\left(\sqrt{l^2 + y^2} - l\right)^2 - W\frac{y}{2}$$

$$\frac{dV}{dy} = k\left(l - \sqrt{l^2 - y^2}\right)\left(\frac{y}{\sqrt{l^2 - y^2}}\right) + k\left(\sqrt{l^2 + y^2} - l\right)\left(\frac{y}{\sqrt{l^2 + y^2}}\right) - \frac{W}{2}$$

$$\frac{dV}{dy} = 0: \quad \left[\left(\frac{l}{\sqrt{l^2 - y^2}} - 1\right) + \left(1 - \frac{l}{\sqrt{l^2 + y^2}}\right)\right]y = \frac{W}{2k}$$

Data: $W = 80$ N, $l = 0.5$ m, $k = 600$ N/m

$$\left[\frac{0.5}{\sqrt{(0.5)^2 - y^2}} - \frac{0.5}{\sqrt{(0.5)^2 + y^2}}\right]y = \frac{80}{2(1200)} = 0.066667$$

Solve by trial and error: $y = 0.252$ m $\qquad y = 252$ mm ◀

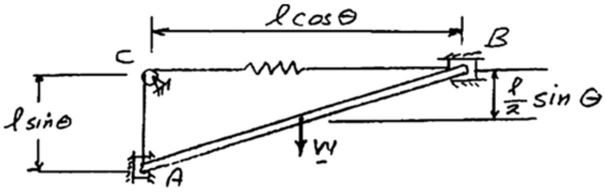
PROBLEM 10.79

A slender rod *AB*, of weight *W*, is attached to two blocks *A* and *B* that can move freely in the guides shown. The constant of the spring is *k*, and the spring is unstretched when *AB* is horizontal. Neglecting the weight of the blocks, derive an equation in *θ*, *W*, *l*, and *k* that must be satisfied when the rod is in equilibrium.

SOLUTION



Elongation of spring:

$$s = l\sin\theta + l\cos\theta - l$$

$$s = l(\sin\theta + \cos\theta - 1)$$

Potential energy:

$$V = \frac{1}{2}ks^2 - W\frac{1}{2}\sin\theta \quad W = mg$$

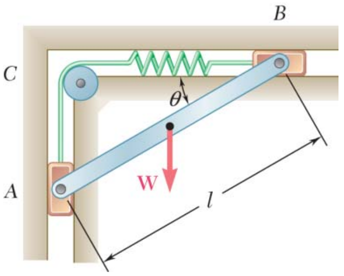
$$= \frac{1}{2}kl^2(\sin\theta + \cos\theta - 1)^2 - mg\frac{l}{2}\sin\theta$$

$$\frac{dV}{d\theta} = kl^2(\sin\theta + \cos\theta - 1)(\cos\theta - \sin\theta) - \frac{1}{2}mgl\cos\theta \tag{1}$$

Equilibrium:

$$\frac{dV}{d\theta} = 0: \quad (\sin\theta + \cos\theta - 1)(\cos\theta - \sin\theta) - \frac{mg}{2kl}\cos\theta = 0$$

or $\cos\theta\left[(\sin\theta + \cos\theta - 1)(1 - \tan\theta) - \dfrac{mg}{2kl}\right] = 0$ ◀



PROBLEM 10.80

A slender rod AB, of weight W, is attached to two blocks A and B that can move freely in the guides shown. Knowing that the spring is unstretched when AB is horizontal, determine three values of θ corresponding to equilibrium when $W = 300$ lb, $l = 16$ in., and $k = 75$ lb/in. State in each case whether the equilibrium is stable, unstable, or neutral.

SOLUTION

Using the results of Problem 10.79, particularly the condition of equilibrium

$$\cos\theta\left[(\sin\theta+\cos\theta-1)(1-\tan\theta)-\frac{mg}{2kl}\right]=0$$

Now, with $W = 300$ lb, $l = 16$ in., and $k = 75$ lb/in.

$$\frac{W}{2kl}=\frac{300\text{ lb}}{(16\text{ in.})(75\text{ lb/in.})}=0.25$$

Thus: $$\cos\theta\left[(\sin\theta+\cos\theta-1)(1-\tan\theta)-0.25\right]=0$$

$$\cos\theta=0\quad\text{and}\quad(\sin\theta+\cos\theta-1)(1-\tan\theta)=0.25$$

First equation yields $\theta = 90°$. Solving the second equation by trial, we find $\theta = 9.39°$ and $34.16°$
Values of θ for equilibrium are

$$\theta=9.39°,\ 34.2°,\text{ and }90.0°$$

Stability: we differentiate Eq. (1).

$$\frac{d^2y}{ds^2}=kl^2[(\cos\theta-\sin\theta)(\cos\theta-\sin\theta)+(\sin\theta+\cos\theta-1)(-\sin\theta-\cos\theta)]+\frac{1}{2}wl\sin\theta$$

$$=kl^2\left[\cos^2\theta+\sin^2\theta-2\cos\theta\sin\theta-\sin^2\theta-\cos^2\theta-2\cos\theta\sin\theta+\sin\theta+\cos\theta+\frac{W}{2kl}\sin\theta\right]$$

$$=kl^2\left[\left(1+\frac{W}{2kl}\right)\sin\theta+\cos\theta-2\sin2\theta\right]$$

$$\frac{d^2V}{d\theta^2}=kl^2(1.25\sin\theta+\cos\theta-2\sin2\theta)$$

$\theta = 9.39°$: $$\frac{d^2V}{d\theta^2}=kl^2(1.25\sin9.4+\cos9.4-2\sin18.8)$$

$$=kl^2(+0.55)<0$$ Stable ◀

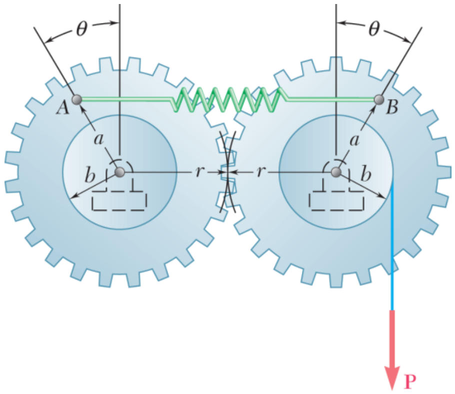
PROBLEM 10.80 (Continued)

$\theta = 34.2°$: $$\frac{d^2v}{d\theta^2} = kl^2(1.25\sin 34.2° + \cos 34.3° - 2\sin 68.4°)$$

$$= kl^2(-0.33) < 0$$ Unstable ◀

$\theta = 90.0°$: $$\frac{d^2V}{d\theta^2} = kl^2(1.25\sin 90° + \cos 90° - 2\sin 180°)$$

$$= kl^2(1.25) > 0$$ Stable ◀

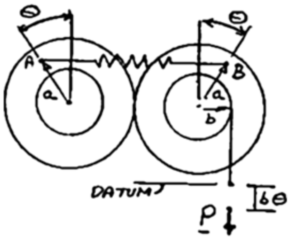


PROBLEM 10.81

A spring *AB* of constant *k* is attached to two identical gears as shown. Knowing that the spring is undeformed when $\theta = 0$, determine two values of the angle θ corresponding to equilibrium when $P = 30$ lb, $a = 4$ in., $b = 3$ in., $r = 6$ in., and $k = 5$ lb/in. State in each case whether the equilibrium is stable, unstable, or neutral.

SOLUTION

Elongation of spring



$$s = 2(a\sin\theta) = 2a\sin\theta$$

$$V = \frac{1}{2}ks^2 - Pb\theta$$

$$= \frac{1}{2}k(2a\sin\theta)^2 - Pb\theta$$

$$\frac{dV}{d\theta} = 4ka^2\sin\theta\cos\theta - Pb$$

$$= 2ka^2\sin 2\theta - Pb \qquad (1)$$

Equilibrium $$\frac{dV}{d\theta} = 0: \quad \sin 2\theta = \frac{Pb}{2ka^2}$$

$$\sin 2\theta = \frac{(30\text{ lb})(3\text{ in.})}{2(5\text{ lb/in.})(4\text{ in.})^2}; \quad \sin 2\theta = 0.5625$$

$$2\theta = 34.229° \quad \text{and} \quad 145.771°$$

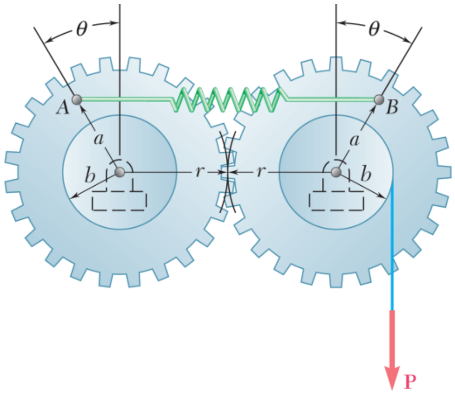
$$\theta = 17.11° \quad \text{and} \quad 72.9° \blacktriangleleft$$

Stability: We differentiate Eq. (1)

$$\frac{d^2V}{d\theta^2} = 4ka^2\cos 2\theta$$

$$\theta = 17.11°: \quad \frac{d^2v}{d\theta^2} = 4ka^2\cos 34.2° = 4ka^2(0.83) > 0 \qquad \text{Stable} \blacktriangleleft$$

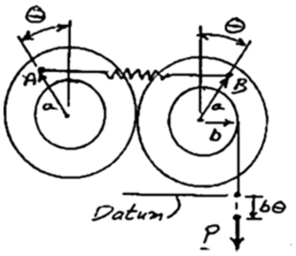
$$\theta = 72.9°: \quad \frac{d^2v}{d\theta^2} = 4ka^2\cos 145.8° = 4ka^2(-0.83) < 0 \qquad \text{Unstable} \blacktriangleleft$$



PROBLEM 10.82

A spring *AB* of constant *k* is attached to two identical gears as shown. Knowing that the spring is undeformed when $\theta = 0$, and given that $a = 60$ mm, $b = 45$ mm, $r = 90$ mm, and $k = 6$ kN/m, determine (*a*) the range of values of *P* for which a position of equilibrium exists, (*b*) two values of θ corresponding to equilibrium if the value of *P* is equal to half the upper limit of the range found in part *a*.

SOLUTION



Elongation of spring

$$s = 2(a\sin\theta) = 2a\sin\theta$$

Potential energy

$$V = \frac{1}{2}ks^2 - Pb\theta = \frac{1}{2}k(2a\sin\theta)^2 - Pb\theta$$

$$V = 2ka^2\sin^2\theta - Pb\theta$$

Equilibrium

$$\frac{dV}{d\theta} = 0: \quad \frac{dV}{d\theta} = 4ka^2\sin\theta\cos\theta - Pb \qquad (1)$$

$$= 2ka^2\sin 2\theta - Pb = 0$$

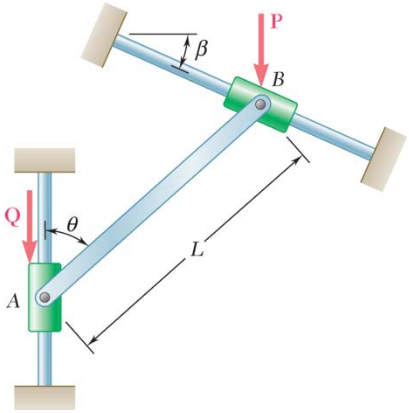
$$\sin 2\theta = \frac{Pb}{2ka^2}; \quad \text{For} \quad P_{\max}; \ \frac{P_{\max}b}{2ka^2} = 1$$

(*a*) $$\frac{P_{\max}(0.045\text{ m})}{2(6000\text{ N/m})(0.06\text{ m})^2} = 1$$

$P_{\max} = 960$ N ◀

(*b*) For $P = \frac{1}{2}P_{\max}$, $$\sin 2\theta = \frac{1}{2}; \ 2\theta = 30° \quad \text{and} \quad 150°$$

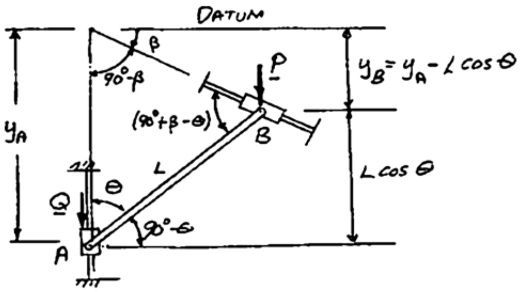
$\theta = 15.00°$ and $75.0°$ ◀



PROBLEM 10.83

A slender rod AB is attached to two collars A and B that can move freely along the guide rods shown. Knowing that $\beta = 30°$ and $P = Q = 400$ N, determine the value of the angle θ corresponding to equilibrium.

SOLUTION



Law of Sines

$$\frac{y_A}{\sin(90° + \beta - \theta)} = \frac{L}{\sin(90 - \beta)}$$

$$\frac{y_A}{\cos(\theta - \beta)} = \frac{L}{\cos\beta}$$

or

$$y_A = L\frac{\cos(\theta - \beta)}{\cos\beta}$$

From the figure:

$$y_B = L\frac{\cos(\theta - \beta)}{\cos\beta} - L\cos\theta$$

Potential Energy:

$$V = -Py_B - Qy_A = -P\left[L\frac{\cos(\theta - \beta)}{\cos\beta} - L\cos\theta\right] - QL\frac{\cos(\theta - \beta)}{\cos\beta}$$

$$\frac{dV}{d\theta} = -PL\left[-\frac{\sin(\theta - \beta)}{\cos\beta} + \sin\theta\right] + QL\frac{\sin(\theta - \beta)}{\cos\beta}$$

$$= L(P + Q)\frac{\sin(\theta - \beta)}{\cos\beta} - PL\sin\theta$$

PROBLEM 10.83 (Continued)

Equilibrium
$$\frac{dV}{d\theta}=0: \quad L(P+Q)\frac{\sin(\theta-\beta)}{\cos\beta}-PL\sin\theta=0$$

or
$$(P+Q)\sin(\theta-\beta)=P\sin\theta\cos\beta$$

$$(P+Q)(\sin\theta\cos\beta-\cos\theta\sin\beta)=P\sin\theta\cos\beta$$

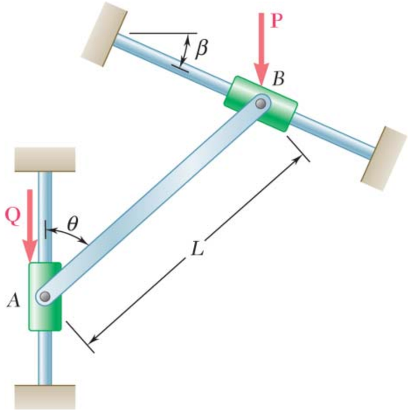
or
$$-(P+Q)\cos\theta\sin\beta+Q\sin\theta\cos\beta=0$$

$$-\frac{P+Q}{Q}\frac{\sin\beta}{\cos\beta}+\frac{\sin\theta}{\cos\theta}=0$$

$$\tan\theta=\frac{P+Q}{Q}\tan\beta \qquad (2)$$

With
$$P=Q=400\text{ N}, \quad \beta=30°$$

$$\tan\theta=\frac{800\text{ N}}{400\text{ N}}\tan 30°=1.1547 \qquad \theta=49.1° \blacktriangleleft$$



PROBLEM 10.84

A slender rod *AB* is attached to two collars *A* and *B* that can move freely along the guide rods shown. Knowing that $\beta = 30°$, $P = 100\text{ N}$, and $Q = 25\text{ N}$, determine the value of the angle θ corresponding to equilibrium.

SOLUTION

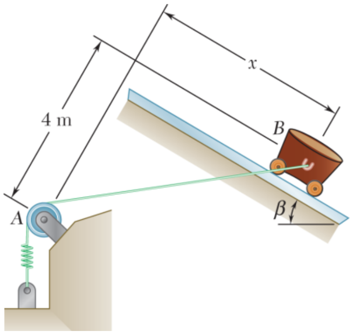
Using Equation (2) of Problem 10.83, with $P = 100$ N, $Q = 25$ N, and $\beta = 30°$, we have

$$\tan\theta = \frac{(100\text{ N})(25\text{ N})}{(25\text{ N})}\tan 30°$$

$$= 57.735$$

$$\theta = 89.007°$$

$\theta = 89.0°$ ◀

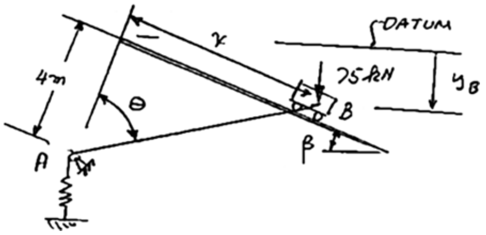


PROBLEM 10.85

Cart *B*, which weighs 75 kN, rolls along a sloping track that forms an angle β with the horizontal. The spring constant is 5 kN/m, and the spring is unstretched when $x = 0$. Determine the distance x corresponding to equilibrium for the angle β indicated.

Angle $\beta = 30°$.

SOLUTION



$$x = (4\text{ m})\tan\theta \qquad (1)$$

$$y_B = x\sin\beta = 4\tan\theta\sin\beta$$

$$AC = (4\text{ m})\cos\theta$$

For $x = 0$, $$(AC)_0 = 4\text{ m}$$

Stretch of spring. $$s = AC - (AC)_0 = \frac{4}{\cos\theta} - 4 = 4\left(\frac{1}{\cos\theta} - 1\right)$$

$$V = \frac{1}{2}ks^2 - (75\text{ kN})y_B$$

$$= \frac{1}{2}(5\text{ kN/m})16\left(\frac{1}{\cos\theta} - 1\right)^2 - (75\text{ kN})4\tan\theta\sin\beta$$

$$\frac{dV}{d\theta} = 80\left(\frac{1}{\cos\theta} - 1\right)\frac{\sin\theta}{\cos^2\theta} - 300\frac{\sin\beta}{\cos^2\theta}$$

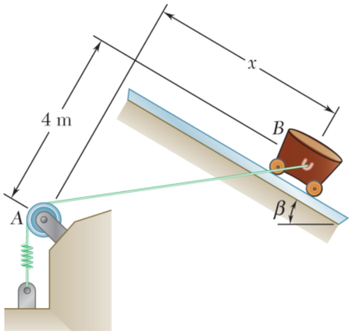
Equilibrium $$\frac{dV}{d\theta} = 0: \quad \left(\frac{1}{\cos\theta} - 1\right)\sin\theta = 3.75\sin\beta \qquad (2)$$

Given: $$\beta = 30°, \quad \sin\theta = 0.5$$

Eq. (2): $$\left(\frac{1}{\cos\theta} - 1\right)\sin\theta = 3.75(0.5) = 1.875$$

Solve by trial and error: $$\theta = 70.46°$$

Eq. (1): $$x = (4\text{ m})\tan 70.46° \qquad x = 11.27\text{ m} \blacktriangleleft$$

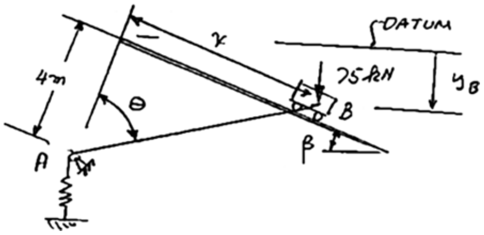


PROBLEM 10.86

Cart *B*, which weighs 75 kN, rolls along a sloping track that forms an angle β with the horizontal. The spring constant is 5 kN/m, and the spring is unstretched when $x = 0$. Determine the distance *x* corresponding to equilibrium for the angle β indicated.

Angle $\beta = 60°$.

SOLUTION



$$x = (4\text{ m})\tan\theta \qquad (1)$$

$$y_B = x\sin\beta = 4\tan\theta\sin\beta$$

$$AC = (4\text{ m})\cos\theta$$

For $x = 0$, $(AC)_0 = 4\text{ m}$

Stretch of spring: $s = AC - (AC)_0 = \dfrac{4}{\cos\theta} - 4 = 4\left(\dfrac{1}{\cos\theta} - 1\right)$

$$V = \frac{1}{2}ks^2 - (75\text{ kN})y_B$$

$$= \frac{1}{2}(5\text{ kN/m})16\left(\frac{1}{\cos\theta} - 1\right)^2 - (75\text{ kN})4\tan\theta\sin\beta$$

$$\frac{dV}{d\theta} = 80\left(\frac{1}{\cos\theta} - 1\right)\frac{\sin\theta}{\cos^2\theta} - 300\frac{\sin\beta}{\cos^2\theta}$$

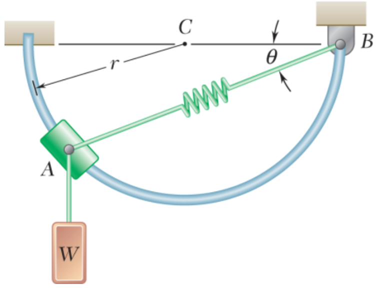
Equilibrium $\dfrac{dV}{d\theta} = 0\text{:} \quad \left(\dfrac{1}{\cos\theta} - 1\right)\sin\theta = 3.75\sin\beta \qquad (2)$

Given: $\beta = 60°, \sin\theta = 0.86603$

Eq. (2): $\left(\dfrac{1}{\cos\theta} - 1\right)\sin\theta = 3.75(0.86603) = 3.2476$

Solve by trial and error: $\theta = 76.67°$

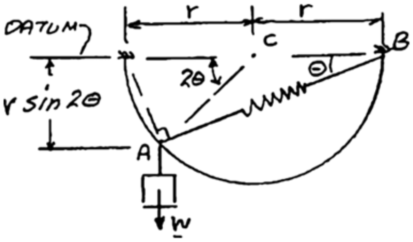
Eq. (1): $x = (4\text{ m})\tan 26.67°$ $\quad x = 16.88\text{ m}$ ◀



PROBLEM 10.87

Collar *A* can slide freely on the semicircular rod shown. Knowing that the constant of the spring is *k* and that the unstretched length of the spring is equal to the radius *r*, determine the value of θ corresponding to equilibrium when $W = 50$ lb, $r = 9$ in., and $k = 15$ lb/in.

SOLUTION



Stretch of spring
$$s = AB - r$$
$$s = 2(r\cos\theta) - r$$
$$s = r(2\cos\theta - 1)$$

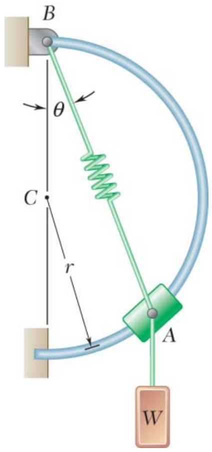
Potential energy:
$$V = \frac{1}{2}ks^2 - Wr\sin 2\theta \qquad W = mg$$
$$V = \frac{1}{2}kr^2(2\cos\theta - 1)^2 - Wr\sin 2\theta$$
$$\frac{dV}{d\theta} = -kr^2(2\cos\theta - 1)2\sin\theta - 2Wr\cos 2\theta$$

Equilibrium
$$\frac{dV}{d\theta} = 0: \quad -kr^2(2\cos\theta - 1)\sin\theta - Wr\cos 2\theta = 0$$
$$\frac{(2\cos\theta - 1)\sin\theta}{\cos 2\theta} = -\frac{W}{kr}$$

Now
$$\frac{W}{kr} = \frac{(50\text{ lb})}{(15\text{ lb/in.})(9\text{ in.})} = 0.37037$$

Then
$$\frac{(2\cos\theta - 1)\sin\theta}{\cos 2\theta} = -0.37037$$

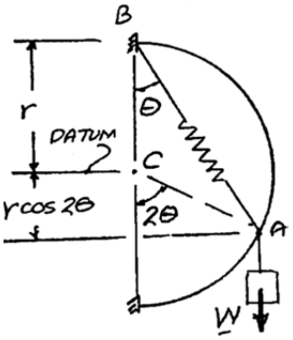
Solving numerically, $\theta = 0.95637\text{ rad} = 54.8°$ $\qquad \theta = 54.8°$ ◀



PROBLEM 10.88

Collar *A* can slide freely on the semicircular rod shown. Knowing that the constant of the spring is *k* and that the unstretched length of the spring is equal to the radius *r*, determine the value of θ corresponding to equilibrium when $W = 50$ lb, $r = 9$ in., and $k = 15$ lb/in.

SOLUTION



Stretch of spring

$$s = AB - r = 2(r\cos\theta) - r$$

$$s = r(2\cos\theta - 1)$$

$$V = \frac{1}{2}ks^2 - Wr\cos 2\theta$$

$$= \frac{1}{2}kr^2(2\cos\theta - 1)^2 - Wr\cos 2\theta$$

$$\frac{dV}{d\theta} = -kr^2(2\cos\theta - 1)2\sin\theta + 2Wr\sin 2\theta$$

Equilibrium

$$\frac{dV}{d\theta} = 0: \quad -kr^2(2\cos\theta - 1)\sin\theta + Wr\sin 2\theta = 0$$

$$-kr^2(2\cos\theta - 1)\sin\theta + Wr(2\sin\theta\cos\theta) = 0$$

or

$$\frac{(2\cos\theta - 1)\sin\theta}{2\cos\theta} = \frac{W}{kr}$$

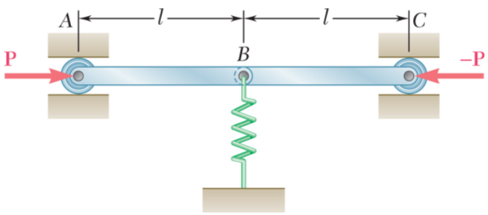
Now

$$\frac{W}{kr} = \frac{(50\text{ lb})}{(15\text{ lb/in.})(9\text{ in.})} = 0.37037$$

Then

$$\frac{2\cos\theta - 1}{2\cos\theta} = 0.37037$$

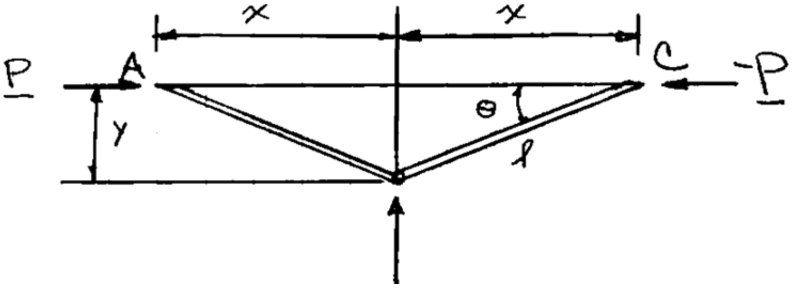
Solving $\theta = 37.4°$ ◀



PROBLEM 10.89

Two bars *AB* and *BC* of negligible weight are attached to a single spring of constant *k* that is unstretched when the bars are horizontal. Determine the range of values of the magnitude *P* of two equal and opposite forces **P** and –**P** for which the equilibrium of the system is stable in the position shown.

SOLUTION



$$x = l\cos\theta$$
$$y = l\sin\theta$$

$$V = 2Px + \frac{1}{2}ky^2$$

$$v = 2Pl\cos\theta + \frac{1}{2}kl^2\sin^2\theta$$

$$\frac{dV}{d\theta} = -2Pl\sin\theta + kl^2\sin\theta\cos\theta$$

$$= -2Pl\sin\theta + \frac{1}{2}kl^2\sin 2\theta$$

$$\frac{d^2V}{d\theta^2} = -2Pl\cos\theta + kl^2\cos 2\theta \qquad (1)$$

For equilibrium position $\theta = 0$ to be stable

$$\frac{d^2V}{d\theta^2} = -2Pl + kl^2 > 0 \qquad (2)$$

$$P < \frac{1}{2}kl \blacktriangleleft$$

PROBLEM 10.89 (Continued)

Note: For $P = \frac{1}{2}kl,$ we have $\frac{d^2V}{d\theta^2} = 0$ and we must determine which is the first derivative to be $\neq 0.$

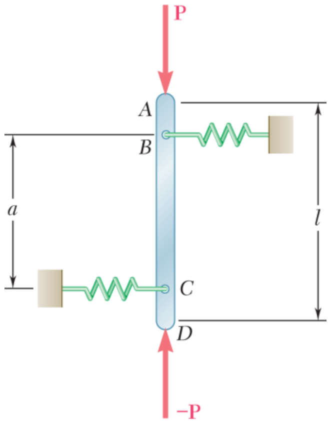
Differentiating Eq. (1):

$$\frac{d^3V}{d\theta^3} = +2Pl\sin\theta - 2kl^2\sin 2\theta = 0 \text{ for } \theta = 0$$

$$\frac{d^4V}{d\theta^4} = 2Pl\cos\theta - 4kl^2\cos 2\theta = 2Pl - 4kl^2 \text{ for } \theta = 0$$

But $P = \frac{1}{2}kl.$ Thus $\frac{d^4V}{d\theta^4} = kl^2 - 4kl^2 < 0$ and we conclude that the equilibrium is unstable for $P = \frac{1}{2}kl.$

The sign < in Eq. (2) is thus correct.



PROBLEM 10.90

A vertical bar *AD* is attached to two springs of constant *k* and is in equilibrium in the position shown. Determine the range of values of the magnitude *P* of two equal and opposite vertical forces **P** and –**P** for which the equilibrium position is stable if (*a*) $AB = CD$, (*b*) $AB = 2CD$.

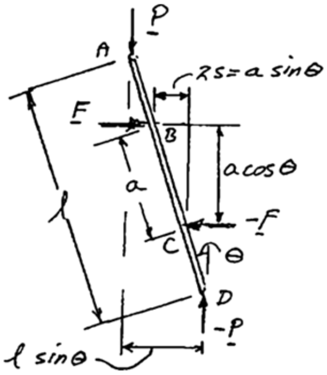
SOLUTION

For both (*a*) and (*b*): Since **P** and –**P** are vertical, they form a couple of moment

$$M_P = +Pl\sin\theta$$

The forces **F** and –**F** exerted by springs must, therefore, also form a couple, with moment

$$M_F = -Fa\cos\theta$$



We have $$dU = M_P d\theta + M_F d\theta$$
$$= (Pl\sin\theta - Fa\cos\theta)d\theta$$

but $$F = ks = k\left(\frac{1}{2}a\sin\theta\right)$$

Thus, $$dU = \left(Pl\sin\theta - \frac{1}{2}ka^2\sin\theta\cos\theta\right)d\theta$$

From Equation (10.19), page 580, we have

$$dV = -dU = -Pl\sin\theta d\theta + \frac{1}{4}ka^2\sin 2\theta d\theta$$

or $$\frac{dV}{d\theta} = -Pl\sin\theta + \frac{1}{4}ka^2\sin 2\theta$$

and $$\frac{d^2V}{d\theta^2} = -Pl\cos\theta + \frac{1}{2}ka^2\cos 2\theta \qquad (1)$$

For $\theta = 0$: $$\frac{d^2V}{d\theta^2} = -Pl + \frac{1}{2}ka^2$$

PROBLEM 10.90 (Continued)

For Stability: $\dfrac{d^2V}{d\theta^2} > 0, \quad -Pl + \dfrac{1}{2}ka^2 > 0$

or (for Parts *a* and *b*) $P < \dfrac{ka^2}{2l}$ ◀

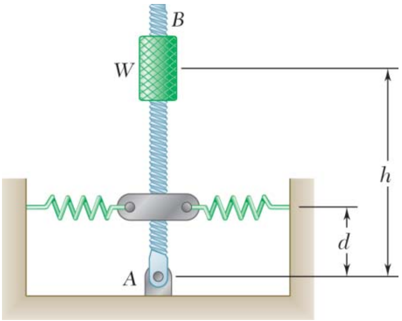
Note: To check that equilibrium is unstable for $P = \frac{ka^2}{2l}$, we differentiate (1) twice:

$$\frac{d^3V}{d\theta^3} = +Pl\sin\theta - ka^2\sin 2\theta = 0, \quad \text{for} \quad \theta = 0,$$

$$\frac{d^4V}{d\theta^4} = Pl\cos\theta - 2ka^2\cos 2\theta$$

For $\theta = 0$ $\dfrac{d^4V}{d\theta^4} = Pl - 2ka^2 = \dfrac{ka^2}{2} - 2ka^2 < 0$

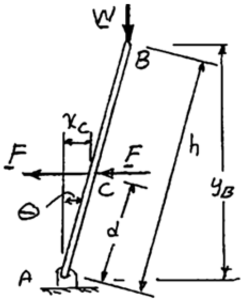
Thus, equilibrium is unstable when $P = \dfrac{ka^2}{2l}$



PROBLEM 10.91

Rod AB is attached to a hinge at A and to two springs, each of constant k. If $h = 25$ in., $d = 12$ in., and $W = 80$ lb, determine the range of values of k for which the equilibrium of the rod is stable in the position shown. Each spring can act in either tension or compression.

SOLUTION



We have $$x_C = d\sin\theta \qquad y_B = h\cos\theta$$

Potential Energy: $$V = 2\left(\frac{1}{2}kx_C^2 + Wy_B\right)$$

$$= kd^2\sin^2\theta + Wh\cos\theta$$

Then $$\frac{dV}{d\theta} = 2kd^2\sin\theta\cos\theta - Wh\sin\theta$$

$$= kd^2\sin 2\theta - Wh\sin\theta$$

and $$\frac{d^2V}{d\theta^2} = 2kd^2\cos 2\theta - Wh\cos\theta \tag{1}$$

For equilibrium position $\theta = 0$ to be stable, we must have

$$\frac{d^2V}{d\theta^2} = 2kd^2 - Wh > 0$$

or $$kd^2 > \frac{1}{2}Wh \tag{2}$$

Note: For $kd^2 = \frac{1}{2}Wh,$ we have $\frac{d^2V}{d\theta^2} = 0,$ so that we must determine which is the first derivative that is not equal to zero. Differentiating Equation (1), we write

$$\frac{d^3V}{d\theta^3} = -4kd^2\sin 2\theta + Wh\sin\theta = 0 \qquad \text{for } \theta = 0$$

$$\frac{d^4V}{d\theta^2} = -8kd^2\cos 2\theta + Wh\cos\theta$$

For $\theta = 0$: $$\frac{d^4V}{d\theta^4} = -8kd^2 + Wh$$

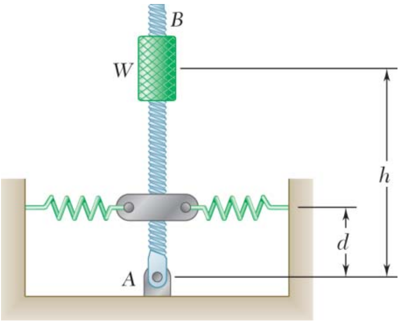
PROBLEM 10.91 (Continued)

Since $kd^2 = \frac{1}{2}Wh$, $\frac{d^4V}{d\theta^4} = -4Wh + Wh < 0$, we conclude that the equilibrium is unstable for $kd^2 = \frac{1}{2}Wh$ and the $>$ sign in Equation (2) is correct.

With $W = 80$ lb, $h = 25$ in., and $d = 12$ in.

Equation (2) gives $$k(12\text{ in.})^2 > \frac{1}{2}(80\text{ lb})(25\text{ in.})$$

or $k > 6.944$ lb/in. $k > 6.94$ lb/in. ◀



PROBLEM 10.92

Rod *AB* is attached to a hinge at *A* and to two springs, each of constant *k*. If $h = 45$ in., $k = 6$ lb/in., and $W = 60$ lb, determine the smallest distance *d* for which the equilibrium of the rod is stable in the position shown. Each spring can act in either tension or compression.

SOLUTION

Using Equation (2) of Problem 10.91 with

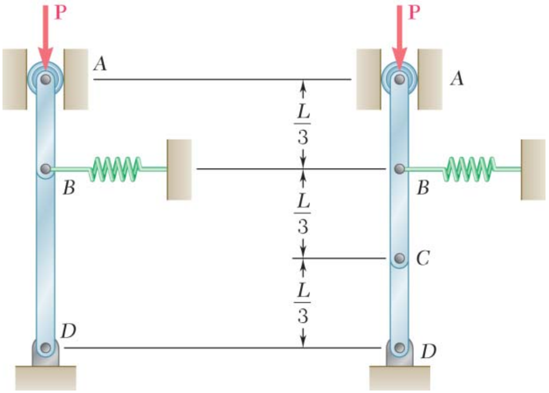
$$h = 45 \text{ in.}, \quad k = 6 \text{ lb/in.}, \quad \text{and} \quad W = 60 \text{ lb}$$

$$(6 \text{ lb/in.})d^2 > \frac{1}{2}(60 \text{ lb})(45 \text{ in.})$$

or

$$d^2 > 225 \text{ in.}^2$$

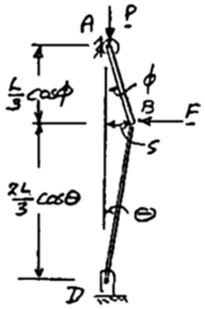
$$d > 15.0000 \text{ in.} \qquad \text{smallest } d = 15.00 \text{ in.} \blacktriangleleft$$



PROBLEM 10.93

Two bars are attached to a single spring of constant k that is unstretched when the bars are vertical. Determine the range of values of P for which the equilibrium of the system is stable in the position shown.

SOLUTION



$$s = \frac{L}{3}\sin\phi = \frac{2L}{3}\sin\theta$$

For small values of ϕ and θ

$$\phi = 2\theta$$

$$V = P\left(\frac{L}{3}\cos\phi + \frac{2L}{3}\cos\theta\right) + \frac{1}{2}ks^2$$

$$V = \frac{PL}{3}(\cos 2\theta + 2\cos\theta) + \frac{1}{2}k\left(\frac{2L}{3}\sin\theta\right)^2$$

$$\frac{dV}{d\theta} = \frac{PL}{3}(-2\sin 2\theta - 2\sin\theta) + \frac{2}{9}kL^2\sin\theta\cos\theta$$

$$= -\frac{PL}{3}(2\sin 2\theta + 2\sin\theta) + \frac{2}{9}kL^2\sin 2\theta$$

$$\frac{d^2V}{d\theta^2} = -\frac{PL}{3}(4\cos 2\theta + 2\cos\theta) + \frac{4}{9}kL^2\cos 2\theta$$

when $\theta = 0$:

$$\frac{d^2V}{d\theta^2} = -\frac{6PL}{3} + \frac{4}{9}kL^2$$

For stability:

$$\frac{d^2V}{d\theta^2} > 0, \quad -2PL + \frac{4}{9}kL^2 > 0$$

$$P < \frac{2}{9}kL \blacktriangleleft$$

For small values of ϕ and θ

$$\phi = 2\theta$$

$$s = \frac{L}{3}\sin\theta$$

$$V = P\left(\frac{2L}{3}\cos\theta + \frac{L}{3}\cos\phi\right) + \frac{1}{2}ks^2$$

$$= \frac{PL}{3}(2\cos\theta + \cos 2\theta) + \frac{1}{2}k\left(\frac{L}{3}\sin\theta\right)^2$$

$$\frac{dV}{d\theta} = \frac{PL}{3}(-2\sin\theta - 2\sin 2\theta) + \frac{kL^2}{9}\sin\theta\cos\theta$$

$$\frac{dV}{d\theta} = -\frac{2PL}{3}(\sin\theta + \sin 2\theta) + \frac{kL^2}{18}\sin 2\theta$$

$$\frac{d^2V}{d\theta^2} = -\frac{2PL}{3}(\cos\theta + 2\cos 2\theta) + \frac{kL^2}{9}\cos 2\theta$$

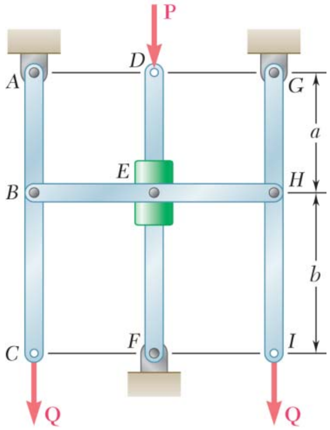
when $\theta = 0$:

$$\frac{dV^2}{d\theta^2} = -2PL + \frac{kL^2}{9}$$

For stability:

$$\frac{d^2V}{d\theta^2} > 0, \quad -2PL + \frac{kL^2}{9} > 0$$

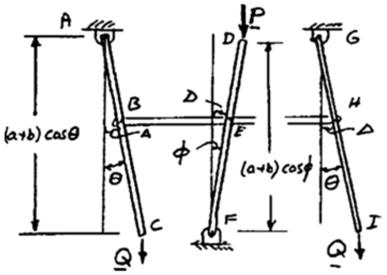
$$P < \frac{1}{18}kL \blacktriangleleft$$



PROBLEM 10.95

The horizontal bar *BEH* is connected to three vertical bars. The collar at *E* can slide freely on bar *DF*. Determine the range of values of *Q* for which the equilibrium of the system is stable in the position shown when $a = 24$ in., $b = 20$ in., and $P = 150$ lb.

SOLUTION



First note $\Delta = a\sin\theta = b\sin\phi$

For small values of θ and ϕ: $a\theta = b\phi$

or

$$\phi = \frac{a}{b}\theta$$

$$V = P(a+b)\cos\phi - 2Q(a+b)\cos\theta$$

$$= (a+b)\left[P\cos\left(\frac{a}{b}\theta\right) - 2Q\cos\theta\right]$$

$$\frac{dV}{d\theta} = (a+b)\left[-\frac{a}{b}P\sin\left(\frac{a}{b}\theta\right) + 2Q\sin\theta\right]$$

$$\frac{d^2V}{d\theta^2} = (a+b)\left[-\frac{a^2}{b^2}P\cos\left(\frac{a}{b}\theta\right) + 2Q\cos\theta\right]$$

when $\theta = 0$:

$$\frac{d^2V}{d\theta^2} = (a+b)\left(-\frac{a^2}{b^2}P + 2Q\right)$$

PROBLEM 10.95 (Continued)

Stability: $$\frac{d^2V}{d\theta^2} > 0: \quad -\frac{a^2}{b^2}P + 2Q > 0$$

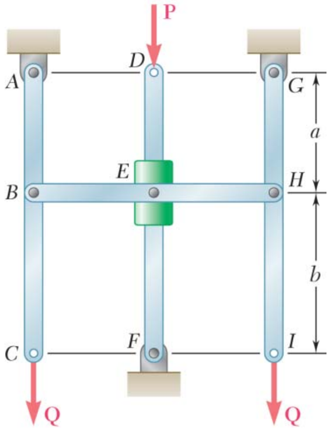
$$P < 2\frac{b^2}{a^2}Q \qquad (1)$$

or $$Q > \frac{a^2}{2b^2}P \qquad (2)$$

with $P = 150$ lb, $a = 24$ in., and $b = 20$ in.

Equation (1): $$Q > \frac{(24 \text{ in.})^2}{2(20 \text{ in.})^2}(150 \text{ lb}) = 108.000 \text{ lb}$$

For stability $Q > 108.0$ lb ◀



PROBLEM 10.96

The horizontal bar *BEH* is connected to three vertical bars. The collar at *E* can slide freely on bar *DF*. Determine the range of values of *P* for which the equilibrium of the system is stable in the position shown when $a = 150$ mm, $b = 200$ mm, and $Q = 45$ N.

SOLUTION

Using Equation (2) of Problem 10.95 with

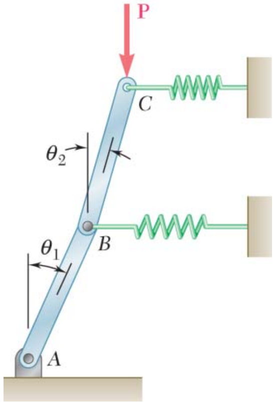
$$Q = 45\text{ N},\quad a = 150\text{ mm},\quad \text{and}\quad b = 200\text{ mm}$$

Equation (2)

$$P < 2\frac{(200\text{ mm})^2}{(150\text{ mm})^2}(45\text{ N})$$

$$= 160.000\text{ N}$$

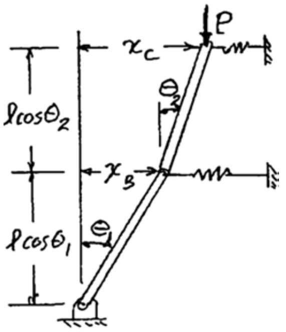
For stability $P < 160.0\text{ N}$ ◀



PROBLEM 10.97*

Bars *AB* and *BC*, each of length *l* and of negligible weight, are attached to two springs, each of constant *k*. The springs are undeformed, and the system is in equilibrium when $\theta_1 = \theta_2 = 0$. Determine the range of values of *P* for which the equilibrium position is stable.

SOLUTION



We have

$$x_B = l\sin\theta$$

$$x_C = l\sin\theta_1 + l\sin\theta_2$$

$$y_C = l\cos\theta_1 + l\cos\theta_2$$

$$V = Py_C + \frac{1}{2}kx_B^2 + \frac{1}{2}kx_C^2$$

or

$$V = Pl(\cos\theta_1 + \cos\theta_2) + \frac{1}{2}kl^2\left[\sin^2\theta_1 + (\sin\theta_1 + \sin\theta_2)^2\right]$$

For small values of θ_1 and θ_2:

$$\sin\theta_1 \approx \theta_1, \quad \sin\theta_2 \approx \theta_2, \quad \cos\theta_1 \approx 1 - \frac{1}{2}\theta_1^2, \quad \cos\theta_2 \approx 1 - \frac{1}{2}\theta_2^2$$

Then

$$V = Pl\left(1 - \frac{\theta_1^2}{2} + 1 - \frac{\theta_2^2}{2}\right) + \frac{1}{2}kl^2\left[\theta_1^2 + \left(\theta_1 + \theta_2\right)^2\right]$$

and

$$\frac{\partial V}{\partial\theta_1} = -Pl\theta_1 + kl^2[\theta_1 + (\theta_1 + \theta_2)]$$

$$\frac{\partial V}{\partial\theta_2} = -Pl\theta_2 + kl^2(\theta_1 + \theta_2)$$

$$\frac{\partial^2 V}{\partial\theta_1^2} = -Pl + 2kl^2 \qquad \frac{\partial^2 V}{\partial\theta_2^2} = -Pl + kl^2$$

$$\frac{\partial^2 V}{\partial\theta_1\partial\theta_2} = kl^2$$

Stability: Conditions for stability (see Page 583).

PROBLEM 10.97* (Continued)

For $$\theta_1 = \theta_2 = 0: \quad \frac{\partial V}{\partial \theta_1} = \frac{\partial V}{\partial \theta_2} = 0 \quad \text{(condition satisfied)}$$

$$\left(\frac{\partial^2 V}{\partial \theta_1 \partial \theta_2}\right)^2 - \frac{\partial^2 V}{\partial \theta_1^2}\frac{\partial^2 V}{\partial \theta_2^2} < 0$$

Substituting $$(kl^2)^2 - (-Pl + 2kl^2)(-Pl + kl) < 0$$

$$k^2 l^4 - P^2 l^2 + 3Pkl^3 - 2k^2 l^4 < 0$$

$$P^2 - 3klP + k^2 l^2 > 0$$

Solving $$P < \frac{3-\sqrt{5}}{2}kl \quad \text{or} \quad P > \frac{3+\sqrt{5}}{2}kl$$

or $$P < 0.382kl \quad \text{or} \quad P > 2.62kl$$

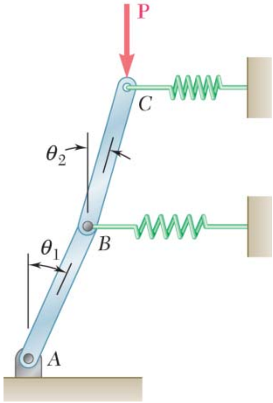
$$\frac{\partial^2 V}{\partial \theta_1^2} > 0: \quad -Pl + 2kl^2 > 0$$

or $$P < \frac{1}{2}kl$$

$$\frac{\partial^2 V}{\partial \theta_2^2} > 0: \quad -Pl + kl^2 > 0$$

or $$P < kl$$

Therefore, all conditions for stable equilibrium are satisfied when $0 \le P < 0.382kl$ ◀



PROBLEM 10.98*

Solve Problem 10.97 knowing that $l = 800$ mm and $k = 2.5$ kN/m.

PROBLEM 10.97* Bars *AB* and *BC*, each of length *l* and of negligible weight, are attached to two springs, each of constant *k*. The springs are undeformed, and the system is in equilibrium when $\theta_1 = \theta_2 = 0$. Determine the range of values of *P* for which the equilibrium position is stable.

SOLUTION

From the analysis of Problem 10.97 with

$$l = 800 \text{ mm} \quad \text{and} \quad k = 2.5 \text{ kN/m}$$

$$P < 0.382kl = 0.382(2500 \text{ N/m})(0.8 \text{ m}) = 764 \text{ N}$$

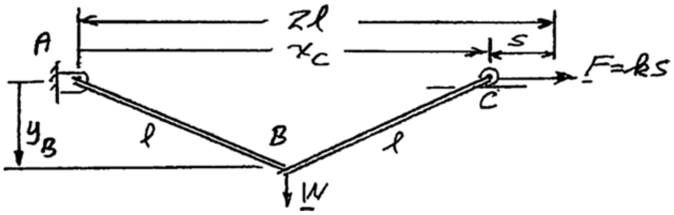
PROBLEM 10.106

A vertical load **W** is applied to the linkage at *B*. The constant of the spring is *k*, and the spring is unstretched when *AB* and *BC* are horizontal. Neglecting the weight of the linkage, derive an equation in *θ*, *W*, *l*, and *k* that must be satisfied when the linkage is in equilibrium.

SOLUTION



$$x_C = 2l\cos\theta \quad \delta x_C = -2l\sin\theta\delta\theta$$
$$y_B = l\sin\theta \quad \delta y_B = l\cos\theta\delta\theta$$
$$F = ks = k(2l - x_C) = 2kl(1-\cos\theta)$$

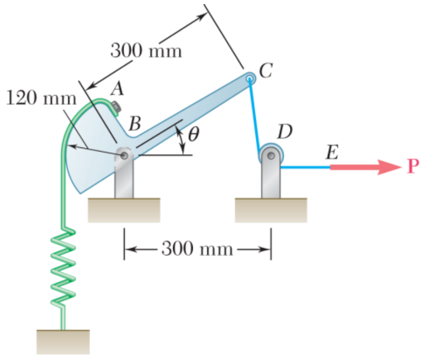
Virtual Work: $\delta U = 0$: $\quad F\delta x_C + W\delta y_B = 0$

$$2kl(1-\cos\theta)(-2l\sin\theta\delta\theta) + W(l\cos\theta\delta\theta) = 0$$

$$4kl^2(1-\cos\theta)\sin\theta = Wl\cos\theta$$

or $$(1-\cos\theta)\tan\theta = \frac{W}{4kl}$$

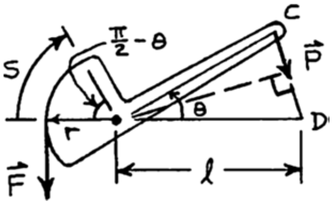
From above $$(1-\cos\theta)\tan\theta = \frac{W}{4kl} \blacktriangleleft$$



PROBLEM 10.107

A force **P** of magnitude 240 N is applied to end *E* of cable *CDE*, which passes under pulley *D* and is attached to the mechanism at *C*. Neglecting the weight of the mechanism and the radius of the pulley, determine the value of θ corresponding to equilibrium. The constant of the spring is $k = 4$ kN/m, and the spring is unstretched when $\theta = 90°$.

SOLUTION



$$s = r\left(\frac{\pi}{2} - \theta\right)$$

$$\delta s = -r\delta\theta$$

$$F = ks = kr\left(\frac{\pi}{2} - \theta\right)$$

$$CD = 2l\sin\frac{\theta}{2}$$

$$\delta(CD) = 2l\cos\frac{\theta}{2}\left(\frac{1}{2}\delta\theta\right)$$

$$= l\cos\frac{\theta}{2}\delta\theta$$

Virtual Work:

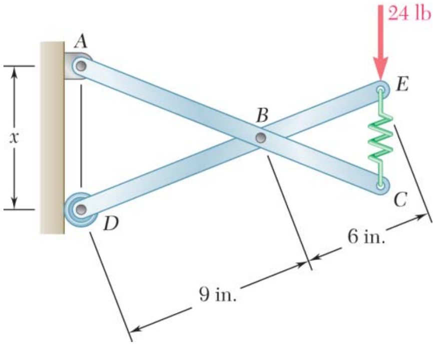
Since **F** tends to decrease *s* and **P** tends to decrease *CD*, we have

$$\delta U = -F\delta s - P\delta(CD) = 0$$

$$-kr\left(\frac{\pi}{2} - \theta\right)(-r\delta\theta) - P\left(l\cos\frac{\theta}{2}\delta\theta\right) = 0$$

$$\frac{\frac{\pi}{2} - \theta}{\cos\frac{\theta}{2}} = \frac{pl}{kr^2} = \frac{(240\text{ N})(0.3\text{ m})}{(4000\text{ N/m})(0.12\text{ m})^2} = 1.25$$

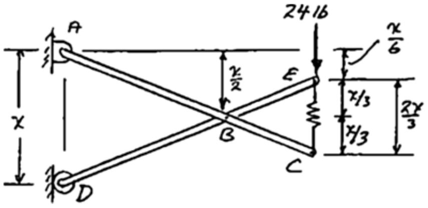
Solving by trial and error: $\theta = 0.33868$ rad $\theta = 19.40°$ ◀



PROBLEM 10.108

Two identical rods *ABC* and *DBE* are connected by a pin at *B* and by a spring *CE*. Knowing that the spring is 4 in. long when unstretched and that the constant of the spring is 8 lb/in., determine the distance *x* corresponding to equilibrium when a 24-lb load is applied at *E* as shown.

SOLUTION



Deformation of spring

$$s = EC - 4\text{ in.} = \frac{2x}{3} - 4$$

$$V = \frac{1}{2}ks^2 - (24\text{ lb})\frac{x}{6} = \frac{1}{2}(8\text{ lb/in.})\left(\frac{2x}{3} - 4\right)^2 - 4x$$

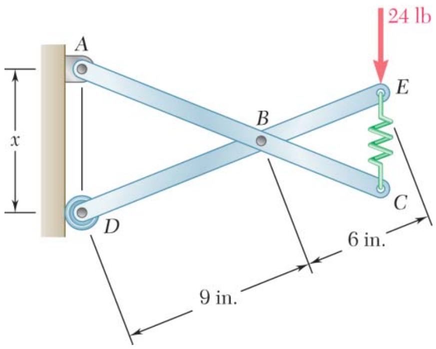
$$\frac{dV}{dx} = 8\left(\frac{2x}{3} - 4\right)\frac{2}{3} - 4$$

Equilibrium: $\frac{dV}{dx} = 0 \qquad \frac{16}{3}\left(\frac{2x}{3} - 4\right) - 4 = 0$

$$\frac{2x}{3} - 4 = 4\left(\frac{3}{16}\right)$$

$$\frac{2x}{3} = 4 + \frac{3}{4}$$

$x = 7.13\text{ in.}$ ◀

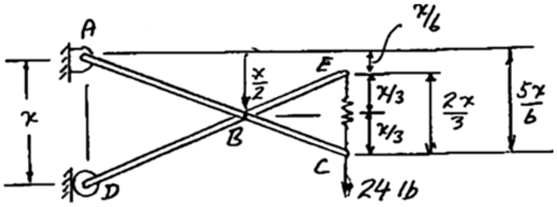


PROBLEM 10.109

Solve Problem 10.108 assuming that the 24-lb load is applied at *C* instead of *E*.

PROBLEM 10.108 Two identical rods *ABC* and *DBE* are connected by a pin at *B* and by a spring *CE*. Knowing that the spring is 4 in. long when unstretched and that the constant of the spring is 8 lb/in., determine the distance *x* corresponding to equilibrium when a 24-lb load is applied at *E* as shown.

SOLUTION



Deformation of spring

$$s = EC - 4\text{ in.} = \frac{2x}{3} - 4$$

$$V = \frac{1}{2}ks^2 - (24\text{ lb})\frac{5x}{6} = \frac{1}{2}(8\text{ lb/in.})\left(\frac{2x}{3} - 4\right)^2 - 20x$$

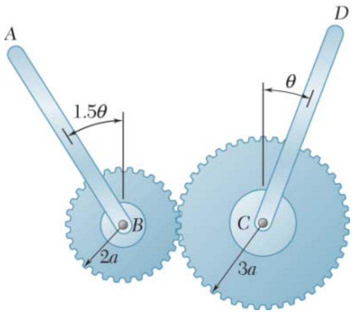
$$\frac{dV}{dx} = 8\left(\frac{2x}{3} - 4\right)\frac{2}{3} - 20$$

Equilibrium: $\frac{dV}{dx} = 0 \qquad \frac{16}{3}\left(\frac{2x}{3} - 4\right) - 20 = 0$

$$\frac{2x}{3} - 4 = 20\left(\frac{3}{16}\right)$$

$$\frac{2x}{3} = 4 + 3.75$$

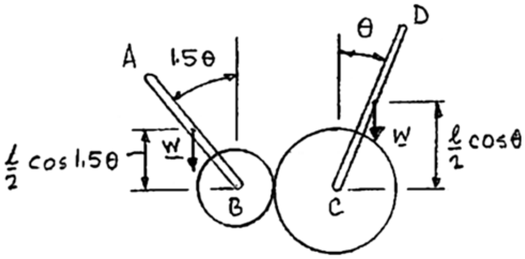
$x = 11.63$ in. ◀



PROBLEM 10.110

Two uniform rods, each of mass *m* and length *l*, are attached to gears as shown. For the range $0 \le \theta \le 180°$, determine the positions of equilibrium of the system and state in each case whether the equilibrium is stable, unstable, or neutral.

SOLUTION



Potential energy
$$V = W\left(\frac{l}{2}\cos 1.5\theta\right) + W\left(\frac{l}{2}\cos\theta\right) \quad W = mg$$

$$\frac{dV}{d\theta} = \frac{Wl}{2}(-1.5\sin 1.5\theta) + \frac{Wl}{2}(-\sin\theta)$$
$$= -\frac{Wl}{2}(1.5\sin 1.5\theta + \sin\theta)$$
$$\frac{d^2V}{d\theta^2} = -\frac{Wl}{2}(2.25\cos 1.5\theta + \cos\theta)$$

For equilibrium
$$\frac{dV}{d\theta} = 0: \quad 1.5\sin 1.5\theta + \sin\theta = 0$$

Solutions: One solution, by inspection, is $\theta = 0$, and a second angle less than 180° can be found numerically:

$$\theta = 2.4042 \text{ rad} = 137.8°$$

Now
$$\frac{d^2V}{d\theta^2} = -\frac{Wl}{2}(2.25\cos 1.5\theta + \cos\theta)$$

At $\theta = 0$:
$$\frac{d^2V}{d\theta^2} = -\frac{Wl}{2}(2.25\cos 0° + \cos 0°)$$
$$= -\frac{Wl}{2}(3.25)(< 0)$$

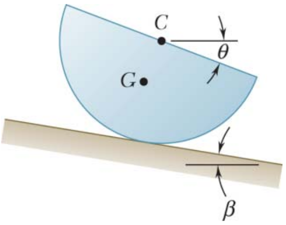
$\theta = 0$, Unstable ◀

PROBLEM 10.110 (Continued)

At $\theta = 137.8°$: $$\frac{d^2V}{d\theta^2} = -\frac{Wl}{2}[2.25\cos(1.5\times 137.8°) + \cos 137.8°]$$

$$= \frac{Wl}{2}(2.75)(> 0)$$

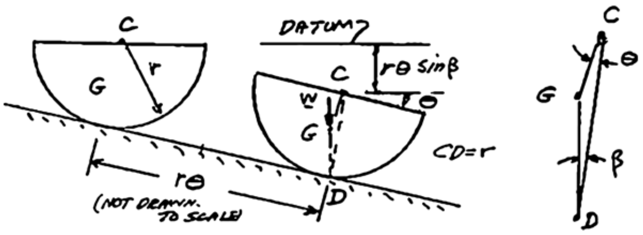
$\theta = 137.8°$, Stable ◀



PROBLEM 10.111

A homogeneous hemisphere of radius r is placed on an incline as shown. Assuming that friction is sufficient to prevent slipping between the hemisphere and the incline, determine the angle θ corresponding to equilibrium when $\beta = 10°$.

SOLUTION



Detail

$$CG = \frac{3}{8}r$$

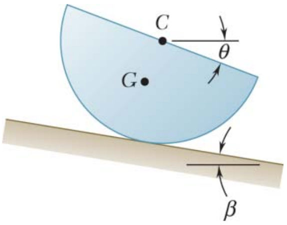
$$V = W(-r\theta\sin\beta - (CG)\cos\theta)$$

$$\frac{dV}{d\theta} = W\left(-r\sin\beta + \frac{3}{8}r\sin\theta\right)$$

Equilibrium: $\dfrac{dV}{d\theta} = 0, \quad -\sin\beta + \dfrac{3}{8}\sin\theta = 0$

$$\sin\beta = \frac{3}{8}\sin\theta \qquad (1)$$

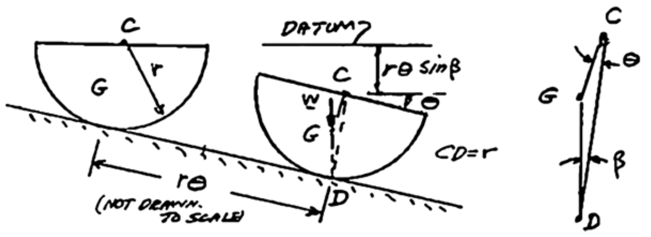
For $\beta = 10°$ $\quad \sin 10° = \dfrac{3}{8}\sin\theta \quad \sin\theta = 0.46306, \quad \theta = 27.6°$ ◀



PROBLEM 10.112

A homogeneous hemisphere of radius r is placed on an incline as shown. Assuming that friction is sufficient to prevent slipping between the hemisphere and the incline, determine (a) the largest angle β for which a position of equilibrium exists, (b) the angle θ corresponding to equilibrium when the angle β is equal to half the value found in part a.

SOLUTION



Detail

$$CG = \frac{3}{8}r$$

$$V = W(-r\theta\sin\beta - (CG)\cos\theta)$$

$$\frac{dV}{d\theta} = W\left(-r\sin\beta + \frac{3}{8}r\sin\theta\right)$$

Equilibrium: $$\frac{dV}{d\theta} = 0, \quad -\sin\beta + \frac{3}{8}\sin\theta = 0$$

$$\sin\beta = \frac{3}{8}\sin\theta \qquad (1)$$

(a) For $\beta_{\max}$, $\theta = 90°$

Eq. (1) $\quad \sin\beta_{\max} = \frac{3}{8}\sin 90°, \quad \sin\beta_{\max} = \frac{3}{8} = 22.02°$ $\qquad \beta_{\max} = 22.0°$ ◀

(b) When $\beta = \frac{1}{2}\beta_{\max} = 11.01°$

Eq. (1) $\quad \sin 11.01° = \frac{3}{8}\sin\theta; \quad \sin\theta = 0.5093$ $\qquad \theta = 30.6°$ ◀

Note: We can also use ΔCGD and law of sines to derive Eq. (1).

$$\frac{\sin\beta}{CG} = \frac{\sin\theta}{CD}; \quad \sin\beta = \frac{CG}{CD}\sin\theta; \quad \sin\beta = \frac{3}{8}\sin\theta$$

Mc Graw Hill Education

TO THE INSTRUCTOR

As indicated in its preface, *Vector Mechanics for Engineers: Dynamics* is designed for a first course in dynamics. New concepts have, therefore, been presented in simple terms and every step has been explained in detail. However, because of the large number of optional sections that have been included, this text can also be used to teach a course that will challenge the more advanced student.

The text has been divided into units, each corresponding to a well-defined topic and consisting of one or several theory sections, one or several Sample Problems, a section entitled *Solving Problems on Your Own*, and a large number of problems to be assigned. To assist instructors in making up schedules of assignments that will best fit their classes, the various topics covered in the text have been listed in Table I and a suggested number of periods to be spent on each topic has been indicated. Both a minimum and a maximum number of periods have been suggested, and the topics which form the standard basic course in dynamics have been separated from those that are optional. The total number of periods required to teach the basic material varies from 27 to 48, while covering the entire text would require from 40 to 67 periods. In most instances, of course, the instructor will want to include some, but not all, of the additional material presented in the text. If allowance is made for the time spent for review and exams, it is seen that this text is equally suitable for teaching the standard basic dynamics course in 40 to 45 periods and for teaching a more complete dynamics course to advanced students. In addition, it should be noted that *Statics* and *Dynamics* can be used together to teach a combined 4- or 5-credit-hour course covering all the essential topics in dynamics as well as those sections of statics that are prerequisites to the study of dynamics.

The problems have been grouped according to the portions of material they illustrate and have been arranged in order of increasing difficulty, with problems requiring special attention indicated by asterisks. We note that, in most cases, problems have been arranged in groups of six or more, all problems of the same group being closely related. This means that instructors will easily find additional problems to amplify a particular point they may have brought up in discussing a problem assigned for homework.

Educational research has shown that students can often choose appropriate equations and solve algorithmic problems without having a strong conceptual understanding of mechanics principles. To help assess and develop student conceptual understanding, we have included Concept Questions, which are multiple choice problems that require few, if any, calculations. Each possible incorrect answer typically represents a common misconception (e.g., students often think that a vehicle moving in a curved path at constant speed has zero acceleration). Students are encouraged to solve these problems using the principles and techniques discussed in the text and to use these principles to help them develop their intuition. Mastery and discussion of these Concept Questions will deepen students' conceptual understanding and help them to solve dynamics problems.

Drawing diagrams correctly is a critical step in solving kinetics problems in dynamics. A new type of problem has been added to the text to emphasize the importance of drawing these diagrams. In Chapters 12 and 16 the Free-Body Practice Problems require students to draw a free-body diagram (FBD) showing the applied forces and an equivalent diagram called a “kinetic diagram” (KD) showing $m\mathbf{a}$ (or its components) and $\bar{I}\alpha$. These diagrams provide students with a pictorial representation of Newton’s second law and are critical in helping students to correctly solve kinetic problems. In Chapters 13 and 17 the Impulse-Momentum Practice problems require students to draw diagrams showing the momenta of the bodies before impact, the impulses exerted on the body during impact, and the final momenta of the bodies.

A group of problems designed to be solved with computational software can be found through Connect. Also on Connect are solutions for these problems, including analyses of the problems and problem solutions and output for the most widely used computational programs.

To assist in the preparation of homework assignments, Table II provides a brief description of all groups of problems and a classification of the problems in each group according to the units used. It should also be noted that the answers to all problems are given at the end of the text, except for those with a number in italic. Because of the large number of problems available in both systems of units, the instructor has the choice of assigning problems using SI units and problems using U.S. customary units in whatever proportion is found to be desirable. To illustrate this point, sample lesson schedules are shown in Tables III and IV, together with various alternative lists of assigned problems. Half of the problems in each of the six lists suggested in Table III are stated in SI units and half in U.S. customary units. On the other hand, 75% of the problems in the four lists suggested in Table IV are stated in SI units and 25% in U.S. customary units.

Because the approach used in this text differs in a number of respects from the approach used in other books, instructors will be well advised to read the preface to *Vector Mechanics for Engineers,* in which the authors have outlined their general philosophy. In addition, instructors will find in the following pages a description, chapter by chapter, of the more significant features of this text. It is hoped that this material will help instructors in organizing their courses to best fit the needs of their students.

The authors wish to acknowledge and thank Professor James M. Widmann of California Polytechnic State University for his careful preparation of the solutions contained in this manual.

DESCRIPTION OF THE MATERIAL CONTAINED IN *VECTOR MECHANICS FOR ENGINEERS: DYNAMICS*, Tenth Edition

Chapter 11
Kinematics of Particles

In this chapter, the motion of bodies is studied without regard to their size; all bodies are assumed to reduce to single particles. The analysis of the effect of the size of a body and the study of the relative motion of the various particles forming a given body are postponed until Chap. 15. In order to present the simpler topics first, Chap. 11 has been divided into two parts: rectilinear motion of particles, and curvilinear motion of particles.

In Sec. 11.1A, position, velocity, and acceleration are defined for a particle in rectilinear motion. They are defined as quantities which may be either positive or negative and students should be warned not to confuse position coordinate and distance traveled, or velocity and speed. The significance of positive and negative acceleration should be stressed. Negative acceleration may indicate a loss in speed in the positive direction or a gain in speed in the negative direction.

As they begin the study of dynamics, many students are under the belief that the motion of a particle must be either uniform or uniformly accelerated. To destroy this misconception, the motion of a particle is first described under very general conditions, assuming a variable acceleration which may depend upon the time, the position, or the velocity of the particle (Sec. 11.1B). To facilitate the handling of the initial conditions, definite integrals, rather than indefinite integrals, are used in the integration of the equations of motion.

The special equations related to uniform and uniformly accelerated motion are derived in Secs. 11.2A and 11.2B. Before using these equations, students should be warned to check carefully that the motion under consideration is actually a uniform or a uniformly accelerated motion.

Two important concepts are introduced in Sec. 11.2C: (1) the concept of relative motion, which will be developed further in Secs. 11.4D, 15.2B and (2) the concept of dependent motions and degrees of freedom.

The first part of Chap. 11 ends with the presentation of several graphical methods of solution of rectilinear-motion problems (Sec. 11.3). This material is optional and may be omitted. Several problems in which the data are given in graphical form have been included.

The second part of the chapter begins with the introduction of the vectors defining the position, velocity and acceleration of a particle in curvilinear motion. The derivative of a vector function is defined and introduced at this point (Sec. 11.4B). The motion of a particle is first studied in terms of rectangular components (Sec. 11.4C); it is shown that in many cases (for example, projectiles) the study of curvilinear motion can be reduced to that of two independent rectilinear motions. The concept of fixed and moving frames of reference is introduced in Sec. 11.4D and is immediately used to treat the relative motion of particles.

The use of tangential and normal components, and of radial and transverse components is discussed in Secs. 11.5. Each system of components is first introduced in two dimensions and then extended to include three-dimensional space.

Chapter 12
Kinetics of Particles: Newton's Second Law

As indicated earlier, this chapter and the following two are concerned only with the kinetics of particles and systems of particles. They neglect the effect of the size of the bodies considered and ignore the rotation of the bodies about their mass center. The effect of size will be taken into account in Chaps. 16 through 18, which deal with the kinetics of rigid bodies.

Sec. 12.1 presents Newton's second law of motion and introduces the concept of a newtonian frame of reference. In Sec. 12.1B the concept of linear momentum of a particle is introduced, and Newton's second law is expressed in its alternative form, which states that the resultant of the forces acting on a particle is equal to the rate of change of the linear momentum of the particle. Section 12.1C reviews the two systems of units used in this text, the SI metric units and the U.S. customary units which were previously discussed in Sec. 1.3. This section also emphasizes the difference between an absolute and a gravitational system of units.

A number of problems with two degrees of freedom have been included (Problems 12.28 through 12.35), some of which require a careful analysis of the accelerations involved (see Sample Problem 12.5).

Section 12.1D applies Newton's second law to the study of the motion of a particle in terms of rectangular components, tangential and normal components, and radial and transverse components. The term *inertia vector* is used in preference to inertia force or reversed effective force to avoid any possible confusion with actual forces.

In Sec. 12.2 the concept of angular momentum of a particle is introduced, and Newton's second law is used to show that the sum of the moments about a point *O* of the forces acting on a particle is equal to the rate of change of the angular momentum of the particle about *O*. Section 12.2B considers the particular case of the motion of a particle under a central force. The early introduction of the concept of angular momentum greatly facilitates the discussion of this motion. Section 12.2C presents Newton's law of gravitation and its application to the study of the motion of earth satellites.

Section 12.3 is optional. Section 12.3A derives the differential equation of the trajectory of a particle under a central force, while Sec. 12.3B discusses the trajectories of satellites and other space vehicles under the gravitational attraction of the earth. While the general equation of orbital motion is derived (Eq. 12.36), its application is restricted to launchings in which the velocity at burnout is parallel to the surface of the earth. (Oblique launchings are considered in Sec. 13.2D.) The periodic time is found directly from the fundamental definition of areal velocity rather than by formulas requiring a previous knowledge of the properties of conic sections.

Instructors may omit Section 12.3 and yet assign a number of interesting space mechanics problems to their students after they have reached Sec. 13.2D.

Chapter 13
Kinetics of Particles: Energy and Momentum Methods

After a brief introduction designed to give to students some motivation for the study of this chapter, the concept of work of a force is introduced in Sec. 13.1A. The term work is always used in connection with a well-defined force. Three examples considered are the work of a weight (i.e., the work of the force exerted by the earth on a given body), the work of the force exerted by a spring on a given body, and the work of a gravitational force. Confusing statements such as the work done on a body, or the work done on a spring are avoided.

The concept of kinetic energy is introduced in Sec. 13.1B and the principle of work and energy is derived by integration of Newton's equation of motion. In applying the principle of work and energy, students should be encouraged to draw separate sketches representing the initial and final positions of the body (Sec. 13.1C). Section 13.1D introduces the concepts of power and efficiency.

Section 13.2 is devoted to the concepts of conservative forces and potential energy and to the principle of conservation of energy. Potential energy should always be associated with a given conservative force acting on a body. By avoiding statements such as "the energy contained in a spring" a clearer presentation of the subject is obtained, which will not conflict with the more advanced concepts that students may encounter in later courses. In applying the principle of conservation of energy, students should again be encouraged to draw separate sketches representing the initial and final positions of the body considered.

In Sec. 13.2D, the principles of conservation of energy and conservation of angular momentum are applied jointly to the solution of problems involving conservative central forces. A large number of problems of this type, dealing with the motion of satellites and other space vehicles, are available for homework assignment. As noted earlier, these problems (except the last two, Probs. 13.117 and 13.118) can be solved even if Section 12.3 has been omitted.

The second part of Chap. 13 is devoted to the principle of impulse and momentum and to its application to the study of the motion of a particle. Section 13.3 introduces the concept of linear impulse and derives the principle of impulse and momentum from Newton's second law. The instructor should emphasize the fact that impulses and momenta are vector quantities. Students should be encouraged to draw three separate sketches when applying the principle of impulse and momentum and to show clearly the vectors representing the initial momentum, the impulses, and the final momentum. It is only after the concept of impulsive force has been presented that students will begin to appreciate the effectiveness of the method of impulse and momentum (Sec. 13.3B).

Direct central impact and oblique central impact are studied in Section 13.4. Note that the coefficient of restitution is defined as the ratio of the impulses during the period of restitution and the period of deformation. This more basic approach will make it possible in Chapter 17 to extend the results obtained here for central impact to the case of eccentric impact. Emphasis should be placed on the fact that, except for perfectly elastic impact, energy is not conserved. Note that the discussion of oblique central impact in Sec. 13.4B has been expanded to cover the case when one or both of the colliding bodies are constrained in their motions.

Section 13.4C shows how to select from the three fundamental methods studied in Chaps. 12 and 13 the one best suited for the solution of a given problem. It also shows how several methods can be combined to solve a given problem. Note that problems have been included (Probs. 13.177 through 13.189) which require the use of both the method of energy and the method of momentum in their solutions.

Chapter 14
Systems of Particles

Chapter 14 is devoted to the study of the motion of systems of particles. Sections 14.1A and 14.1B derive the fundamental equations (14.10) and (14.11) relating, respectively, the resultant and the moment resultant of the external forces to the rate of change of the linear and angular momentum of a system of particles. Sections 14.1C and 14.1D are devoted, respectively, to the motion of the mass center of a system and to the motion of the system about its mass center. Section 14.1E discusses the conditions under which the linear momentum and the angular momentum of a system of particles are conserved. Sections 14.2A and 14.2B deal with the application of the work-energy principle to a system of particles, and in Sec. 14.2C the application of the impulse-momentum principle is discussed.

A number of challenging problems have been provided to illustrate the application of the principles discussed in this chapter. The first group of problems (Probs. 14.1 through 14.30) deal chiefly with the conservation of the linear momentum of a system of particles and with the motion of the mass center of the system, while the second group of problems (Probs. 14.31 through 14.58) involve the combined use of the principles of conservation of energy, linear momentum, and angular momentum. However, the main purpose of these sections is to lay the proper foundation for the later study of the kinetics of rigid bodies (Chaps. 16 through 18). Depending upon the preparation and interest of the students, a greater or lesser emphasis may be placed on this part of the course. It is essential, however, that the significance of Eqs. (14.16) and (14.23) be pointed out to students, in view of the role played by these equations in the study of the motion of rigid bodies.

The instructor should note the distinction made in Sec. 14.1A between *equivalent* systems of forces (i.e., systems of forces which have the same effect) and *equipollent* systems of forces (i.e., systems of forces which have the same resultant and the same moment resultant). The equivalence of two systems of forces has been indicated in diagrams by *red* equals signs, and their equipollence by *blue* equals signs.

Section 14.3 is optional. It is devoted to the study of variable systems of particles, with applications to the determination of the forces exerted by deflected streams and the thrust of propellers, jet engines, and rockets. Since Newton's second law $\mathbf{F} = m\mathbf{a}$ was stated for a particle with a constant mass and does not apply, in general, to a system with a variable mass, the derivations given in Sec. 14.3A for a steady stream of particles and in Sec. 14.3B for a system gaining or losing mass are based on the consideration of an auxiliary system consisting of unchanging particles. This approach should give students a basic understanding of the subject and lead them to more advanced courses in mechanics of fluids.

Chapter 15
Kinematics of Rigid Bodies

With this chapter we start the study of the dynamics of rigid bodies. After an introduction in which the fundamental types of plane motion are defined (Sec. 15.1A), the relations defining the velocity and the acceleration of any given particle of a rigid body are established for two particular cases: translation (Sec. 15.1A) and rotation about a fixed axis (Secs. 15.1B and 15.1C).

In Sec. 15.2 it is shown that the most general plane motion can always be considered as the sum of a translation and a rotation. This property is established by considering the relative motion of two particles of the rigid body and is immediately applied in Sec. 15.2B to the determination of velocities.

Section 15.3 introduces the concept of the instantaneous center of rotation. The instructor should stress the fact that, while the instantaneous-center method simplifies the solution of many problems involving velocities, it cannot be used to determine accelerations.

In Sec. 15.4 the concept of relative motion is used again, this time to determine accelerations in plane motion. Students should be warned against any unwarranted assumptions concerning the direction of unknown accelerations. Section 15.4B is optional. It presents an analytical method for the determination of velocities and accelerations based on the use of a parameter.

Section 15.5A discusses the rate of change of a vector with respect to a rotating frame, and Sec. 15.5B applies the results obtained to the determination of Coriolis acceleration in plane motion. It should be kept in mind, however, that Coriolis acceleration does not depend upon the existence of an actual slab or rod on which the particle moves. It can appear whenever *rotating* axes are used. There lies the fundamental difference between the approach of Sec. 15.5 and that of Secs. 11.4D and 15.4A where moving axes *of fixed direction* were used.

The remaining sections of Chap. 15 are devoted to the kinematics of rigid bodies in three dimensions and are optional. However, they should be included in a course covering the kinetics of rigid bodies in three dimensions (Chap. 18) and should be taught either at this point or immediately before Chap. 18.

In Sec. 15.6A the motion of a rigid body about a fixed point is presented. Students should note that while the finite rotations of a rigid body have magnitude and direction, the rotations are not vectors; on the other hand, both angular velocity and angular acceleration are vector quantities. In Sec. 15.6B, the general motion of a rigid body is analyzed. It should be emphasized that in this section the moving frame of reference is of fixed orientation and does not rotate.

Section 15.7 considers the motion of particles and rigid bodies with respect to rotating frames of reference and extend the concept of Coriolis acceleration to three-dimensional motion.

Chapter 16
Plane Motion of Rigid Bodies: Forces and Accelerations

This chapter is devoted to the plane motion of rigid bodies which consist of plane slabs or which are symmetrical with respect to the reference plane. Cases involving the plane motion of nonsymmetrical bodies and, more generally, the motion of rigid bodies in three dimensions are considered in Chap. 18. If the determination of mass moments of inertia has not been covered in the previous statics course, the instructor should include material from Appendix B at this point.

In Sec. 16.1 the fundamental relations derived in Chap. 14 for a system of particles are used to show that the external forces acting on a rigid body are equipollent to the vector $m\overline{\mathbf{a}}$ attached at the mass center G of the body and the couple of moment $\dot{\mathbf{H}}_G$. This result, which is illustrated in Fig. 16.3, is valid in the most general case of motion of a rigid body (three-dimensional as well as plane motion).

It is shown in Sec. 16.1B that in the case of the plane motion of a slab or symmetrical body, the angular momentum $\mathbf{H}_G$ reduces to $\overline{I}\omega$ and its rate of change to $\overline{I}\alpha$. It is shown that the external forces acting on a rigid body are actually *equivalent* to the inertial terms represented by the vector $m\overline{\mathbf{a}}$ and the couple $\overline{I}\alpha$. As noted in Sec. 16.5, this result is obtained independently of the principle of transmissibility and can be used to *derive* this principle from the other axioms of mechanics.

At this point students will have reached the climax of their study of rigid-body motion in two dimensions. Indeed, they can solve any problem by drawing two sketches—one showing the external forces, the other the vector $m\overline{\mathbf{a}}$ and the couple $\overline{I}\alpha$—and then expressing that the two systems of vectors shown are equivalent.

The various types of plane-motion problems have been grouped according to their kinematic characteristics. Translation, centroidal rotation, and plane motion consisting of a translation and an unrelated centroidal rotation are considered first, since they are the simplest ones to analyze. They are followed by plane motions with various kinematic constraints: non-centroidal rotation, rolling motion, and other types of plane motion. Problems involving systems of rigid bodies have been included at the end of this chapter, with either one degree of freedom (Probs. 16.126 through 16.134) or two degrees of freedom (Probs. 16.135 through 16.141). The instructor should stress the fact that, in spite of the different kinematic characteristics of these various motions, the approach to the kinetics of the motion is consistently the same: all problems are solved by drawing two sketches—one showing the external forces, the other the vector $m\overline{\mathbf{a}}$ and the couple $\overline{I}\alpha$—and then expressing that the two systems of vectors are equivalent.

Since the approach used in this text differs from others in the emphasis placed on the direct application of Newton’s second Law, rather than on specialized formulas, it might be appropriate at this point to summarize the advantages derived from this approach.

(1) A single method is used, which applies to all cases of plane motion, regardless of their kinematic characteristics, and which can be used safely under any conditions. This is in contrast to using the equation $\Sigma M = I\alpha$ which is limited in its applications.

(2) By stressing the use of the free-body diagram and kinetic diagram, this method provides a better understanding of the kinetics of the motion. There will be little danger, for example, in the solution of a problem of non-centroidal rotation, that students will forget the effect of the acceleration of the mass center on the reaction at the fixed point, a mistake which occurs frequently when the specialized formula $\Sigma M_O = I_O\alpha$ is used.

(3) The method used divides the solution of a problem into two main parts, one in which the kinematic and kinetic characteristics of the problem are considered (separately if necessary), and the other in which the methods of statics are used. In this way the techniques of each separate field can be used most efficiently. For example, moment equations can be written to eliminate unwanted reactions, just as it was done in statics; this can be done independently of the kinetic characteristics of the problem.

(4) By resolving every plane motion (even a non-centroidal rotation) into a translation and a centroidal rotation, a unified approach is obtained, which will also be used in Chap. 17 with the method of work and energy and with the method of impulse and momentum, and which will be extended in Chap. 18 to the study of the three-dimensional motion of a rigid body. This approach is a basic one, which can be applied effectively throughout the study of mechanics in advanced courses as well as in elementary ones.

Chapter 17
Plane Motion of Rigid Bodies: Energy and Momentum Methods

The first portion of the chapter extends the method of work and energy, already used in Chap. 13, to the study of the plane motion of rigid bodies. The expressions for the work of a couple and for the kinetic energy of a rigid body are derived in Secs. 17.1B and 17.1C. Using the results obtained in Sec. 14.2A, the kinetic energy of a rigid body is separated into a translational part and a rotational part (about the mass center). The authors believe that, while it may lead to slightly longer solutions, this method is more fundamental and should be used in preference to special formulas. Indeed, it follows the basic idea of resolving every plane motion into a translation and a centroidal rotation.

It is shown in Sec. 17.1D that the method of work and energy is especially effective in the case of systems of rigid bodies connected by pins, inextensible cords, and meshed gears. In Sec. 17.1E the principle of conservation of energy is used to analyze the plane motion of rigid bodies.

In the second part of Chap. 17, the method of impulse and momentum is extended to the study of the motion of rigid bodies. The approach used is different from that of most elementary textbooks. Ready-to-use formulas are avoided; instead, students are taught to express the general principle of impulse and momentum by means of impulse-momentum diagrams and to write the equations most appropriate to the solution of the problem considered.

The results obtained in Sec. 14.2C for a system of particles are directly applicable to the system of particles forming a rigid body and can be used to analyze the plane motion of rigid bodies. It is shown in Sec. 17.2A that the momenta of the various particles forming a rigid body reduce to a vector $m\overline{\mathbf{v}}$ and a couple $\overline{I}\omega$ in the most general case of plane motion.

While the principle of conservation of angular momentum is discussed in Sec. 17.2C because of its physical and historical significance, it is not actually used in the solution of problems. To solve any problem, regardless of the type of motion, and whether it involves constant forces of finite magnitude applied for a finite time or impulsive forces applied for a very short time interval, students are told to draw three separate sketches showing, respectively, the initial momenta, the impulses of the external forces, and the final momenta. The momenta of a rigid body are represented in the most general case by a *momentum vector* $m\overline{\mathbf{v}}$ attached at the mass center and a *momentum couple* $\overline{I}\omega$. If students then consider the components of the vectors involved, they obtain relations between linear impulses and linear momenta. If they consider the moments of the same vectors, they obtain angular impulses and angular momenta. If, by equating moments about a point such as a pivot, they obtain an equation which does not involve any of the external forces, they will have automatically established conservation of angular momentum about that point.

The advantages derived from this approach can be summarized as follows:

(1) Students learn only one method of solution, a method based directly on a fundamental principle and which can be used safely under any conditions. This is in contrast with the equation $\sum M_0 \Delta t = I_0(\omega_2 - \omega_1)$, which is limited in its applications.

(2) The method stresses the use of impulse and momentum diagrams and thus provides a better understanding of the kinetics of the motion. It is unlikely, for example, that students will forget an impulsive reaction at a fixed support.

(3) Students use the basic tools they learned in statics: reduction of a system of vectors to a vector and a couple and equations relating the components or the moments of these vectors.

(4) Again, the same unified approach is used: every plane motion is resolved into a translation and a centroidal rotation. In Chap. 18 this approach will be extended to the solution of problems involving the three-dimensional motion of rigid bodies.

Some teachers may fear that the inclusion of momentum vectors and momentum couples in the same diagrams may lead to confusion. This will not be the case, however, if students are instructed to write separate equations involving either components or moments, as they did in statics. The first equations will contain linear impulses and linear momenta expressed in N•s or lb•s, and the latter angular impulses and angular momenta expressed in N•m•s or lb•ft•s.

Section 17.3 is devoted to the eccentric impact of two rigid bodies, a topic seldom included in an elementary text. No special difficulty will be encountered, however, if separate sketches are used as indicated above.

Chapter 18
Kinetics of Rigid Bodies in Three Dimensions

In this chapter the restrictions imposed in preceding chapters (e.g., plane motion, symmetrical bodies) are lifted and students proceed to the analysis of more general (and more difficult) problems, such as the rotation of nonsymmetrical bodies about fixed axes and the motion of gyroscopes.

In Sec. 18.1, the general result obtained in Sec. 16.1 is recalled, namely, that the external forces acting on a rigid body are equipollent to the vector $m\overline{\mathbf{a}}$ attached at the mass center G of the body and the couple of moment $\dot{\mathbf{H}}_G$. It is also pointed out that the main feature of the impulse-momentum method, namely, the reduction of the momenta of the particles of a rigid body to a linear momentum vector $m\overline{\mathbf{v}}$ attached at G and an angular momentum, remains valid and that the work-energy principle and the principle of conservation of energy still apply in the case of the motion of a rigid body in three dimensions. The difficulties encountered in the study of the three dimensional motion of a rigid body are related to the determination of the angular momentum $\mathbf{H}_G$, of its rate of change $\dot{\mathbf{H}}_G$, and of the kinetic energy of the body.

The determination of the angular momentum $\mathbf{H}_G$ of a rigid body from its angular velocity ω is discussed in Sec. 18.1A. Since this requires the use of mass products of inertia, as well as the use of mass moments of inertia, the instructor should cover the material from Appendix B (or from the second part of Chap. 9) if this material has not been included in the previous statics course.

Section 18.1B is devoted to the application of the impulse-momentum principle to the three-dimensional motion of a rigid body, and Sec. 18.1C to the determination of its kinetic energy.

In Secs. 18.2A and 18.2B, the rate of change of the angular momentum $\mathbf{H}_G$ is computed and the equations of motion for a rigid body in three dimensions are derived. Newton's second law is extended to the case of three-dimensional motion by showing that the external forces are actually *equivalent* to the effective forces represented by the vector $m\overline{\mathbf{a}}$ and the couple $\dot{\mathbf{H}}_G$. Sections 18.2C and 18.2D are devoted to the particular cases of the motion of a rigid body about a fixed point and the rotation of a rigid body about a fixed axis, with applications to the balancing of rotating shafts.

While Euler's equations of motion have been derived, it should be noted that the more fundamental vector relations represented by Equations (18.22), (18.23), and (18.28) are used in the solution of problems.

The remaining portion of this chapter (Secs. 18.2D through 18.3C) is designed for advanced students and, in general, should be omitted for ordinary classes. In Secs. 18.3A and 18.3B the motion of a gyroscope is considered. At this point Eulerian angles are introduced. It should be carefully noted that the rotating system of axes $Oxyz$ is attached to the inner gimbal; these axes are principal axes of inertia and they follow the precession and nutation of the gyroscope; they do not, however, spin with the gyroscope. The special case of steady precession is considered in Sec. 18.3B. Several problems dealing with the steady precession of a top and other axisymmetrical bodies have been included and, in one of them (Prob. 18.110), it is shown that the formula usually given in introductory texts is only approximate.

The motion of an axisymmetrical body under no force (Sec. 18.3C) introduces students to one of the most interesting aspects of classical dynamics—an aspect which has gained widespread attention in recent years due to the interest in space vehicles and artificial satellites. In this connection, it should be pointed out that Poinsot's theory of the motion of a nonsymmetrical body under no force may be covered by assigning Probs. 18.143 through 18.145. An additional problem (Prob. 18.146) relates to the stability of the rotation of a nonsymmetrical body about a principal axis.

Chapter 19
Mechanical Vibrations

This chapter provides an introduction to the study of mechanical vibrations. While only one-degree-of-freedom systems are included, all the basic principles are presented. The various topics covered are as follows:

(a) Free, undamped vibrations of a particle (Sec. 19.1A). The differential equation characterizing simple harmonic motion is derived and all basic terms, such as period, natural frequency, and amplitude, are defined. Both the analytical and the geometrical methods of solution are described. It is shown in Sec. 19.1B that the motion of a simple pendulum can be approximated by a simple harmonic motion. Section 19.1C, which is optional, shows how an exact solution can be obtained for the period of oscillations of a simple pendulum.

(b) Free, undamped vibrations of a rigid body. The principle of equivalence of the systems of applied forces and inertial terms is first used to determine the natural frequency and the period of oscillations of a rigid body (Sec. 19.2). Note that the same positive sense is assumed for the angular acceleration and displacement The principle of conservation of energy is then used to solve the same type of problems (Sec. 19.3).

(*c*) *Forced, undamped vibrations of a particle* (Sec. 19.4). This section introduces students to the concepts of forced frequency, transient and steady-state vibrations, and resonance. While all students will be able to understand this section, those with a knowledge of elementary differential equations will derive a greater benefit from it since it provides a direct application of the solution of linear nonhomogeneous equations with constant coefficients.

(d) Free, damped vibrations of a particle (Sec. 19.5A), and

(e) Forced, damped vibrations of a particle (Sec. 19.5B). These two sections take into account the effect of friction and thus provide a more rigorous analysis of the vibrations of a particle. They are not recommended, however, to students who do not possess a basic knowledge of elementary differential equations.

In Sec. 19.5C the electrical analogue for a vibrating mechanical system is discussed; this section is optional and should not be assigned unless Secs. 19.5A and 19.5B have been covered.

TABLE I. LIST OF TOPICS COVERED IN *VECTOR MECHANICS FOR ENGINEERS: DYNAMICS*

		Suggested Number of Periods	
Sections	**Topics**	**Basic Course**	**Additional Topics**
11. KINEMATICS OF PARTICLES			
11.1	Rectilinear Motion	1	
11.2	Special Cases and Relative Motion	1	
*11.3	Graphical Methods		1
11.4	Curvilinear Motion (Rectangular Components)	1-2	
11.5	Tangential and Normal Components	0.5-1	
11.5B	Radial and Transverse Components	0.5-1	
12. KINETICS OF PARTICLES: NEWTON'S SECOND LAW			
12.1	Newton’s Second Law and Linear Momentum		1-2
12.2	Angular Momentum and Orbital Mechanics	1-2	
*12.3	Applications of Central-Force Motion		1-2
13. KINETICS OF PARTICLES: ENERGY AND MOMENTUM METHODS			
13.1	Work and Energy	1-2	
13.2	Conservation of Energy; Central Forces	1-2	
13.3	Impulse and Momentum; Impulsive Motion	1-2	
13.4	Impact; Mixed Problems	1-2	
14. SYSTEMS OF PARTICLES			
14.1	Motion of Systems of Particles	0.5-1	
14.2	Energy and Momentum Methods for Systems of Particles	0.5-1	
*14.3	Variable Systems of Particles		1-2
15. KINEMATICS OF RIGID BODIES			
15.1	Translation; Rotation About a Fixed Axis	1-1.5	
15.2	Velocities in Plane Motion	1-1.5	
15.3	Instantaneous Center	1	
15.4	Accelerations in Plane Motion	1-2	0.5
15.5	Motion With Respect to a Rotating Frame	1-2	
*15.6	Motion of a Rigid Body in Space		1-2
*15.7	Motion Relative to a Moving Reference Frame		1-2
16. PLANE MOTION OF RIGID BODIES: FORCES AND ACCELERATIONS			
16.1	Kinetics of a Rigid Body in Plane Motion	2-3	
16.2	Constrained Plane Motion	2-4	
17. PLANE MOTION OF RIGID BODIES: ENERGY AND MOMENTUM METHODS			
17.1	Energy Methods for a Rigid Body	1-2	
17.2	Momentum Methods for a Rigid Body	1-2	
17.3	Eccentric Impact	1-2	
18. KINETICS OF RIGID BODIES IN THREE DIMENSIONS			
*18.1	Energy and Momentum in Three Dimensions		2
*18.2	Motion of a Rigid Body in Three Dimensions		1-2
*18.3	Motion of a Gyroscope		2
19. MECHANICAL VIBRATIONS			
19.1	Vibrations of Particles without Damping		1-2
*19.1C	Exact Solution of a Simple Pendulum		0.5
19.2	Free Vibrations of Rigid Bodies	1-2	
19.3	Energy Methods		1-1.5
19.4	Forced Vibrations	1-1.5	
*19.5	Damped Vibrations		1-2
*19.5C	Electrical Analogues		1
	Total Number of Periods	27-48	13-19

TABLE II: CLASSIFICATION AND DESCRIPTION OF PROBLEMS

13.*199*,200	13.*196*,*201*	

CHAPTER 14: SYSTEMS OF PARTICLES

14.1,2	14.3,4	Conservation of linear momentum (one dimension)
14.7,8	14.*5*,*6*	
14.9,10	14.11,12	Conservation of angular momentum
14.*13*,*14*		
14.15,16	14.19,20	Motion of mass center
14.*17*,*18*		
14.24,25	14.21,22	Conservation of linear momentum (2 or 3 dimensions)
14.26	14.*23*	
14.*27*,28	14.29,30	Derivations and proofs
14.31,34	14.32,33	Conservation of linear momentum and computation of change in kinetic energy
14.*34*,*36*		

---

* Problems which do not involve any specific system of units have been indicated by underlining their numbers.
Answers are not given to problems with the numbers set in italic type.

TABLE II: CLASSIFICATION AND DESCRIPTION OF PROBLEMS (CONTINUED)

Problem Number* **SI Units**	 **U.S. Units**	 **Problem Description**
14.37,38	14.39,40	Conservation of linear momentum and conservation of energy
14.43,44	14._41 ,42_	
14.45,48	14.46,47	Conservation of linear and angular momentum
	14._49,50_	
14.51,52	14.55,56	Conservation of linear momentum, angular momentum and energy
14._53,54_		
14.57,68	14.59,60	Thrust caused by a diverted flow
14.61,62		
14.64,66	14._63,65_	Reactions at supports of vanes or conveyor belts
14.67,68		
14.69,71	14.70,72	Thrust developed by a jet engine, a propeller, or a fan
14._73,75_	14.74	
14.76		
14.77,78		Power and efficiency
14.79	14.80	
14. _81,83_	14._82_,*_84_	Theory problems from fluid mechanics
14.*_85_		
14.86,87	14._88_	Motion of chains
	14.90,91	Motion of a toy car
14.91,94	14._92,93_	Thrust of rockets
14.95,96	14._97,98_	
14.101	14.99,100	
	14.102	
	14.103,104	Efficiency formulas for jet engine and rocket
14.106,107	14._105_,108	Review problems
14._109_,110	14.112,_113_	
14._111_,115	14.114,116	

CHAPTER 15: KINEMATICS OF RIGID BODIES

		Rotation about a fixed axis
15.1,2	15.3,4	solutions using equations
15.5,6	15.7,8	
15.9		
15.10,11	15.12,13	rotation about a skew axis
15._14,15_		
15.17	15.16	motion of the earth
15.18,19		motion in two dimensions
15._20,21_	15.22,23	
	15.24	
15.26,27	15.25	rolling contact with no slipping
15.29,30	15.28,31	linear and angular motion
15._34,35_	15.32,33	disks brought into contact
*15.36	*15.37	special problems

---

* Problems which do not involve any specific system of units have been indicated by underlining their numbers.
Answers are not given to problems with the numbers set in italic type.

TABLE II: CLASSIFICATION AND DESCRIPTION OF PROBLEMS (CONTINUED)

Problem Number*		
SI Units	**U.S. Units**	**Problem Description**
		General plane motion: velocities
15.40,41	15.38,39	motion of s single rigid body
15._42_,_43_		
15.44,45		application of vector algebra to motion of a plate
15._46_,47		
15.49,50	15.48,_52_	planetary gear systems
15.51	15.53,_54_	
		motion of rod connected to
15.55,56	15.57,58	a crank and a sliding block
15.61,62	15. _59_,_60_	
15.63,64		two cranks
15.65	15._66_,_67_	
15.68,69	15.70,72	motion involving a rolling wheel
15.71		
		Instantaneous center of rotation
15.76,77	15._73_,74	problems involving parallel velocities
15.78,79	15.75,_81_	
15.80		
15._84_,_85_	15.82,83	single rod: angle between controlling velocities = 90^{o}
15.86,87		
15.88,90	15.89	single rod angle between controlling velocities $\neq 90^{o}$
15._91_,_92_		
15._93_	15.94	
15.96,97	15.95,98	problems involving two instantaneous centers
15.100	15.99	space and body centrodes
15.102,103	15._101_,_104_	previous problems solved using instantaneous center
		General plane motion: accelerations
15.105,106		find relations among accelerations ($\omega = 0$)
15.107,108	15.109,110	
15.111	15.112,113	rolling motion
15.115,_116_	15.114	
15._117_,_119_	15.118	
		motion of a body controlled by
15.120,121	15._123_,124	one crank and a sliding block
15.122	15.125,_126_	
15.127,128	15.129,130	two cranks
15.132,134	15.131,133	
15.136	15.135	
15.137		special problems
*15.138,*139	*15.140,*141	analysis of plane motion in terms of a parameter
*15._142_,*143	*15._144_,147	
*15._145_,_*146_	*15._148_,*149	

---

* Problems which do not involve any specific system of units have been indicated by underlining their numbers.
Answers are not given to problems with the numbers set in italic type.

TABLE II: CLASSIFICATION AND DESCRIPTION OF PROBLEMS (CONTINUED)

Problem Number*		
SI Units	**U.S. Units**	**Problem Description**
		Plane motion of a particle relative to a rotating frame
15.150,151	15.152,155	velocity of a particle with respect to a rotating frame
15.153,154	15.*156,157*	
		Coriolis acceleration
15.160,162	15.*158,159*	acceleration of a particle moving at constant speed with respect to frame rotating with constant velocity
15.163,164	15.161	
15.165,166		
15.167,168		
15.169	15.170,171	
15.*172,173*		
15.174,175		acceleration of a particle with respect to a frame rotating with an angular acceleration
15.176,177		
15.178	15.*179,180*	
*15.183	15.*181,*182	
		Motion about a fixed point. General Motion
15.184,185		relation between linear and angular velocity for a rigid body with a fixed point
15.186	15.187	
15.190,*191*	15.188,189	angular acceleration of a body rotating simultaneously about two axes
15.*192*,193	15.*194*,195	
15.197,198	15.196	velocity and/or acceleration of a body rotating about a fixed point
15.199,200	15.*201,202*	
15.205	15.203,204	rod attached to moving collars: find velocities of collars (angular velocity is indeterminate)
15.*208,209*	15.206,207	
	15.210,211	universal joints
15.213	15.112	rod with clevis attached at one end
15.*214*	15.*215*,216	rod attached to moving collars: find acceleration of collars (angular velocities and angular accelerations are indeterminate)
15.218,219	15.117	
		Three dimensional motion of a particle relative to a rotating frame. Coriolis Acceleration
15.222,223	15.220,221	$\dot{\Omega} = 0$ and $\dot{u} = 0$
15.224	15.*225,226*	
15.227,228		
15.*229*	15.230	Ω and u not constant
15.231,233	15.232	previous problems to be solved using rotating frames
15.234,235	15.236	axis of Ω in plane of mechanism
15.*237,238*	14,239	
15.244,245	15.240,241	frame of reference in general motion
15.*246,247*	15.242,243	
15.248,*251*	15.249,*250*	Review problems
15.252,*254*	15.253,*257*	
15.255,256	15.258,259	

---

* Problems which do not involve any specific system of units have been indicated by underlining their numbers.
Answers are not given to problems with the numbers set in italic type.

TABLE II: CLASSIFICATION AND DESCRIPTION OF PROBLEMS (CONTINUED)

Problem Number*		
SI Units	**U.S. Units**	**Problem Description**
		CHAPTER 16: PLANE MOTION OF RIGID BODIES FORCES AND ACCELERATIONS
		Rectilinear translation
16.4,5	16.1,2	find reactions or accelerations
16.6	16.3	
16.9,10	16.*7*,*8*	determine whether body tips or slides
16.11,*12*		
		Curvilinear translation
16.*13*,14		bodies with zero velocity ($a_n = 0$)
16.15,*16*		
16.*17*		
	16.18	bodies with velocities ($a_n \neq 0$)
	16.19,20	
16.*_22_	16.*_21_	draw shear and bending-moment diagrams for accelerated rod
		Centroidal rotation
16.23	16.24	proofs that effective forces reduce to $m\bar{\mathbf{a}}$ and $\bar{I}\alpha$
16.25,29	16.26,27	single body
16.30,31	16.28	
16.*32*,35	16.33,34	connected pulleys and blocks
16.*36*	16.*37*,*38*	
16.41,42	16.39,40	friction disks
16.43,44	16.45	
		General plane motion
16.46	16.47	proofs concerning system of effective forces
16.50,51	16.48,49	find accelerations for given loading
16.*53*,*54*	16.52	
16.55,56	16.57,60	vertical motion controlled by applied forces and gravity
16.58,59	16.*61*,*62*	
16.63	16.64,65	bars suspended from springs and suddenly released
16.66,67	16.*68*	
16.69,70	16.71,72	spheres, disks, or hoops rotating and sliding on horizontal surface
16.*73*,*74*		
		Non-centroidal rotation
16.75		derivation involving center of percussion
16.76,77	16.78,79	find acceleration and reactions for a suspended body
		find reactions for a body rotating with
16.80,83	16.*81*,*82*	constant angular velocity
16.84	16.85,86	angular acceleration and velocity
16.87,*90*	16.88,*89*	two connected bodies
16.*91*		
		Rolling motion
16.92	16.93	derivations involving use of $\Sigma M_C = I_C\alpha$
16.*96*,*97*	16.94,95	single body rolling on an incline under gravity

---

* Problems which do not involve any specific system of units have been indicated by underlining their numbers.
Answers are not given to problems with the numbers set in italic type.

TABLE II: CLASSIFICATION AND DESCRIPTION OF PROBLEMS (CONTINUED)

Problem Number*		
SI Units	**U.S. Units**	**Problem Description**
16.98,99	16.102,103	single body rolling, or rotating and sliding
16.*100*,*101*	16.104,105	
16.108,109	16.*106*.107	connected bodies
	16.*110*	
16.113,114	16.111,112	unbalanced bodies
	16.115,116	
		General plane motion
		single rigid body, find accelerations and reactions
16.119,120	16.117,118	problems in which the velocity is zero
16.121,*122*		
16.*123*		
16.124,127	16.125,126	problems in which the velocity is not zero
16.128,129		
16.*130*,131		
	16.*132*,*133*	problems involving an integration
		connected rigid bodies
16.135,136	16.134	systems with one degree of freedom
16.137,138	16.139,140	
16.*142*	16.*141*	needs rotating axis
16.*143,*145	16.*144	systems with two degrees of freedom
16.*146,	16.*147,*148	
16.*149,*150		
16.*150	16.*151,*152	draw shear and bending-moment diagrams for accelerated rod
16.*155*,156	16.153,154	Review problems
16.*159*,160	16.157,158	
16.163,164	16.*161*,*164*	

CHAPTER 17: PLANE MOTION OF RIGID BODIES
ENERGY AND MOMENTUM METHODS

ENERGY METHODS

SI Units	U.S. Units	Problem Description
		Centroidal rotation
17.1,4	17.2,3	single body with applied couple
17.6	17.5	
17.11,12	17.7,*8*	connected bodies
17.13,*14*	17.*9*,10	
17.*15*		
		Noncentroidal rotation
17.17	17.16,18	
17.21,22	17.19,20	
17.*23*,*24*		

---

* Problems which do not involve any specific system of units have been indicated by underlining their numbers.
Answers are not given to problems with the numbers set in italic type.

TABLE II: CLASSIFICATION AND DESCRIPTION OF PROBLEMS (CONTINUED)

Problem Number*		
SI Units	**U.S. Units**	**Problem Description**
		Rolling motion
17.25,26	17.27	single body
17.*28*,29	17.30	
17.31		
17.34,*35*	17.32,33	connected bodies
		General plane motion
17.36,37	17.39,40	single body
17.38	17.*41*	
17.42,43		connected bodies
17.44,45		
17.46,47		
17.49,50	17.48,51	Power
		MOMENTUM METHODS
		Centroidal rotation
17.52,54	17.53,55	single body
17.*56*,*57*	17.58,59	
17.*60*,*61*	17.63,64	connected bodies
17.62		
17.65,66	17.67,68	Derivations involving noncentroidal rotation (center of percussion)
		Rolling motion
17.70,71	17.69	single body
17.74,75	17.72,*73*	connected bodies
	17.*76*	
17.77	17.78	sliding and rotating sphere
		Conservation of angular momentum
17.79	17.80	problems involving changes in the configuration of a rotating assembly
17.82,83	17.81	problems involving relative motion between components of a rotating assembly
17.86,87	17.*84*,*85*	
17.88,89	17.90,91	problems involving conservation of energy
17.*92*,*93*	17.95	
17.94		
		Eccentric impact
17.96	17.97,98	projectile becomes embedded in a body suspended from a fixed point
17.101,102	17.99,100	
17.102,103	17. 104,105	single body, rotation about a fixed point
17.106,107	17.108,109	
17.*110*,*111*	17.112	
17.*113*		
17.*114*,115	17.118,119	problems involving method of work and energy
17.116,117	17.120	
17.121,122	17.123,124	two bodies, general plane motion
17.*126*	17.*125*	
17.127,128	*17.130*	
17.*129*		
17.131,*134	17.132,133	special problems

---

* Problems which do not involve any specific system of units have been indicated by underlining their numbers.
Answers are not given to problems with the numbers set in italic type.

TABLE II: CLASSIFICATION AND DESCRIPTION OF PROBLEMS (CONTINUED)

Problem Number*		
SI Units	**U.S. Units**	**Problem Description**
17.*138*,139	17.135,136	Review problems
17.140,*141*	17.137,142	
17.143,145	17.*144*,*146*	

CHAPTER 18: KINETICS OF RIGID BODIES IN THREE DIMENSIONS

SI Units	U.S. Units	Problem Description
18.1,5	18.2,3	Computation of angular momentum (no product of inertia)
18.7,8	18.*4*,*6*	
18.10,12	18.9,11	Use of equation $\mathbf{H}_O = \bar{\mathbf{r}} \times m\bar{\mathbf{v}} + \mathbf{H}_G$
18.*13*,*14*		
18.15,16	18.17,18	Computation of angular momentum (using products of inertia)
18.*19*,*20*		
18.21,22	18.*23*,*24*	Impulse and momentum in three dimensions
18.27,28	18.25,26	
18.*29*,*30*	18.31,32	impact problems
18.35,36	18.33,34	
18.37	18.38	
18.39,43	18.40,41	Computation of kinetic energy
18.44,45	18.42,*46*	
18.47,49	18.*48*	
18.50		
18.*51*,*52*	18.53,54	
18.55,59	18.56,57	Computation of derivative of angular momentum
18.60	18.58,*61*	
18.*63*,64	18.*62*	
		Dynamic reactions on rotating shaft
18.65,68	18.66,67	for ω = constant
18.*69*,*70*		
18.71,74	18.72,73	for $\omega = 0$ and $\alpha \neq 0$
18.*77*,*78*	18.75,76	
18.79,81	18.*80*,*83*	Simple problems on gyroscopic effect
18.82,84		
18.86,87	18.85,88	Relative equilibrium under rotation about a fixed axis
18.90,91	18.*89*,*92*	
		Dynamic reactions for combined rotations
18.95,96	18.93,94	with constant rates
18.99,100	18.*97*,*98*	
18.103,104	18.101,102	with variable rates
18.*105*,*106 (starred)		
18.109,*110*	18.107,*108*	Steady precession. Simple problems
	18.111,112	

---

* Problems which do not involve any specific system of units have been indicated by underlining their numbers.
Answers are not given to problems with the numbers set in italic type.

TABLE II: CLASSIFICATION AND DESCRIPTION OF PROBLEMS (CONTINUED)

Problem Number*		
SI Units	**U.S. Units**	**Problem Description**
18.115,116	18,113.114	Steady precession. More advanced problems
18.*118*	18.117	
18.119,120	18.121,122	Precession under no force (theory)
18.*123*,124	18.*125*,128	Precession under no force (applications)
18.126,127	18.*129*,130	
		Conservation of energy and angular momentum
18.131,*134*	18.132,133	for bodies with precession and nutation
18.135,136		
18.*139,*140	18.*137,*138	for bodies with precession, nutation, and spin
	18.**141*,**142*	
18.*143,144	18.*145,*146	Poinsot analysis
18.148,151	18.*147*,*149*	Review problems
18.*152*,153	18.150,154	
18.155,157	18.156,*158*	
		CHAPTER 19: MECHANICAL VIBRATIONS
		VIBRATIONS WITHOUT DAMPING
		Free vibrations of a particle
19.1,4	19.2,3	problems involving amplitude, frequency, maximum velocity and acceleration
19.5,7	19.6,*9*	
19.8	19.*10*	
19.14,*15*	19.11,12	problems involving velocity and acceleration at a given instant
19.*16*	19.13	
19.17,20	19.18,18	springs in parallel or in series
19.*21*,*22*		
19.24,26	19.23,25	change mass or stiffness of the system
19.28,30	19.*27*,29	special problems
19.31	19.*32*	
19.*34,*36	19.*33,*35	simple pendulum with large amplitude
		Free vibrations of rigid bodies
19.37,39	19.38,41	systems with elastic restoring forces
19.*40*,*43*	19.42	
19.44,45	19.*46*,*47*	systems with restoring forces due to gravity
19.48,49	19.50,51	
19.52,53	19.54	derivations for motion of compound pendulum
19.55,56	19.57,*58*	systems with elastic and gravity restoring forces
19.60,62	19.59,*61*	determine velocity and acceleration
19.63,64	19.67,68	torsional vibrations
19.*65.66*		

---

* Problems which do not involve any specific system of units have been indicated by underlining their numbers.
Answers are not given to problems with the numbers set in italic type.

TABLE II: CLASSIFICATION AND DESCRIPTION OF PROBLEMS (CONTINUED)

Problem Number*		
SI Units	**U.S. Units**	**Problem Description**
		Conservation of energy used to analyze the motion of
19.69,72	19.70,71	particles
19.75,76	19.*73,74*	single rigid body; pendulum
19.77,80	19.78,79	single rigid body; elastic restoring forces
19.*81,82*		
19.83,*84*	19.85,86	connected rigid bodies
19.87,*88*		
19.89,92	19.90,91	special problems
19.95,96	19.93,94	
19.*98	19.*97	
		Forced vibrations
19.99,100	19.101,102	problems involving periodic applied force
19.*103,104*		
19.106,107	19.105,*108*	problems involving periodic support motion
19.109,112	19.110,*111*	
19.113,114	19.115,116	problems involving rotating machinery
19.117,119	19.*118,120*

CHAPTER 11

PROBLEM 11.1

A snowboarder starts from rest at the top of a double black diamond hill. As he rides down the slope, GPS coordinates are used to determine his displacement as a function of time: $x = 0.5t^3 + t^2 + 2t$ where x and t are expressed in ft and seconds, respectively. Determine the position, velocity, and acceleration of the boarder when t = 5 seconds.

SOLUTION

Position: $x = 0.5t^3 + t^2 + 2t$

Velocity: $v = \dfrac{dx}{dt} = 1.5t^2 + 2t + 2$

Acceleration: $a = \dfrac{dv}{dt} = 3t + 2$

At $t = 5$ s, $x = 0.5(5)^3 + 5^2 + 2(5)$ $\qquad x = 97.5$ ft ◀

$v = 1.5(5)^2 + 2(5) + 2$ $\qquad v = 49.5$ ft/s ◀

$a = 3(5) + 2$ $\qquad a = 17$ ft/s^2 ◀

PROBLEM 11.2

The motion of a particle is defined by the relation $x = 2t^3 - 9t^2 + 12t + 10,$ where x and t are expressed in feet and seconds, respectively. Determine the time, the position, and the acceleration of the particle when $v = 0$.

SOLUTION

$$x = 2t^3 - 9t^2 + 12t + 10$$

Differentiating,

$$v = \frac{dx}{dt} = 6t^2 - 18t + 12 = 6(t^2 - 3t + 2)$$

$$= 6(t-2)(t-1)$$

$$a = \frac{dv}{dt} = 12t - 18$$

So $v = 0$ at $t = 1\text{ s}$ and $t = 2\text{ s}$.

At $t = 1\text{ s}$,

$$x_1 = 2 - 9 + 12 + 10 = 15$$

$t = 1.000\text{ s}$ ◀

$$a_1 = 12 - 18 = -6$$

$x_1 = 15.00\text{ ft}$ ◀

$a_1 = -6.00\text{ ft/s}^2$ ◀

At $t = 2\text{ s}$,

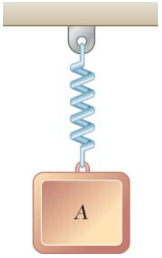
$$x_2 = 2(2)^3 - 9(2)^2 + 12(2) + 10 = 14$$

$t = 2.00\text{ s}$ ◀

$x_2 = 14.00\text{ ft}$ ◀

$$a_2 = (12)(2) - 18 = 6$$

$a_2 = 6.00\text{ ft/s}^2$ ◀



PROBLEM 11.3

The vertical motion of mass A is defined by the relation $x = 10 \sin 2t + 15 \cos 2t + 100$, where x and t are expressed in mm and seconds, respectively. Determine (a) the position, velocity and acceleration of A when $t = 1$ s, (b) the maximum velocity and acceleration of A.

SOLUTION

$$x = 10 \sin 2t + 15 \cos 2t + 100$$

$$v = \frac{dx}{dt} = 20 \cos 2t - 30 \sin 2t$$

$$a = \frac{dv}{dt} = -40 \sin 2t - 60 \cos 2t$$

For trigonometric functions set calculator to radians:

(a) At $t = 1$ s.

$$x_1 = 10 \sin 2 + 15 \cos 2 + 100 = 102.9 \qquad x_1 = 102.9 \text{ mm} \blacktriangleleft$$

$$v_1 = 20 \cos 2 - 30 \sin 2 = -35.6 \qquad v_1 = -35.6 \text{ mm/s} \blacktriangleleft$$

$$a_1 = -40 \sin 2 - 60 \cos 2 = -11.40 \qquad a_1 = -11.40 \text{ mm/s}^2 \blacktriangleleft$$

(b) Maximum velocity occurs when $a = 0$.

$$-40 \sin 2t - 60 \cos 2t = 0$$

$$\tan 2t = -\frac{60}{40} = -1.5$$

$$2t = \tan^{-1}(-1.5) = -0.9828 \text{ and } -0.9828 + \pi$$

Reject the negative value. $2t = 2.1588$

$$t = 1.0794 \text{ s}$$

$$t = 1.0794 \text{ s for } v_{\max}$$

so

$$v_{\max} = 20 \cos(2.1588) - 30 \sin(2.1588)$$
$$= -36.056 \qquad v_{\max} = -36.1 \text{ mm/s} \blacktriangleleft$$

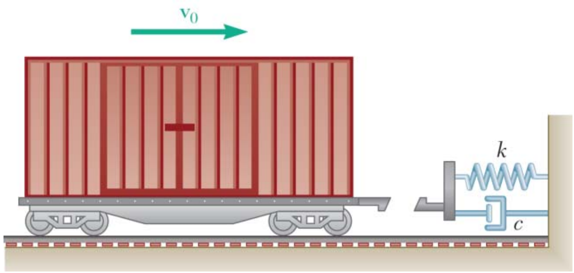
Note that we could have also used

$$v_{\max} = \sqrt{20^2 + 30^2} = 36.056$$

by combining the sine and cosine terms.

For $a_{\max}$ we can take the derivative and set equal to zero or just combine the sine and cosine terms.

$$a_{\max} = \sqrt{40^2 + 60^2} = 72.1 \text{ mm/s}^2 \qquad a_{\max} = 72.1 \text{ mm/s}^2 \blacktriangleleft$$



PROBLEM 11.4

A loaded railroad car is rolling at a constant velocity when it couples with a spring and dashpot bumper system. After the coupling, the motion of the car is defined by the relation $x = 60e^{-4.8t}\sin 16t$ where x and t are expressed in mm and seconds, respectively. Determine the position, the velocity and the acceleration of the railroad car when (*a*) $t = 0$, (*b*) $t = 0.3$ s.

SOLUTION

$$x = 60e^{-4.8t}\sin 16t$$

$$v = \frac{dx}{dt} = 60(-4.8)e^{-4.8t}\sin 16t + 60(16)e^{-4.8t}\cos 16t$$

$$v = -288e^{-4.8t}\sin 16t + 960e^{-4.8t}\cos 16t$$

$$a = \frac{dv}{dt} = 1382.4e^{-4.8t}\sin 16t - 4608e^{-4.8t}\cos 16t$$

$$-4608e^{-4.8t}\cos 16t - 15360e^{-4.8t}\sin 16t$$

$$a = -13977.6e^{-4.8t}\sin 16t - 9216e^{-4.8}\cos 16t$$

(*a*) At $t = 0$,

$x_0 = 0$ $\qquad$ $x_0 = 0$ mm ◀

$v_0 = 960$ mm/s $\qquad$ $v_0 = 960$ mm/s $\longrightarrow$ ◀

$a_0 = -9216$ mm/s^2 $\qquad$ $a_0 = 9220$ mm/s^2 $\longleftarrow$ ◀

$$e^{-4.8t} = e^{-1.44} = 0.23692$$

$$\sin 16t = \sin 4.8 = -0.99616$$

$$\cos 16t = \cos 4.8 = 0.08750$$

$x_{0.3} = (60)(0.23692)(-0.99616) = -14.16$ $\qquad$ $x_{0.3} = 14.16$ mm $\longleftarrow$ ◀

$$v_{0.3} = -(288)(0.23692)(-0.99616)$$

$+(960)(0.23692)(0.08750) = 87.9$ $\qquad$ $v_{0.3} = 87.9$ mm/s $\longrightarrow$ ◀

$$a_{0.3} = -(13977.6)(0.23692)(-0.99616)$$

$-(9216)(0.23692)(0.08750) = 3108$ $\qquad$ $a_{0.3} = 3110$ mm/s^2 ◀

or 3.11 m/s^2 $\longrightarrow$ ◀

PROBLEM 11.5

The motion of a particle is defined by the relation $x = 6t^4 - 2t^3 - 12t^2 + 3t + 3$, where x and t are expressed in meters and seconds, respectively. Determine the time, the position, and the velocity when $a = 0$.

SOLUTION

We have $$x = 6t^4 - 2t^3 - 12t^2 + 3t + 3$$

Then $$v = \frac{dx}{dt} = 24t^3 - 6t^2 - 24t + 3$$

and $$a = \frac{dv}{dt} = 72t^2 - 12t - 24$$

When $a = 0$: $$72t^2 - 12t - 24 = 12(6t^2 - t - 2) = 0$$

or $$(3t - 2)(2t + 1) = 0$$

or $$t = \frac{2}{3}\text{ s} \quad \text{and} \quad t = -\frac{1}{2}\text{ s} \quad \text{(Reject)}$$

$t = 0.667$ s ◀

At $t = \frac{2}{3}$ s: $$x_{2/3} = 6\left(\frac{2}{3}\right)^4 - 2\left(\frac{2}{3}\right)^3 - 12\left(\frac{2}{3}\right)^2 + 3\left(\frac{2}{3}\right) + 3$$

or $x_{2/3} = 0.259$ m ◀

$$v_{2/3} = 24\left(\frac{2}{3}\right)^3 - 6\left(\frac{2}{3}\right)^2 - 24\left(\frac{2}{3}\right) + 3$$

or $v_{2/3} = -8.56$ m/s ◀

PROBLEM 11.6

The motion of a particle is defined by the relation $x = t^3 - 9t^2 + 24t - 8$, where x and t are expressed in inches and seconds, respectively. Determine (a) when the velocity is zero, (b) the position and the total distance traveled when the acceleration is zero.

SOLUTION

We have $$x = t^3 - 9t^2 + 24t - 8$$

Then $$v = \frac{dx}{dt} = 3t^2 - 18t + 24$$

and $$a = \frac{dv}{dt} = 6t - 18$$

(a) When $v = 0$: $$3t^2 - 18t + 24 = 3(t^2 - 6t + 8) = 0$$

$$(t-2)(t-4) = 0$$

$t = 2.00$ s and $t = 4.00$ s ◀

(b) When $a = 0$: $$6t - 18 = 0 \quad \text{or} \quad t = 3 \text{ s}$$

At $t = 3$ s: $$x_3 = (3)^3 - 9(3)^2 + 24(3) - 8$$ or $x_3 = 10.00$ in. ◀

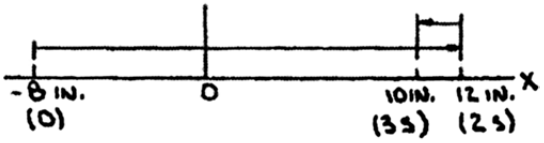
First observe that $0 \le t < 2$ s: $v > 0$

$2 \text{ s} < t \le 3$ s: $v < 0$

Now

At $t = 0$: $x_0 = -8$ in.

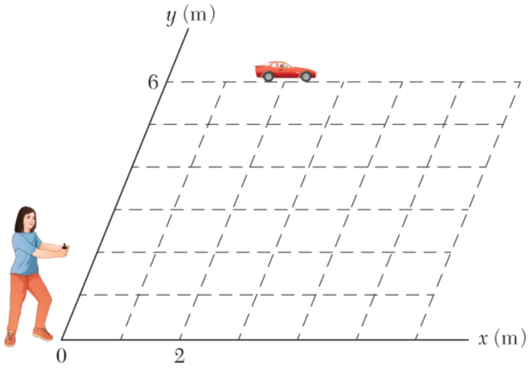
At $t = 2$ s: $x_2 = (2)^3 - 9(2)^2 + 24(2) - 8 = 12$ in.



Then $$x_2 - x_0 = 12 - (-8) = 20 \text{ in.}$$

$$|x_3 - x_2| = |10 - 12| = 2 \text{ in.}$$

Total distance traveled $= (20 + 2)$ in. Total distance $= 22.0$ in. ◀



PROBLEM 11.7

A girl operates a radio-controlled model car in a vacant parking lot. The girl's position is at the origin of the *xy* coordinate axes, and the surface of the parking lot lies in the x-y plane. She drives the car in a straight line so that the *x* coordinate is defined by the relation $x(t) = 0.5t^3 - 3t^2 + 3t + 2$, where *x* and *t* are expressed in meters and seconds, respectively. Determine (*a*) when the velocity is zero, (*b*) the position and total distance travelled when the acceleration is zero.

SOLUTION

Position: $x(t) = 0.5t^3 - 3t^2 + 3t + 2$

Velocity: $v(t) = \dfrac{dx}{dt}$

$$v(t) = 1.5t^2 - 6t + 3$$

(*a*) Time when v=0

$$0 = 1.5t^2 - 6t + 3$$

$$t = \frac{6 \pm \sqrt{6^2 - 4(1.5)(3)}}{2 * 1.5}$$

$t = 0.586\text{ s}$ and $t = 3.414\text{ s}$ ◀

Acceleration: $a(t) = \dfrac{dv}{dt}$

$$a(t) = 3t - 6$$

Time when a=0

$$0 = 3t - 6$$

$$t = 2\text{ s}$$

(*b*) Position at t=2 s

$$x(2) = 0.5(2)^3 - 3(2)^2 + 3 * 2 + 2$$

$x(2) = 0\text{ m}$ ◀

To find total distance note that car changes direction at t=0.586 s

Position at t=0 s

$$x(0) = 0.5(0)^3 - 3(0)^2 + 3 * 0 + 2$$

$$x(0) = 2$$

Position at t=0.586 s

$$x(0.586) = 0.5(0.586)^3 - 3(0.586)^2 + 3 * 0.586 + 2$$

$$x(0.586) = 2.828\text{ m}$$

Distances traveled:

From t=0 to t=0.586 s: $|x(0.586) - x(0)| = 0.828\text{ m}$

From t=0.586 to t=2 s: $|x(2) - x(0.586)| = 2.828\text{ m}$

Total distance traveled $= 0.828\text{ m} + 2.828\text{ m}$

Total distance $= 3.656\text{ m}$ ◀

PROBLEM 11.8

The motion of a particle is defined by the relation $x = t^2 - (t-2)^3$, where *x* and *t* are expressed in feet and seconds, respectively. Determine (*a*) the two positions at which the velocity is zero, (*b*) the total distance traveled by the particle from *t* = 0 to *t* = 4 s..

SOLUTION

Position: $x(t) = t^2 - (t-2)^3$

Velocity: $v(t) = \frac{dx}{dt}$

$$v(t) = 2t - 3(t-2)^2$$

$$v(t) = 2t - 3(t^2 - 4t + 4)$$

$$= -3t^2 + 14t - 12$$

Time when v(t)=0 $\quad 0 = -3t^2 + 14t - 12$

$$t = \frac{-14 \pm \sqrt{14^2 - 4(-3)(-12)}}{2(-3)}$$

$t = 1.131$ s and $t = 3.535$ s

(a) Position at t=1.131 s $\quad x(1.131) = (1.131)^2 - (1.1.31 - 2)^3$

$x(1.131) = 1.935$ ft. ◀

Position at t=3.535 s $\quad x(3.535) = (3.535)^2 - (3.535 - 2)^3$

$x(3.531) = 8.879$ ft. ◀

To find total distance traveled note that the particle changes direction at t=1.131 s and again at t=3.535 s.

Position at t=0 s $\quad x(0) = (0)^2 - (0 - 2)^3$

$x(0) = 8$ ft

Position at t=4 s $\quad x(4) = (4)^2 - (4 - 2)^3$

$x(4) = 8$ ft

(b) Distances traveled:

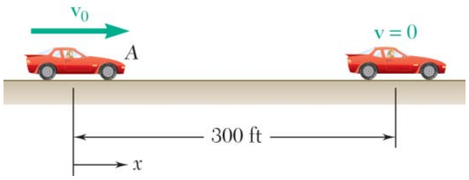
From t=0 to t=1.131 s: $\quad |x(1.131) - x(0)| = 6.065$ ft.

From t=1.131 to t=3.531 s: $\quad |x(3.535) - x(1.131)| = 6.944$ ft.

From t=3.531 to t=4 s: $\quad |x(4) - x(3.535)| = 0.879$ ft.

Total distance traveled $= 6.065$ ft $+ 6.944$ ft $+ 0.879$ ft

Total distance $= 13.888$ ft. ◀



PROBLEM 11.9

The brakes of a car are applied, causing it to slow down at a rate of 10 ft/s^2. Knowing that the car stops in 100 ft, determine (*a*) how fast the car was traveling immediately before the brakes were applied, (*b*) the time required for the car to stop.

SOLUTION

$$a = -10 \text{ ft/s}^2$$

(*a*) Velocity at $x = 0$.

$$v\frac{dv}{dx} = a = -10$$

$$\int_{v_0}^{0} v\,dv = -\int_0^{x_f} (-10)dx$$

$$0 - \frac{v_0^2}{2} = -10x_f = -(10)(300)$$

$$v_0^2 = 6000 \qquad v_0 = 77.5 \text{ ft/s}^2 \blacktriangleleft$$

(*b*) Time to stop.

$$\frac{dv}{dx} = a = -10$$

$$\int_{v_0}^{0} dv = -\int_0^{t_f} -10dt$$

$$0 - v_0 = -10t_f$$

$$t_f = \frac{v_0}{10} = \frac{77.5}{10} \qquad t_f = 7.75 \text{ s} \blacktriangleleft$$

PROBLEM 11.10

The acceleration of a particle is defined by the relation $a = 3e^{-0.2t}$, where a and t are expressed in ft/s^2 and seconds, respectively. Knowing that $x = 0$ and $v = 0$ at $t = 0$, determine the velocity and position of the particle when $t = 0.5$ s.

SOLUTION

Acceleration: $a = 3e^{-0.2t}$ ft/s^2

Given: $v_0 = 0$ ft/s, $x_0 = 0$ ft

Velocity: $a = \frac{dv}{dt} \Rightarrow dv = adt$

$$\int_{v_0}^{v} dv = \int_0^t adt$$

$$v - v_o = \int_0^t 3e^{-0.2t}dt \Rightarrow v - 0 = -15e^{-0.2t}\Big|_0^t$$

$$v = 15\left(1 - e^{-0.2t}\right) \text{ ft/s}$$

Position: $v = \frac{dx}{dt} \Rightarrow dx = vdt$

$$\int_{x_0}^{x} dx = \int_0^t vdt$$

$$x - x_o = \int_0^t 15\left(1 - e^{-0.2t}\right)dt \Rightarrow \text{x} - 0 = 15\left(t + 5e^{-0.2t}\right)\Big|_0^t$$

$$x = 15\left(t + 5e^{-0.2t}\right) - 75 \text{ ft}$$

Velocity at t=0.5 s $v = 15\left(1 - e^{-0.2*0.5}\right)$ ft/s

$$v(0.5) = 1.427 \text{ ft/s} \blacktriangleleft$$

Position at t=0.5 s $x = 15\left(0.5 + 5e^{-0.2*0.5}\right) - 75$ ft

$$x(0.5) = 0.363 \text{ ft.} \blacktriangleleft$$

PROBLEM 11.11

The acceleration of a particle is directly proportional to the square of the time t. When $t = 0$, the particle is at $x = 24$ m. Knowing that at $t = 6$ s, $x = 96$ m and $v = 18$ m/s, express x and v in terms of t.

SOLUTION

We have $$a = kt^2 \quad k = \text{constant}$$

Now $$\frac{dv}{dt} = a = kt^2$$

At $t = 6$ s, $v = 18$ m/s: $$\int_{18}^{v} dv = \int_{6}^{t} kt^2 dt$$

or $$v - 18 = \frac{1}{3}k(t^3 - 216)$$

or $$v = 18 + \frac{1}{3}k(t^3 - 216)(\text{m/s})$$

Also $$\frac{dx}{dt} = v = 18 + \frac{1}{3}k(t^3 - 216)$$

At $t = 0$, $x = 24$ m: $$\int_{24}^{x} dx = \int_{0}^{t}\left[18 + \frac{1}{3}k(t^3 - 216)\right]dt$$

or $$x - 24 = 18t + \frac{1}{3}k\left(\frac{1}{4}t^4 - 216t\right)$$

Now

At $t = 6$ s, $x = 96$ m: $$96 - 24 = 18(6) + \frac{1}{3}k\left[\frac{1}{4}(6)^4 - 216(6)\right]$$

or $$k = \frac{1}{9} \text{ m/s}^4$$

Then $$x - 24 = 18t + \frac{1}{3}\left(\frac{1}{9}\right)\left(\frac{1}{4}t^4 - 216t\right)$$

or $$x(t) = \frac{1}{108}t^4 + 10t + 24 \quad ◀$$

and $$v = 18 + \frac{1}{3}\left(\frac{1}{9}\right)(t^3 - 216)$$

or $$v(t) = \frac{1}{27}t^3 + 10 \quad ◀$$

PROBLEM 11.12

The acceleration of a particle is defined by the relation $a = kt^2$. (*a*) Knowing that $v = -8$ m/s when $t = 0$ and that $v = +8$ m/s when $t = 2$ s, determine the constant *k*. (*b*) Write the equations of motion, knowing also that $x = 0$ when $t = 2$ s.

SOLUTION

$$a = kt^2 \qquad (1)$$

$$\frac{dv}{dt} = a = kt^2$$

$t = 0,\ v = -8$ m/s and $t = 2$ s, $v = +8$ ft/s

(*a*)

$$\int_{-8}^{8} dv = \int_0^2 kt^2\, dt$$

$$8 - (-8) = \frac{1}{3}k(2)^3$$

$k = 6.00\ \text{m/s}^4$ ◀

(*b*) Substituting $k = 6\ \text{m/s}^4$ into (1)

$$\frac{dv}{dt} = a = 6t^2$$

$a = 6t^2$ ◀

$t = 0, v = -8$ m/s:

$$\int_{-8}^{v} dv = \int_0^t 6t^2\, dt$$

$$v - (-8) = \frac{1}{3}6(t)^3$$

$v = 2t^3 - 8$ ◀

$$\frac{dx}{dt} = v = 2t^3 - 8$$

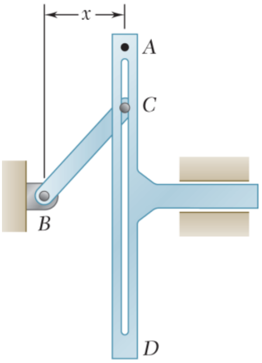
$t = 2$ s, $x = 0$:

$$\int_0^x dx = \int_2^t (2t^3 - 8)dt; \quad x = \left|\frac{1}{2}t^4 - 8t\right|_2^t$$

$$x = \left[\frac{1}{2}t^4 - 8t\right] - \left[\frac{1}{2}(2)^4 - 8(2)\right]$$

$$x = \frac{1}{2}t^4 - 8t - 8 + 16$$

$x = \frac{1}{2}t^4 - 8t + 8$ ◀



PROBLEM 11.13

A Scotch yoke is a mechanism that transforms the circular motion of a crank into the reciprocating motion of a shaft (or vice versa). It has been used in a number of different internal combustion engines and in control valves. In the Scotch yoke shown, the acceleration of Point A is defined by the relation $a = -1.8\sin kt$, where a and t are expressed in m/s^2 and seconds, respectively, and $k = 3$ rad/s. Knowing that $x = 0$ and $v = 0.6$ m/s when $t = 0$, determine the velocity and position of Point A when $t = 0.5$ s.

SOLUTION

Acceleration: $a = -1.8\sin kt \text{ m/s}^2$

Given: $v_0 = 0.6 \text{ m/s}, \quad x_0 = 0, \quad k = 3 \text{ rad/s}$

Velocity:

$$a = \frac{dv}{dt} \Rightarrow \quad dv = adt \quad \Rightarrow \int_{v_0}^{v} dv = \int_0^t adt$$

$$v - v_0 = \int_0^t a\,dt = -1.8\int_0^t \sin kt\,dt = \frac{1.8}{k}\cos kt\Big|_0^t$$

$$v - 0.6 = \frac{1.8}{3}(\cos kt - 1) = 0.6\cos kt - 0.6$$

$$v = 0.6\cos kt \text{ m/s}$$

Position:

$$v = \frac{dx}{dt} \Rightarrow \quad dx = vdt \quad \Rightarrow \int_{x_0}^{x} dx = \int_0^t vdt$$

$$x - x_0 = \int_0^t v\,dt = 0.6\int_0^t \cos kt\,dt = \frac{0.6}{k}\sin kt\Big|_0^t$$

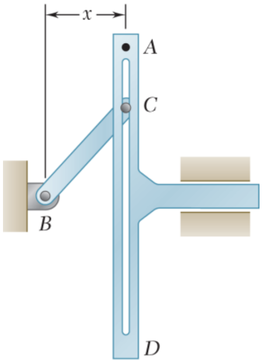
$$x - 0 = \frac{0.6}{3}(\sin kt - 0) = 0.2\sin kt$$

$$x = 0.2\sin kt \text{ m}$$

When t =0.5 s, $kt = (3)(0.5) = 1.5 \text{ rad}$

$v = 0.6\cos 1.5 = 0.0424 \text{ m/s}$ $\quad v = 42.4 \text{ mm/s}$ ◀

$x = 0.2\sin 1.5 = 0.1995 \text{ m}$ $\quad x = 199.5 \text{ mm}$ ◀



PROBLEM 11.14

For the scotch yoke mechanism shown, the acceleration of Point A is defined by the relation $a = -1.08\sin kt - 1.44\cos kt$, where a and t are expressed in m/s^2 and seconds, respectively, and $k = 3$ rad/s. Knowing that $x = 0.16$ m and $v = 0.36$ m/s when $t = 0$, determine the velocity and position of Point A when $t = 0.5$ s.

SOLUTION

Acceleration: $a = -1.08\sin kt - 1.44\cos kt \text{ m/s}^2$

Given: $v_0 = 0.36 \text{ m/s}, \quad x_0 = 0.16, \quad k = 3 \text{ rad/s}$

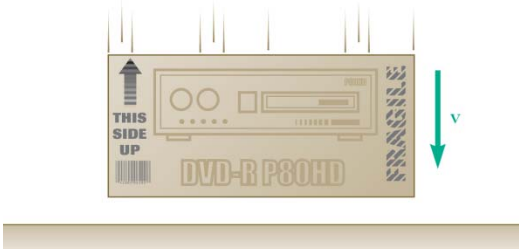
Velocity:
$$a = \frac{dv}{dt} \Rightarrow \quad dv = a\,dt \quad \Rightarrow \int_{v_0}^{v} dv = \int_0^t a\,dt$$

Integrate:
$$v - v_0 = -1.08 \int_0^t \sin kt\,dt - 1.44 \int_0^t \cos kt\,dt$$
$$v - 0.36 = \frac{1.08}{k}\cos kt\Big|_0^t - \frac{1.44}{k}\sin kt\Big|_0^t$$
$$= \frac{1.08}{3}(\cos 3t - 1) - \frac{1.44}{3}(\sin 3t - 0)$$
$$= 0.36\cos 3t - 0.36 - 0.48\sin 3t$$
$$v = 0.36\cos 3t - 0.48\sin 3t \text{ m/s}$$

Evaluate at $t = 0.5$ s
$$= 0.36\cos 1.5 - 0.36 - 0.48\sin 1.5$$
$v = -453$ mm/s ◀

Position:
$$v = \frac{dx}{dt} \Rightarrow \quad dx = v\,dt \quad \Rightarrow \int_{x_0}^{x} dx = \int_0^t v\,dt$$
$$x - x_0 = \int_0^t v\,dt = 0.36 \int_0^t \cos kt\,dt - 0.48 \int_0^t \sin kt\,dt$$
$$x - 0.16 = \frac{0.36}{k}\sin kt\Big|_0^t + \frac{0.48}{k}\cos kt\Big|_0^t$$
$$= \frac{0.36}{3}(\sin 3t - 0) + \frac{0.48}{3}(\cos 3t - 1)$$
$$= 0.12\sin 3t + 0.16\cos 3t - 0.16$$
$$x = 0.12\sin 3t + 0.16\cos 3t \text{ m}$$

Evaluate at $t = 0.5$ s
$$x = 0.12\sin 1.5 + 0.16\cos 1.5 = 0.1310 \text{ m}$$
$x = 131.0$ mm ◀



PROBLEM 11.15

A piece of electronic equipment that is surrounded by packing material is dropped so that it hits the ground with a speed of 4 m/s. After contact the equipment experiences an acceleration of $a = -kx$, where k is a constant and x is the compression of the packing material. If the packing material experiences a maximum compression of 20 mm, determine the maximum acceleration of the equipment.

SOLUTION

$$a = \frac{vdv}{dx} = -kx$$

Separate and integrate.

$$\int_{v_0}^{v_f} vdv = -\int_0^{x_f} kx\,dx$$

$$\frac{1}{2}v_f^2 - \frac{1}{2}v_0^2 = -\frac{1}{2}kx^2\bigg|_0^{x_f} = -\frac{1}{2}kx_f^2$$

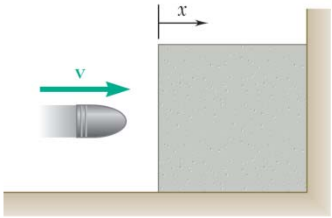
Use $v_0 = 4$ m/s, $x_f = 0.02$ m, and $v_f = 0$. Solve for k.

$$0 - \frac{1}{2}(4)^2 = -\frac{1}{2}k(0.02)^2 \qquad k = 40{,}000 \text{ s}^{-2}$$

Maximum acceleration.

$$a_{\max} = -kx_{\max}: \quad (-40{,}000)(0.02) = -800 \text{ m/s}^2$$

$a = 800 \text{ m/s}^2 \uparrow$ ◀



PROBLEM 11.16

A projectile enters a resisting medium at $x = 0$ with an initial velocity $v_0 = 900$ ft/s and travels 4 in. before coming to rest. Assuming that the velocity of the projectile is defined by the relation $v = v_0 - kx$, where v is expressed in ft/s and x is in feet, determine (*a*) the initial acceleration of the projectile, (*b*) the time required for the projectile to penetrate 3.9 in. into the resisting medium.

SOLUTION

First note

When $x = \frac{4}{12}$ ft, $v = 0$: $\quad 0 = (900 \text{ ft/s}) - k\left(\frac{4}{12} \text{ ft}\right)$

or $\quad k = 2700 \frac{1}{\text{s}}$

(*a*) We have $\quad v = v_0 - kx$

Then $\quad a = \frac{dv}{dt} = \frac{d}{dt}(v_0 - kx) = -kv$

or $\quad a = -k(v_0 - kx)$

At $t = 0$: $\quad a = 2700 \frac{1}{\text{s}}(900 \text{ ft/s} - 0)$

or $\quad a_0 = -2.43 \times 10^6 \text{ ft/s}^2$ ◀

(*b*) We have $\quad \frac{dx}{dt} = v = v_0 - kx$

At $t = 0$, $x = 0$: $\quad \int_0^x \frac{dx}{v_0 - kx} = \int_0^t dt$

or $\quad -\frac{1}{k}[\ln(v_0 - kx)]_0^x = t$

or $\quad t = \frac{1}{k}\ln\left(\frac{v_0}{v_0 - kx}\right) = \frac{1}{k}\ln\left(\frac{1}{1 - \frac{k}{v_0}x}\right)$

When $x = 3.9$ in.: $\quad t = \frac{1}{2700 \frac{1}{\text{s}}}\ln\left[\frac{1}{1 - \frac{2700 \text{ 1/s}}{900 \text{ ft/s}}\left(\frac{3.9}{12} \text{ ft}\right)}\right]$

or $\quad t = 1.366 \times 10^{-3}$ s ◀

PROBLEM 11.17

The acceleration of a particle is defined by the relation $a = -k/x$. It has been experimentally determined that $v = 15$ ft/s when $x = 0.6$ ft and that $v = 9$ ft/s when $x = 1.2$ ft. Determine (*a*) the velocity of the particle when $x = 1.5$ ft, (*b*) the position of the particle at which its velocity is zero.

SOLUTION

$$a = \frac{v\,dv}{dx} = \frac{-k}{x}$$

Separate and integrate using $x = 0.6$ ft, $v = 15$ ft/s.

$$\int_{15}^{v} v\,dv = -k\int_{0.6}^{x} \frac{dx}{x}$$

$$\frac{1}{2}v^2\Big|_{15}^{v} = -k\ln x\Big|_{0.6}^{x}$$

$$\frac{1}{2}v^2 - \frac{1}{2}(15)^2 = -k\ln\left(\frac{x}{0.6}\right) \qquad (1)$$

When $v = 9$ ft/s, $x = 1.2$ ft

$$\frac{1}{2}(9)^2 - \frac{1}{2}(15)^2 = -k\ln\left(\frac{1.2}{0.6}\right)$$

Solve for *k*.

$$k = 103.874 \text{ ft}^2/\text{s}^2$$

(*a*) Velocity when $x = 65$ ft.

Substitute $k = 103.874 \text{ ft}^2/\text{s}^2$ and $x = 1.5$ ft into (1).

$$\frac{1}{2}v^2 - \frac{1}{2}(15)^2 = -103.874\ln\left(\frac{1.5}{0.6}\right)$$

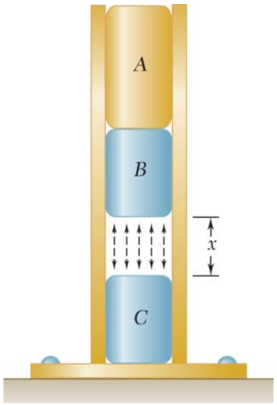
$v = 5.89$ ft/s ◀

(*b*) Position when for $v = 0$,

$$0 - \frac{1}{2}(15)^2 = -103.874\ln\left(\frac{x}{0.6}\right)$$

$$\ln\left(\frac{x}{0.6}\right) = 1.083$$

$x = 1.772$ ft ◀



PROBLEM 11.18

A brass (nonmagnetic) block *A* and a steel magnet *B* are in equilibrium in a brass tube under the magnetic repelling force of another steel magnet *C* located at a distance $x = 0.004$ m from *B*. The force is inversely proportional to the square of the distance between *B* and *C*. If block *A* is suddenly removed, the acceleration of block *B* is $a = -9.81 + k/x^2$, where a and x are expressed in m/s^2 and m, respectively, and $k = 4 \times 10^{-4}\ \text{m}^3/\text{s}^2$. Determine the maximum velocity and acceleration of *B*.

SOLUTION

The maximum velocity occurs when $a = 0$. $\qquad 0 = -9.81 + \dfrac{k}{x_m^2}$

$$x_m^2 = \frac{k}{9.81} = \frac{4 \times 10^{-4}}{9.81} = 40.775 \times 10^{-6}\ \text{m}^2 \qquad x_m = 0.0063855\ \text{m}$$

The acceleration is given as a function of *x*.

$$v\frac{dv}{dx} = a = -9.81 + \frac{k}{x^2}$$

Separate variables and integrate:

$$vdv = -9.81dx + \frac{k\,dx}{x^2}$$

$$\int_0^v vdv = -9.81\int_{x_0}^{x} dx + k\int_{x_0}^{x} \frac{dx}{x^2}$$

$$\frac{1}{2}v^2 = -9.81(x - x_0) - k\left(\frac{1}{x} - \frac{1}{x_0}\right)$$

$$\frac{1}{2}v_m^2 = -9.81(x_m - x_0) - k\left(\frac{1}{x_m} - \frac{1}{x_0}\right)$$

$$= -9.81(0.0063855 - 0.004) - (4 \times 10^{-4})\left(\frac{1}{0.0063855} - \frac{1}{0.004}\right)$$

$$= -0.023402 + 0.037358 = 0.013956\ \text{m}^2/\text{s}^2$$

Maximum velocity: $\qquad v_m = 0.1671\ \text{m/s} \qquad\qquad v_m = 167.1\ \text{mm/s}$ ↑ ◀

The maximum acceleration occurs when *x* is smallest, that is, $x = 0.004$ m.

$$a_m = -9.81 + \frac{4 \times 10^{-4}}{(0.004)^2} \qquad\qquad a_m = 15.19\ \text{m/s}^2$$ ↑ ◀

PROBLEM 11.19

Based on experimental observations, the acceleration of a particle is defined by the relation $a = -(0.1 + \sin x/b)$, where a and x are expressed in m/s^2 and meters, respectively. Knowing that $b = 0.8$ m and that $v = 1$ m/s when $x = 0$, determine (*a*) the velocity of the particle when $x = -1$ m, (*b*) the position where the velocity is maximum, (*c*) the maximum velocity.

SOLUTION

We have $$v\frac{dv}{dx} = a = -\left(0.1 + \sin\frac{x}{0.8}\right)$$

When $x = 0,\ v = 1$ m/s: $$\int_1^v v\,dv = \int_0^x -\left(0.1 + \sin\frac{x}{0.8}\right)dx$$

or $$\frac{1}{2}(v^2 - 1) = -\left[0.1x - 0.8\cos\frac{x}{0.8}\right]_0^x$$

or $$\frac{1}{2}v^2 = -0.1x + 0.8\cos\frac{x}{0.8} - 0.3$$

(*a*) When $x = -1$ m: $$\frac{1}{2}v^2 = -0.1(-1) + 0.8\cos\frac{-1}{0.8} - 0.3$$

or $v = \pm 0.323$ m/s ◀

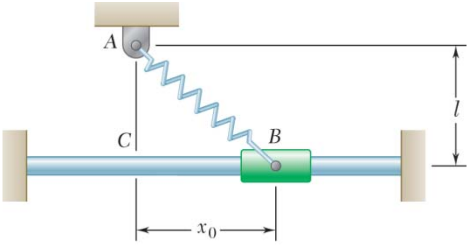
(*b*) When $v = v_{\text{max}},\ a = 0$: $$-\left(0.1 + \sin\frac{x}{0.8}\right) = 0$$

or $x = -0.080\,134$ m $x = -0.0801$ m ◀

(*c*) When $x = -0.080\,134$ m:

$$\frac{1}{2}v_{\text{max}}^2 = -0.1(-0.080\,134) + 0.8\cos\frac{-0.080\,134}{0.8} - 0.3$$
$$= 0.504\ \text{m}^2/\text{s}^2$$

or $v_{\text{max}} = 1.004$ m/s ◀



PROBLEM 11.20

A spring AB is attached to a support at A and to a collar. The unstretched length of the spring is l. Knowing that the collar is released from rest at $x = x_0$ and has an acceleration defined by the relation $a = -100(x - lx/\sqrt{l^2 + x^2})$, determine the velocity of the collar as it passes through Point C.

SOLUTION

Since a is function of x,

$$a = v\frac{dv}{dx} = -100\left(x - \frac{lx}{\sqrt{l^2 + x^2}}\right)$$

Separate variables and integrate:

$$\int_{v_0}^{v_f} v\,dv = -100\int_{x_0}^{0}\left(x - \frac{lx}{\sqrt{l^2 + x^2}}\right)dx$$

$$\frac{1}{2}v_f^2 - \frac{1}{2}v_0^2 = -100\left(\frac{x^2}{2} - l\sqrt{l^2 + x^2}\right)\Bigg|_{x_0}^{0}$$

$$\frac{1}{2}v_f^2 - 0 = -100\left(-\frac{x_0^2}{2} - l^2 + l\sqrt{l^2 + x_0^2}\right)$$

$$\frac{1}{2}v_f^2 = \frac{100}{2}(-l^2 + x_0^2 - l^2 - 2l\sqrt{l^2 + x_0^2})$$

$$= \frac{100}{2}(\sqrt{l^2 + x_0^2} - l)^2$$

$$v_f = 10(\sqrt{l^2 + x_0^2} - l) \blacktriangleleft$$

PROBLEM 11.21

The acceleration of a particle is defined by the relation $a = k\left(1 - e^{-x}\right)$, where k is a constant. Knowing that the velocity of the particle is $v = +9$ m/s when $x = -3$ m and that the particle comes to rest at the origin, determine (*a*) the value of k, (*b*) the velocity of the particle when $x = -2$ m.

SOLUTION

Acceleration: $a = k\left(1 - e^{-x}\right)$

Given: at $x = -3$ m, $v = 9$ m/s

at $x = 0$ m, $v = 0$ m/s

$$adx = vdv$$

$$\mathrm{k}\left(1 - e^{-x}\right)dx = vdv$$

Integrate using x=-3 m and v=9 m/s as the lower limits of the integrals

$$\int_{-3}^{x} \mathrm{k}\left(1 - e^{-x}\right)dx = \int_{9}^{v} vdv$$

$$k\left(x + e^{-x}\right)\Big|_{-3}^{x} = \frac{1}{2}v^2\Big|_{9}^{v}$$

Velocity: $k\left(x + e^{-x} - \left(-3 + e^{3}\right)\right) = \frac{1}{2}v^2 - \frac{1}{2}(9)^2$ (1)

(a) Now substitute v=0 m/s and x=0 m into (1) and solve for k

$$k\left(0 + e^{-0} - \left(-3 + e^{3}\right)\right) = \frac{1}{2}0^2 - \frac{1}{2}(9)^2$$

$k = 2.52\ \mathrm{m}^2/\mathrm{s}^2$ ◀

(b) Find velocity when x= -2 m using the equation (1) and the value of k

$$2.518\left(-2 + e^{2} - \left(-3 + e^{3}\right)\right) = \frac{1}{2}v^2 - \frac{1}{2}(9)^2$$

$v = 4.70$ m/s ◀

PROBLEM 11.22

Starting from $x = 0$ with no initial velocity, a particle is given an acceleration $a = 0.1\sqrt{v^2 + 16}$, where a and v are expressed in ft/s^2 and ft/s, respectively. Determine (*a*) the position of the particle when $v =$ 3ft/s, (*b*) the speed and acceleration of the particle when $x = 4$ ft.

SOLUTION

$$a = \frac{vdv}{dx} = 0.1(v^2 + 16)^{1/2} \tag{1}$$

Separate and integrate.

$$\int_0^v \frac{vdv}{\sqrt{v^2 + 16}} = \int_0^x 0.1\, dx$$

$$(v^2 + 16)^{1/2}\Big|_0^v = 0.1x$$

$$(v^2 + 16)^{1/2} - 4 = 0.1x$$

$$x = 10[(v^2 + 16)^{1/2} - 4] \tag{2}$$

(*a*) $v = 3$ ft/s.

$$x = 10[(3^2 + 16)^{1/2} - 4] \qquad x = 10.00 \text{ ft} \blacktriangleleft$$

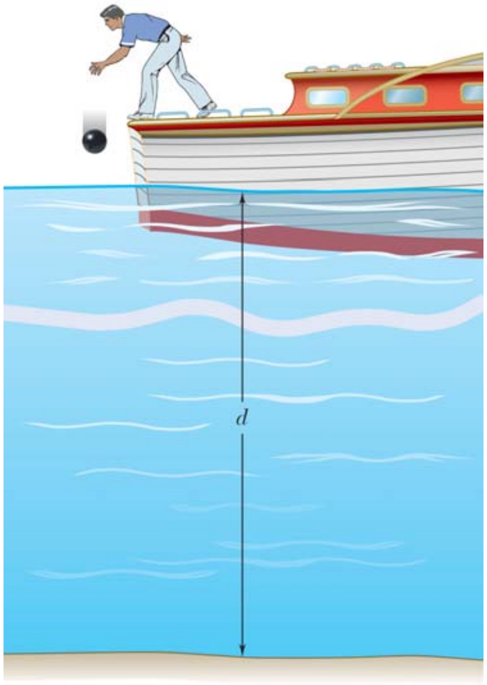
(*b*) $x = 4$ ft.

From (2), $$(v^2 + 16)^{1/2} = 4 + 0.1x = 4 + (0.1)(4) = 4.4$$

$$v^2 + 16 = 19.36$$

$$v^2 = 3.36 \text{ ft}^2/\text{s}^2 \qquad v = 1.833 \text{ ft/s} \blacktriangleleft$$

From (1), $$a = 0.1(1.833^2 + 16)^{1/2} \qquad a = 0.440 \text{ ft/s}^2 \blacktriangleleft$$



PROBLEM 11.23

A ball is dropped from a boat so that it strikes the surface of a lake with a speed of 16.5 ft/s. While in the water the ball experiences an acceleration of $a = 10 - 0.8v$, where a and v are expressed in ft/s^2 and ft/s, respectively. Knowing the ball takes 3 s to reach the bottom of the lake, determine (*a*) the depth of the lake, (*b*) the speed of the ball when it hits the bottom of the lake.

SOLUTION

$$a = \frac{dv}{dt} = 10 - 0.8v$$

Separate and integrate:

$$\int_{v_0}^{v} \frac{dv}{10 - 0.8v} = \int_0^t dt$$

$$-\frac{1}{0.8}\ln(10 - 0.8v)\bigg|_{v_0}^{v} = t$$

$$\ln\left(\frac{10 - 0.8v}{10 - 0.8v_0}\right) = -0.8t$$

$$10 - 0.8v = (10 - 0.8v_0)e^{-0.8t}$$

or $$0.8v = 10 - (10 - 0.8v_0)e^{-0.8t}$$

$$v = 12.5 - (12.5 - v_0)e^{-0.8t}$$

With $v_0 = 16.5\,\text{ft/s}$ $$v = 12.5 + 4e^{-0.8t}$$

Integrate to determine x as a function of t.

$$v = \frac{dx}{dt} = 12.5 + 4e^{-0.8t}$$

$$\int_0^x dx = \int_0^t (12.5 + 4e^{-0.8t})dt$$

PROBLEM 11.23 (Continued)

$$x = 12.5t - 5e^{-0.8t}\Big|_0^t = 12.5t - 5e^{-0.8t} + 5$$

(*a*) At $t = 35$ s,

$x = 12.5(3) - 5e^{-2.4} + 5 = 42.046$ ft $\qquad x = 42.0$ ft ◀

(*b*) $v = 12.5 + 4e^{-2.4} = 12.863$ ft/s $\qquad v = 12.86$ ft/s ◀

PROBLEM 11.24

The acceleration of a particle is defined by the relation $a = -k\sqrt{v}$, where k is a constant. Knowing that $x = 0$ and $v = 81$ m/s at $t = 0$ and that $v = 36$ m/s when $x = 18$ m, determine (*a*) the velocity of the particle when $x = 20$ m, (*b*) the time required for the particle to come to rest.

SOLUTION

(*a*) We have $$v\frac{dv}{dx} = a = -k\sqrt{v}$$

so that $$\sqrt{v}\, dv = -k\,dx$$

When $x = 0, v = 81\text{ m/s}$: $$\int_{81}^{v} \sqrt{v}\, dv = \int_{0}^{x} -k\,dx$$

or $$\frac{2}{3}[v^{3/2}]_{81}^{v} = -kx$$

or $$\frac{2}{3}[v^{3/2} - 729] = -kx$$

When $x = 18\text{ m}, v = 36\text{ m/s}$: $$\frac{2}{3}(36^{3/2} - 729) = -k(18)$$

or $$k = 19\sqrt{\text{m/s}^2}$$

Finally

When $x = 20\text{ m}$: $$\frac{2}{3}(v^{3/2} - 729) = -19(20)$$

or $$v^{3/2} = 159$$ $v = 29.3$ m/s ◀

(*b*) We have $$\frac{dv}{dt} = a = -19\sqrt{v}$$

At $t = 0, v = 81\text{ m/s}$: $$\int_{81}^{v} \frac{dv}{\sqrt{v}} = \int_{0}^{t} -19dt$$

or $$2[\sqrt{v}]_{81}^{v} = -19t$$

or $$2(\sqrt{v} - 9) = -19t$$

When $v = 0$: $$2(-9) = -19t$$

or $t = 0.947$ s ◀

PROBLEM 11.25

The acceleration of a particle is defined by the relation $a = -kv^{2.5}$, where k is a constant. The particle starts at $x = 0$ with a velocity of 16 mm/s, and when $x = 6$ mm the velocity is observed to be 4 mm/s. Determine (*a*) the velocity of the particle when $x = 5$ mm, (*b*) the time at which the velocity of the particle is 9 mm/s.

SOLUTION

Acceleration: $a = -kv^{2.5}$

Given: at t=0, $x = 0$ mm, $v = 16$ mm/s

at $x = 6$ mm, $v = 4$ mm/s

$$adx = vdv$$

$$-kv^{2.5}dx = vdv$$

Separate variables $-kdx = v^{-3/2}dv$

Integrate using x=-0 m and v=16 mm/s as the lower limits of the integrals

$$\int_0^x \text{-k}dx = \int_{16}^v v^{-3/2}dv$$

$$-kx\Big|_0^x = -2v^{-1/2}\Big|_{16}^v$$

Velocity and position: $kx = 2v^{-1/2} - \frac{1}{2}$ (1)

Now substitute v=4 mm/s and x=6 mm into (1) and solve for k

$$k(6) = 4^{-1/2} - \frac{1}{2}$$

$$k = 0.0833 \text{ mm}^{-3/2}s^{1/2}$$

(a) Find velocity when x= 5 mm using the equation (1) and the value of k

$$k(5) = 2v^{-1/2} - \frac{1}{2}$$

$v = 4.76$ mm/s◀

(b) $a = \frac{dv}{dt}$ or $adt = dv$

$a = \frac{dv}{dt}$ or $adt = dv$

Separate variables $-kdt = v^{-2.5}dv$

PROBLEM 11.25 (Continued)

Integrate using t=0 and v=16 mm/s as the lower limits of the integrals

$$\int_0^t \text{-k}dt = \int_{16}^v v^{-5/2}dv$$

$$-kt\Big|_0^t = -\frac{2}{3}v^{-3/2}\Big|_{16}^v$$

Velocity and time: $$kt = \frac{2}{3}v^{-3/2} - \frac{1}{96} \qquad (2)$$

Find time when v= 9 mm/s using the equation (2) and the value of k

$$kt = \frac{2}{3}(9)^{-3/2} - \frac{1}{96}$$

$t = 0.171$ s◀

Problem 11.26

A human powered vehicle (HPV) team wants to model the acceleration during the 260 *m* sprint race (the first 60 *m* is called a flying start) using $a = A - Cv^2$, where a is acceleration in m/s^2 and v is the velocity in m/s. From wind tunnel testing, they found that $C = 0.0012\ \text{m}^{-1}$. Knowing that the cyclist is going 100 km/h at the 260 meter mark, what is the value of A?

SOLUTION

Acceleration: $a = A - Cv^2\ \text{m/s}^2$

Given: $C = 0.0012\ \text{m}^{-1}$, $v_f = 100$ km/hr when $x_f = 260$ m

Note: 100 km/hr = 27.78 m/s

$$adx = vdv$$

$$\left(A - Cv^2\right)dx = vdv$$

Separate variables $$dx = \frac{vdv}{A - Cv^2}$$

Integrate starting from rest and traveling a distance x_f with a final velocity v_f.

$$\int_0^{x_f} dx = \int_0^{v_f} \frac{vdv}{A - Cv^2}$$

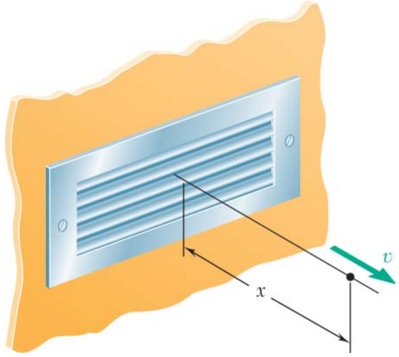
$$x\Big|_0^{x_f} = -\frac{1}{2C}\ln\left(A - Cv^2\right)\Big|_0^{v_f}$$

$$x_f = -\frac{1}{2C}\ln\left(A - v_f^2\right) + \frac{1}{2C}\ln\left(A\right)$$

$$x_f = \frac{1}{2C}\ln\left(\frac{A}{A - Cv_f^2}\right)$$

Next solve for A $$A = -\frac{Cv_f^2 e^{2Cx_f}}{1 - e^{2Cx_f}}$$

Now substitute values of C, x_f and v_f and solve for A $\quad A = 1.995\ \text{m/s}^2$ ◀



PROBLEM 11.27

Experimental data indicate that in a region downstream of a given louvered supply vent the velocity of the emitted air is defined by $v = 0.18v_0/x$, where v and x are expressed in m/s and meters, respectively, and v_0 is the initial discharge velocity of the air. For $v_0 = 3.6$ m/s, determine (*a*) the acceleration of the air at $x = 2$ m, (*b*) the time required for the air to flow from $x = 1$ to $x = 3$ m.

SOLUTION

(*a*) We have $$a = v\frac{dv}{dx}$$

$$= \frac{0.18v_0}{x}\frac{d}{dx}\left(\frac{0.18v_0}{x}\right)$$

$$= -\frac{0.0324v_0^2}{x^3}$$

When $x = 2$ m: $$a = -\frac{0.0324(3.6)^2}{(2)^3}$$

or $$a = -0.0525 \text{ m/s}^2 \blacktriangleleft$$

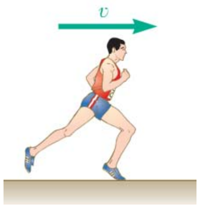
(*b*) We have $$\frac{dx}{dt} = v = \frac{0.18v_0}{x}$$

From $x = 1$ m to $x = 3$ m: $$\int_1^3 x\,dx = \int_{t_1}^{t_3} 0.18v_0\,dt$$

or $$\left[\frac{1}{2}x^2\right]_1^3 = 0.18v_0(t_3 - t_1)$$

or $$(t_3 - t_1) = \frac{\frac{1}{2}(9-1)}{0.18(3.6)}$$

or $$t_3 - t_1 = 6.17 \text{ s} \blacktriangleleft$$



PROBLEM 11.28

Based on observations, the speed of a jogger can be approximated by the relation $v = 7.5(1-0.04x)^{0.3}$, where v and x are expressed in mi/h and miles, respectively. Knowing that $x = 0$ at $t = 0$, determine (*a*) the distance the jogger has run when $t = 1$ h, (*b*) the jogger's acceleration in ft/s^2 at $t = 0$, (*c*) the time required for the jogger to run 6 mi.

SOLUTION

(*a*) We have

$$\frac{dx}{dt} = v = 7.5(1-0.04x)^{0.3}$$

At $t = 0,\ x = 0$:

$$\int_0^x \frac{dx}{(1-0.04x)^{0.3}} = \int_0^t 7.5dt$$

or

$$\frac{1}{0.7}\left(-\frac{1}{0.04}\right)[(1-0.04x)^{0.7}]_0^x = 7.5t$$

or

$$1-(1-0.04x)^{0.7} = 0.21t \qquad (1)$$

or

$$x = \frac{1}{0.04}[1-(1-0.21t)^{1/0.7}]$$

At $t = 1$ h:

$$x = \frac{1}{0.04}\{1-[1-0.21(1)]^{1/0.7}\}$$

or

$$x = 7.15 \text{ mi} \blacktriangleleft$$

(*b*) We have

$$\begin{aligned} a &= v\frac{dv}{dx} \\ &= 7.5(1-0.04x)^{0.3}\frac{d}{dx}[7.5(1-0.04x)^{0.3}] \\ &= 7.5^2(1-0.04x)^{0.3}[(0.3)(-0.04)(1-0.04x)^{-0.7}] \\ &= -0.675(1-0.04x)^{-0.4} \end{aligned}$$

At $t = 0,\ x = 0$:

$$a_0 = -0.675 \text{ mi/h}^2 \times \frac{5280 \text{ ft}}{1 \text{ mi}} \times \left(\frac{1 \text{ h}}{3600 \text{ s}}\right)^2$$

or

$$a_0 = -275 \times 10^{-6} \text{ ft/s}^2 \blacktriangleleft$$

(*c*) From Eq. (1)

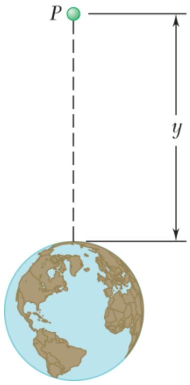
$$t = \frac{1}{0.21}[1-(1-0.04x)^{0.7}]$$

When $x = 6$ mi:

$$\begin{aligned} t &= \frac{1}{0.21}\{1-[1-0.04(6)]^{0.7}\} \\ &= 0.83229 \text{ h} \end{aligned}$$

or

$$t = 49.9 \text{ min} \blacktriangleleft$$



PROBLEM 11.29

The acceleration due to gravity at an altitude y above the surface of the earth can be expressed as

$$a = \frac{-32.2}{[1 + (y/20.9 \times 10^6)]^2}$$

where a and y are expressed in ft/s^2 and feet, respectively. Using this expression, compute the height reached by a projectile fired vertically upward from the surface of the earth if its initial velocity is (*a*) 1800 ft/s, (*b*) 3000 ft/s, (*c*) 36,700 ft/s.

SOLUTION

We have
$$v\frac{dv}{dy} = a = -\frac{32.2}{\left(1 + \frac{y}{20.9 \times 10^6}\right)^2}$$

When
$$y = 0, \qquad v = v_0$$

provided that v does reduce to zero,
$$y = y_{\max}, \quad v = 0$$

Then
$$\int_{v_0}^{0} v\,dv = \int_0^{y_{\max}} \frac{-32.2}{\left(1 + \frac{y}{20.9 \times 10^6}\right)^2} dy$$

or
$$-\frac{1}{2}v_0^2 = -32.2\left[-20.9 \times 10^6 \frac{1}{1 + \frac{y}{20.9 \times 10^6}}\right]_0^{y_{\max}}$$

or
$$v_0^2 = 1345.96 \times 10^6 \left(1 - \frac{1}{1 + \frac{y_{\max}}{20.9 \times 10^6}}\right)$$

or
$$y_{\max} = \frac{v_0^2}{64.4 - \frac{v_0^2}{20.9 \times 10^6}}$$

(*a*) $v_0 = 1800$ ft/s:
$$y_{\max} = \frac{(1800)^2}{64.4 - \frac{(1800)^2}{20.9 \times 10^6}}$$

or $$y_{\max} = 50.4 \times 10^3 \text{ ft} \blacktriangleleft$$

(*b*) $v_0 = 3000$ ft/s:
$$y_{\max} = \frac{(3000)^2}{64.4 - \frac{(3000)^2}{20.9 \times 10^6}}$$

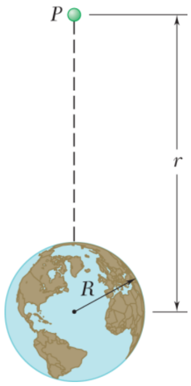
or $$y_{\max} = 140.7 \times 10^3 \text{ ft} \blacktriangleleft$$

PROBLEM 11.29 (Continued)

(*c*) $v_0 = 36,700$ ft/s: $$y_{\max} = \frac{(36,700)^2}{64.4 - \frac{(36,700)^2}{20.9\times 10^6}} = -3.03\times 10^{10} \text{ ft}$$

This solution is invalid since the velocity does not reduce to zero. The velocity 36,700 ft/s is above the escape velocity v_R from the earth. For v_R and above.

$y_{\max} \longrightarrow \infty$ ◀



PROBLEM 11.30

The acceleration due to gravity of a particle falling toward the earth is $a = -gR^2/r^2$, where r is the distance from the *center* of the earth to the particle, R is the radius of the earth, and g is the acceleration due to gravity at the surface of the earth. If $R = 3960$ mi, calculate the *escape velocity,* that is, the minimum velocity with which a particle must be projected vertically upward from the surface of the earth if it is not to return to the earth. (*Hint:* $v = 0$ for $r = \infty$.)

SOLUTION

We have $$v\frac{dv}{dr} = a = -\frac{gR^2}{r^2}$$

When $$r = R, \quad v = v_e$$
$$r = \infty, \quad v = 0$$

then $$\int_{v_e}^{0} v\,dv = \int_R^\infty -\frac{gR^2}{r^2}\,dr$$

or $$-\frac{1}{2}v_e^2 = gR^2\left[\frac{1}{r}\right]_R^\infty$$

or $$v_e = \sqrt{2gR}$$
$$= \left(2 \times 32.2\ \text{ft/s}^2 \times 3960\ \text{mi} \times \frac{5280\ \text{ft}}{1\ \text{mi}}\right)^{1/2}$$

or $$v_e = 36.7 \times 10^3\ \text{ft/s}$$ ◀

PROBLEM 11.31

The velocity of a particle is $v = v_0[1 - \sin(\pi t/T)]$. Knowing that the particle starts from the origin with an initial velocity v_0, determine (*a*) its position and its acceleration at $t = 3T$, (*b*) its average velocity during the interval $t = 0$ to $t = T$.

SOLUTION

(*a*) We have

$$\frac{dx}{dt} = v = v_0\left[1 - \sin\left(\frac{\pi t}{T}\right)\right]$$

At $t = 0, x = 0$:

$$\int_0^x dx = \int_0^t v_0\left[1 - \sin\left(\frac{\pi t}{T}\right)\right]dt$$

$$x = v_0\left[t + \frac{T}{\pi}\cos\left(\frac{\pi t}{T}\right)\right]_0^t = v_0\left[t + \frac{T}{\pi}\cos\left(\frac{\pi t}{T}\right) - \frac{T}{\pi}\right] \qquad (1)$$

At $t = 3T$:

$$x_{3T} = v_0\left[3T + \frac{T}{\pi}\cos\left(\frac{\pi \times 3T}{T}\right) - \frac{T}{\pi}\right] = v_0\left(3T - \frac{2T}{\pi}\right) \qquad x_{3T} = 2.36\, v_0 T \blacktriangleleft$$

$$a = \frac{dv}{dt} = \frac{d}{dt}\left\{v_0\left[1 - \sin\left(\frac{\pi t}{T}\right)\right]\right\} = -v_0\frac{\pi}{T}\cos\frac{\pi t}{T}$$

At $t = 3T$:

$$a_{3T} = -v_0\frac{\pi}{T}\cos\frac{\pi \times 3T}{T} \qquad a_{3T} = \frac{\pi v_0}{T} \blacktriangleleft$$

(*b*) Using Eq. (1)

At $t = 0$:

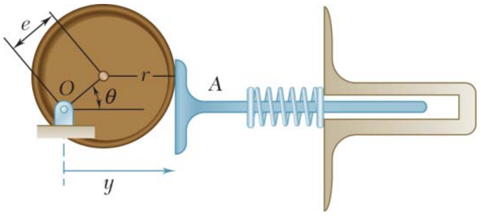
$$x_0 = v_0\left[0 + \frac{T}{\pi}\cos(0) - \frac{T}{\pi}\right] = 0$$

At $t = T$:

$$x_T = v_0\left[T + \frac{T}{\pi}\cos\left(\frac{\pi T}{T}\right) - \frac{T}{\pi}\right] = v_0\left(T - \frac{2T}{\pi}\right) = 0.363 v_0 T$$

Now

$$v_{\text{ave}} = \frac{x_T - x_0}{\Delta t} = \frac{0.363 v_0 T - 0}{T - 0} \qquad v_{\text{ave}} = 0.363 v_0 \blacktriangleleft$$



Problem 11.32

An eccentric circular cam, which serves a similar function as the Scotch yoke mechanism in Problem 11.13, is used in conjunction with a flat face follower to control motion in pumps and in steam engine valves. Knowing that the eccentricity is denoted by e, the maximum range of the displacement of the follower is $d_{\max}$, and the maximum velocity of the follower is $v_{\max}$, determine the displacement, velocity, and acceleration of the follower.

SOLUTION

Constraint:

$$y = r + e\cos\theta \tag{1}$$

Differentiate:

$$\dot{y} = -e\dot{\theta}\sin\theta \tag{2}$$

Differentiate again:

$$\ddot{y} = -e\ddot{\theta}\sin\theta - e\dot{\theta}^2\cos\theta \tag{3}$$

$y_{\max}$ occurs when cosθ =1 and $y_{\min}$ occurs when cosθ = -1

$$d_{\max} = y_{\max} - y_{\min}$$

$$d_{\max} = r + e - (r - e)$$

$$d_{\max} = 2e$$

$$e = \frac{d_{\max}}{2} \tag{4}$$

Substitute (4) into (1) to get Position $\quad y = r + \dfrac{d_{\max}}{2}\cos\theta$ ◀

Max Velocity occurs when $\sin\theta = \pm 1$

$$v_{\max} = \mp e\dot{\theta}$$

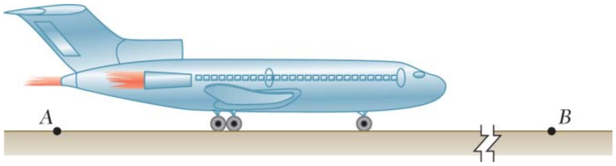
$$\dot{\theta} = \frac{v_{\max}}{\mp e} \tag{5}$$

Substitute (5) into (2) to get velocity and assume cw rotation. $\quad \dot{y} = -v_{\max}\sin\theta$

Substitute (4) and (5) into (3)

$$\ddot{y} = -\frac{d_{\max}}{2}\ddot{\theta}\sin\theta - \frac{d_{\max}}{2}\left(\frac{4v_{\max}^2}{d_{\max}^2}\right)\cos\theta$$

Acceleration: $\quad \ddot{y} = -\dfrac{d_{\max}}{2}\ddot{\theta}\sin\theta - \dfrac{2v_{\max}^2}{d_{\max}}\cos\theta$ ◀



Problem 11.33

An airplane begins its take-off run at *A* with zero velocity and a constant acceleration *a*. Knowing that it becomes airborne 30 s later at *B* and that the distance *AB* is 900 m, determine (*a*) the acceleration *a*, (*b*) the take-off velocity v_B.

SOLUTION

Given: $x_A = 0,\ x_B = 900\text{ m},\ v_A = 0,\ t = 30\text{ s}$

Uniform Acceleration: $x_B = x_A + v_A t + \frac{1}{2}at^2$

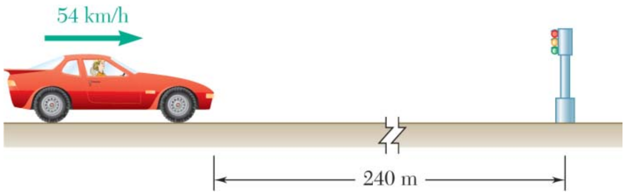
Substitute known values: $900\text{ m} = 0 + 0 + \frac{1}{2}a(30\text{ s})^2$

(a) Solve for acceleration $a = 2.0\text{ m/s}^2$ ◀

Uniform Acceleration: $v_B = v_A + at$

Substitute known values: $v_B = 0 + (2\text{ m/s}^2)(30\text{ s})$

(b) Velocity at takeoff (point B) $v_B = 60.0\text{ m/s}$ ◀



PROBLEM 11.34

A motorist is traveling at 54 km/h when she observes that a traffic light 240 m ahead of her turns red. The traffic light is timed to stay red for 24 s. If the motorist wishes to pass the light without stopping just as it turns green again, determine (*a*) the required uniform deceleration of the car, (*b*) the speed of the car as it passes the light.

SOLUTION

Uniformly accelerated motion:

$$x_0 = 0 \quad v_0 = 54 \text{ km/h} = 15 \text{ m/s}$$

(a) $x = x_0 + v_0 t + \frac{1}{2} a t^2$

when $t = 24\text{ s}$, $x = 240$ m:

$$240 \text{ m} = 0 + (15 \text{ m/s})(24 \text{ s}) + \frac{1}{2} a (24 \text{ s})^2$$

$$a = -0.4167 \text{ m/s}^2$$

$a = -0.417 \text{ m/s}^2$ ◀

(*b*) $v = v_0 + a t$

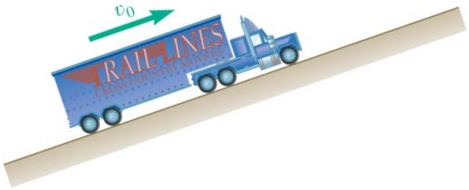
when $t = 24\text{ s}$:

$$v = (15 \text{ m/s}) + (-0.4167 \text{ m/s})(24 \text{ s})$$

$$v = 5.00 \text{ m/s}$$

$$v = 18.00 \text{ km/h}$$

$v = 18.00$ km/h ◀



Problem 11.35

Steep safety ramps are built beside mountain highways to enable vehicles with defective brakes to stop safely. A truck enters a 750-ft ramp at a high speed v_0 and travels 540 ft in 6 s at constant deceleration before its speed is reduced to $v_0/2$. Assuming the same constant deceleration, determine (*a*) the additional time required for the truck to stop, (*b*) the additional distance traveled by the truck.

SOLUTION

Given: $x_o = 0,\ x_A = 540\text{ m},\ t_A = 6\text{ s},\ v_A = \frac{1}{2}v_o,\ L_{ramp} = 750\,ft$

Uniform Acceleration: $v_A = v_o + at_A$

Substitute known values: $\frac{1}{2}v_o = v_o + (a)(6)$

$$a = -\frac{1}{12}v_o$$

Uniform Acceleration: $x_A = x_o + v_o t_A + \frac{1}{2}at_A^2$

Substitute known values: $540 = 0 + v_o(6) - \frac{1}{24}v_o(6)^2$

$$v_o = 120\text{ ft/s and } a = -10\text{ ft/s}^2$$

(a) $v_B = v_o + at_B$

Substitute known values: $0 = 120 - 10t_B$

Solve for t_B: $t_B = 12\text{ s}$

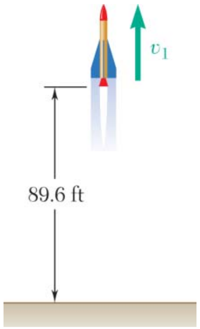
Additional time to stop $t_B - t_A = 6.0\text{ s}$ ◀

(b) $x_B = x_o + v_o t_B + \frac{1}{2}at_B^2$

Substitute known values: $x_B = 0 + 120(12) - \frac{1}{2}10(12)^2$

Solve for x_B: $x_B = 720\text{ ft}$

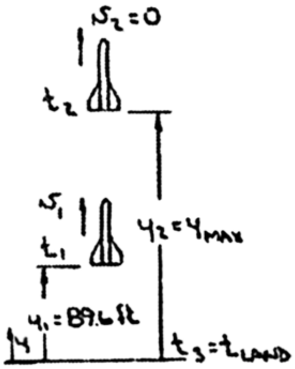
Additional time to stop $x_B - x_A = 180.0\text{ ft}$ ◀



PROBLEM 11.36

A group of students launches a model rocket in the vertical direction. Based on tracking data, they determine that the altitude of the rocket was 89.6 ft at the end of the powered portion of the flight and that the rocket landed 16 s later. Knowing that the descent parachute failed to deploy so that the rocket fell freely to the ground after reaching its maximum altitude and assuming that $g = 32.2\ \text{ft/s}^2$, determine (*a*) the speed v_1 of the rocket at the end of powered flight, (*b*) the maximum altitude reached by the rocket.

SOLUTION



(*a*) We have $y = y_1 + v_1 t + \frac{1}{2}at^2$

At t_{land}, $y = 0$

Then $0 = 89.6\ \text{ft} + v_1(16\ \text{s}) + \frac{1}{2}(-32.2\ \text{ft/s}^2)(16\ \text{s})^2$

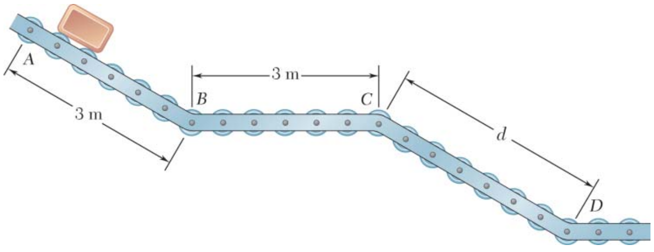
or $v_1 = 252\ \text{ft/s}$ ◀

(*b*) We have $v^2 = v_1^2 + 2a(y - y_1)$

At $y = y_{\text{max}}, \quad v = 0$

Then $0 = (252\ \text{ft/s})^2 + 2(-32.2\ \text{ft/s}^2)(y_{\text{max}} - 89.6)\ \text{ft}$

or $y_{\text{max}} = 1076\ \text{ft}$ ◀



PROBLEM 11.37

A small package is released from rest at A and moves along the skate wheel conveyor $ABCD$. The package has a uniform acceleration of 4.8 m/s^2 as it moves down sections AB and CD, and its velocity is constant between B and C. If the velocity of the package at D is 7.2 m/s, determine (a) the distance d between C and D, (b) the time required for the package to reach D.

SOLUTION

(a) For $A \longrightarrow B$ and $C \longrightarrow D$ we have

$$v^2 = v_0^2 + 2a(x - x_0)$$

Then, at B $\quad v_{BC}^2 = 0 + 2(4.8\text{ m/s}^2)(3-0)\text{ m}$

$$= 28.8\text{ m}^2/\text{s}^2 \qquad (v_{BC} = 5.3666\text{ m/s})$$

and at D $\quad v_D^2 = v_{BC}^2 + 2a_{CD}(x_D - x_C) \qquad d = x_D - x_C$

or $\quad (7.2\text{ m/s})^2 = (28.8\text{ m}^2/\text{s}^2) + 2(4.8\text{ m/s}^2)d$

or $\quad d = 2.40\text{ m}$ ◀

(b) For $A \longrightarrow B$ and $C \longrightarrow D$ we have

$$v = v_0 + at$$

Then $A \longrightarrow B$ $\quad 5.3666\text{ m/s} = 0 + (4.8\text{ m/s}^2)t_{AB}$

or $\quad t_{AB} = 1.11804\text{ s}$

and $C \longrightarrow D$ $\quad 7.2\text{ m/s} = 5.3666\text{ m/s} + (4.8\text{ m/s}^2)t_{CD}$

or $\quad t_{CD} = 0.38196\text{ s}$

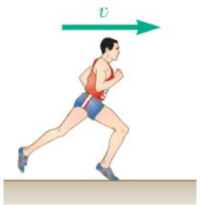
Now, for $B \longrightarrow C$, we have $\quad x_C = x_B + v_{BC}t_{BC}$

or $\quad 3\text{ m} = (5.3666\text{ m/s})t_{BC}$

or $\quad t_{BC} = 0.55901\text{ s}$

Finally, $\quad t_D = t_{AB} + t_{BC} + t_{CD} = (1.11804 + 0.55901 + 0.38196)\text{ s}$

or $\quad t_D = 2.06\text{ s}$ ◀



PROBLEM 11.38

A sprinter in a 100-m race accelerates uniformly for the first 35 m and then runs with constant velocity. If the sprinter's time for the first 35 m is 5.4 s, determine (*a*) his acceleration, (*b*) his final velocity, (*c*) his time for the race.

SOLUTION

Given: $0 \le x \le 35\text{ m}, \quad a = \text{constant}$

$35\text{ m} < x \le 100\text{ m}, \quad v = \text{constant}$

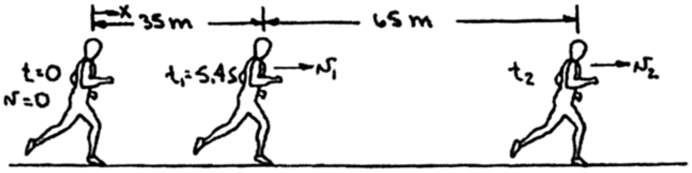
At $t = 0, \quad v = 0 \quad$ when $\quad x = 35\text{ m}, \quad t = 5.4\text{ s}$

Find:

(*a*) a

(*b*) v when $x = 100\text{ m}$

(*c*) t when $x = 100\text{ m}$



(*a*) We have $$x = 0 + 0t + \frac{1}{2}at^2 \quad \text{for} \quad 0 \le x \le 35\text{ m}$$

At $t = 5.4$ s: $$35\text{ m} = \frac{1}{2}a(5.4\text{ s})^2$$

or $$a = 2.4005\text{ m/s}^2$$

$a = 2.40\text{ m/s}^2$ ◀

(*b*) First note that $v = v_{\max}$ for $35\text{ m} \le x \le 100\text{ m}$.

Now $$v^2 = 0 + 2a(x - 0) \quad \text{for} \quad 0 \le x \le 35\text{ m}$$

When $x = 35$ m: $$v_{\max}^2 = 2(2.4005\text{ m/s}^2)(35\text{ m})$$

or $$v_{\max} = 12.9628\text{ m/s}$$

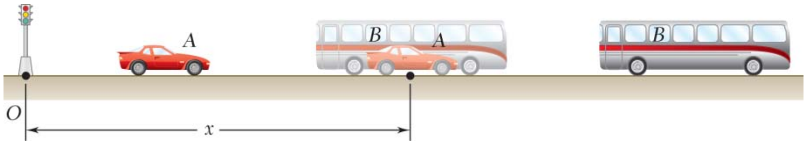
$v_{\max} = 12.96\text{ m/s}$ ◀

(*c*) We have $$x = x_1 + v_0(t - t_1) \quad \text{for} \quad 35\text{ m} < x \le 100\text{ m}$$

When $x = 100$ m: $$100\text{ m} = 35\text{ m} + (12.9628\text{ m/s})(t_2 - 5.4)\text{ s}$$

or

$t_2 = 10.41\text{ s}$ ◀



PROBLEM 11.39

Automobile *A* starts from *O* and accelerates at the constant rate of 0.75 m/s^2. A short time later it is passed by bus *B* which is traveling in the opposite direction at a constant speed of 6 m/s. Knowing that bus *B* passes point *O* 20 s after automobile *A* started from there, determine when and where the vehicles passed each other.

SOLUTION

Place origin at 0.

Motion of auto. $(x_A)_0 = 0, \quad (v_A)_0 = 0, \quad a_A = 0.75 \text{ m/s}^2$

$$x_A = (x_A)_0 + (v_A)_0 t + \frac{1}{2}a_A t^2 = 0 + 0 + \left(\frac{1}{2}\right)(0.75)t^2$$

$$x_A = 0.375t^2 \text{ m}$$

Motion of bus. $(x_B)_0 = ?, \quad (v_B)_0 = -6 \text{ m/s}, \quad a_B = 0$

$$x_B = (x_B)_0 - (v_B)_0 t = (x_B)_0 - 6t \text{ m}$$

At $t = 20 s, \quad x_B = 0.$

$$0 = (x_B)_0 - (6)(20) \qquad (x_B)_0 = 120 \text{ m}$$

Hence, $x_B = 120 - 6t$

When the vehicles pass each other, $x_B = x_A$.

$$120 - 6t = 0.375\, t^2$$

$$0.375\, t^2 + 6t - 120 = 0$$

$$t = \frac{-6 \pm \sqrt{(6)^2 - (4)(0.375)(-120)}}{(2)(0.375)}$$

$$t = \frac{-6 \pm 14.697}{0.75} = 11.596 \text{ s} \quad \text{and} \quad -27.6 \text{ s}$$

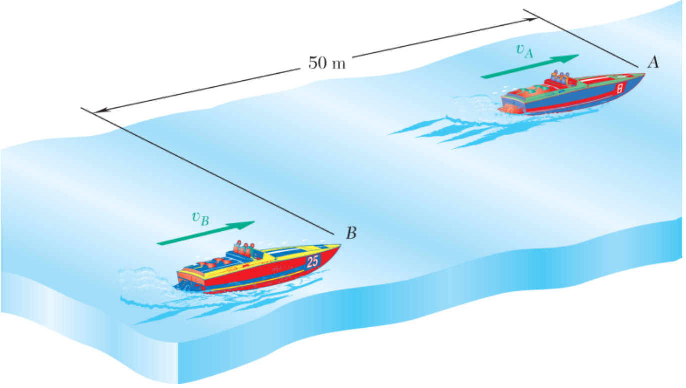
Reject the negative root. $t = 11.60 \text{ s}$ ◀

Corresponding values of x_A and x_B.

$$x_A = (0.375)(11.596)^2 = 50.4 \text{ m}$$

$$x_B = 120 - (6)(11.596) = 50.4 \text{ m}$$

$x = 50.4 \text{ m}$ ◀



PROBLEM 11.40

In a boat race, boat *A* is leading boat *B* by 50 m and both boats are traveling at a constant speed of 180 km/h. At $t = 0$, the boats accelerate at constant rates. Knowing that when *B* passes *A*, $t = 8$ s and $v_A = 225$ km/h, determine (*a*) the acceleration of *A*, (*b*) the acceleration of *B*.

SOLUTION

(*a*) We have $$v_A = (v_A)_0 + a_A t$$

$$(v_A)_0 = 180 \text{ km/h} = 50 \text{ m/s}$$

At $t = 8$ s: $$v_A = 225 \text{ km/h} = 62.5 \text{ m/s}$$

Then $$62.5 \text{ m/s} = 50 \text{ m/s} + a_A (8 \text{ s})$$

or $$a_A = 1.563 \text{ m/s}^2 \blacktriangleleft$$

(*b*) We have

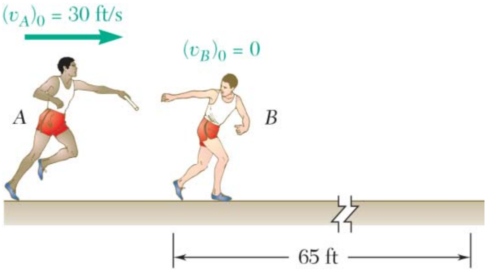
$$x_A = (x_A)_0 + (v_A)_0 t + \frac{1}{2} a_A t^2 = 50 \text{ m} + (50 \text{ m/s})(8 \text{ s}) + \frac{1}{2}(1.5625 \text{ m/s}^2)(8 \text{ s})^2 = 500 \text{ m}$$

and $$x_B = 0 + (v_B)_0 t + \frac{1}{2} a_B t^2 \qquad (v_B)_0 = 50 \text{ m/s}$$

At $t = 8$ s: $$x_A = x_B$$

$$500 \text{ m} = (50 \text{ m/s})(8 \text{ s}) + \frac{1}{2} a_B (8 \text{ s})^2$$

or $$a_B = 3.13 \text{ m/s}^2 \blacktriangleleft$$



PROBLEM 11.41

As relay runner *A* enters the 65-ft-long exchange zone with a speed of 30 ft/s, he begins to slow down. He hands the baton to runner *B* 2.5 s later as they leave the exchange zone with the same velocity. Determine (*a*) the uniform acceleration of each of the runners, (*b*) when runner *B* should begin to run.

SOLUTION

Let $x = 0$ at the start of the exchange zone, and $t = 0$ as runner *A* enters the exchange zone.

Then, $(v_A)_0 = 30$ ft/s.

Motion of runner *A*: $v_A = (v_A)_0 + a_A t$

$$x_A = (v_A)_0 t + \frac{1}{2} a_A t^2$$

(*a*) Solving for a_A, and noting that $x_A = 65$ ft when $t = 2.5$ s

$$a_A = \frac{2\left[x_A - (v_A)_0 t\right]}{t^2} = \frac{2\left[65 - (30)(2.5)\right]}{2.5^2}$$

$a_A = -3.20$ ft/s^2 ◀

At $t = 2.5$ s, $(v_A)_f = 30 + (-3.20)(2.5) = 22.0$ ft/s

Motion of runner *B*: $(v_B)_0 = 0$ and $x_B = 0$ at the starting time t_B of runner *B*.

Then, $v_B^2 - (v_B)_0^2 = 2a_B x_B$

Solving for a_B, and noting that $v_B = (v_A)_f = 22.0$ ft/s

When $x_B = 65$ ft, $$a_B = \frac{(v_B)^2 - (v_B)_0^2}{2x_B} = \frac{22.0^2 - 0}{(2)(65)}$$

$a_B = 3.723$ ft/s^2 ◀

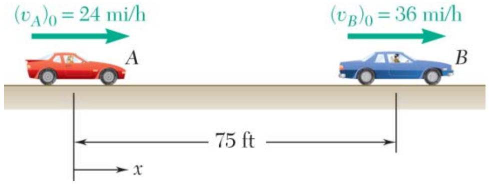
$$v_B = (v_B)_0 + a_B(t - t_B) = a_B(t - t_B)$$

$$t - t_B = \frac{v_B}{a_B}$$

(*b*) Solving for t_B, and noting that $v_B = 22.0$ ft/s when $t = 2.5$ s

$$t_B = t - \frac{v_B}{a_B} = 2.5 - \frac{22.0}{3.723} = -3.41 \text{ s}$$

Runner *B* should begin 3.41 s before runner *A* reaches the exchange zone. ◀



PROBLEM 11.42

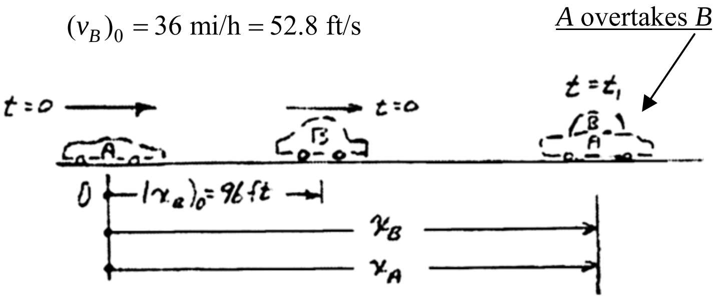
Automobiles A and B are traveling in adjacent highway lanes and at $t = 0$ have the positions and speeds shown. Knowing that automobile A has a constant acceleration of 1.8 ft/s^2 and that B has a constant deceleration of 1.2 ft/s^2, determine (*a*) when and where A will overtake B, (*b*) the speed of each automobile at that time.

SOLUTION

$$a_A = +1.8 \text{ ft/s}^2 \quad a_B = -1.2 \text{ ft/s}^2$$

$$(v_A)_0 = 24 \text{ mi/h} = 35.2 \text{ ft/s}$$

$$(v_B)_0 = 36 \text{ mi/h} = 52.8 \text{ ft/s}$$



Motion of auto A:

$$v_A = (v_A)_0 + a_A t = 35.2 + 1.8t \qquad (1)$$

$$x_A = (x_A)_0 + (v_A)_0 t + \frac{1}{2} a_A t^2 = 0 + 35.2t + \frac{1}{2}(1.8)t^2 \qquad (2)$$

Motion of auto B:

$$v_B = (v_B)_0 + a_B t = 52.8 - 1.2t \qquad (3)$$

$$x_B = (x_B)_0 + (v_B)_0 t + \frac{1}{2} a_B t^2 = 75 + 52.8t + \frac{1}{2}(-1.2)t^2 \qquad (4)$$

(*a*) A overtakes B at $t = t_1$.

$$x_A = x_B: \quad 35.2t + 0.9t_1^2 = 75 + 52.8t_1 - 0.6t_1^2$$

$$1.5t_1^2 - 17.6t_1 - 75 = 0$$

$$t_1 = -3.22 \text{ s} \quad \text{and} \quad t_1 = 15.0546 \qquad t_1 = 15.05 \text{ s} ◀$$

Eq. (2): $$x_A = 35.2(15.05) + 0.9(15.05)^2 \qquad x_A = 734 \text{ ft} ◀$$

PROBLEM 11.42 (Continued)

(*b*) Velocities when $t_1 = 15.05 \text{ s}$

Eq. (1): $v_A = 35.2 + 1.8(15.05)$

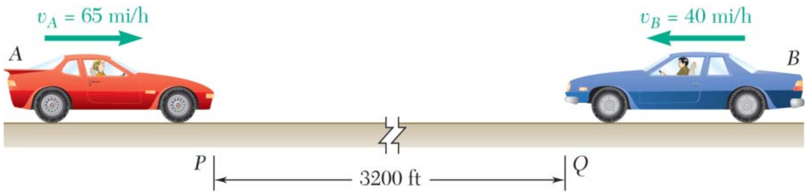
$v_A = 62.29 \text{ ft/s}$ $\qquad v_A = 42.5 \text{ mi/h} \longrightarrow$ ◀

Eq. (3): $v_B = 52.8 - 1.2(15.05)$

$v_B = 34.74 \text{ ft/s}$ $\qquad v_B = 23.7 \text{ mi/h} \longrightarrow$ ◀

PROBLEM 11.43

Two automobiles *A* and *B* are approaching each other in adjacent highway lanes. At $t = 0$, *A* and *B* are 3200 ft apart, their speeds are $v_A = 65$ mi/h and $v_B = 40$ mi/h, and they are at Points *P* and *Q*, respectively. Knowing that *A* passes Point *Q* 40 s after *B* was there and that *B* passes Point *P* 42 s after *A* was there, determine (*a*) the uniform accelerations of *A* and *B*, (*b*) when the vehicles pass each other, (*c*) the speed of *B* at that time.



SOLUTION

(*a*) We have $x_A = 0 + (v_A)_0 t + \frac{1}{2} a_A t^2 \quad (v_A)_0 = 65 \text{ mi/h} = 95.33 \text{ ft/s}$

(x is positive $\longrightarrow$; origin at *P*.)

At $t = 40$ s: $3200 \text{ m} = (95.333 \text{ m/s})(40 \text{ s}) + \frac{1}{2} a_A (40 \text{ s})^2$ $\quad a_A = -0.767 \text{ ft/s}^2$ ◀

Also, $x_B = 0 + (v_B)_0 t + \frac{1}{2} a_B t^2 \quad (v_B)_0 = 40 \text{ mi/h} = 58.667 \text{ ft/s}$

(x_B is positive $\longleftarrow$; origin at *Q*.)

At $t = 42$ s: $3200 \text{ ft} = (58.667 \text{ ft/s})(42 \text{ s}) + \frac{1}{2} a_B (42 \text{ s})^2$

or $a_B = 0.83447 \text{ ft/s}^2$ $\quad a_B = 0.834 \text{ ft/s}^2$ ◀

(*b*) When the cars pass each other $x_A + x_B = 3200$ ft

Then $(95.333 \text{ ft/s}) t_{AB} + \frac{1}{2}(-0.76667 \text{ ft/s}) t_{AB}^2 + (58.667 \text{ ft/s}) t_{AB} + \frac{1}{2}(0.83447 \text{ ft/s}^2) t_{AB}^2 = 3200 \text{ ft}$

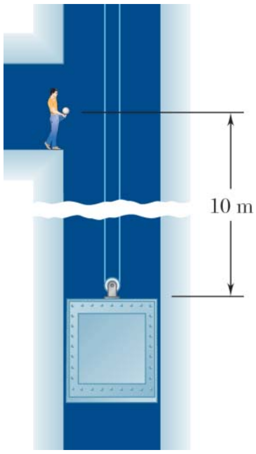
or $0.03390 t_{AB}^2 + 154 t_{AB} - 3200 = 0$

Solving $t = 20.685 \text{ s}$ and $t = -4563 \text{ s}$ $\quad t > 0 \Rightarrow \quad t_{AB} = 20.7 \text{ s}$ ◀

(*c*) We have $v_B = (v_B)_0 + a_B t$

At $t = t_{AB}$: $v_B = 58.667 \text{ ft/s} + (0.83447 \text{ ft/s}^2)(20.685 \text{ s})$

$= 75.927 \text{ ft/s}$ $\quad v_B = 51.8 \text{ mi/h}$ ◀



PROBLEM 11.44

An elevator is moving upward at a constant speed of 4 m/s. A man standing 10 m above the top of the elevator throws a ball upward with a speed of 3 m/s. Determine (*a*) when the ball will hit the elevator, (*b*) where the ball will hit the elevator with respect to the location of the man.

SOLUTION

Place the origin of the position coordinate at the level of the standing man, the positive direction being up. The ball undergoes uniformly accelerated motion.

$$y_B = (y_B)_0 + (v_B)_0 t - \frac{1}{2} g t^2$$

with $(y_B)_0 = 0, (v_B)_0 = 3$ m/s, and $g = 9.81\text{ m/s}^2$.

$$y_B = 3t - 4.905t^2$$

The elevator undergoes uniform motion.

$$y_E = (y_E)_0 + v_E t$$

with $(y_E)_0 = -10$ m and $v_E = 4$ m/s.

(*a*) Time of impact. Set $y_B = y_E$

$$3t - 4.905t^2 = -10 + 4t$$

$$4.905t^2 + t - 10 = 0$$

$t = 1.3295$ and -1.5334

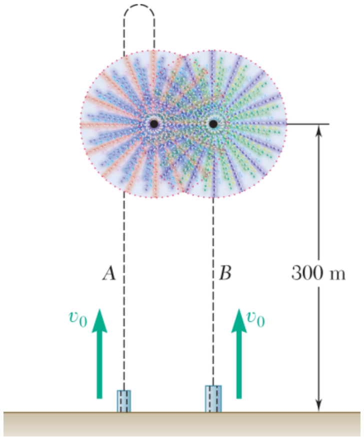
$t = 1.330\text{ s}$ ◀

(*b*) Location of impact.

$$y_B = (3)(1.3295) - (4.905)(1.3295)^2 = -4.68\text{ m}$$

$$y_E = -10 + (4)(1.3295) = -4.68\text{ m} \qquad \text{(checks)}$$

4.68 m below the man ◀



PROBLEM 11.45

Two rockets are launched at a fireworks display. Rocket A is launched with an initial velocity $v_0 = 100$ m/s and rocket B is launched t_1 seconds later with the same initial velocity. The two rockets are timed to explode simultaneously at a height of 300 m as A is falling and B is rising. Assuming a constant acceleration $g = 9.81\ \text{m/s}^2$, determine (a) the time t_1, (b) the velocity of B relative to A at the time of the explosion.

SOLUTION

Place origin at ground level. The motion of rockets A and B is

Rocket A:

$$v_A = (v_A)_0 - gt = 100 - 9.81t \tag{1}$$

$$y_A = (y_A)_0 + (v_A)_0 t - \frac{1}{2}gt^2 = 100t - 4.905t^2 \tag{2}$$

Rocket B:

$$v_B = (v_B)_0 - g(t - t_1) = 100 - 9.81(t - t_1) \tag{3}$$

$$\begin{aligned} y_B &= (y_B)_0 + (v_B)_0(t - t_1) - \frac{1}{2}g(t - t_1)^2 \\ &= 100(t - t_1) - 4.905(t - t_1)^2 \end{aligned} \tag{4}$$

Time of explosion of rockets A and B. $y_A = y_B = 300$ ft

From (2),

$$300 = 100t - 4.905t^2$$

$$4.905t^2 - 100t + 300 = 0$$

$$t = 16.732\ \text{s} \quad \text{and} \quad 3.655\ \text{s}$$

From (4),

$$300 = 100(t - t_1) - 4.905(t - t_1^2)$$

$$t - t_1 = 16.732\ \text{s} \quad \text{and} \quad 3.655\ \text{s}$$

Since rocket A is falling, $t = 16.732$ s

Since rocket B is rising, $t - t_1 = 3.655$ s

(a) Time t_1: $t_1 = t - (t - t_1)$ $\qquad t_1 = 13.08$ s ◀

(b) Relative velocity at explosion.

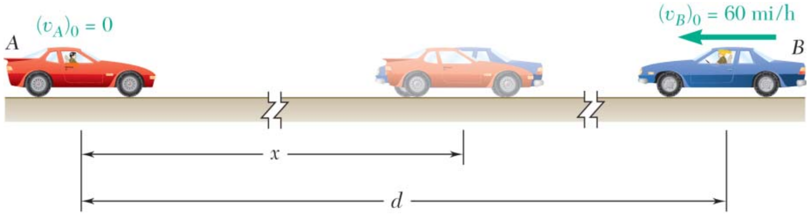
From (1), $v_A = 100 - (9.81)(16.732) = -64.15$ m/s

From (3), $v_B = 100 - (9.81)(16.732 - 13.08) = 64.15$ m/s

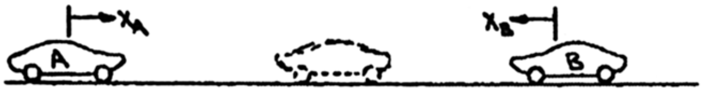
Relative velocity: $v_{B/A} = v_B - v_A$ $\qquad v_{B/A} = 128.3$ m/s ↑ ◀

PROBLEM 11.46

Car *A* is parked along the northbound lane of a highway, and car *B* is traveling in the southbound lane at a constant speed of 60 mi/h. At $t = 0,$ *A* starts and accelerates at a constant rate $a_A,$ while at $t = 5$ s, *B* begins to slow down with a constant deceleration of magnitude $a_A/6.$ Knowing that when the cars pass each other $x = 294$ ft and $v_A = v_B,$ determine (*a*) the acceleration $a_A,$ (*b*) when the vehicles pass each other, (*c*) the distance *d* between the vehicles at $t = 0.$



SOLUTION



For $t \geq 0$: $v_A = 0 + a_A t$

$$x_A = 0 + 0 + \frac{1}{2}a_A t^2$$

$0 \leq t < 5$ s: $x_B = 0 + (v_B)_0 t \quad (v_B)_0 = 60 \text{ mi/h} = 88 \text{ ft/s}$

At $t = 5$ s: $x_B = (88 \text{ ft/s})(5 \text{ s}) = 440 \text{ ft}$

For $t \geq 5$ s: $v_B = (v_B)_0 + a_B(t-5) \qquad a_B = -\frac{1}{6}a_A$

$$x_B = (x_B)_5 + (v_B)_0(t-5) + \frac{1}{2}a_B(t-5)^2$$

Assume $t > 5$ s when the cars pass each other.

At that time (t_{AB}),

$v_A = v_B$: $a_A t_{AB} = (88 \text{ ft/s}) - \frac{a_A}{6}(t_{AB} - 5)$

$x_A = 294$ ft: $294 \text{ ft} = \frac{1}{2}a_A t_{AB}^2$

Then $$\frac{a_A\left(\frac{7}{6}t_{AB} - \frac{5}{6}\right)}{\frac{1}{2}a_A t_{AB}^2} = \frac{88}{294}$$

or $$44t_{AB}^2 - 343t_{AB} + 245 = 0$$

PROBLEM 11.46 (Continued)

Solving $t_{AB} = 0.795\text{ s} \quad \text{and} \quad t_{AB} = 7.00\text{ s}$

(*a*) With $t_{AB} > 5\text{ s}$, $294\text{ ft} = \frac{1}{2}a_A(7.00\text{ s})^2$

or $a_A = 12.00\text{ ft/s}^2$ ◀

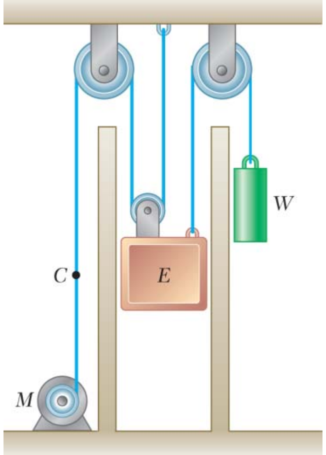
(*b*) From above $t_{AB} = 7.00\text{ s}$ ◀

Note: An acceptable solution cannot be found if it is assumed that $t_{AB} \le 5\text{ s}$.

(*c*) We have

$$\begin{aligned} d &= x + (x_B)_{t_{AB}} \\ &= 294\text{ ft} + 440\text{ ft} + (88\text{ ft/s})(2.00\text{ s}) \\ &\quad + \frac{1}{2}\left(-\frac{1}{6}\times 12.00\text{ ft/s}^2\right)(2.00\text{ s})^2 \end{aligned}$$

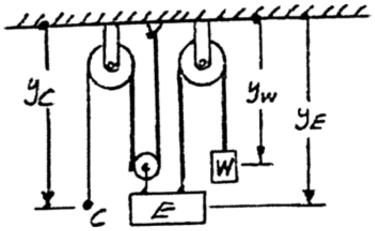
or $d = 906\text{ ft}$ ◀



PROBLEM 11.47

The elevator shown in the figure moves downward with a constant velocity of 4 m/s. Determine (*a*) the velocity of the cable *C*, (*b*) the velocity of the counterweight *W*, (*c*) the relative velocity of the cable *C* with respect to the elevator, (*d*) the relative velocity of the counterweight *W* with respect to the elevator.

SOLUTION



Choose the positive direction downward.

(*a*) Velocity of cable *C*.

$$y_C + 2y_E = \text{constant}$$

$$v_C + 2v_E = 0$$

But, $v_E = 4\ \text{m/s}$

or $v_C = -2v_E = -8\ \text{m/s}$

$\mathbf{v}_C = 8.00\ \text{m/s}\uparrow$ ◀

(*b*) Velocity of counterweight *W*.

$$y_W + y_E = \text{constant}$$

$$v_W + v_E = 0 \quad v_W = -v_E = -4\ \text{m/s}$$

$\mathbf{v}_W = 4.00\ \text{m/s}\uparrow$ ◀

(*c*) Relative velocity of *C* with respect to *E*.

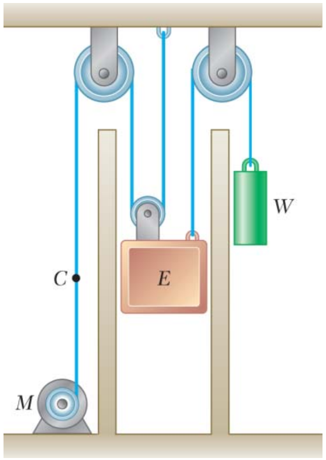
$$v_{C/E} = v_C - v_E = (-8\ \text{m/s}) - (+4\ \text{m/s}) = -12\ \text{m/s}$$

$\mathbf{v}_{C/E} = 12.00\ \text{m/s}\uparrow$ ◀

(*d*) Relative velocity of *W* with respect to *E*.

$$v_{W/E} = v_W - v_E = (-4\ \text{m/s}) - (4\ \text{m/s}) = -8\ \text{m/s}$$

$\mathbf{v}_{W/E} = 8.00\ \text{m/s}\uparrow$ ◀

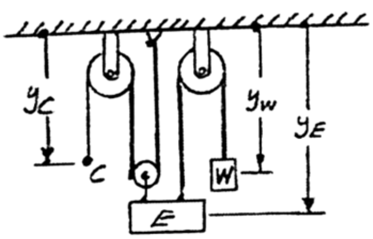


PROBLEM 11.48

The elevator shown starts from rest and moves upward with a constant acceleration. If the counterweight W moves through 30 ft in 5 s, determine (a) the acceleration of the elevator and the cable C, (b) the velocity of the elevator after 5 s.

SOLUTION

We choose positive direction downward for motion of counterweight.



$$y_W = \frac{1}{2} a_W t^2$$

At $t = 5$ s,

$$y_W = 30 \text{ ft}$$

$$30 \text{ ft} = \frac{1}{2} a_W (5 \text{ s})^2$$

$$a_W = 2.4 \text{ ft/s}^2 \qquad \mathbf{a}_W = 2.4 \text{ ft/s}^2 \downarrow$$

(a) Accelerations of E and C.

Since $\quad y_W + y_E = \text{constant} \quad v_W + v_E = 0, \quad \text{and} \quad a_W + a_E = 0$

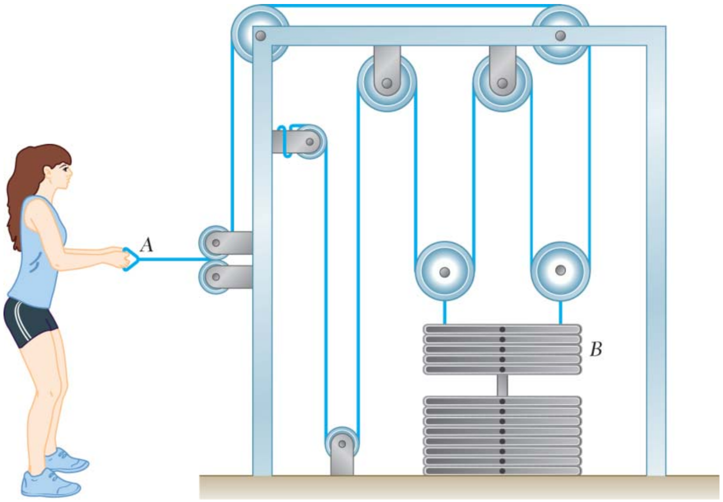
Thus: $\quad a_E = -a_W = -(2.4 \text{ ft/s}^2), \qquad \mathbf{a}_E = 2.40 \text{ ft/s}^2 \uparrow$ ◀

Also, $\quad y_C + 2y_E = \text{ constant}, \quad v_C + 2v_E = 0, \quad \text{and} \quad a_C + 2a_E = 0$

Thus: $\quad a_C = -2a_E = -2(-2.4 \text{ ft/s}^2) = +4.8 \text{ ft/s}^2, \qquad \mathbf{a}_C = 4.80 \text{ ft/s}^2 \downarrow$ ◀

(b) Velocity of elevator after 5 s.

$$v_E = (v_E)_0 + a_E t = 0 + (-2.4 \text{ ft/s}^2)(5 \text{ s}) = -12 \text{ ft/s} \qquad (\mathbf{v}_E)_5 = 12.00 \text{ ft/s} \uparrow$$ ◀

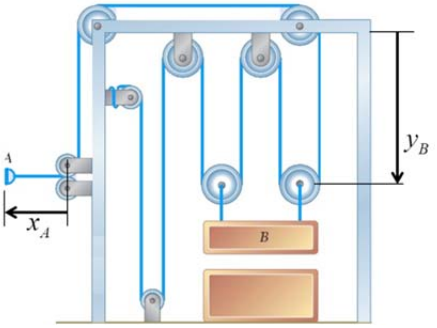


Problem 11.49

An athlete pulls handle *A* to the left with a constant velocity of 0.5 m/s. Determine (*a*) the velocity of the weight *B*, (*b*) the relative velocity of weight *B* with respect to the handle *A*.

SOLUTION

From the diagram: $x_A + 4y_B = \text{constant}$ Sketch:



(a) Differentiate $v_A + 4v_B = 0$ (1)

$x_A = 0.5 \text{ m/s}$

Solve (1) for v_B $v_B = -0.125 \text{ m/s}$

$v_B = 0.125 \text{ m/s} \uparrow$ ◀

(b) Finding the relative velocity:

$$\vec{v}_B = 0.125 \uparrow \text{ m/s}$$

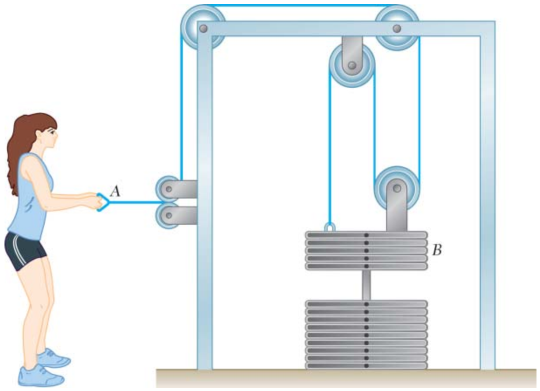
$$\vec{v}_A = 0.5 \leftarrow \text{ m/s}$$

$$\vec{v}_{B/A} = \vec{v}_B - \vec{v}_A$$

$$= 0.125 \uparrow - (0.5 \leftarrow) \text{ m/s}$$

or $\mathbf{v}_{B/A} = 0.5 \rightarrow + 0.125 \uparrow \text{ m/s}$

$\mathbf{v}_{B/A} = 0.5154 \text{ m/s} \measuredangle 14°$ ◀



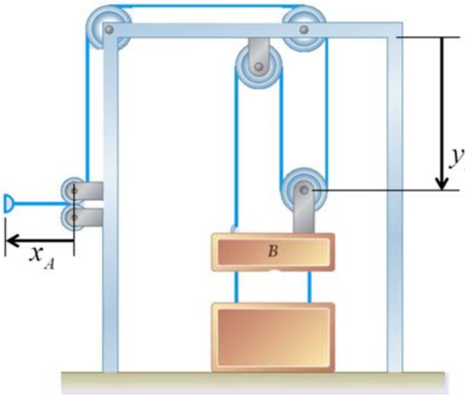
Problem 11.50

An athlete pulls handle A to the left with a constant acceleration. Knowing that after the weight B has been lifted 4 in. its velocity is 2 ft/s, determine (*a*) the accelerations of handle A and weight B (*b*) the velocity and change in position of handle A after 0.5 sec.

SOLUTION

(*a*) From the diagram:

Sketch:



$$x_A + 3y_B = \text{constant}$$

$$v_A + 3v_B = 0 \qquad (1)$$

$$a_A + 3a_B = 0 \qquad (2)$$

Uniform Acceleration of weight B

$$\mathrm{v}_B{}^2 = (\mathrm{v}_B)_o^2 + 2a_B\left(y_B - (y_B)_o\right)$$

Substitute in known values

$$(-2\text{ ft/s})^2 = 0^2 + 2a_B\left(-\frac{4}{12}\text{ ft} - 0\right)$$

$$a_B = -6\text{ ft/s}^2$$

Using (2)

$$a_A + 3(-6\text{ ft/s}^2) = 0$$

$$a_A = 18\text{ ft/s}^2 \leftarrow ◀$$

$$a_B = 6\text{ ft/s}^2 \uparrow ◀$$

(*b*) Uniform Acceleration of Handle A

$$v_A = (v_A)_o + a_A t$$

$$v_A = 0 + \left(18\text{ ft/s}^2\right)(0.5\text{ s})$$

or

$$v_A = 9\text{ ft/s} \leftarrow ◀$$

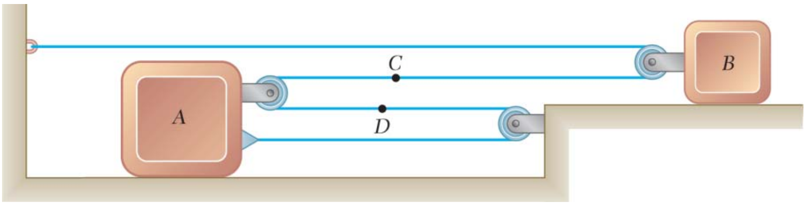
Also

$$y_A = (y_A)_o + (v_A)_o t + \frac{1}{2}a_A t^2$$

$$y_A - (y_A)_o = 0 + \frac{1}{2}\left(18\text{ ft/s}^2\right)(0.5\text{ s})^2$$

or

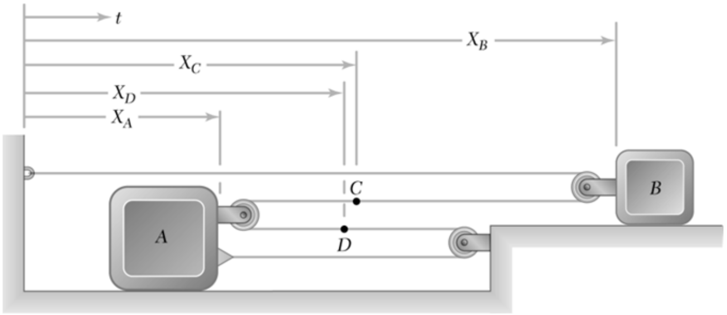
$$\Delta y_A = 2.25\text{ ft} \leftarrow ◀$$



PROBLEM 11.51

Slider block *B* moves to the right with a constant velocity of 300 mm/s. Determine (*a*) the velocity of slider block *A*, (*b*) the velocity of portion *C* of the cable, (*c*) the velocity of portion *D* of the cable, (*d*) the relative velocity of portion *C* of the cable with respect to slider block *A*.

SOLUTION



From the diagram $$x_B + (x_B - x_A) - 2x_A = \text{constant}$$

Then $$2v_B - 3v_A = 0 \tag{1}$$

and $$2a_B - 3a_A = 0 \tag{2}$$

Also, we have $$-x_D - x_A = \text{constant}$$

Then $$v_D + v_A = 0 \tag{3}$$

(*a*) Substituting into Eq. (1) $$2(300\text{ mm/s}) - 3v_A = 0$$

or $$\mathbf{v}_A = 200\text{ mm/s} \longrightarrow \blacktriangleleft$$

(*b*) From the diagram $$x_B + (x_B - x_C) = \text{constant}$$

Then $$2v_B - v_C = 0$$

Substituting $$2(300\text{ mm/s}) - v_C = 0$$

or $$\mathbf{v}_C = 600\text{ mm/s} \longrightarrow \blacktriangleleft$$

(*c*) From the diagram $$(x_C - x_A) + (x_D - x_A) = \text{constant}$$

Then $$v_C - 2v_A + v_D = 0$$

Substituting $$600\text{ mm/s} - 2(200\text{ mm/s}) + v_D = 0$$

or $$\mathbf{v}_D = 200\text{ mm/s} \longleftarrow \blacktriangleleft$$

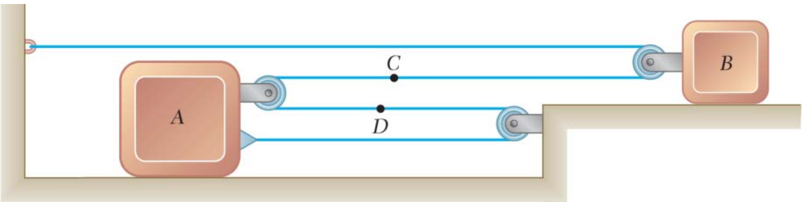
PROBLEM 11.51 (Continued)

(*d*) We have

$$v_{C/A} = v_C - v_A$$
$$= 600 \text{ mm/s} - 200 \text{ mm/s}$$

or

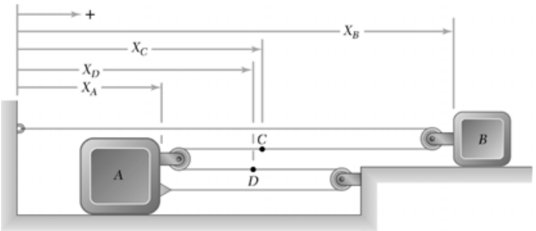
$$\mathbf{v}_{C/A} = 400 \text{ mm/s} \longrightarrow \blacktriangleleft$$



PROBLEM 11.52

At the instant shown, slider block *B* is moving with a constant acceleration, and its speed is 150 mm/s. Knowing that after slider block *A* has moved 240 mm to the right its velocity is 60 mm/s, determine (*a*) the accelerations of *A* and *B*, (*b*) the acceleration of portion *D* of the cable, (*c*) the velocity and change in position of slider block *B* after 4 s.

SOLUTION



From the diagram $\quad x_B + (x_B - x_A) - 2x_A = \text{constant}$

Then $\quad 2v_B - 3v_A = 0 \qquad (1)$

and $\quad 2a_B - 3a_A = 0 \qquad (2)$

(*a*) First observe that if block *A* moves to the right, $\mathbf{v}_A \rightarrow$ and Eq. (1) $\Rightarrow \mathbf{v}_B \rightarrow$. Then, using Eq. (1) at $t = 0$

$$2(150\ \text{mm/s}) - 3(v_A)_0 = 0$$

or $\quad (v_A)_0 = 100\ \text{mm/s}$

Also, Eq. (2) and $a_B = \text{constant} \Rightarrow a_A = \text{constant}$

Then $\quad v_A^2 = (v_A)_0^2 + 2a_A[x_A - (x_A)_0]$

When $x_A - (x_A)_0 = 240$ mm:

$$(60\ \text{mm/s})^2 = (100\ \text{mm/s})^2 + 2a_A(240\ \text{mm})$$

or $\quad a_A = -\dfrac{40}{3}\ \text{mm/s}^2$

or $\quad \mathbf{a}_A = 13.33\ \text{mm/s}^2 \longleftarrow$ ◀

PROBLEM 11.52 (Continued)

Then, substituting into Eq. (2)

$$2a_B - 3\left(-\frac{40}{3}\text{ mm/s}^2\right) = 0$$

or $$a_B = -20\text{ mm/s}^2 \qquad \mathbf{a}_B = 20.0\text{ mm/s}^2 \longleftarrow \blacktriangleleft$$

(*b*) From the diagram, $-x_D - x_A = \text{constant}$

$$v_D + v_A = 0$$

Then $$a_D + a_A = 0$$

Substituting $$a_D + \left(-\frac{40}{3}\text{ mm/s}^2\right) = 0$$

or $$\mathbf{a}_D = 13.33\text{ mm/s}^2 \longrightarrow \blacktriangleleft$$

(*c*) We have $$v_B = (v_B)_0 + a_B t$$

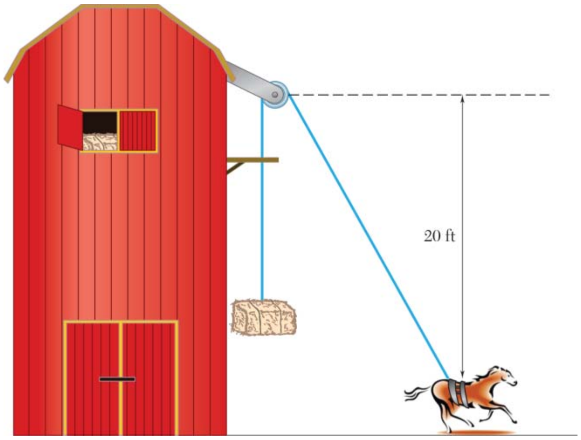
At $t = 4$ s: $$v_B = 150\text{ mm/s} + (-20.0\text{ mm/s}^2)(4\text{ s})$$

or $$\mathbf{v}_B = 70.0\text{ mm/s} \longrightarrow \blacktriangleleft$$

Also $$x_B = (x_B)_0 + (v_B)_0 t + \frac{1}{2}a_B t^2$$

At $t = 4$ s: $$x_B - (x_B)_0 = (150\text{ mm/s})(4\text{ s}) + \frac{1}{2}(-20.0\text{ mm/s}^2)(4\text{ s})^2$$

or $$\mathbf{x}_B - (\mathbf{x}_B)_0 = 440\text{ mm} \longrightarrow \blacktriangleleft$$



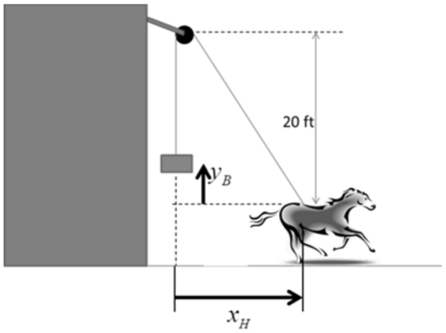
PROBLEM 11.53

A farmer wants to get his hay bales into the top loft of his barn by walking his horse forward with a constant velocity of 1 ft/s. Determine the velocity and acceleration of the hay bale when the horse is 10 ft away from the barn.

SOLUTION

From the diagram, we can write an expression for the total length of rope:

$$L = 20 - y_B + \sqrt{x_H^2 + (20)^2}$$



Differentiate
$$\frac{dL}{dt} = 0$$

$$0 = -\dot{y}_B + \frac{x_H \dot{x}_H}{\sqrt{x_H^2 + (20)^2}}$$

Velocities
$$v_B = \dot{y}_B \text{ and } v_H = \dot{x}_H$$

$$v_B = \frac{x_H v_H}{\sqrt{x_H^2 + (20)^2}}$$

Differentiate again:
$$a_B = \frac{dv_B}{dt}$$

$$a_B = \frac{\dot{x}_H v_H}{\sqrt{x_H^2 + (20)^2}} + \frac{x_H \dot{v}_H}{\sqrt{x_H^2 + (20)^2}} + \frac{x_H v_H (-\tfrac{1}{2})(2x_H)\dot{x}_H}{\left(x_H^2 + (20)^2\right)^{3/2}}$$

or
$$a_B = \frac{v_H^2}{\sqrt{x_H^2 + (20)^2}} + \frac{x_H a_H}{\sqrt{x_H^2 + (20)^2}} - \frac{x_H^2 v_H^2}{\left(x_H^2 + (20)^2\right)^{3/2}}$$

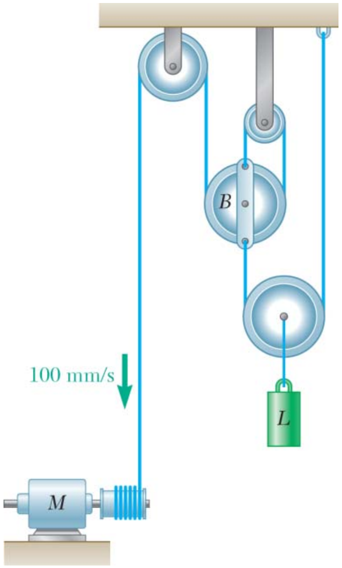
at $x_H = 10$
$$v_B = \frac{10(1)}{\sqrt{(10)^2 + (20)^2}}$$

$v_B = 0.447$ ft/s ◀

and
$$a_B = \frac{(1)^2}{\sqrt{(10)^2 + (20)^2}} + \frac{(10)(0)}{\sqrt{(10)^2 + (20)^2}} - \frac{(10)^2 (1)^2}{\left((10)^2 + (20)^2\right)^{3/2}}$$

$$a_B = 0.0447 + 0 - 0.000894$$

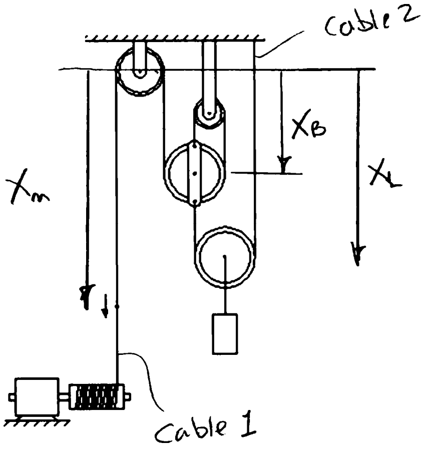
$a_B = 0.0358$ ft/s^2 ◀



PROBLEM 11.54

The motor M reels in the cable at a constant rate of 100 mm/s. Determine (a) the velocity of load L, (b) the velocity of pulley B with respect to load L.

SOLUTION



Let x_B and x_L be the positions, respectively, of pulley B and load L measured downward from a fixed elevation above both. Let x_M be the position of a point on the cable about to enter the reel driven by the motor. Then, considering the lengths of the two cables,

$$x_M + 3x_B = \text{constant} \qquad v_M + 3v_B = 0$$

$$x_L + (x_L - x_B) = \text{constant} \qquad 2v_L + v_B = 0$$

with

$$v_M = 100 \text{ mm/s}$$

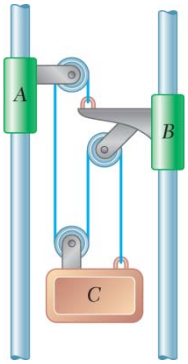
$$v_B = -\frac{v_M}{3} = -33.333 \text{ m/s}$$

$$v_L = \frac{v_B}{2} = -16.667 \text{ mm/s}$$

(a) Velocity of load L. $\mathbf{v}_L = 16.67 \text{ mm/s}\uparrow$ ◀

(b) Velocity of pulley B with respect to load L. $v_{B/L} = v_B - v_L = -33.333 - (-16.667) = -16.667$

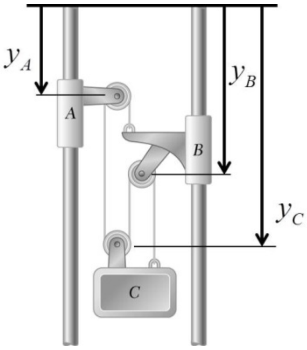
$\mathbf{v}_{B/L} = 16.67 \text{ mm/s}\uparrow$ ◀



PROBLEM 11.55

Collar A starts from rest at $t = 0$ and moves upward with a constant acceleration of 3.6 in./s^2. Knowing that collar B moves downward with a constant velocity of 18 in./s, determine (*a*) the time at which the velocity of block C is zero, (*b*) the corresponding position of block C.

SOLUTION



Define positions as positive downward from a fixed level.

Constraint of cable. $(y_B - y_A) + (y_C - y_A) + 2(y_C - y_B) = \text{constant}$

$3y_C - y_B - 2y_A = \text{constant}$

Differentiate $3v_C - v_B - 2v_A = 0$ (1)

Differentiate again $3a_C - a_B - 2a_A = 0$ (2)

Motion of block C:

$$(v_A)_0 = 0, \;\; a_A = -3.6 \text{ in./s}^2, \;\; v_B = (v_B)_0 = 18 \text{ in./s}, \;\; a_B = 0$$

Using (1) $(v_C)_0 = \frac{1}{3}\left[(v_B)_0 + 2(v_A)_0\right] = 6 \text{ in./s}$

Using (2) $a_C = \frac{1}{3}(a_B + 2a_A) = \frac{1}{3}\left[0 + (2)(-3.6)\right] = -2.4 \text{ in./s}^2$

Constant acceleration

$$\begin{aligned} v_C &= (v_C)_0 + a_C t \\ &= 6 - 1.2t \end{aligned} \qquad (3)$$

Constant acceleration

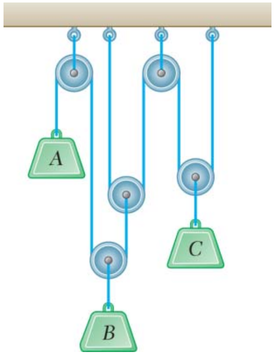
$$\begin{aligned} x_C - (x_C)_0 &= (v_C)_0 t + \frac{1}{2}a_C t^2 \\ &= 6t - 0.6t^2 \end{aligned} \qquad (4)$$

(a) Time at $v_C = 0$:

Using (3) $0 = 6 - 2.4t$ $t = 2.5 \text{ s}$ ◀

(b) Corresponding position of block C:

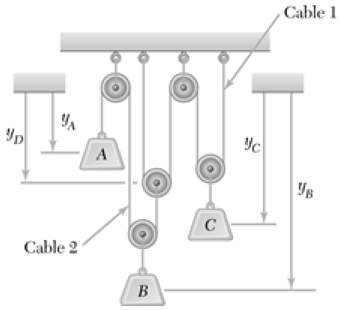
Using (4) $x_C - (x_C)_0 = (6)(2.5) + \left(\frac{1}{2}\right)(-2.4)(2.5)^2$ $x_C - (x_C)_0 = 7.5 \text{ in.} \downarrow$ ◀



PROBLEM 11.56

Block A starts from rest at $t = 0$ and moves downward with a constant acceleration of 6 in./s^2. Knowing that block B moves up with a constant velocity of 3 in./s, determine (a) the time when the velocity of block C is zero, (b) the corresponding position of block C.

SOLUTION



The cable lengths are constant.

$$L_1 = 2y_C + 2y_D + \text{constant}$$
$$L_2 = y_A + y_B + (y_B - y_D) + \text{constant}$$

Eliminate y_D.

$$L_1 + 2L_2 = 2y_C + 2y_D + 2y_A + 2y_B + 2(y_B - y_D) + \text{constant}$$
$$2(y_C + y_A + 2y_B) = \text{constant}$$

Differentiate to obtain relationships for velocities and accelerations, positive downward.

$$v_C + v_A + 2v_B = 0 \qquad (1)$$
$$a_C + a_A + 2a_B = 0 \qquad (2)$$

Use units of inches and seconds.

Motion of block A:

$$v_A = a_A t + 6t$$
$$\Delta y_A = \frac{1}{2}a_A t^2 = \frac{1}{2}(6)t^2 = 3t^2$$

Motion of block B:

$$\mathbf{v}_B = 3 \text{ in./s} \uparrow \qquad v_B = -3 \text{ in./s}$$
$$\Delta y_B = v_B t = -3t$$

Motion of block C: From (1),

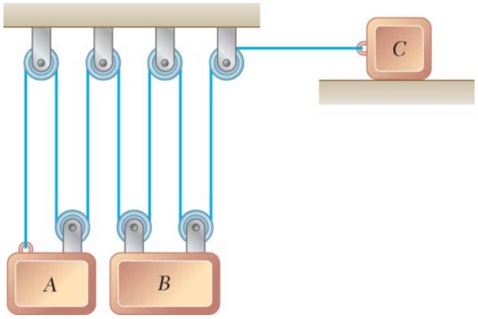
$$v_C = -v_A - 2v_B = -6t - 2(-3) = 6 - 6t$$
$$\Delta y_C = \int_0^t v_C dt = 6t - 3t^2$$

(a) Time when v_C is zero. $6 - 6t = 0$ $\quad t = 1.000 \text{ s}$ ◀

(b) Corresponding position.

$$\Delta y_C = (6)(1) - (3)(1)^2 = 3 \text{ in.}$$

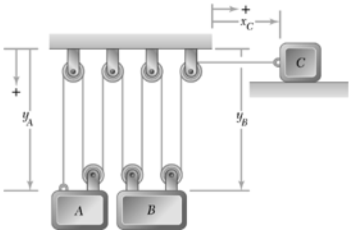
$\Delta y_C = 3.00 \text{ in.} \downarrow$ ◀



PROBLEM 11.57

Block B starts from rest, block A moves with a constant acceleration, and slider block C moves to the right with a constant acceleration of $75\ \text{mm/s}^2$. Knowing that at $t = 2$ s the velocities of B and C are 480 mm/s downward and 280 mm/s to the right, respectively, determine (*a*) the accelerations of A and B, (*b*) the initial velocities of A and C, (*c*) the change in position of slider block C after 3 s.

SOLUTION



From the diagram

$$3y_A + 4y_B + x_C = \text{constant}$$

Then $$3v_A + 4v_B + v_C = 0 \qquad (1)$$

and $$3a_A + 4a_B + a_C = 0 \qquad (2)$$

Given: $$(v_B) = 0,$$

$$a_A = \text{constent}$$

$$(\mathbf{a}_C) = 75\ \text{mm/s}^2 \longrightarrow$$

At $t = 2$ s, $$\mathbf{v}_B = 480\ \text{mm/s} \downarrow$$

$$\mathbf{v}_C = 280\ \text{mm/s} \longrightarrow$$

(*a*) Eq. (2) and $a_A = \text{constant}$ and $a_C = \text{constant} \Rightarrow a_B = \text{constant}$

Then $$v_B = 0 + a_B t$$

At $t = 2$ s: $$480\ \text{mm/s} = a_B(2\ \text{s})$$

$$a_B = 240\ \text{mm/s}^2 \qquad \text{or} \qquad \mathbf{a}_B = 240\ \text{mm/s}^2 \downarrow$$ ◀

Substituting into Eq. (2)

$$3a_A + 4(240\ \text{mm/s}^2) + (75\ \text{mm/s}^2) = 0$$

$$a_A = -345\ \text{mm/s} \qquad \text{or} \qquad \mathbf{a}_A = 345\ \text{mm/s}^2 \uparrow$$ ◀

PROBLEM 11.57 (Continued)

(*b*) We have $v_C = (v_C)_0 + a_C t$

At $t = 2$ s: $280 \text{ mm/s} = (v_C)_0 + (75 \text{ mm/s})(2 \text{ s})$

$v_C = 130 \text{ mm/s}$ or $(\mathbf{v}_C)_0 = 130.0 \text{ mm/s} \longrightarrow$ ◀

Then, substituting into Eq. (1) at $t = 0$

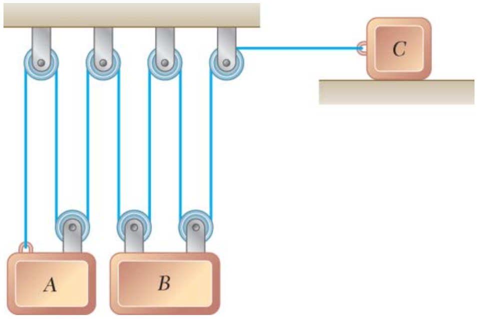
$$3(v_A)_0 + 4(0) + (130 \text{ mm/s}) = 0$$

$v_A = -43.3 \text{ mm/s}$ or $(\mathbf{v}_A)_0 = 43.3 \text{ mm/s} \uparrow$ ◀

(*c*) We have $x_C = (x_C)_0 + (v_C)_0 t + \frac{1}{2} a_C t^2$

At $t = 3$ s: $x_C - (x_C)_0 = (130 \text{ mm/s})(3 \text{ s}) + \frac{1}{2}(75 \text{ mm/s}^2)(3 \text{ s})^2$

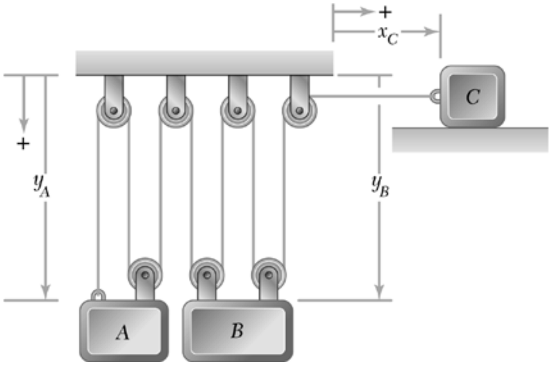
$= 728 \text{ mm}$ or $\mathbf{x}_C - (\mathbf{x}_C)_0 = 728 \text{ mm} \longrightarrow$ ◀



PROBLEM 11.58

Block B moves downward with a constant velocity of 20 mm/s. At $t = 0$, block A is moving upward with a constant acceleration, and its velocity is 30 mm/s. Knowing that at $t = 3$ s slider block C has moved 57 mm to the right, determine (a) the velocity of slider block C at $t = 0$, (b) the accelerations of A and C, (c) the change in position of block A after 5 s.

SOLUTION



From the diagram

$$3y_A + 4y_B + x_C = \text{constant}$$

Then
$$3v_A + 4v_B + v_C = 0 \qquad (1)$$

and
$$3a_A + 4a_B + a_C = 0 \qquad (2)$$

Given:
$$\mathbf{v}_B = 20 \text{ mm/s}\downarrow;$$
$$(\mathbf{v}_A)_0 = 30 \text{ mm/s}\uparrow$$

(a) Substituting into Eq. (1) at $t = 0$

$$3(-30 \text{ mm/s}) + 4(20 \text{ mm/s}) + (v_C)_0 = 0$$

$$(v_C)_0 = 10 \text{ mm/s} \qquad \text{or} \qquad (\mathbf{v}_C)_0 = 10.00 \text{ mm/s} \longrightarrow \blacktriangleleft$$

(b) We have
$$x_C = (x_C)_0 + (v_C)_0 t + \frac{1}{2}a_C t^2$$

At $t = 3$ s:
$$57 \text{ mm} = (10 \text{ mm/s})(3 \text{ s}) + \frac{1}{2}a_C(3 \text{ s})^2$$

$$a_C = 6 \text{ mm/s}^2 \qquad \text{or} \qquad \mathbf{a}_C = 6.00 \text{ mm/s}^2 \longrightarrow \blacktriangleleft$$

Now
$$\mathbf{v}_B = \text{constant} \rightarrow a_B = 0$$

Then, substituting into Eq. (2)

$$3a_A + 4(0) + (6\text{ mm/s}^2) = 0$$

$$a_A = -2\text{ mm/s}^2 \qquad \text{or} \qquad \mathbf{a}_A = 2.00\text{ mm/s}^2 \uparrow \blacktriangleleft$$

(*c*) We have

$$y_A = (y_A)_0 + (v_A)_0 t + \frac{1}{2}a_A t^2$$

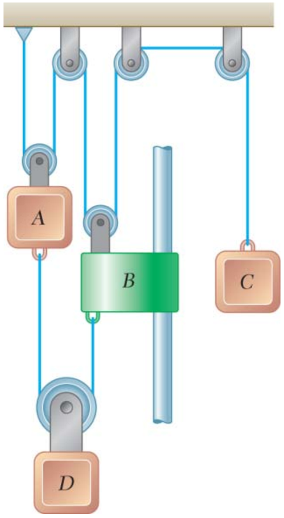
At $t = 5$ s:

$$y_A - (y_A)_0 = (-30\text{ mm/s})(5\text{ s}) + \frac{1}{2}(-2\text{ mm/s}^2)(5\text{ s})^2$$

$$= -175\text{ mm}$$

or

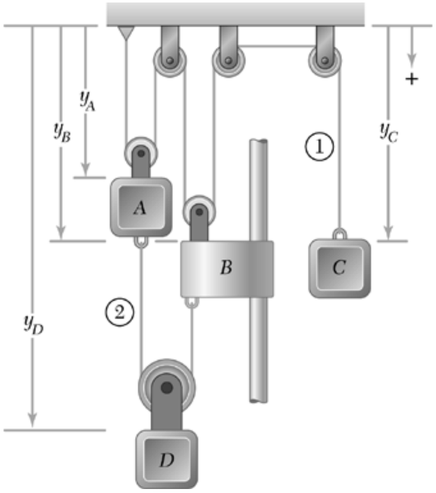
$$\mathbf{y}_A - (\mathbf{y}_A)_0 = 175.0\text{ mm} \uparrow \blacktriangleleft$$



PROBLEM 11.59

The system shown starts from rest, and each component moves with a constant acceleration. If the relative acceleration of block *C* with respect to collar *B* is 60 mm/s^2 upward and the relative acceleration of block *D* with respect to block *A* is 110 mm/s^2 downward, determine (*a*) the velocity of block *C* after 3 s, (*b*) the change in position of block *D* after 5 s.

SOLUTION



From the diagram

Cable 1: $2y_A + 2y_B + y_C = \text{constant}$

Then $2v_A + 2v_B + v_C = 0$ (1)

and $2a_A + 2a_B + a_C = 0$ (2)

Cable 2: $(y_D - y_A) + (y_D - y_B) = \text{constant}$

Then $-v_A - v_B + 2v_D = 0$ (3)

and $-a_A - a_B + 2a_D = 0$ (4)

Given: At $t = 0$, $v = 0$; all accelerations constant;
$a_{C/B} = 60\ \text{mm/s}^2 \uparrow$, $a_{D/A} = 110\ \text{mm/s}^2 \downarrow$

(a) We have $a_{C/B} = a_C - a_B = -60$ or $a_B = a_C + 60$

and $a_{D/A} = a_D - a_A = 110$ or $a_A = a_D - 110$

Substituting into Eqs. (2) and (4)

Eq. (2): $2(a_D - 110) + 2(a_C + 60) + a_C = 0$

or $3a_C + 2a_D = 100$ (5)

Eq. (4): $-(a_D - 110) - (a_C + 60) + 2a_D = 0$

or $-a_C + a_D = -50$ (6)

PROBLEM 11.59 (Continued)

Solving Eqs. (5) and (6) for a_C and a_D

$$a_C = 40 \text{ mm/s}^2$$

$$a_D = -10 \text{ mm/s}^2$$

Now $$v_C = 0 + a_C t$$

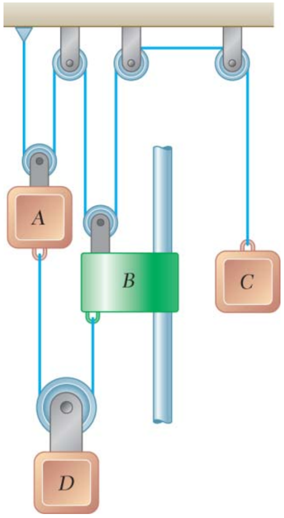
At $t = 3$ s: $$v_C = (40 \text{ mm/s}^2)(3 \text{ s})$$

or $$\mathbf{v}_C = 120.0 \text{ mm/s} \downarrow$$ ◀

(*b*) We have $$y_D = (y_D)_0 + (0)t + \frac{1}{2}a_D t^2$$

At $t = 5$ s: $$y_D - (y_D)_0 = \frac{1}{2}(-10 \text{ mm/s}^2)(5 \text{ s})^2$$

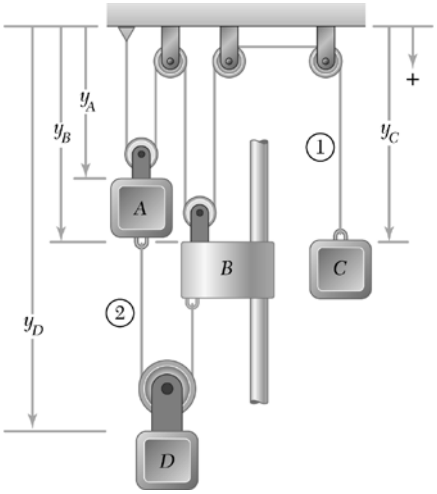
or $$\mathbf{y}_D - (\mathbf{y}_D)_0 = 125.0 \text{ mm} \uparrow$$ ◀



PROBLEM 11.60*

The system shown starts from rest, and the length of the upper cord is adjusted so that *A*, *B*, and *C* are initially at the same level. Each component moves with a constant acceleration, and after 2 s the relative change in position of block *C* with respect to block *A* is 280 mm upward. Knowing that when the relative velocity of collar *B* with respect to block *A* is 80 mm/s downward, the displacements of *A* and *B* are 160 mm downward and 320 mm downward, respectively, determine (*a*) the accelerations of *A* and *B* if $a_B > 10\text{ mm/s}^2$, (*b*) the change in position of block *D* when the velocity of block *C* is 600 mm/s upward.

SOLUTION



From the diagram

Cable 1: $2y_A + 2y_B + y_C = \text{constant}$

Then $$2v_A + 2v_B + v_C = 0 \tag{1}$$

and $$2a_A + 2a_B + a_C = 0 \tag{2}$$

Cable 2: $(y_D - y_A) + (y_D - y_B) = \text{constant}$

Then $$-v_A - v_B - 2v_D = 0 \tag{3}$$

and $$-a_A - a_B + 2a_D = 0 \tag{4}$$

Given: At $t = 0$

$$v = 0$$

$$(y_A)_0 = (y_B)_0 = (y_C)_0$$

All accelerations constant.

At $t = 2\text{ s}$

$$y_{C/A} = 280\text{ mm}\uparrow$$

When $v_{B/A} = 80\text{ mm/s}\downarrow$

$$y_A - (y_A)_0 = 160\text{ mm}\uparrow$$

$$y_B - (y_B)_0 = 320\text{ mm}\downarrow$$

$$a_B > 10\text{ mm/s}^2$$

(*a*) We have $y_A = (y_A)_0 + (0)t + \frac{1}{2}a_A t^2$

and $y_C = (y_C)_0 + (0)t + \frac{1}{2}a_C t^2$

Then $y_{C/A} = y_C - y_A = \frac{1}{2}(a_C - a_A)t^2$

At $t = 2$ s, $y_{C/A} = -280$ mm:

$$-280 \text{ mm} = \frac{1}{2}(a_C - a_A)(2 \text{ s})^2$$

or $a_C = a_A - 140$ (5)

Substituting into Eq. (2)

$$2a_A + 2a_B + (a_A - 140) = 0$$

or $a_A = \frac{1}{3}(140 - 2a_B)$ (6)

Now $v_B = 0 + a_B t$

$v_A = 0 + a_A t$

$v_{B/A} = v_B - v_A = (a_B - a_A)t$

Also $y_B = (y_B)_0 + (0)t + \frac{1}{2}a_B t^2$

When $\mathbf{v}_{B/A} = 80 \text{ mm/s}\downarrow$: $80 = (a_B - a_A)t$ (7)

$\Delta y_A = 160 \text{ mm}\downarrow$: $160 = \frac{1}{2}a_A t^2$

$\Delta y_B = 320 \text{ mm}\downarrow$: $320 = \frac{1}{2}a_B t^2$

Then $160 = \frac{1}{2}(a_B - a_A)t^2$

Using Eq. (7) $320 = (80)t$ or $t = 4$ s

Then $160 = \frac{1}{2}a_A(4)^2$ or $\mathbf{a}_A = 20.0 \text{ mm/s}^2\downarrow$ ◀

and $320 = \frac{1}{2}a_B(4)^2$ or $\mathbf{a}_B = 40.0 \text{ mm/s}^2\downarrow$ ◀

Note that Eq. (6) is not used; thus, the problem is over-determined.

PROBLEM 11.60* (Continued)

(*b*) Substituting into Eq. (5)

$$a_C = 20 - 140 = -120 \text{ mm/s}^2$$

and into Eq. (4)

$$-(20 \text{ mm/s}^2) - (40 \text{ mm/s}^2) + 2a_D = 0$$

or $$a_D = 30 \text{ mm/s}^2$$

Now $$v_C = 0 + a_C t$$

When $v_C = -600$ mm/s: $$-600 \text{ mm/s} = (-120 \text{ mm/s}^2)t$$

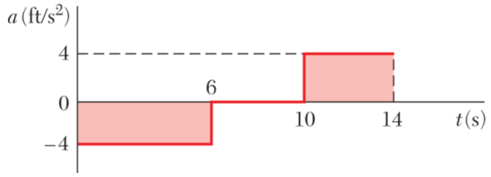
or $$t = 5 \text{ s}$$

Also $$y_D = (y_D)_0 + (0)t + \frac{1}{2}a_D t^2$$

At $t = 5$ s: $$y_D - (y_D)_0 = \frac{1}{2}(30 \text{ mm/s}^2)(5 \text{ s})^2$$

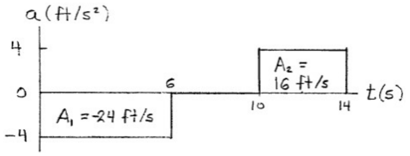
or $$\mathbf{y}_D - (\mathbf{y}_D)_0 = 375 \text{ mm}\downarrow \blacktriangleleft$$

PROBLEM 11.61



A particle moves in a straight line with a constant acceleration of −4 ft/s^2 for 6 s, zero acceleration for the next 4 s, and a constant acceleration of +4 ft/s^2 for the next 4 s. Knowing that the particle starts from the origin and that its velocity is −8 ft/s during the zero acceleration time interval, (*a*) construct the $v-t$ and $x-t$ curves for $0 \le t \le 14$ s, (*b*) determine the position and the velocity of the particle and the total distance traveled when $t = 14$ s.

SOLUTION



From the $a-t$ curve

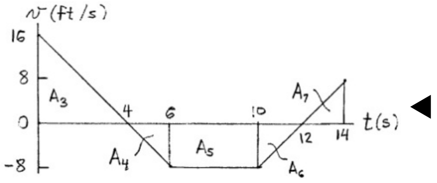
$$A_1 = -24 \text{ ft/s}, A_2 = 16 \text{ ft/s}$$

(*a*) Construct the $v-t$ curve: $v_6 = -8$ ft/s

$$v_0 = v_6 - A_1$$
$$= -8 - (-24)$$
$$= 16 \text{ ft/s}$$

$$v_{10} = -8 \text{ ft/s}$$

$$v_{14} = v_{10} + A_2$$
$$= -8 + 16$$
$$= 8 \text{ ft/s}$$



From the $v-t$ curve $A_3 = 32$ ft, $A_4 = -8$ ft

$$A_5 = -32 \text{ ft}, A_6 = -8 \text{ ft}, A_7 = 8 \text{ ft}$$

(b) Construct the $x-t$ curve $x_0 = 0$

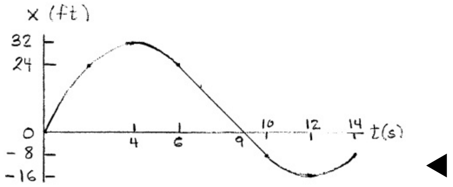
$$x_4 = x_0 + A_3 = 32 \text{ ft}$$

$$x_6 = x_4 + A_4 = 24 \text{ ft}$$

$$x_{10} = x_6 + A_5 = -8 \text{ ft}$$

$$x_{12} = x_{10} + A_6 = -16 \text{ ft}$$

$$x_{14} = x_{12} + A_7 = -8 \text{ ft}$$



Total Distance Traveled

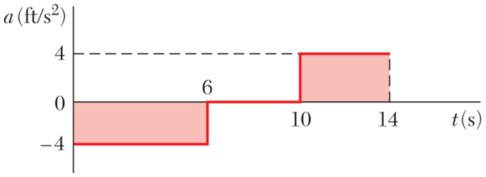
$0 \le t \le 4$ s, $d_1 = |32 - 0| = 32$ ft

$4 \text{ s} \le t \le 12$ s, $d_2 = |-16 - 32| = 48$ ft

$12 \text{ s} \le t \le 14$ s, $d_3 = |-8 - (-16)| = 8$ ft

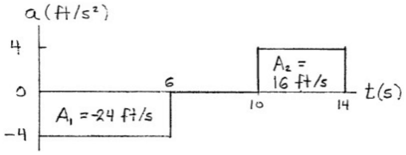
$d = 32 + 48 + 8$ $d = 88$ ft ◀

Problem 11.62



A particle moves in a straight line with a constant acceleration of −4 ft/s^2 for 6 s, zero acceleration for the next 4 s, and a constant acceleration of +4 ft/s^2 for the next 4 s. Knowing that the particle starts from the origin with $v_0 = 16$ ft/s, (*a*) construct the $v-t$ and $x-t$ curves for $0 \le t \le 14$ s, (*b*) determine the amount of time during which the particle is further than 16 ft from the origin.

SOLUTION



From the $a-t$ curve

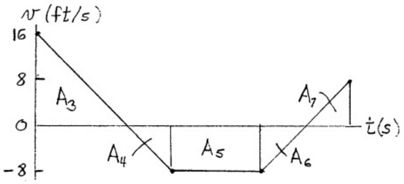
$$A_1 = -24 \text{ ft/s}, A_2 = 16 \text{ ft/s}$$

(b) Construct the $v-t$ curve : $v_0 = 16$ ft/s

$$v_6 = v_0 + A_1$$
$$= 16 + (-24)$$
$$= -8 \text{ ft/s}$$

$$v_{10} = v_6 = -8 \text{ ft/s}$$

$$v_{14} = v_{10} + A_2$$
$$= -8 + 16$$
$$= 8 \text{ ft/s}$$



◀

From the $v-t$ curve $A_3 = 32$ ft, $A_4 = -8$ ft

$$A_5 = -32 \text{ ft}, A_6 = -8 \text{ ft}, A_7 = 8 \text{ ft}$$

Construct the $x-t$ curve $x_0 = 0$

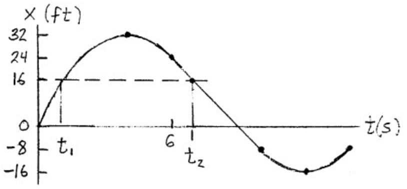
$$x_4 = x_0 + A_3 = 32 \text{ ft}$$

$$x_6 = x_4 + A_4 = 24 \text{ ft}$$

$$x_{10} = x_6 + A_5 = -8 \text{ ft}$$

$$x_{12} = x_{10} + A_6 = -16 \text{ ft}$$

$$x_{14} = x_{12} + A_7 = -8 \text{ ft}$$



◀

(b) Time for $|x| > 16$ ft.

From the $x-t$ diagram, this is time interval t_1 to t_2.

From $0 < t < 6$ s, $\dfrac{dx}{dt} = v = 16 - 4t$

Integrating, using limits $x = 0$ when $t = 0$ and $x = 16$ ft when $t = t_1$

$$[x]_0^{16} = \left[16t - 2t^2\right]_0^{t} \quad \text{or} \quad 16 = 16t_1 - 2t_1^2$$

PROBLEM 11.62 (Continued)

or $t_1^2 - 8t_1 + 8 = 0$

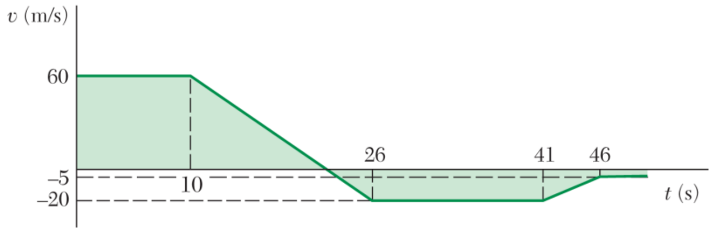
Using the quadratic formula: $t_1 = \dfrac{8 \pm \sqrt{(8)^2 - (4)(1)(8)}}{(2)(1)} = 4 \pm 2.828 = 1.172\text{ s}$ and 6.828 s

The larger root is out of range, thus $t_1 = 1.172\text{ s}$

From $6 < t < 10$, $x = 24 - 8(t - 6) = 72 - 8t$

Setting $x = 16$, $16 = 72 - 8t_2$ or $t_2 = 7\text{ s}$

Time Interval: $\Delta t = t_2 - t_1$ $\Delta t = 5.83\text{ s}$◀



PROBLEM 11.63

A particle moves in a straight line with the velocity shown in the figure. Knowing that $x = -540$ m at $t = 0$, (*a*) construct the a–t and x–t curves for $0 < t < 50$ s, and determine (*b*) the total distance traveled by the particle when $t = 50$ s, (*c*) the two times at which $x = 0$.

SOLUTION

(*a*) a_t = slope of v–t curve at time t

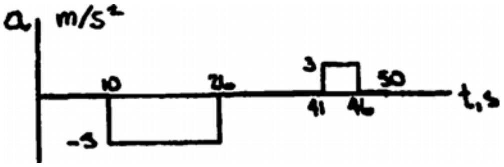
From $t = 0$ to $t = 10$ s: $v = \text{constant} \Rightarrow a = 0$

$t = 10$ s to $t = 26$ s: $$a = \frac{-20 - 60}{26 - 10} = -5 \text{ m/s}^2$$

$t = 26$ s to $t = 41$ s: $v = \text{constant} \Rightarrow a = 0$

$t = 41$ s to $t = 46$ s: $$a = \frac{-5 - (-20)}{46 - 41} = 3 \text{ m/s}^2$$

$t = 46$ s: $v = \text{constant} \Rightarrow a = 0$



$x_2 = x_1 +$ (area under v–t curve from t_1 to t_2)

At $t = 10$ s: $x_{10} = -540 + 10(60) + 60$ m

Next, find time at which $v = 0$. Using similar triangles

$$\frac{t_{v=0} - 10}{60} = \frac{26 - 10}{80} \quad \text{or} \quad t_{v=0} = 22 \text{ s}$$

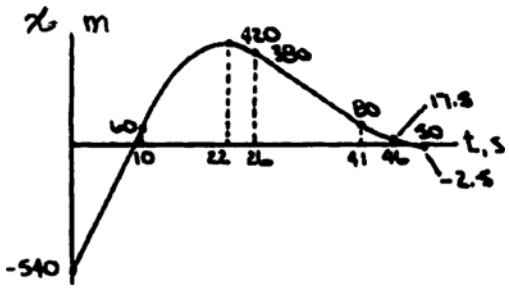
At $t = 22$ s: $x_{22} = 60 + \frac{1}{2}(12)(60) = 420$ m

$t = 26$ s: $x_{26} = 420 - \frac{1}{2}(4)(20) = 380$ m

$t = 41$ s: $x_{41} = 380 - 15(20) = 80$ m

$t = 46$ s: $x_{46} = 80 - 5\left(\frac{20 + 5}{2}\right) = 17.5$ m

$t = 50$ s: $x_{50} = 17.5 - 4(5) = -2.5$ m



PROBLEM 11.63 (Continued)

(*b*) From $t = 0$ to $t = 22\text{ s}$: Distance traveled $= 420 - (-540)$

$$= 960\text{ m}$$

$t = 22\text{ s}$ to $t = 50\text{ s}$: Distance traveled $= |-2.5 - 420|$

$$= 422.5\text{ m}$$

Total distance traveled $= (960 + 422.5)\text{ ft} = 1382.5\text{ m}$

Total distance traveled $= 1383\text{ m}$ ◀

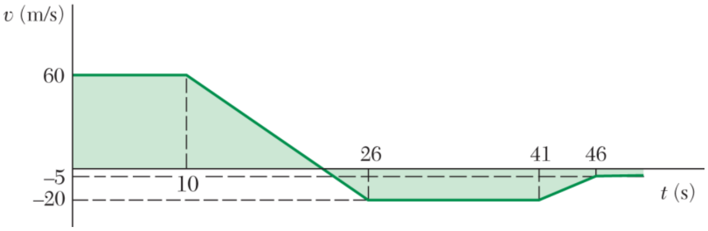
(*c*) Using similar triangles

Between 0 and 10 s:
$$\frac{(t_{x=0})_1 - 0}{540} = \frac{10}{600}$$

$(t_{x=0})_1 = 9.00\text{ s}$ ◀

Between 46 s and 50 s:
$$\frac{(t_{x=0})_2 - 46}{17.5} = \frac{4}{20}$$

$(t_{x=0})_2 = 49.5\text{ s}$ ◀



PROBLEM 11.64

A particle moves in a straight line with the velocity shown in the figure. Knowing that $x = -540$ m at $t = 0$, (a) construct the a–t and x–t curves for $0 < t < 50$ s, and determine (b) the maximum value of the position coordinate of the particle, (c) the values of t for which the particle is at $x = 100$ m.

SOLUTION

(a) a_t = slope of v–t curve at time t

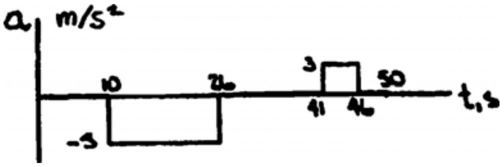
From $t = 0$ to $t = 10$ s: $v = \text{constant} \Rightarrow a = 0$

$t = 10$ s to $t = 26$ s: $a = \dfrac{-20-60}{26-10} = -5 \text{ m/s}^2$

$t = 26$ s to $t = 41$ s: $v = \text{constant} \Rightarrow a = 0$

$t = 41$ s to $t = 46$ s: $a = \dfrac{-5-(-20)}{46-41} = 3 \text{ m/s}^2$

$t = 46$ s: $v = \text{constant} \Rightarrow a = 0$



$x_2 = x_1 +$ (area under v–t curve from t_1 to t_2)

At $t = 10$ s: $x_{10} = -540 + 10(60) = 60$ m

Next, find time at which $v = 0$. Using similar triangles

$$\frac{t_{v=0} - 10}{60} = \frac{26-10}{80} \quad \text{or} \quad t_{v=0} = 22 \text{ s}$$

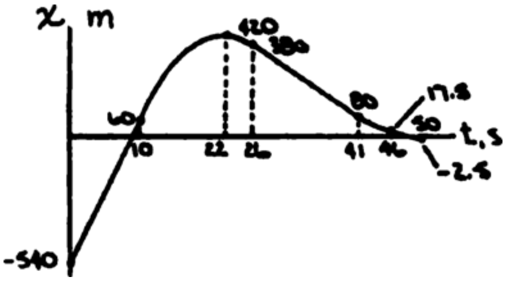
At $t = 22$ s: $x_{22} = 60 + \dfrac{1}{2}(12)(60) = 420$ m

$t = 26$ s: $x_{26} = 420 - \dfrac{1}{2}(4)(20) = 380$ m

$t = 41$ s: $x_{41} = 380 - 15(20) = 80$ m

$t = 46$ s: $x_{46} = 80 - 5\left(\dfrac{20+5}{2}\right) = 17.5$ m

$t = 50$ s: $x_{50} = 17.5 - 4(5) = -2.5$ m

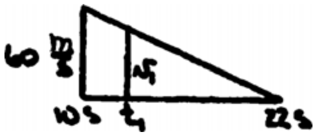


PROBLEM 11.64 (Continued)

(*b*) Reading from the x–t curve $x_{\max} = 420 \text{ m}$ ◀

(*c*) Between 10 s and 22 s

$100 \text{ m} = 420 \text{ m} - (\text{area under } v\text{–}t \text{ curve from } t, \text{ to } 22 \text{ s}) \text{ m}$



$$100 = 420 - \frac{1}{2}(22 - t_1)(v_1)$$

$$(22 - t_1)(v_1) = 640$$

Using similar triangles

$$\frac{v_1}{22 - t_1} = \frac{60}{12} \qquad \text{or} \qquad v_1 = 5(22 - t_1)$$

Then

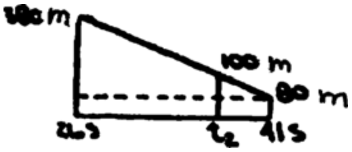
$$(22 - t_1)[5(22 - t_1)] = 640$$

$$t_1 = 10.69 \text{ s} \quad \text{and} \quad t_1 = 33.3 \text{ s}$$

We have $10 \text{ s} < t_1 < 22 \text{ s} \Rightarrow$ $t_1 = 10.69 \text{ s}$ ◀

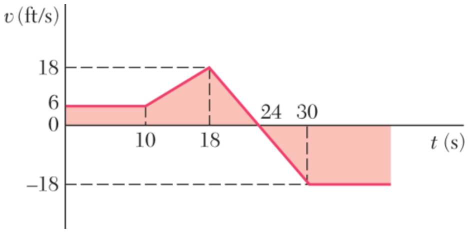
Between 26 s and 41 s:

Using similar triangles



$$\frac{41 - t_2}{20} = \frac{15}{300}$$

$t_2 = 40.0 \text{ s}$ ◀



Problem 11.65

A particle moves in a straight line with the velocity shown in the figure. Knowing that $x = -48$ ft at $t = 0$, draw the a–t and x–t curves for $0 < t < 40$ s and determine (*a*) the maximum value of the position coordinate of the particle, (*b*) the values of t for which the particle is at a distance of 108 ft from the origin.

SOLUTION

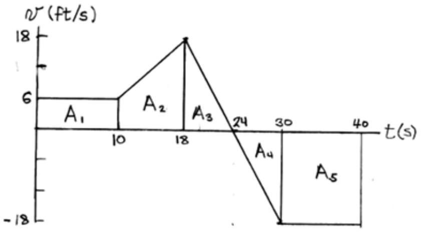
The $a - t$ curve is the slope of the $v - t$ curve

$0 < t < 10$ s, $\quad a = 0$

$10 \text{ s} < t < 18$ s, $\quad a = \dfrac{18 - 6}{18 - 10} = 1.5 \text{ ft/s}^2$

$18 \text{ s} < t < 30$ s, $\quad a = \dfrac{-18 - 18}{30 - 18} = -3 \text{ ft/s}^2$

$30 \text{ s} < t < 40$ s $\quad a = 0$



◀

Points on the x–t curve may be calculated using areas of the v–t curve.

$$A_1 = (10)(6) = 60 \text{ ft}$$

$$A_2 = \frac{1}{2}(6 + 18)(18 - 10) = 96 \text{ ft}$$

$$A_3 = \frac{1}{2}(18)(24 - 18) = 54 \text{ ft}$$

$$A_4 = \frac{1}{2}(-18)(30 - 24) = -54 \text{ ft}$$

$$A_5 = (-18)(40 - 30) = -180 \text{ ft}$$

Value of x at specific times:

$$x_0 = -48 \text{ ft}$$

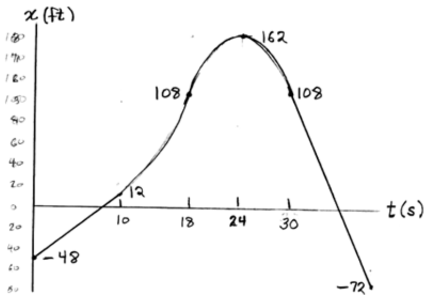
$$x_{10} = x_0 + A_1 = 12 \text{ ft}$$

$$x_{18} = x_{10} + A_2 = 108 \text{ ft}$$

$$x_{24} = x_{18} + A_3 = 162 \text{ ft}$$

$$x_{30} = x_{24} + A_4 = 108 \text{ ft}$$

$$x_{40} = x_{30} + A_5 = -72 \text{ ft}$$



◀

PROBLEM 11.65 (Continued)

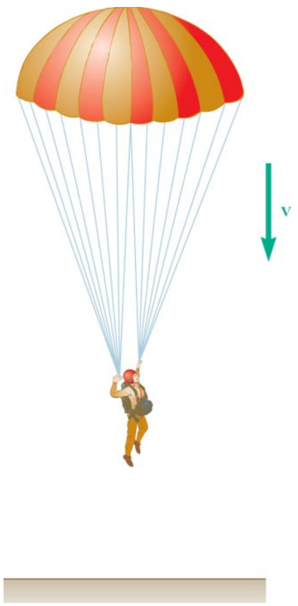
(b) Times when $x = 108$ ft.

From the $x - t$ curve $t = 18$ s and $t = 30$ s ◀



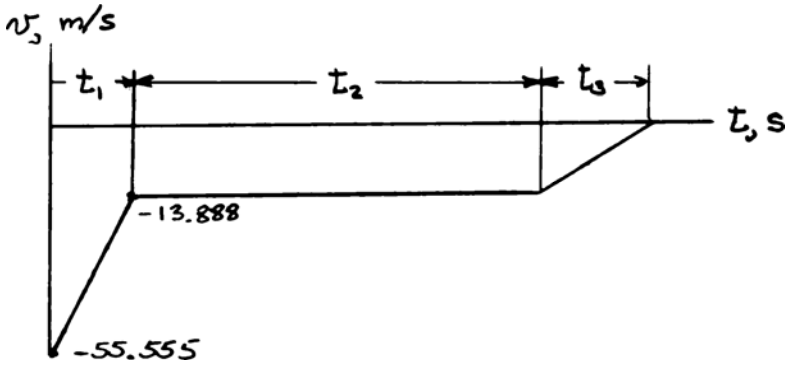
PROBLEM 11.66

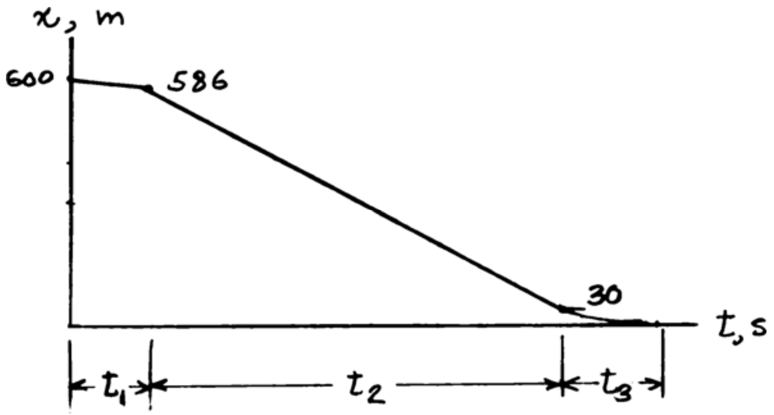
A parachutist is in free fall at a rate of 200 km/h when he opens his parachute at an altitude of 600 m. Following a rapid and constant deceleration, he then descends at a constant rate of 50 km/h from 586 m to 30 m, where he maneuvers the parachute into the wind to further slow his descent. Knowing that the parachutist lands with a negligible downward velocity, determine (*a*) the time required for the parachutist to land after opening his parachute, (*b*) the initial deceleration.

SOLUTION

Assume second deceleration is constant. Also, note that

$$200 \text{ km/h} = 55.555 \text{ m/s},$$
$$50 \text{ km/h} = 13.888 \text{ m/s}$$





(*a*) Now $\Delta x =$ area under $v{-}t$ curve for given time interval

Then

$$(586 - 600)\text{ m} = -t_1\left(\frac{55.555 + 13.888}{2}\right)\text{ m/s}$$

$$t_1 = 0.4032\text{ s}$$

$$(30 - 586)\text{ m} = -t_2(13.888\text{ m/s})$$

$$t_2 = 40.0346\text{ s}$$

$$(0 - 30)\text{ m} = -\frac{1}{2}(t_3)(13.888\text{ m/s})$$

$$t_3 = 4.3203\text{ s}$$

$$t_{\text{total}} = (0.4032 + 40.0346 + 4.3203)\text{ s}$$

$t_{\text{total}} = 44.8\text{ s}$ ◀

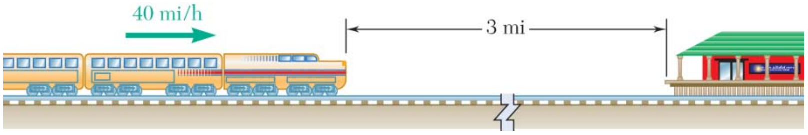
(*b*) We have

$$a_{\text{initial}} = \frac{\Delta v_{\text{initial}}}{t_1}$$

$$= \frac{[-13.888 - (-55.555)]\text{ m/s}}{0.4032\text{ s}}$$

$$= 103.3\text{ m/s}^2$$

$\mathbf{a}_{\text{initial}} = 103.3\text{ m/s}^2 \uparrow$ ◀



PROBLEM 11.67

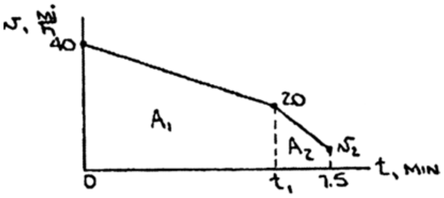
A commuter train traveling at 40 mi/h is 3 mi from a station. The train then decelerates so that its speed is 20 mi/h when it is 0.5 mi from the station. Knowing that the train arrives at the station 7.5 min after beginning to decelerate and assuming constant decelerations, determine (*a*) the time required for the train to travel the first 2.5 mi, (*b*) the speed of the train as it arrives at the station, (*c*) the final constant deceleration of the train.

SOLUTION

Given: At $t = 0$, $v = 40$ mi/h, $x = 0$; when $x = 2.5$ mi, $v = 20$ mi/h;

at $t = 7.5$ min, $x = 3$ mi; constant decelerations.

The $v-t$ curve is first drawn as shown.



(*a*) We have $A_1 = 2.5$ mi

$$(t_1 \text{ min})\left(\frac{40+20}{2}\right)\text{ mi/h} \times \frac{1\text{ h}}{60\text{ min}} = 2.5\text{ mi}$$

$t_1 = 5.00$ min ◀

(*b*) We have $A_2 = 0.5$ mi

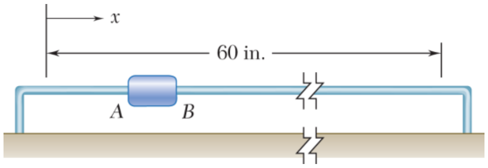
$$(7.5-5)\text{ min} \times \left(\frac{20+v_2}{2}\right)\text{mi/h} \times \frac{1\text{ h}}{60\text{ min}} = 0.5\text{ mi}$$

$v_2 = 4.00$ mi/h ◀

(*c*) We have $a_{\text{final}} = a_{12}$

$$= \frac{(4-20)\text{ mi/h}}{(7.5-5)\text{ min}} \times \frac{5280\text{ ft}}{\text{mi}} \times \frac{1\text{ min}}{60\text{ s}} \times \frac{1\text{ h}}{3600\text{ s}}$$

$a_{\text{final}} = -0.1564\text{ ft/s}^2$ ◀



PROBLEM 11.68

A temperature sensor is attached to slider *AB* which moves back and forth through 60 in. The maximum velocities of the slider are 12 in./s to the right and 30 in./s to the left. When the slider is moving to the right, it accelerates and decelerates at a constant rate of 6 in./s^2; when moving to the left, the slider accelerates and decelerates at a constant rate of 20 in./s^2. Determine the time required for the slider to complete a full cycle, and construct the $v-t$ and $x-t$ curves of its motion.

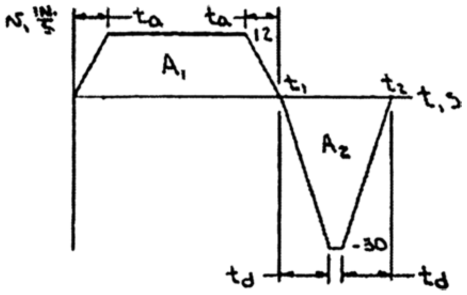
SOLUTION

The $v-t$ curve is first drawn as shown. Then

$$t_a = \frac{v_{\text{right}}}{a_{\text{right}}} = \frac{12 \text{ in./s}}{6 \text{ in./s}^2} = 2 \text{ s}$$

$$t_d = \frac{v_{\text{left}}}{a_{\text{left}}} = \frac{30 \text{ in./s}}{20 \text{ in./s}}$$

$$= 1.5 \text{ s}$$



Now $A_1 = 60$ in.

or $[(t_1 - 2) \text{ s}](12 \text{ in./s}) = 60$ in.

or $t_1 = 7$ s

and $A_2 = 60$ in.

or $\{[(t_2 - 7) - 1.5] \text{ s}\}(30 \text{ in./s}) = 60$ in.

or $t_2 = 10.5$ s

Now $t_{\text{cycle}} = t_2$

$t_{\text{cycle}} = 10.5$ s ◀

We have $x_{ii} = x_i + (\text{area under } v-t \text{ curve from } t_i \text{ to } t_{ii})$

At $t = 2$ s: $x_2 = \frac{1}{2}(2)(12) = 12$ in.

$t = 5$ s: $x_5 = 12 + (5-2)(12)$

$= 48$ in.

$t = 7$ s: $x_7 = 60$ in.

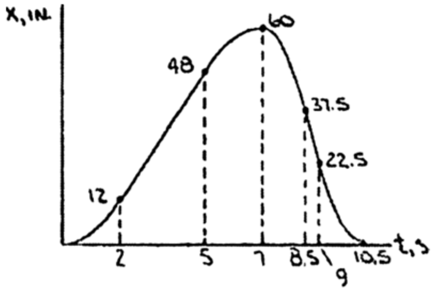
$t = 8.5$ s: $x_{8.5} = 60 - \frac{1}{2}(1.5)(30)$

$= 37.5$ in.

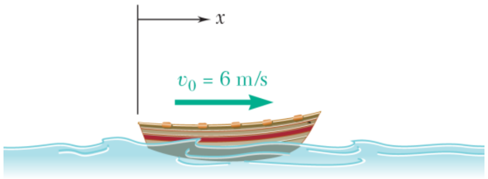
$t = 9$ s: $x_9 = 37.5 - (0.5)(30)$

$= 22.5$ in.

$t = 10.5$ s: $x_{10.5} = 0$



PROBLEM 11.69



In a water-tank test involving the launching of a small model boat, the model's initial horizontal velocity is 6 m/s, and its horizontal acceleration varies linearly from $-12\ \text{m/s}^2$ at $t = 0$ to $-2\ \text{m/s}^2$ at $t = t_1$ and then remains equal to $-2\ \text{m/s}^2$ until $t = 1.4$ s. Knowing that $v = 1.8$ m/s when $t = t_1$, determine (*a*) the value of t_1, (*b*) the velocity and the position of the model at $t = 1.4$ s.

SOLUTION

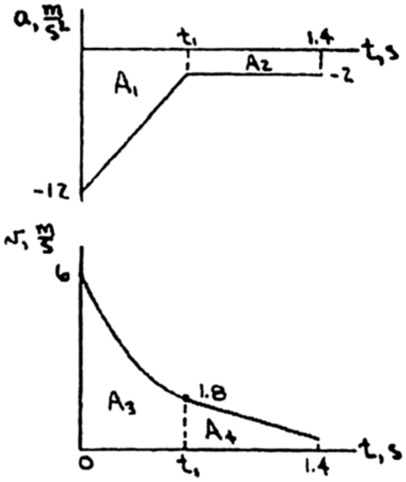
Given: $v_0 = 6$ m/s; for $0 < t < t_1$,

for $t_1 < t < 1.4\ \text{s} \quad a = -2\ \text{m/s}^2$;

at $t = 0 \quad a = -12\ \text{m/s}^2$;

at $t = t_1$ $a = -2\ \text{m/s}^2,\ v = 1.8\ \text{m/s}^2$

The a–t and v–t curves are first drawn as shown. The time axis is not drawn to scale.



(*a*) We have $v_{t_1} = v_0 + A_1$

$$1.8\ \text{m/s} = 6\ \text{m/s} - (t_1\ \text{s})\left(\frac{12+2}{2}\right)\text{m/s}^2$$

$$t_1 = 0.6\ \text{s} \quad ◀$$

(*b*) We have $v_{1.4} = v_{t_1} + A_2$

$$v_{1.4} = 1.8\ \text{m/s} - (1.4 - 0.6)\ \text{s} \times 2\ \text{m/s}^2$$

$$v_{1.4} = 0.20\ \text{m/s} \quad ◀$$

Now $x_{1.4} = A_3 + A_4$, where A_3 is most easily determined using integration. Thus,

for $0 < t < t_1$: $$a = \frac{-2-(-12)}{0.6}t - 12 = \frac{50}{3}t - 12$$

Now $$\frac{dv}{dt} = a = \frac{50}{3}t - 12$$

At $t = 0$, $v = 6$ m/s: $$\int_6^v dv = \int_0^t \left(\frac{50}{3}t - 12\right)dt$$

or $$v = 6 + \frac{25}{3}t^2 - 12t$$

We have $$\frac{dx}{dt} = v = 6 - 12t + \frac{25}{3}t^2$$

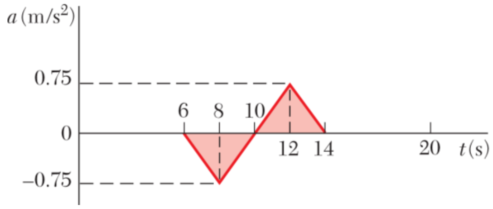
Then $$A_3 = \int_0^{x_{t_1}} dx = \int_0^{0.6} (6 - 12t + \frac{25}{3}t^2)dt$$

$$= \left[6t - 6t^2 + \frac{25}{9}t^3\right]_0^{0.6} = 2.04 \text{ m}$$

Also $$A_4 = (1.4 - 0.6)\left(\frac{1.8 + 0.2}{2}\right) = 0.8 \text{ m}$$

Then $$x_{1.4} = (2.04 + 0.8) \text{ m}$$

or $$x_{1.4} = 2.84 \text{ m} \blacktriangleleft$$



PROBLEM 11.70

The acceleration record shown was obtained for a small airplane traveling along a straight course. Knowing that $x = 0$ and $v = 60$ m/s when $t = 0$, determine (a) the velocity and position of the plane at $t = 20$ s, (b) its average velocity during the interval $6\text{ s} < t < 14\text{ s}$.

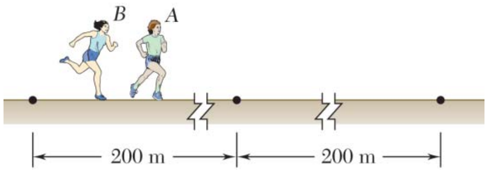
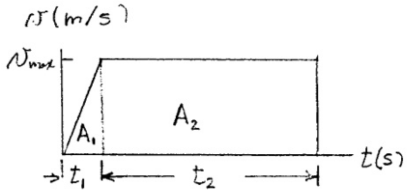
$v_{\text{average}} = 59.25$ m/s ◀

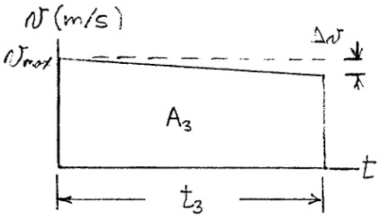


PROBLEM 11.71

In a 400-m race, runner A reaches her maximum velocity v_A in 4 s with constant acceleration and maintains that velocity until she reaches the half-way point with a split time of 25 s. Runner B reaches her maximum velocity v_B in 5 s with constant acceleration and maintains that velocity until she reaches the half-way point with a split time of 25.2 s. Both runners then run the second half of the race with the same constant deceleration of 0.1 m/s^2. Determine (*a*) the race times for both runners, (*b*) the position of the winner relative to the loser when the winner reaches the finish line.

SOLUTION





Sketch $v-t$ curves for first 200 m.

Runner A: $t_1 = 4\text{ s}, t_2 = 25 - 4 = 21\text{ s}$

$$A_1 = \frac{1}{2}(4)(v_A)_{\max} = 2(v_A)_{\max}$$

$$A_2 = 21(v_A)_{\max}$$

$$A_1 + A_2 = \Delta x = 200\text{ m}$$

$$23(v_A)_{\max} = 200 \qquad \text{or} \qquad (v_A)_{\max} = 8.6957\text{ m/s}$$

Runner B: $t_1 = 5\text{ s}, \qquad t_2 = 25.2 - 5 = 20.2\text{ s}$

$$A_1 = \frac{1}{2}(5)(v_B)_{\max} = 2.5(v_B)_{\max}$$

$$A_2 = 20.2(v_B)_{\max}$$

$$A_1 + A_2 = \Delta x = 200\text{ m}$$

$$22.7(v_B)_{\max} = 200 \qquad \text{or} \qquad (v_B)_{\max} = 8.8106\text{ m/s}$$

Sketch $v-t$ curve for second 200 m. $\Delta v = |a|t_3 = 0.1t_3$

$$A_3 = v_{\max}t_3 - \frac{1}{2}\Delta v t_3 = 200 \qquad \text{or} \qquad 0.05t_3^2 - v_{\max}t_3 + 200 = 0$$

$$t_3 = \frac{v_{\max} \pm \sqrt{(v_{\max})^2 - (4)(0.05)(200)}}{(2)(0.05)} = 10\left(v_{\max} \pm \sqrt{(v_{\max})^2 - 40}\right)$$

Runner A: $(v_{\max})_A = 8.6957, \qquad (t_3)_A = 146.64\text{ s} \qquad \text{and} \qquad 27.279\text{ s}$

Reject the larger root. Then total time $t_A = 25 + 27.279 = 52.279\text{ s}$ $\qquad t_A = 52.2\text{ s}$ ◀

PROBLEM 11.71 (Continued)

Runner B: $(v_{\max})_B = 8.8106$, $(t_3)_B = 149.45$ s and 26.765 s

Reject the larger root. Then total time $t_B = 25.2 + 26.765 = 51.965$ s

$t_B = 52.0$ s ◀

Velocity of A at $t = 51.965$ s:

$$v_1 = 8.6957 - (0.1)(51.965 - 25) = 5.999 \text{ m/s}$$

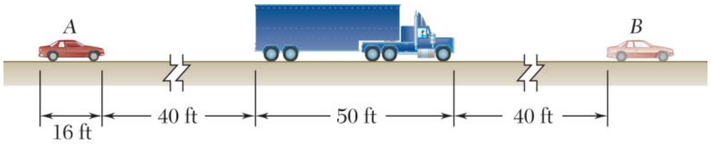
Velocity of A at $t = 51.279$ s:

$$v_2 = 8.6957 - (0.1)(52.279 - 25) = 5.968 \text{ m/s}$$

Over $51.965 \text{ s} \le t \le 52.965$ s, runner A covers a distance Δx

$$\Delta x = v_{\text{ave}}(\Delta t) = \frac{1}{2}(5.999 + 5.968)(52.279 - 51.965)$$

$\Delta x = 1.879$ m ◀



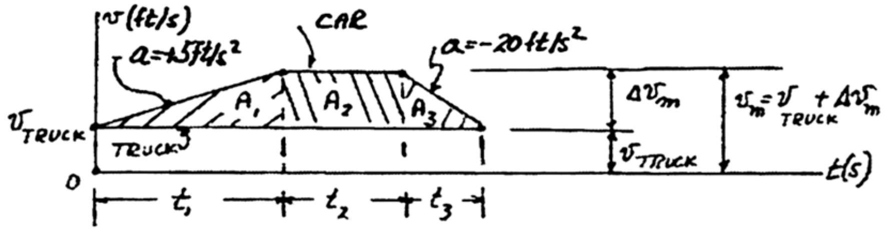
PROBLEM 11.72

A car and a truck are both traveling at the constant speed of 35 mi/h; the car is 40 ft behind the truck. The driver of the car wants to pass the truck, i.e., he wishes to place his car at *B*, 40 ft in front of the truck, and then resume the speed of 35 mi/h. The maximum acceleration of the car is $5\ \text{ft/s}^2$ and the maximum deceleration obtained by applying the brakes is $20\ \text{ft/s}^2$. What is the shortest time in which the driver of the car can complete the passing operation if he does not at any time exceed a speed of 50 mi/h? Draw the $v{-}t$ curve.

SOLUTION

Relative to truck, car must move a distance: $\Delta x = 16 + 40 + 50 + 40 = 146\ \text{ft}$

Allowable increase in speed: $\Delta v_m = 50 - 35 = 15\ \text{mi/h} = 22\ \text{ft/s}$



Acceleration Phase: $t_1 = 22/5 = 4.4\ \text{s}$ $A_1 = \frac{1}{2}(22)(4.4) = 48.4\ \text{ft}$

Deceleration Phase: $t_3 = 22/20 = 1.1\ \text{s}$ $A_3 = \frac{1}{2}(22)(1.1) = 12.1\ \text{ft}$

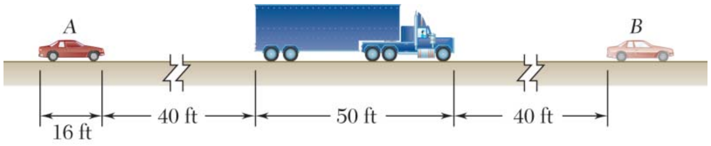
But: $\Delta x = A_1 + A_2 + A_3$: $146\ \text{ft} = 48.4 + (22)t_2 + 12.1$ $t_2 = 3.89\ \text{s}$

$t_{\text{total}} = t_1 + t_2 + t_3 = 4.4\ \text{s} + 3.89\ \text{s} + 1.1\ \text{s} = 9.39\ \text{s}$ $t_B = 9.39\ \text{s}$ ◀

PROBLEM 11.73

Solve Problem 11.72, assuming that the driver of the car does not pay any attention to the speed limit while passing and concentrates on reaching position *B* and resuming a speed of 35 mi/h in the shortest possible time. What is the maximum speed reached? Draw the v–t curve.

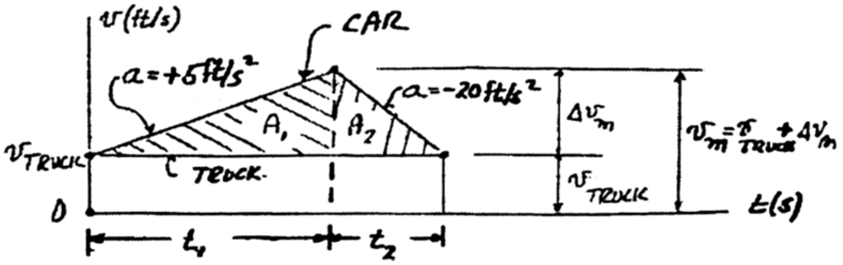
PROBLEM 11.72 A car and a truck are both traveling at the constant speed of 35 mi/h; the car is 40 ft behind the truck. The driver of the car wants to pass the truck, i.e., he wishes to place his car at *B*, 40 ft in front of the truck, and then resume the speed of 35 mi/h. The maximum acceleration of the car is 5 ft/s^2 and the maximum deceleration obtained by applying the brakes is 20 ft/s^2. What is the shortest time in which the driver of the car can complete the passing operation if he does not at any time exceed a speed of 50 mi/h? Draw the v–t curve.



SOLUTION

Relative to truck, car must move a distance:

$$\Delta x = 16 + 40 + 50 + 40 = 146 \text{ ft}$$



$$\Delta v_m = 5t_1 = 20t_2; \qquad t_2 = \frac{1}{4}t_1$$

$\Delta x = A_1 + A_2$:

$$146 \text{ ft} = \frac{1}{2}(\Delta v_m)(t_1 + t_2)$$

$$146 \text{ ft} = \frac{1}{2}(5t_1)\left(t_1 + \frac{1}{4}t_1\right)$$

$$t_1^2 = 46.72 \qquad t_1 = 6.835 \text{ s} \qquad t_2 = \frac{1}{4}t_1 = 1.709$$

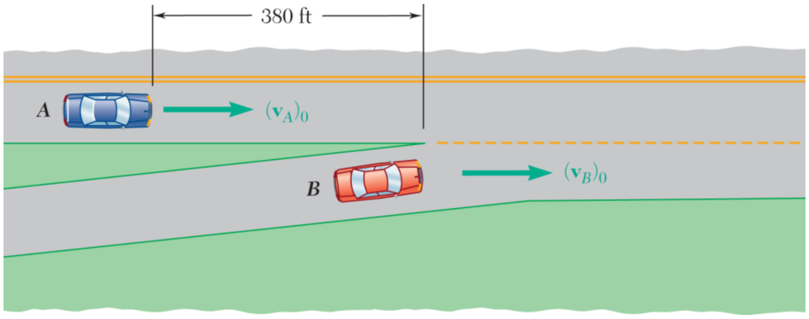
$$t_{\text{total}} = t_1 + t_2 = 6.835 + 1.709$$

$t_B = 8.54$ s ◀

$$\Delta v_m = 5t_1 = 5(6.835) = 34.18 \text{ ft/s} = 23.3 \text{ mi/h}$$

Speed $v_{\text{total}} = 35$ mi/h, $v_m = 35 \text{ mi/h} + 23.3 \text{ mi/h}$

$v_m = 58.3$ mi/h ◀



PROBLEM 11.74

Car A is traveling on a highway at a constant speed $(v_A)_0 = 60$ mi/h, and is 380 ft from the entrance of an access ramp when car B enters the acceleration lane at that point at a speed $(v_B)_0 = 15$ mi/h. Car B accelerates uniformly and enters the main traffic lane after traveling 200 ft in 5 s. It then continues to accelerate at the same rate until it reaches a speed of 60 mi/h, which it then maintains. Determine the final distance between the two cars.

SOLUTION

Given: $(v_A)_0 = 60$ mi/h, $(v_B)_0 = 1.5$ mi/h; at $t = 0$,

$(x_A)_0 = -380$ ft, $(x_B)_0 = 0$; at $t = 5$ s,

$x_B = 200$ ft; for 15 mi/h $< v_B \leq 60$ mi/h,

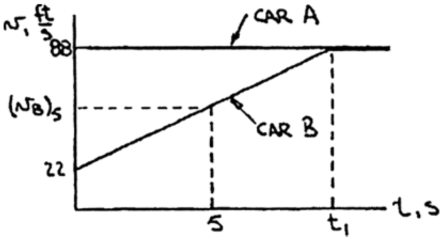
$a_B =$ constant; for $v_B = 60$ mi/h,

$a_B = 0$

First note 60 mi/h = 88 ft/s

15 mi/h = 22 ft/s

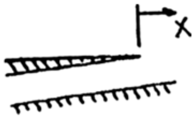
The v–t curves of the two cars are then drawn as shown.



Using the coordinate system shown, we have

at $t = 5$ s, $x_B = 200$ ft: $$(5\text{ s})\left[\frac{22+(v_B)_5}{2}\right]\text{ ft/s} = 200\text{ ft}$$

or $$(v_B)_5 = 58\text{ ft/s}$$



Then, using similar triangles, we have

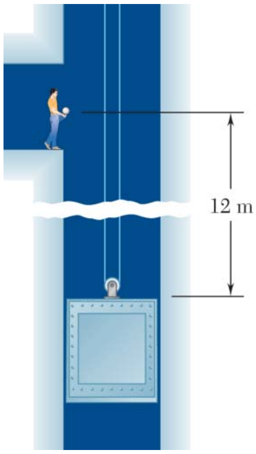
$$\frac{(88-22)\text{ ft/s}}{t_1} = \frac{(58-22)\text{ ft/s}}{5\text{ s}} (= a_B)$$

or $$t_1 = 9.1667\text{ s}$$

Finally, at $t = t_1$

$$x_{B/A} = x_B - x_A = \left[(9.1667\text{ s})\left(\frac{22+88}{2}\right)\text{ft/s}\right] - [-380\text{ ft} + (9.1667\text{ s})(88\text{ ft/s})]$$

or $$x_{B/A} = 77.5\text{ ft} ◀$$



PROBLEM 11.75

An elevator starts from rest and moves upward, accelerating at a rate of 1.2 m/s^2 until it reaches a speed of 7.8 m/s, which it then maintains. Two seconds after the elevator begins to move, a man standing 12 m above the initial position of the top of the elevator throws a ball upward with an initial velocity of 20 m/s. Determine when the ball will hit the elevator.

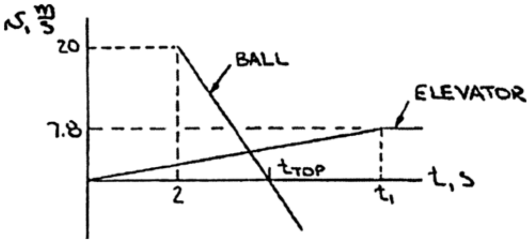
SOLUTION

Given: At $t = 0 \quad v_E = 0$; For $0 < v_E \leq 7.8$ m/s, $a_E = 1.2 \text{ m/s}^2 \uparrow$;

For $v_E = 7.8$ m/s, $a_E = 0$;

At $t = 2$ s, $v_B = 20 \text{m/s} \uparrow$

The v–t curves of the ball and the elevator are first drawn as shown. Note that the initial slope of the curve for the elevator is 1.2 m/s^2, while the slope of the curve for the ball is $-g\,(-9.81 \text{ m/s}^2)$.



The time t_1 is the time when v_E reaches 7.8 m/s.

Thus, $$v_E = (0) + a_E t$$

or $$7.8 \text{ m/s} = (1.2 \text{ m/s}^2)t_1$$

or $$t_1 = 6.5 \text{ s}$$

The time t_{top} is the time at which the ball reaches the top of its trajectory.

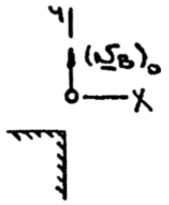
Thus, $$v_B = (v_B)_0 - g(t-2)$$

or $$0 = 20 \text{ m/s} - (9.81 \text{ m/s}^2)(t_{\text{top}} - 2) \text{ s}$$

or $$t_{\text{top}} = 4.0387 \text{ s}$$

PROBLEM 11.75 (Continued)

Using the coordinate system shown, we have



$0 < t < t_1$: $$y_E = -12 \text{ m} + \left(\frac{1}{2}a_E t^2\right) \text{ m}$$

At $t = t_{\text{top}}$: $$y_B = \frac{1}{2}(4.0387 - 2) \text{ s} \times (20 \text{ m/s})$$
$$= 20.387 \text{ m}$$

and $$y_E = -12 \text{ m} + \frac{1}{2}(1.2 \text{ m/s}^2)(4.0387 \text{ s})^2$$
$$= -2.213 \text{ m}$$

At $$t = [2 + 2(4.0387 - 2)] \text{ s} = 6.0774 \text{ s}, \ \ y_B = 0$$

and at $t = t_1$, $$y_E = -12 \text{ m} + \frac{1}{2}(6.5 \text{ s})(7.8 \text{ m/s}) = 13.35 \text{ m}$$

The ball hits the elevator $(y_B = y_E)$ when $t_{\text{top}} \le t \le t_1$.

For $t \ge t_{\text{top}}$: $$y_B = 20.387 \text{ m} - \left[\frac{1}{2} \text{ g } (t - t_{\text{top}})^2\right] \text{ m}$$

Then,

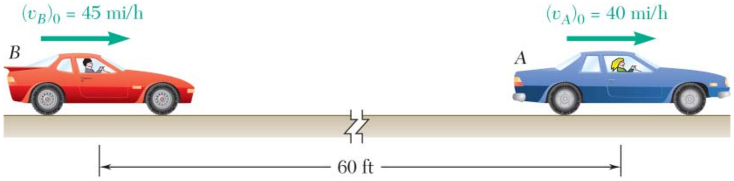
when $$y_B = y_E$$

$$20.387 \text{ m} - \frac{1}{2}(9.81 \text{ m/s}^2)(t - 4.0387)^2$$
$$= -12 \text{ m} + \frac{1}{2}(1.2 \text{ m/s}^2)(t \text{ s})^2$$

or $$5.505t^2 - 39.6196t + 47.619 = 0$$

Solving $$t = 1.525 \text{ s} \quad \text{and} \quad t = 5.67 \text{ s}$$

Since 1.525 s is less than 2 s, $t = 5.67$ s ◀



PROBLEM 11.76

Car *A* is traveling at 40 mi/h when it enters a 30 mi/h speed zone. The driver of car *A* decelerates at a rate of 16 ft/s^2 until reaching a speed of 30 mi/h, which she then maintains. When car *B*, which was initially 60 ft behind car *A* and traveling at a constant speed of 45 mi/h, enters the speed zone, its driver decelerates at a rate of 20 ft/s^2 until reaching a speed of 28 mi/h. Knowing that the driver of car *B* maintains a speed of 28 mi/h, determine (*a*) the closest that car *B* comes to car *A*, (*b*) the time at which car *A* is 70 ft in front of car *B*.

SOLUTION

Given: $(v_A)_0 = 40$ mi/h; For $30 \text{ mi/h} < v_A \leq 40$ mi/h, $a_A = -16 \text{ ft/s}^2$; For $v_A = 30$ mi/h, $a_A = 0$;

$(x_{A/B})_0 = 60$ ft; $(v_B)_0 = 45$ mi/h;

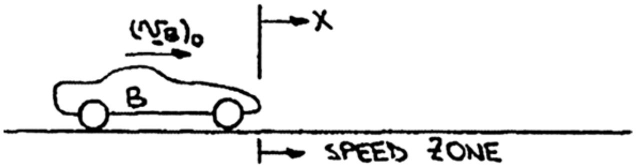
When $x_B = 0$, $a_B = -20 \text{ ft/s}^2$;

For $v_B = 28$ mi/h, $a_B = 0$

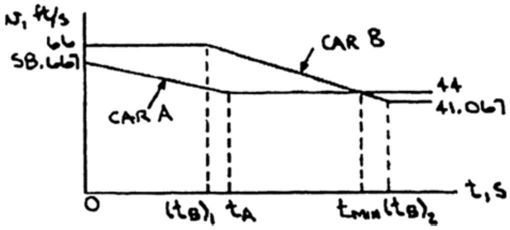
First note $40 \text{ mi/h} = 58.667 \text{ ft/s}$ $30 \text{ mi/h} = 44 \text{ ft/s}$

$45 \text{ mi/h} = 66 \text{ ft/s}$ $28 \text{ mi/h} = 41.067 \text{ ft/s}$

At $t = 0$



The v–t curves of the two cars are as shown.



At $t = 0$: Car *A* enters the speed zone.

$t = (t_B)_1$: Car *B* enters the speed zone.

$t = t_A$: Car *A* reaches its final speed.

$t = t_{\min}$: $v_A = v_B$

$t = (t_B)_2$: Car *B* reaches its final speed.

PROBLEM 11.76 (Continued)

(*a*) We have $$a_A = \frac{(v_A)_{\text{final}} - (v_A)_0}{t_A}$$

or $$-16\text{ ft/s}^2 = \frac{(44 - 58.667)\text{ ft/s}}{t_A}$$

or $$t_A = 0.91669\text{ s}$$

Also $$60\text{ ft} = (t_B)_1(v_B)_0$$

or $$60\text{ ft} = (t_B)_1(66\text{ ft/s}) \qquad \text{or} \qquad (t_B)_1 = 0.90909\text{ s}$$

and $$a_B = \frac{(v_B)_{\text{final}} - (v_B)_0}{(t_B)_2 - (t_B)_1}$$

or $$-20\text{ ft/s}^2 = \frac{(41.067 - 66)\text{ ft/s}}{[(t_B)_2 - 0.90909]\text{ s}}$$

Car *B* will continue to overtake car *A* while $v_B > v_A$. Therefore, $(x_{A/B})_{\min}$ will occur when $v_A = v_B$, which occurs for

$$(t_B)_1 < t_{\min} < (t_B)_2$$

For this time interval

$$v_A = 44\text{ ft/s}$$
$$v_B = (v_B)_0 + a_B[t - (t_B)_1]$$

Then at $t = t_{\min}$: $$44\text{ ft/s} = 66\text{ ft/s} + (-20\text{ ft/s}^2)(t_{\min} - 0.90909)\text{ s}$$

or $$t_{\min} = 2.00909\text{ s}$$

Finally $$(x_{A/B})_{\min} = (x_A)_{t_{\min}} - (x_B)_{t_{\min}}$$

$$= \left\{ t_A \left[\frac{(v_A)_0 + (v_A)_{\text{final}}}{2} \right] + (t_{\min} - t_A)(v_A)_{\text{final}} \right\}$$

$$- \left\{ (x_B)_0 + (t_B)_1(v_B)_0 + [t_{\min} - (t_B)_1] \left[\frac{(v_B)_0 + (v_A)_{\text{final}}}{2} \right] \right\}$$

$$= \left[(0.91669\text{ s}) \left(\frac{58.667 + 44}{2} \right) \text{ft/s} + (2.00909 - 0.91669)\text{ s} \times (44\text{ ft/s}) \right]$$

$$- \left[-60\text{ ft} + (0.90909\text{ s})(66\text{ ft/s}) + (2.00909 - 0.90909)\text{ s} \times \left(\frac{66 + 44}{2} \right) \text{ft/s} \right]$$

$$= (47.057 + 48.066)\text{ ft} - (-60 + 60.000 + 60.500)\text{ ft}$$

$$= 34.623\text{ ft}$$

or $(x_{A/B})_{\min} = 34.6\text{ ft}$ ◀

PROBLEM 11.76 (Continued)

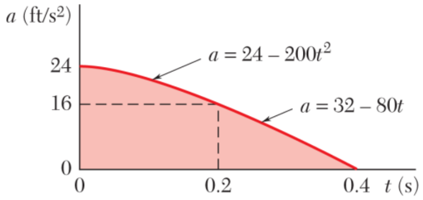
(*b*) Since $(x_{A/B}) \le 60$ ft for $t \le t_{\min}$, it follows that $x_{A/B} = 70$ ft for $t > (t_B)_2$

[Note $(t_B)_2 \simeq t_{\min}$]. Then, for $t > (t_B)_2$

$$x_{A/B} = (x_{A/B})_{\min} + [(t - t_{\min})(v_A)_{\text{final}}]$$
$$- \left\{[(t_B)_2 - (t_{\min})]\left[\frac{(v_A)_{\text{final}} + (v_B)_{\text{final}}}{2}\right] + [t - (t_B)_2](v_B)_{\text{final}}\right\}$$

or
$$70 \text{ ft} = 34.623 \text{ ft} + [(t - 2.00909) \text{ s} \times (44 \text{ ft/s})]$$
$$- \left[(2.15574 - 2.00909) \text{ s} \times \left(\frac{44 + 41.06}{2}\right) \text{ft/s} + (t - 2.15574) \text{ s} \times (41.067) \text{ ft/s}\right]$$

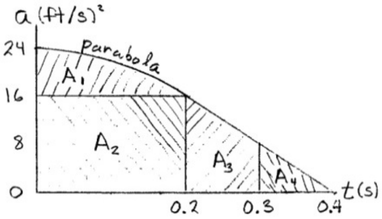
or $t = 14.14$ s ◀

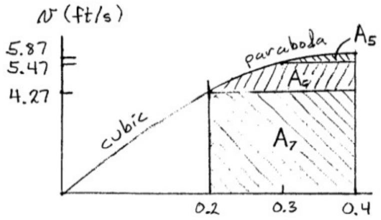


PROBLEM 11.77

An accelerometer record for the motion of a given part of a mechanism is approximated by an arc of a parabola for 0.2 s and a straight line for the next 0.2 s as shown in the figure. Knowing that $v = 0$ when $t = 0$ and $x = 0.8$ ft when $t = 0.4$ s, (*a*) construct the $v-t$ curve for $0 \le t \le 0.4$ s, (*b*) determine the position of the part at $t = 0.3$ s and $t = 0.2$ s.

SOLUTION





Divide the area of the $a-t$ curve into the four areas A_1, A_2, A_3 and A_4.

$$A_1 = \frac{2}{3}(8)(0.2) = 1.0667 \text{ ft/s}$$

$$A_2 = (16)(0.2) = 3.2 \text{ ft/s}$$

$$A_3 = \frac{1}{2}(16 + 8)(0.1) = 1.2 \text{ ft/s}$$

$$A_4 = \frac{1}{2}(8)(0.1) = 0.4 \text{ ft/s}$$

Velocities: $v_0 = 0$

$v_{0.2} = v_0 + A_1 + A_2$ $\quad v_{0.2} = 4.27$ ft/s ◀

$v_{0.3} = v_{0.2} + A_3$ $\quad v_{0.3} = 5.47$ ft/s ◀

$v_{0.4} = v_{0.3} + A_4$ $\quad v_{0.4} = 5.87$ ft/s ◀

Sketch the $v-t$ curve and divide its area into A_5, A_6, and A_7 as shown.

$$\int_x^{0.8} dx = 0.8 - x = \int_t^{0.4} v\,dt \qquad \text{or} \qquad x = 0.8 - \int_t^{0.4} v\,dt$$

At $t = 0.3$ s, $\quad x_{0.3} = 0.8 - A_5 - (5.47)(0.1)$

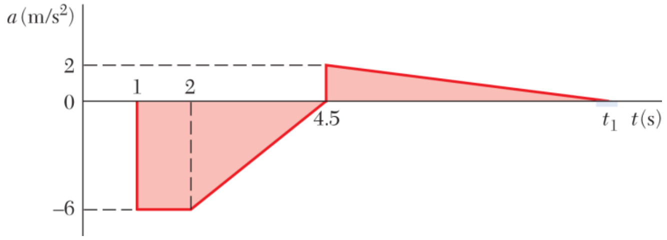
With $A_5 = \frac{2}{3}(0.4)(0.1) = 0.0267$ ft, $\quad x_{0.3} = 0.227$ ft ◀

At $t = 0.2$ s, $\quad x_{0.2} = 0.8 - (A_5 + A_6) - A_7$

With $A_5 + A_6 = \frac{2}{3}(1.6)(0.2) = 0.2133$ ft,

and $\quad A_7 = (4.27)(0.2) = 0.8533$ ft

$x_{0.2} = 0.8 - 0.2133 - 0.8533$ $\quad x_{0.2} = -0.267$ ft ◀



PROBLEM 11.78

A car is traveling at a constant speed of 54 km/h when its driver sees a child run into the road. The driver applies her brakes until the child returns to the sidewalk and then accelerates to resume her original speed of 54 km/h; the acceleration record of the car is shown in the figure. Assuming $x = 0$ when $t = 0$, determine (*a*) the time t_1 at which the velocity is again 54 km/h, (*b*) the position of the car at that time, (*c*) the average velocity of the car during the interval $1\text{ s} \le t \le t_1$.

SOLUTION

Given: At $t = 0, \quad x = 0, \quad v = 54\text{ km/h};$

For $t = t_1, \quad v = 54\text{ km/h}$

First note $54\text{ km/h} = 15\text{ m/s}$

(*a*) We have $v_b = v_a + (\text{area under } a\text{–}t \text{ curve from } t_a \text{ to } t_b)$

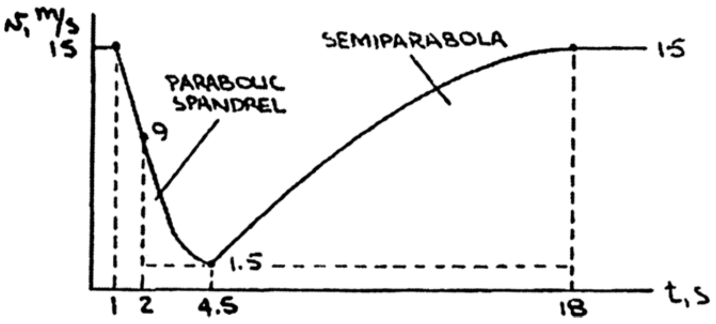
Then at $t = 2\text{ s}: \quad v = 15 - (1)(6) = 9\text{ m/s}$

$$t = 4.5\text{ s}: \quad v = 9 - \frac{1}{2}(2.5)(6) = 1.5\text{ m/s}$$

$$t = t_1: \quad 15 = 1.5 + \frac{1}{2}(t_1 - 4.5)(2)$$

or $t_1 = 18.00\text{ s}$ ◀

(*b*) Using the above values of the velocities, the v–t curve is drawn as shown.



Now x at $t = 18$ s

$$x_{18} = 0 + \Sigma\,(\text{area under the } v\text{–}t \text{ curve from } t = 0 \text{ to } t = 18\text{ s})$$

$$= (1\text{ s})(15\text{ m/s}) + (1\text{ s})\left(\frac{15+9}{2}\right)\text{m/s}$$

$$+\left[(2.5\text{ s})(1.5\text{ m/s}) + \frac{1}{3}(2.5\text{ s})(7.5\text{ m/s})\right]$$

$$+\left[(13.5\text{ s})(1.5\text{ m/s}) + \frac{2}{3}(13.5\text{ s})(13.5\text{ m/s})\right]$$

$$= [15 + 12 + (3.75 + 6.25) + (20.25 + 121.50)]\text{ m}$$

$$= 178.75\text{ m}$$

or $x_{18} = 178.8$ m ◀

(*c*) First note $x_1 = 15$ m

$$x_{18} = 178.75\text{ m}$$

Now $$v_{\text{ave}} = \frac{\Delta x}{\Delta t} = \frac{(178.75 - 15)\text{ m}}{(18-1)\text{ s}} = 9.6324\text{ m/s}$$

or $v_{\text{ave}} = 34.7$ km/h ◀

PROBLEM 11.79

An airport shuttle train travels between two terminals that are 1.6 mi apart. To maintain passenger comfort, the acceleration of the train is limited to ±4 ft/s^2, and the jerk, or rate of change of acceleration, is limited to ±0.8 ft/s^2 per second. If the shuttle has a maximum speed of 20 mi/h, determine (*a*) the shortest time for the shuttle to travel between the two terminals, (*b*) the corresponding average velocity of the shuttle.

SOLUTION

Given: $x_{\max} = 1.6 \text{ mi}; \quad |a_{\max}| = 4 \text{ ft/s}^2$

$$\left|\left(\frac{da}{dt}\right)_{\max}\right| = 0.8 \text{ ft/s}^2\text{/s}; \quad v_{\max} = 20 \text{ mi/h}$$

First note $20 \text{ mi/h} = 29.333 \text{ ft/s}$

$$1.6 \text{ mi} = 8448 \text{ ft}$$

(*a*) To obtain $t_{\min}$, the train must accelerate and decelerate at the maximum rate to maximize the time for which $v = v_{\max}$. The time Δt required for the train to have an acceleration of 4 ft/s^2 is found from

$$\left(\frac{da}{dt}\right)_{\max} = \frac{a_{\max}}{\Delta t}$$

or $$\Delta t = \frac{4 \text{ ft/s}^2}{0.8 \text{ ft/s}^2\text{/s}}$$

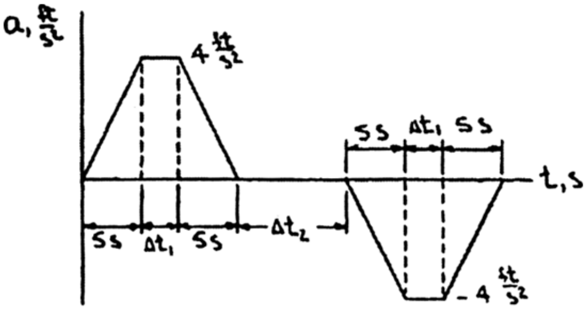
or $$\Delta t = 5 \text{ s}$$

Now,

after 5 s, the speed of the train is $v_5 = \frac{1}{2}(\Delta t)(a_{\max}) \quad \left(\text{since } \frac{da}{dt} = \text{constant}\right)$

or $$v_5 = \frac{1}{2}(5 \text{ s})(4 \text{ ft/s}^2) = 10 \text{ ft/s}$$

Then, since $v_5 < v_{\max}$, the train will continue to accelerate at 4 ft/s^2 until $v = v_{\max}$. The a–t curve must then have the shape shown. Note that the magnitude of the slope of each inclined portion of the curve is 0.8 ft/s^2/s.



Now at $t = (10 + \Delta t_1)$ s, $v = v_{\max}$:

$$2\left[\frac{1}{2}(5\text{ s})(4\text{ ft/s}^2)\right] + (\Delta t_1)(4\text{ ft/s}^2) = 29.333\text{ ft/s}$$

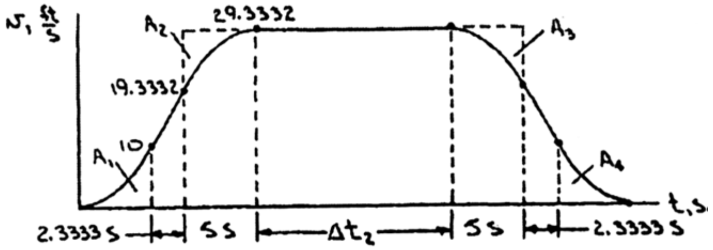
or $\Delta t_1 = 2.3333$ s

Then at $t = 5$ s: $v = 0 + \frac{1}{2}(5)(4) = 10$ ft/s

$t = 7.3333$ s: $v = 10 + (2.3333)(4) = 19.3332$ ft/s

$t = 12.3333$ s: $v = 19.3332 + \frac{1}{2}(5)(4) = 29.3332$ ft/s

Using symmetry, the v–t curve is then drawn as shown.



Noting that $A_1 = A_2 = A_3 = A_4$ and that the area under the v–t curve is equal to $x_{\max}$, we have

$$2\left[(2.3333\text{ s})\left(\frac{10 + 19.3332}{2}\right)\text{ft/s}\right] + (10 + \Delta t_2)\text{ s} \times (29.3332\text{ ft/s}) = 8448\text{ ft}$$

or $\Delta t_2 = 275.67$ s

Then $t_{\min} = 4(5\text{ s}) + 2(2.3333\text{ s}) + 275.67\text{ s}$

$= 300.34$ s

or $t_{\min} = 5.01$ min ◀

(*b*) We have $v_{\text{ave}} = \dfrac{\Delta x}{\Delta t} = \dfrac{1.6\text{ mi}}{300.34\text{ s}} \times \dfrac{3600\text{ s}}{1\text{ h}}$

or $v_{\text{ave}} = 19.18$ mi/h ◀

PROBLEM 11.80

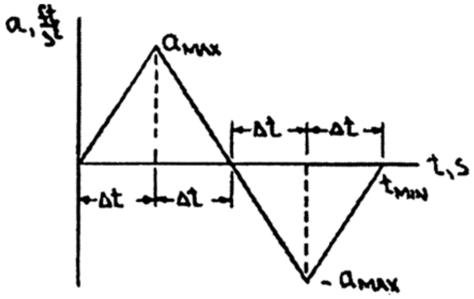
During a manufacturing process, a conveyor belt starts from rest and travels a total of 1.2 ft before temporarily coming to rest. Knowing that the jerk, or rate of change of acceleration, is limited to ±4.8 ft/s^2 per second, determine (*a*) the shortest time required for the belt to move 1.2 ft, (*b*) the maximum and average values of the velocity of the belt during that time.

SOLUTION

Given: At $t = 0, \quad x = 0, \quad v = 0; \quad x_{\max} = 1.2 \text{ ft};$

when $x = x_{\max}, \quad v = 0; \quad \left| \left(\frac{da}{dt} \right)_{\max} \right| = 4.8 \text{ ft/s}^2$

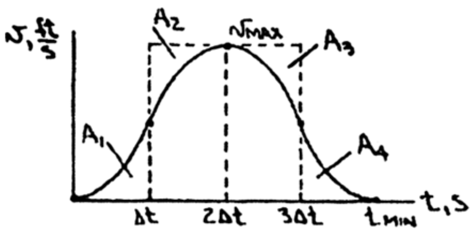
(*a*) Observing that $v_{\max}$ must occur at $t = \frac{1}{2} t_{\min}$, the a–t curve must have the shape shown. Note that the magnitude of the slope of each portion of the curve is 4.8 ft/s^2/s.



We have at $t = \Delta t$: $v = 0 + \frac{1}{2}(\Delta t)(a_{\max}) = \frac{1}{2} a_{\max} \Delta t$

$t = 2\Delta t$: $v_{\max} = \frac{1}{2} a_{\max} \Delta t + \frac{1}{2}(\Delta t)(a_{\max}) = a_{\max} \Delta t$

Using symmetry, the v–t is then drawn as shown.



Noting that $A_1 = A_2 = A_3 = A_4$ and that the area under the v–t curve is equal to $x_{\max}$, we have

$$(2\Delta t)(v_{\max}) = x_{\max}$$

$$v_{\max} = a_{\max} \Delta t \Rightarrow 2 a_{\max} \Delta t^2 = x_{\max}$$

PROBLEM 11.80 (Continued)

Now $\frac{a_{\max}}{\Delta t} = 4.8 \text{ ft/s}^2/\text{s}$ so that

$$2(4.8\Delta t \text{ ft/s}^3)\Delta t^2 = 1.2 \text{ ft}$$

or $\Delta t = 0.5 \text{ s}$

Then $t_{\min} = 4\Delta t$

or $t_{\min} = 2.00 \text{ s}$ ◀

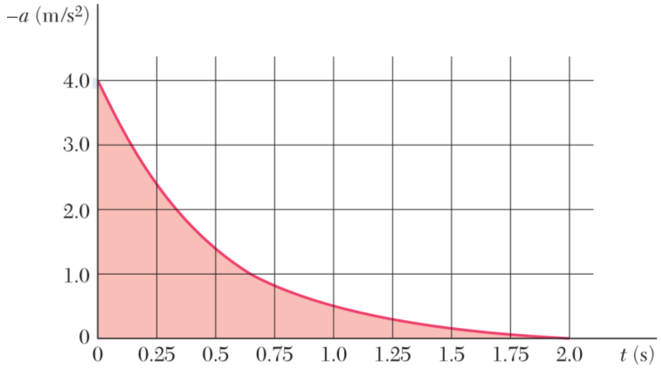
(*b*) We have

$$\begin{aligned} v_{\max} &= a_{\max}\Delta t \\ &= (4.8 \text{ ft/s}^2/\text{s} \times \Delta\text{t})\Delta t \\ &= 4.8 \text{ ft/s}^2/\text{s} \times (0.5 \text{ s})^2 \end{aligned}$$

or $v_{\max} = 1.2 \text{ ft/s}$ ◀

Also $v_{\text{ave}} = \frac{\Delta x}{\Delta t_{\text{total}}} = \frac{1.2 \text{ ft}}{2.00 \text{ s}}$

or $v_{\text{ave}} = 0.6 \text{ ft/s}$ ◀



PROBLEM 11.81

Two seconds are required to bring the piston rod of an air cylinder to rest; the acceleration record of the piston rod during the 2 s is as shown. Determine by approximate means (*a*) the initial velocity of the piston rod, (*b*) the distance traveled by the piston rod as it is brought to rest.

SOLUTION

Given: a–t curve; at $t = 2$ s, $v = 0$

1. The a–t curve is first approximated with a series of rectangles, each of width $\Delta t = 0.25$ s. The area $(\Delta t)(a_{\text{ave}})$ of each rectangle is approximately equal to the change in velocity Δv for the specified interval of time. Thus,

$$\Delta v \cong a_{\text{ave}}\,\Delta t$$

where the values of a_{ave} and Δv are given in columns 1 and 2, respectively, of the following table.

2. Now

$$v(2) = v_0 + \int_0^2 a\,dt = 0$$

and approximating the area $\int_0^2 a\,dt$ under the a–t curve by $\Sigma a_{\text{ave}}\Delta t \approx \Sigma \Delta v$, the initial velocity is then equal to

$$v_0 = -\Sigma \Delta v$$

Finally, using

$$v_2 = v_1 + \Delta v_{12}$$

where Δv_{12} is the change in velocity between times t_1 and t_2, the velocity at the end of each 0.25 interval can be computed; see column 3 of the table and the v–t curve.

3. The v–t curve is then approximated with a series of rectangles, each of width 0.25 s. The area $(\Delta t)(v_{\text{ave}})$ of each rectangle is approximately equal to the change in position Δx for the specified interval of time. Thus

$$\Delta x \approx v_{\text{ave}}\Delta t$$

where v_{ave} and Δx are given in columns 4 and 5, respectively, of the table.

PROBLEM 11.81 (Continued)

4. With $x_0 = 0$ and noting that

$$x_2 = x_1 + \Delta x_{12}$$

where Δx_{12} is the change in position between times t_1 and t_2, the position at the end of each 0.25 s interval can be computed; see column 6 of the table and the x–t curve.

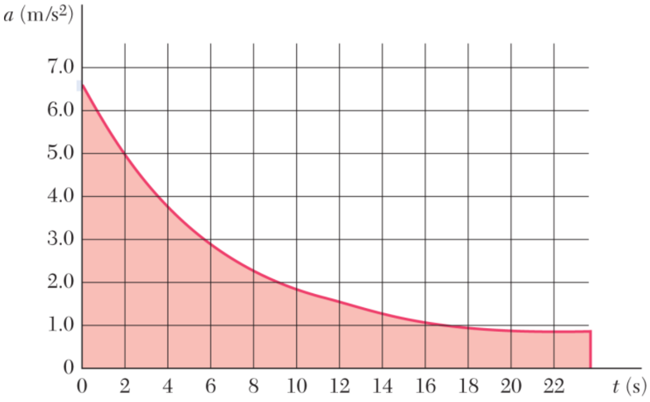
(*b*) At $t = 2$ s $x = 0.840$ m ◀



PROBLEM 11.82

The acceleration record shown was obtained during the speed trials of a sports car. Knowing that the car starts from rest, determine by approximate means (*a*) the velocity of the car at $t = 8$ s, (*b*) the distance the car has traveled at $t = 20$ s.

SOLUTION

Given: a–t curve; at $t = 0, \ x = 0, \ v = 0$

1. The a–t curve is first approximated with a series of rectangles, each of width $\Delta t = 2$ s. The area $(\Delta t)(a_{\text{ave}})$ of each rectangle is approximately equal to the change in velocity Δv for the specified interval of time. Thus,

$$\Delta v \cong a_{\text{ave}} \ \Delta t$$

where the values of a_{ave} and Δv are given in columns 1 and 2, respectively, of the following table.

2. Noting that $v_0 = 0$ and that

$$v_2 = v_1 + \Delta v_{12}$$

where Δv_{12} is the change in velocity between times t_1 and t_2, the velocity at the end of each 2 s interval can be computed; see column 3 of the table and the v–t curve.

3. The v–t curve is next approximated with a series of rectangles, each of width $\Delta t = 2$ s. The area $(\Delta t)(v_{\text{ave}})$ of each rectangle is approximately equal to the change in position Δx for the specified interval of time.

Thus, $\Delta x \cong v_{\text{ave}} \ \Delta t$

where v_{ave} and Δx are given in columns 4 and 5, respectively, of the table.

4. With $x_0 = 0$ and noting that

$$x_2 = x_1 + \Delta x_{12}$$

where Δx_{12} is the change in position between times t_1 and t_2, the position at the end of each 2 s interval can be computed; see column 6 of the table and the x–t curve.

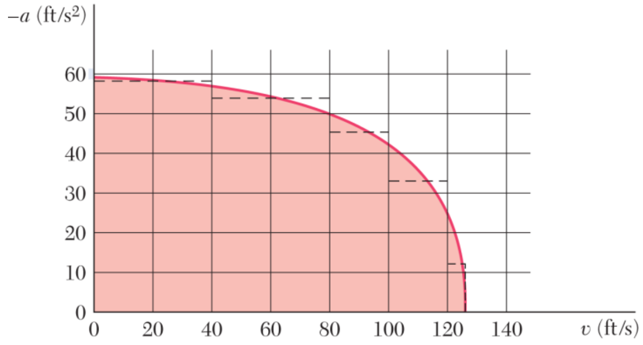
(*a*) At $t = 8$ s, $v = 32.58$ m/s or $v = 117.3$ km/h ◀

(*b*) At $t = 20$ s $x = 660$ m ◀



PROBLEM 11.83

A training airplane has a velocity of 126 ft/s when it lands on an aircraft carrier. As the arresting gear of the carrier brings the airplane to rest, the velocity and the acceleration of the airplane are recorded; the results are shown (solid curve) in the figure. Determine by approximate means (*a*) the time required for the airplane to come to rest, (*b*) the distance traveled in that time.

SOLUTION

Given: $a\!-\!v$ curve:

$$v_0 = 126 \text{ ft/s}$$

The given curve is approximated by a series of uniformly accelerated motions (the horizontal dashed lines on the figure).

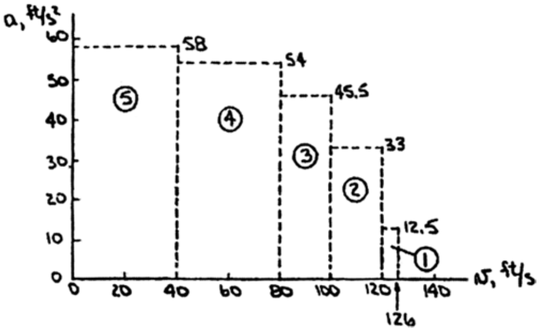
For uniformly accelerated motion

$$v_2^2 = v_1^2 + 2a(x_2 - x_1)$$
$$v_2 = v_1 + a(t_2 - t_1)$$

or

$$\Delta x = \frac{v_2^2 - v_1^2}{2a}$$

$$\Delta t = \frac{v_2 - v_1}{a}$$

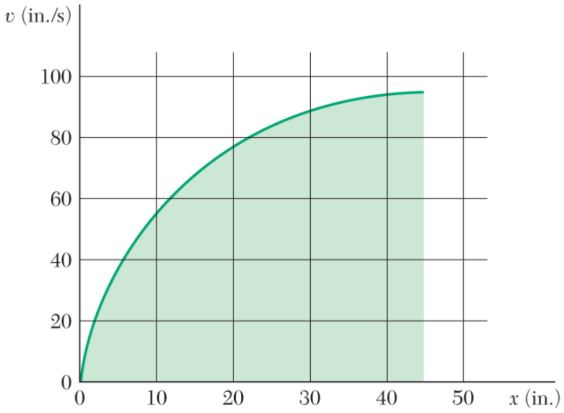


For the five regions shown above, we have

Region	v_1, ft/s	v_2, ft/s	a, ft/s^2	Δx, ft	Δt, s
1	126	120	−12.5	59.0	0.480
2	120	100	−33	66.7	0.606
3	100	80	−45.5	39.6	0.440
4	80	40	−54	44.4	0.741
5	40	0	−58	13.8	0.690
Σ				223.5	2.957

(*a*) From the table, when $v = 0$ $t = 2.96$ s ◀

(*b*) From the table and assuming $x_0 = 0$, when $v = 0$ $x = 224$ ft ◀

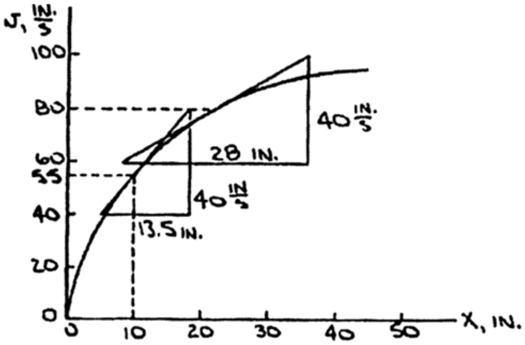


PROBLEM 11.84

Shown in the figure is a portion of the experimentally determined $v-x$ curve for a shuttle cart. Determine by approximate means the acceleration of the cart (*a*) when $x = 10$ in., (*b*) when $v = 80$ in./s.

SOLUTION

Given: $v-x$ curve



First note that the slope of the above curve is $\frac{dv}{dx}$. Now

$$a = v\frac{dv}{dx}$$

(*a*) When $x = 10$ in., $v = 55$ in./s

Then

$$a = 55 \text{ in./s}\left(\frac{40 \text{ in./s}}{13.5 \text{ in.}}\right)$$

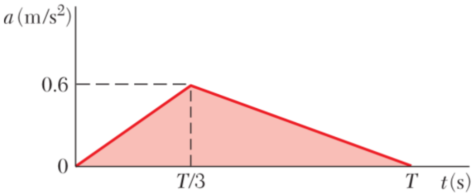
or $a = 163.0 \text{ in./s}^2$ ◀

(*b*) When $v = 80$ in./s, we have

$$a = 80 \text{ in./s}\left(\frac{40 \text{ in./s}}{28 \text{ in.}}\right)$$

or $a = 114.3 \text{ in./s}^2$ ◀

Note: To use the method of measuring the subnormal outlined at the end of Section 11.8, it is necessary that the same scale be used for the *x* and *v* axes (e.g., 1 in. = 50 in., 1 in. = 50 in./s). In the above solution, Δv and Δx were measured directly, so different scales could be used.



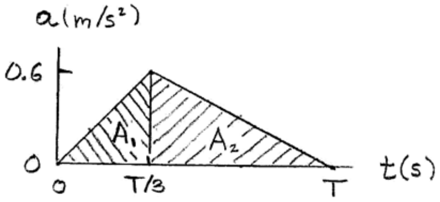
PROBLEM 11.85

An elevator starts from rest and rises 40 m to its maximum velocity in T s with the acceleration record shown in the figure. Determine (*a*) the required time T, (*b*) the maximum velocity, (*c*) the velocity and position of the elevator at $t = T/2$.

SOLUTION

Find the position of the elevator from the $a-t$ curve using the moment-area method.

First, find the areas A_1 and A_2 on the $a-t$ curve



$$A_1 = \frac{1}{2}(0.6)\frac{T}{3} = 0.1T \text{ m/s}$$

$$A_2 = \frac{1}{2}(0.6)\frac{2T}{3} = 0.2T \text{ m/s}$$

(a) Apply the moment-area formula: $x - x_0 = v_0 t + \int_0^T (T-t)\,a dt$

$$x = v_0 t + (A_1)\left(T - \frac{2}{3}\left(\frac{T}{3}\right)\right) + A_2\left(T - \left(\frac{T}{3} + \frac{1}{3}\left(\frac{2T}{3}\right)\right)\right)$$

$$40 = 0 + \frac{7}{90}T^2 + \frac{8}{90}T^2$$

$$= \frac{15}{90}T^2$$

$$= \frac{1}{6}T^2$$

$$T^2 = (40)(6)$$

$$= 240 \text{ s}^2$$

$T = 15.49$ s ◀

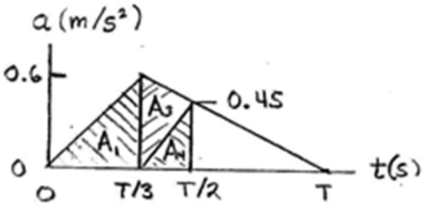
(b) $v_{\max} = v_0 + A_1 + A_2 = 0 + 0.1T + 0.2T = 0.3T$

$v_{\max} = 4.65$ m/s ◀

(c) To find the position at t=T/2, first find the areas A_1 and A_2 on the $a-t$ curve

$$A_1 = 0.1T \qquad A_3 = \frac{1}{2}(0.6)\frac{T}{6} = 0.05T$$

$$A_4 = \frac{1}{2}(0.45)\frac{T}{6} = 0.0375T$$



Apply the moment-area formula: $x - x_0 = v_0 t + \int_0^{T/2}\left(\frac{T}{2} - t\right) a dt$

PROBLEM 11.85 (Continued)

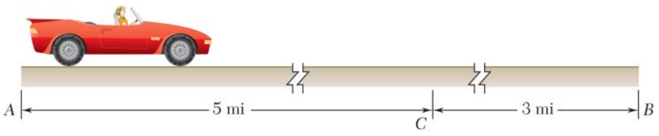
$$x = v_0\frac{T}{2} + A_1\left(\frac{T}{2} - \frac{2T}{9}\right) + A_3\left(\frac{2}{3}\cdot\frac{T}{6}\right) + A_4\left(\frac{1}{3}\cdot\frac{T}{6}\right)$$

$$= 0 + (0.1T)\left(\frac{5T}{18}\right) + (0.05T)\left(\frac{T}{9}\right) + (0.0375T)\frac{T}{18} = 0.035417T^2$$

$$= (0.035417)(15.49)^2$$

$x = 8.50 \text{ m}$ ◀

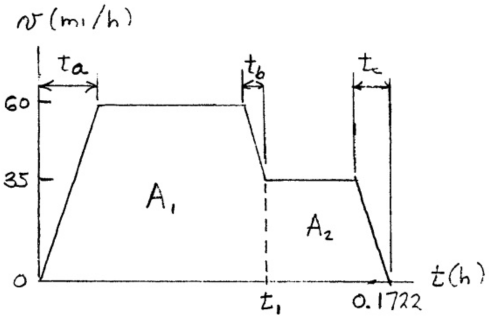
$v = v_0 + A_1 + A_3 + A_4 = 0.1875T$ $\quad$ $v = 2.90 \text{ m/s}$ ◀



PROBLEM 11.86

Two road rally checkpoints *A* and *B* are located on the same highway and are 8 mi apart. The speed limits for the first 5 mi and the last 3 mi are 60 mi/h and 35 mi/h, respectively. Drivers must stop at each checkpoint, and the specified time between points *A* and *B* is 10 min 20 s. Knowing that a driver accelerates and decelerates at the same constant rate, determine the magnitude of her acceleration if she travels at the speed limit as much as possible.

SOLUTION



Given

$$10 \text{ min } 20 \text{ s} = \frac{10}{60} + \frac{20}{3600}$$

$$= 0.1722 \text{ h}$$

Sketch the $v - t$ curve and note $t_a = \frac{60}{a}$, $t_b = \frac{25}{a}$, $t_c = \frac{35}{a}$

Find Areas A_1 and A_2

$$A_1 = 60t_1 - \frac{1}{2}(60)(t_a) - \frac{1}{2}(25)t_b$$

$$= 60\,t_1 - 1800\frac{1}{a} - 312.5\frac{1}{a} \qquad (1)$$

$$A_2 = 35(0.1722 - t_1) - \frac{1}{2}(35)t_c$$

$$= 6.0278 - 35t_1 - 612.5\frac{1}{a} \qquad (2)$$

Also given $\qquad A_1 = 5 \text{ mi and } A_2 = 3 \text{ mi}$

Setting (1) equal to 5 mi: $\qquad 60t_1 - 2112.5\frac{1}{a} = 5 \qquad (3)$

Setting (2) equal to 3 mi: $\qquad 35t_1 + 612.5\frac{1}{a} = 3.0278 \qquad (4)$

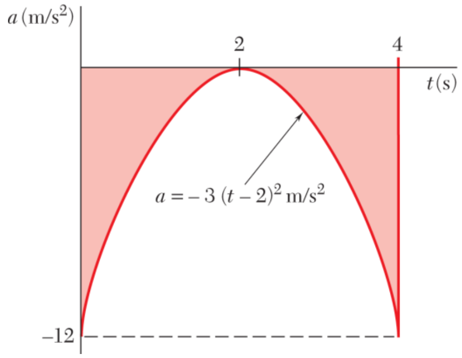
Solving equations (3) and (4) for t_1 and $\frac{1}{a}$:

$$t_1 = 85.45 \times 10^{-3} \text{ h} = 5.13 \text{ min}$$

$$\frac{1}{a} = 60.23 \times 10^{-6} \text{ h}^2/\text{mi}$$

$$a = 16.616 \times 10^3 \text{ mi/h}^2 = \frac{(16.616 \times 10^3)(5280)}{(3600)^2}$$

$a = 6.77 \text{ ft/s}^2$ ◀



PROBLEM 11.87

As shown in the figure, from $t = 0$ to $t = 4$ s, the acceleration of a given particle is represented by a parabola. Knowing that $x = 0$ and $v = 8$ m/s when $t = 0$, (*a*) construct the v–t and x–t curves for $0 < t < 4$ s, (*b*) determine the position of the particle at $t = 3$ s. (*Hint:* Use table inside the front cover.)

SOLUTION

Given At $t = 0, \quad x = 0, \quad v = 8\ \mathrm{m/s}$

(*a*) We have $v_2 = v_1 + (\text{area under } a\text{–}t \text{ curve from } t_1 \text{ to } t_2)$

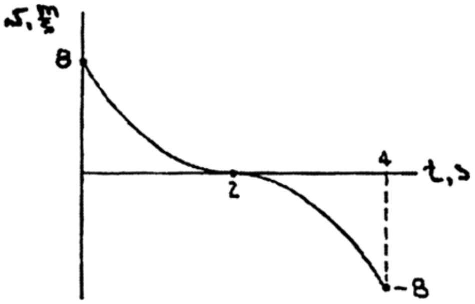
and $x_2 = x_1 + (\text{area under } v\text{–}t \text{ curve from } t_1 \text{ to } t_2)$

Then, using the formula for the area of a parabolic spandrel, we have

$$\text{at } t = 2\ \mathrm{s}: \quad v = 8 - \frac{1}{3}(2)(12) = 0$$

$$t = 4\ \mathrm{s}: \quad v = 0 - \frac{1}{3}(2)(12) = -8\ \mathrm{m/s}$$

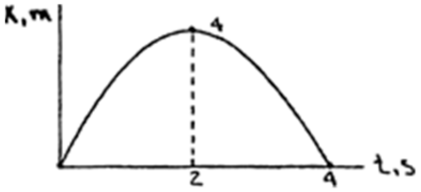
The v–t curve is then drawn as shown.



Note: The area under each portion of the curve is a spandrel of Order no. 3.

$$\text{Now} \quad \text{at } t = 2\ \mathrm{s}: \quad x = 0 + \frac{(2)(8)}{3+1} = 4\ \mathrm{m}$$

$$t = 4\ \mathrm{s}: \quad x = 4 - \frac{(2)(8)}{3+1} = 0$$



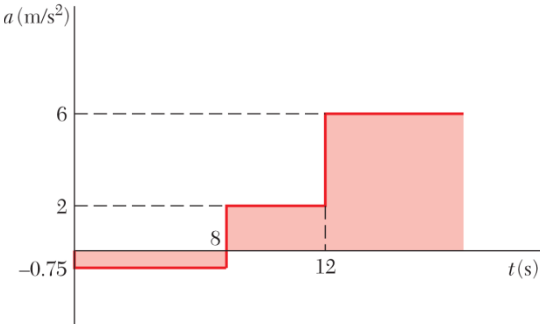
The x–t curve is then drawn as shown. ◀

(*b*) We have At $t = 3$ s: $a = -3(3-2)^2 = -3\ \mathrm{m/s^2}$

$$v = 0 - \frac{1}{3}(1)(3) = -1\ \mathrm{m/s}$$

$$x = 4 - \frac{(1)(1)}{3+1}$$

or $x_3 = 3.75\ \mathrm{m}$ ◀

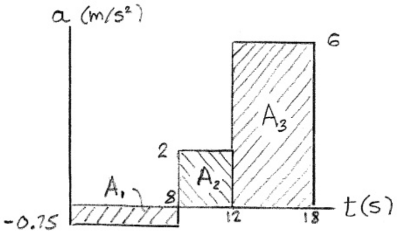


PROBLEM 11.88

A particle moves in a straight line with the acceleration shown in the figure. Knowing that the particle starts from the origin with $v_0 = -2$ m/s, (*a*) construct the $v - t$ and $x - t$ curves for $0 < t < 18$ s, (*b*) determine the position and the velocity of the particle and the total distance traveled when $t = 18$ s.

SOLUTION

Find the indicated areas under the a–t curve:



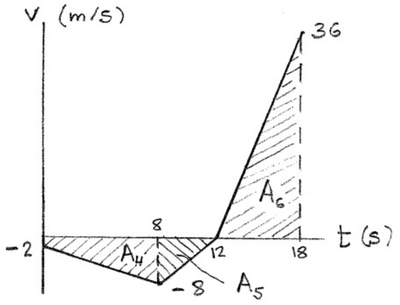
$$A_1 = (-0.75)(8) = -6 \text{ m/s}$$
$$A_2 = (2)(4) = 8 \text{ m/s}$$
$$A_3 = (6)(6) = 36 \text{ m/s}$$

Find the values of velocity at times indicated:

$$v_0 = -2 \text{ m/s}$$
$$v_8 = v_0 + A_1 = -8 \text{ m/s}$$
$$v_{12} = v_8 + A_2 = 0$$
$$v_{18} = v_{12} + A_3 = 36 \text{ m/s}$$

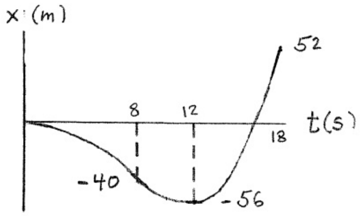
(a) Sketch $v - t$ curve using straight line portions over the constant acceleration periods.

Find the indicated areas under the v–t curve:



$$A_4 = \frac{1}{2}(-2 - 8)(8) = -40 \text{ m}$$
$$A_5 = \frac{1}{2}(-8)(4) = -16 \text{ m}$$
$$A_6 = \frac{1}{2}(36)(6) = 108 \text{ m}$$

Find the values of position at times indicated:



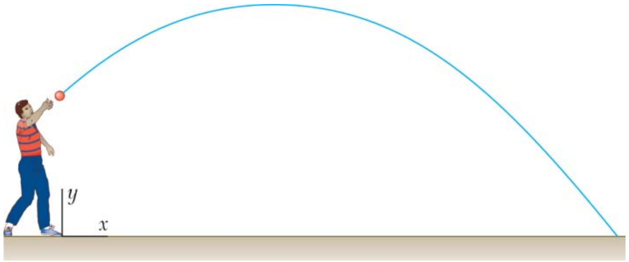
$$x_0 = 0$$
$$x_8 = x_0 + A_4 = -40 \text{ m}$$
$$x_{12} = x_8 + A_5 = -56 \text{ m}$$
$$x_{18} = x_{12} + A_6 = 52 \text{ m}$$

Sketch the $x - t$ curve using the positions and times calculated:

(b) Position at t=18s $x_{18} = 52$ m ◀

Velocity at t-18s $v_{18} = 36$ m/s ◀

Total Distance Traveled: = 56 + 108 $d = 164$ m ◀



PROBLEM 11.89

A ball is thrown so that the motion is defined by the equations $x = 5t$ and $y = 2 + 6t - 4.9t^2$, where x and y are expressed in meters and t is expressed in seconds. Determine (*a*) the velocity at $t = 1$ s, (*b*) the horizontal distance the ball travels before hitting the ground.

SOLUTION

Units are meters and seconds.

Horizontal motion: $$v_x = \frac{dx}{dt} = 5$$

Vertical motion: $$v_y = \frac{dy}{dt} = 6 - 9.8t$$

(*a*) Velocity at $t = 1$ s.

$$v_x = 5$$
$$v_y = 6 - 9.8 = -3.8$$

$$v = \sqrt{v_x^2 + v_y^2} = \sqrt{5^2 + 3.8^2} = 6.28 \text{ m/s}$$

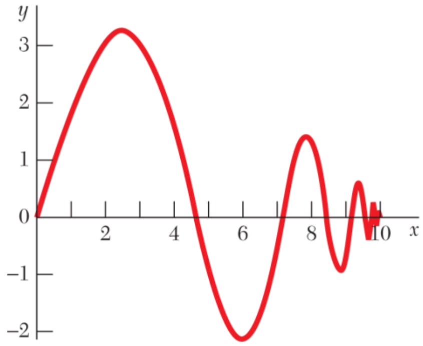
$$\tan\theta = \frac{v_y}{v_x} = \frac{-3.8}{5} \qquad \theta = -37.2°$$

$v = 6.28$ m/s $\searrow$ 37.2° ◀

(*b*) Horizontal distance: $(y = 0)$

$$y = 2 + 6t - 4.9t^2$$
$$t = 1.4971 \text{ s}$$
$$x = (5)(1.4971) = 7.4856 \text{ m}$$

$x = 7.49$ m ◀



PROBLEM 11.90

The motion of a vibrating particle is defined by the position vector $\mathbf{r} = 10(1 - e^{-3t})\mathbf{i} + (4e^{-2t}\sin 15t)\mathbf{j}$, where $\mathbf{r}$ and t are expressed in millimeters and seconds, respectively. Determine the velocity and acceleration when (*a*) $t = 0$, (*b*) $t = 0.5$ s.

SOLUTION

$$\mathbf{r} = 10(1 - e^{-3t})\mathbf{i} + (4e^{-2t}\sin 15t)\mathbf{j}$$

Then $$\mathbf{v} = \frac{d\mathbf{r}}{dt} = 30e^{-3t}\mathbf{i} + [60e^{-2t}\cos 15t - 8e^{-2t}\sin 15t]\mathbf{j}$$

and $$\mathbf{a} = \frac{d\mathbf{v}}{dt} = -90e^{-3t}\mathbf{i} + [-120e^{-2t}\cos 15t - 900e^{-2t}\sin 15t - 120e^{-2t}\cos 15t + 16e^{-2t}\sin 15t]\mathbf{j}$$

$$= -90e^{-3t}\mathbf{i} + [-240e^{-2t}\cos 15t - 884e^{-2t}\sin 15t]\mathbf{j}$$

(*a*) When $t = 0$:

$\mathbf{v} = 30\mathbf{i} + 60\mathbf{j}$ mm/s — $\mathbf{v} = 67.1$ mm/s ∠ 63.4° ◀

$\mathbf{a} = -90\mathbf{i} - 240\mathbf{j}$ mm/s^2 — $\mathbf{a} = 256$ mm/s^2 ∠ 69.4° ◀

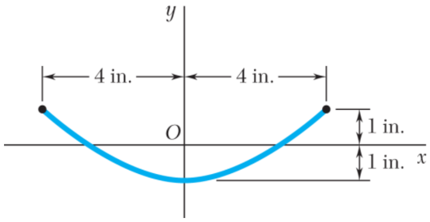
When $t = 0.5$ s:

$$\mathbf{v} = 30e^{-1.5}\mathbf{i} + [60e^{-1}\cos 7.5 - 8e^{-1}\sin 7.5]$$
$$= 6.694\mathbf{i} + 4.8906\mathbf{j} \text{ mm/s}$$

$\mathbf{v} = 8.29$ mm/s ∠ 36.2° ◀

$$\mathbf{a} = 90e^{-1.5}\mathbf{i} + [-240e^{-1}\cos 7.5 - 884e^{-1}\sin 7.5\mathbf{j}]$$
$$= -20.08\mathbf{i} - 335.65\mathbf{j} \text{ mm/s}^2$$

$\mathbf{a} = 336$ mm/s^2 ∠ 86.6° ◀



PROBLEM 11.91

The motion of a vibrating particle is defined by the position vector $\mathbf{r} = (4\sin \pi t)\mathbf{i} - (\cos 2\pi t)\mathbf{j}$, where r is expressed in inches and t in seconds. (*a*) Determine the velocity and acceleration when $t = 1$ s. (*b*) Show that the path of the particle is parabolic.

SOLUTION

$$\mathbf{r} = (4\sin \pi t)\mathbf{i} - (\cos 2\pi t)\mathbf{j}$$
$$\mathbf{v} = (4\pi \cos \pi t)\mathbf{i} + (2\pi \sin 2\pi t)\mathbf{j}$$
$$\mathbf{a} = -(4\pi^2 \sin \pi t)\mathbf{i} + (4\pi^2 \cos 2\pi t)\mathbf{j}$$

(*a*) When $t = 1$ s:

$$\mathbf{v} = (4\pi \cos \pi)\mathbf{i} + (2\pi \sin 2\pi)\mathbf{j} \qquad \mathbf{v} = -(4\pi \text{ in/s})\mathbf{i} \blacktriangleleft$$

$$\mathbf{a} = -(4\pi^2 \sin \pi)\mathbf{i} - (4\pi^2 \cos \pi)\mathbf{j} \qquad \mathbf{a} = -(4\pi^2 \text{in/s}^2)\mathbf{j} \blacktriangleleft$$

(*b*) Path of particle:

Since $\mathbf{r} = x\mathbf{i} + y\,\mathbf{j}$; $x = 4\sin \pi t,$ $y = -\cos 2\pi t$

Recall that $\cos 2\theta = 1 - 2\sin^2 \theta$ and write

$$y = -\cos 2\pi t = -(1 - 2\sin^2 \pi t) \qquad (1)$$

But since $x = 4\sin \pi t$ or $\sin \pi t = \frac{1}{4}x,$ Eq.(1) yields

$$y = -\left[1 - 2\left(\frac{1}{4}x\right)^2\right] \qquad y = \frac{1}{8}x^2 - 1 \text{ (Parabola)} \blacktriangleleft$$

PROBLEM 11.92

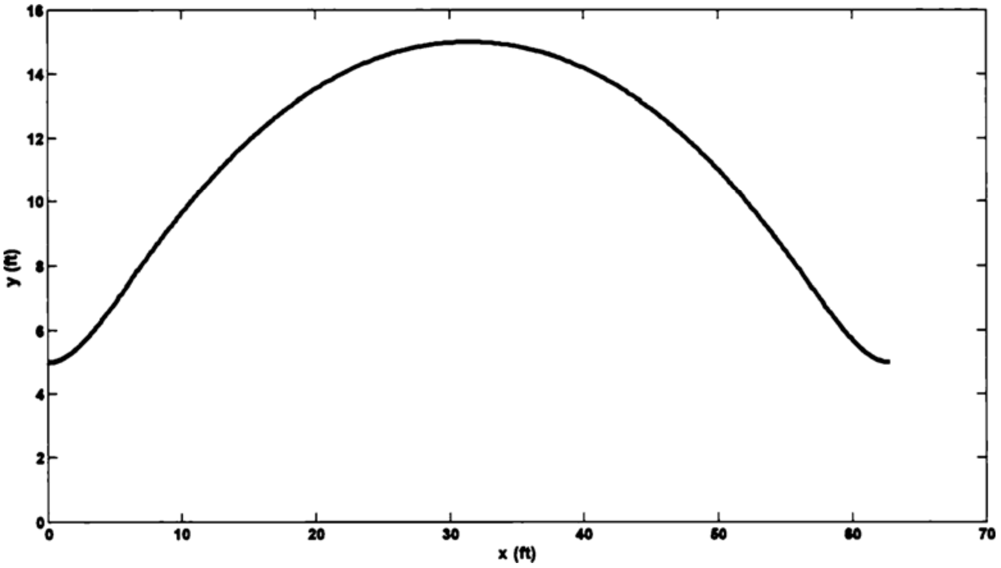
The motion of a particle is defined by the equations $x = 10t - 5\sin t$ and $y = 10 - 5\cos t$, where x and y are expresed in feet and t is expressed in seconds. Sketch the path of the particle for the time interval $0 \le t \le 2\pi$, and determine (*a*) the magnitudes of the smallest and largest velocities reached by the particle, (*b*) the corresponding times, positions, and directions of the velocities.

SOLUTION

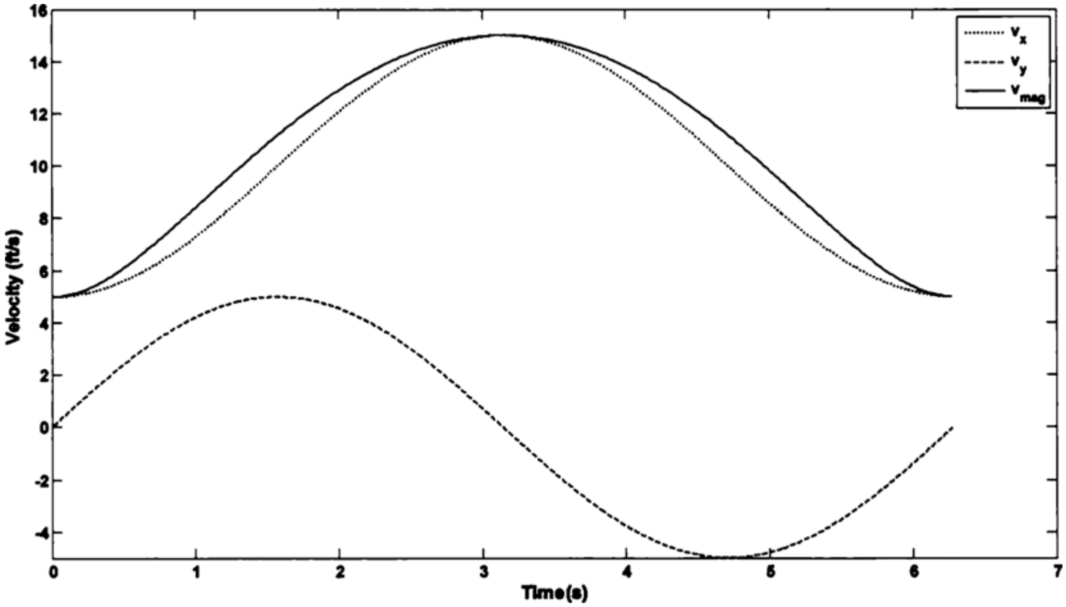
Sketch the path of the particle, i.e., plot of *y* versus *x*.

Using $x = 10t - 5\sin t$, and $y = 10 - 5\cos t$ obtain the values in the table below. Plot as shown.

$t(s)$	x(ft)	y(ft)
0	0.00	5
$\frac{\pi}{2}$	10.71	10
π	31.41	15
$3\frac{\pi}{2}$	52.12	10
2π	62.83	5



PROBLEM 11.92 (Continued)



(*a*) Differentiate with respect to *t* to obtain velocity components.

$$v_x = \frac{dx}{dt} = 10 - 5\cos t \quad \text{and} \quad v_y = 5\sin t$$

$$v^2 = v_x^2 + v_y^2 = (10 - 5\cos t)^2 + 25\sin^2 t = 125 - 100\cos t$$

$$\frac{d(v)^2}{dt} = 100\sin t = 0 \quad t = 0.\ \pm\pi.\ \pm 2\pi \ldots \pm N\pi$$

When $t = 2N\pi.$ $\quad \cos t = 1.$ $\quad$ and $\quad v^2$ is minimum.

When $t = (2N+1)\pi.$ $\quad \cos t = -1.$ $\quad$ and $\quad v^2$ is maximum.

$$(v^2)_{\min} = 125 - 100 = 25(\text{ft/s})^2 \quad v_{\min} = 5 \text{ ft/s} \blacktriangleleft$$

$$(v^2)_{\max} = 125 + 100 = 225(\text{ft/s})^2 \qquad v_{\max} = 15 \text{ ft/s} \blacktriangleleft$$

(*b*) When $v = v_{\min}.$

When $N = 0, 1, 2, \ldots$

$$x = 10(2\pi N) - 5\sin(2\pi N) \qquad x = 20\pi N \text{ ft} \blacktriangleleft$$

$$y = 10 - 5\cos(2\pi N) \qquad y = 5 \text{ ft} \blacktriangleleft$$

$$v_x = 10 - 5\cos(2\pi N) \qquad v_x = 5 \text{ ft/s} \blacktriangleleft$$

$$v_y = 5\sin(2\pi N) \qquad v_y = 0 \blacktriangleleft$$

$$\tan\theta = \frac{v_y}{v_x} = 0, \qquad \theta = 0 \blacktriangleleft$$

PROBLEM 11.92 (Continued)

Problem 11.94

A girl operates a radio-controlled model car in a vacant parking lot. The girl's position is at the origin of the *xy* coordinate axes, and the surface of the parking lot lies in the *x*-*y* plane. The motion of the car is defined by the position vector $\vec{r} = (2+2t^2)\hat{i} + (6+t^3)\hat{j}$ where *r* and *t* are expressed in meters and seconds, respectively. Determine (a) the distance between the car and the girl when $t = 2$ s, (*b*) the distance the car traveled in the interval from $t = 0$ to $t = 2$ s, (*c*) the speed and direction of the car's velocity at $t = 2$ s, (d) the magnitude of the car's acceleration at $t = 2$ s.

SOLUTION

Given: $\mathbf{r} = (2+2t^2)\mathbf{i} + (6+t^3)\mathbf{j}$

(a) At t=2s $\quad \mathbf{r}(2) = 10\mathbf{i} + 14\mathbf{j}$ m

$|\mathbf{r}(2)| = \sqrt{10^2 + 14^2}$ m $\qquad |\mathbf{r}(2)| = 17.20$ m ◀

(b) The car is traveling on a curved path. The distance that the car travels during any infinitesimal interval is given by: $\quad ds = \sqrt{dx^2 + dy^2}$

where: $\quad dx = 4t\,dt$ and $dy = 3t^2 dt$

Substituting $\quad ds = \sqrt{16t^2 + 9t^4}\,dt$

Integrating: $\quad \int_0^s ds = \int_0^2 t\sqrt{16 + 9t^2}\,dt$

$s = \frac{1}{27}\left(16 + 9t^2\right)^{3/2}\Big|_0^2 \qquad s = 11.52$ m ◀

(c) Velocity can be found by $\quad \mathbf{v} = \frac{d\mathbf{r}}{dt}$

$\mathbf{v} = 4t\mathbf{i} + 3t^2\mathbf{j}$ m/s

At t=2 s $\quad \mathbf{v} = 8\mathbf{i} + 12\mathbf{j}$ m/s $\qquad |\mathbf{v}| = 14.42$ m/s ∡ 56.31° ◀

(d) Acceleration can be found by $\mathbf{a} = \frac{d\mathbf{v}}{dt}$

$\mathbf{a} = 4\mathbf{i} + 6t\mathbf{j}$ m/s^2

At $t = 2$ s $\quad \mathbf{a} = 4\mathbf{i} + 12\mathbf{j}$ m/s^2 $\qquad |\mathbf{a}| = 12.65$ m/s^2 ◀

PROBLEM 11.95

The three-dimensional motion of a particle is defined by the position vector **r** = (*Rt* cos $\omega_n t$)**i** + *ct***j** + (*Rt* sin $\omega_n t$)**k**. Determine the magnitudes of the velocity and acceleration of the particle. (The space curve described by the particle is a conic helix.)

SOLUTION

We have
$$\mathbf{r} = (Rt\cos\omega_n t)\mathbf{i} + ct\mathbf{j} + (Rt\sin\omega_n t)\mathbf{k}$$

Then
$$\mathbf{v} = \frac{d\mathbf{r}}{dt} = R(\cos\omega_n t - \omega_n t\sin\omega_n t)\mathbf{i} + c\mathbf{j} + R(\sin\omega_n t + \omega_n t\cos\omega_n t)\mathbf{k}$$

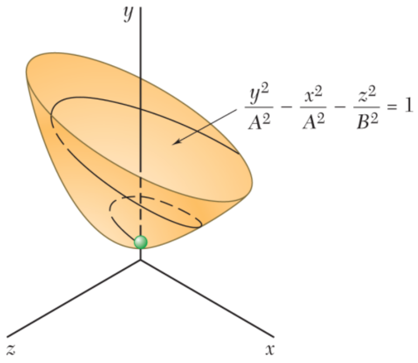
and
$$\begin{aligned}\mathbf{a} &= \frac{d\mathbf{v}}{dt}\\ &= R(-\omega_n\sin\omega_n t - \omega_n\sin\omega_n t - \omega_n^2 t\cos\omega_n t)\mathbf{i}\\ &\quad + R(\omega_n\cos\omega_n t + \omega_n\cos\omega_n t - \omega_n^2 t\sin\omega_n t)\mathbf{k}\\ &= R(-2\omega_n\sin\omega_n t - \omega_n^2 t\cos\omega_n t)\mathbf{i} + R(2\omega_n\cos\omega_n t - \omega_n^2 t\sin\omega_n t)\mathbf{k}\end{aligned}$$

Now
$$\begin{aligned}v^2 &= v_x^2 + v_y^2 + v_z^2\\ &= [R(\cos\omega_n t - \omega_n t\sin\omega_n t)]^2 + (c)^2 + [R(\sin\omega_n t + \omega_n t\cos\omega_n t)]^2\\ &= R^2\Big[\left(\cos^2\omega_n t - 2\omega_n t\sin\omega_n t\cos\omega_n t + \omega_n^2 t^2\sin^2\omega_n t\right)\\ &\quad + \left(\sin^2\omega_n t + 2\omega_n t\sin\omega_n t\cos\omega_n t + \omega_n^2 t^2\cos^2\omega_n t\right)\Big] + c^2\\ &= R^2\left(1 + \omega_n^2 t^2\right) + c^2\end{aligned}$$

or
$$v = \sqrt{R^2\left(1 + \omega_n^2 t^2\right) + c^2} \quad ◀$$

Also,
$$\begin{aligned}a^2 &= a_x^2 + a_y^2 + a_z^2\\ &= \left[R\left(-2\omega_n\sin\omega_n t - \omega_n^2 t\cos\omega_n t\right)\right]^2 + (0)^2\\ &\quad + \left[R\left(2\omega_n\cos\omega_n t - \omega_n^2 t\sin\omega_n t\right)\right]^2\\ &= R^2\Big[\left(4\omega_n^2\sin^2\omega_n t + 4\omega_n^3 t\sin\omega_n t\cos\omega_n t + \omega_n^4 t^2\cos^2\omega_n t\right)\\ &\quad + \left(4\omega_n^2\cos^2\omega_n t - 4\omega_n^3 t\sin\omega_n t\cos\omega_n t + \omega_n^4 t^2\sin^2\omega_n t\right)\Big]\\ &= R^2\left(4\omega_n^2 + \omega_n^4 t^2\right)\end{aligned}$$

or
$$a = R\omega_n\sqrt{4 + \omega_n^2 t^2} \quad ◀$$



PROBLEM 11.96

The three-dimensional motion of a particle is defined by the position vector $\mathbf{r} = (At\cos t)\mathbf{i} + (A\sqrt{t^2+1})\mathbf{j} + (Bt\sin t)\mathbf{k}$, where r and t are expressed in feet and seconds, respectively. Show that the curve described by the particle lies on the hyperboloid $(y/A)^2 - (x/A)^2 - (z/B)^2 = 1$. For $A = 3$ and $B = 1$, determine (*a*) the magnitudes of the velocity and acceleration when $t = 0$, (*b*) the smallest nonzero value of t for which the position vector and the velocity are perpendicular to each other.

SOLUTION

We have
$$\mathbf{r} = (At\cos t)\mathbf{i} + (A\sqrt{t^2+1})\mathbf{j} + (Bt\sin t)\mathbf{k}$$

or
$$x = At\cos t \quad y = A\sqrt{t^2+1} \quad z = Bt\sin t$$

Then
$$\cos t = \frac{x}{At} \qquad \sin t = \frac{z}{Bt} \qquad t^2 = \left(\frac{y}{A}\right)^2 - 1$$

Now
$$\cos^2 t + \sin^2 t = 1 \quad \Rightarrow \quad \left(\frac{x}{At}\right)^2 + \left(\frac{z}{Bt}\right)^2 = 1$$

or
$$t^2 = \left(\frac{x}{A}\right)^2 + \left(\frac{z}{B}\right)^2$$

Then
$$\left(\frac{y}{A}\right)^2 - 1 = \left(\frac{x}{A}\right)^2 + \left(\frac{z}{B}\right)^2$$

or
$$\left(\frac{y}{A}\right)^2 - \left(\frac{x}{A}\right)^2 - \left(\frac{z}{B}\right)^2 = 1 \qquad \text{Q.E.D.} \qquad \blacktriangleleft$$

(*a*) With $A = 3$ and $B = 1$, we have

$$\mathbf{v} = \frac{d\mathbf{r}}{dt} = 3(\cos t - t\sin t)\mathbf{i} + 3\frac{t}{\sqrt{t^2+1}}\mathbf{j} + (\sin t + t\cos t)\mathbf{k}$$

and
$$\mathbf{a} = \frac{d\mathbf{v}}{dt} = 3(-\sin t - \sin t - t\cos t)\mathbf{i} + 3\frac{\sqrt{t^2+1} - t\left(\frac{t}{\sqrt{t^2+1}}\right)}{(t^2+1)}\mathbf{j}$$
$$+ (\cos t + \cos t - t\sin t)\mathbf{k}$$
$$= -3(2\sin t + t\cos t)\mathbf{i} + 3\frac{1}{(t^2+1)^{3/2}}\mathbf{j} + (2\cos t - t\sin t)\mathbf{k}$$

At $t = 0$: $\mathbf{v} = 3(1-0)\mathbf{i} + (0)\mathbf{j} + (0)\mathbf{k}$

$$v = \sqrt{v_x^2 + v_y^2 + v_z^2}$$

or $v = 3 \text{ ft/s}$ ◀

and $\mathbf{a} = -3(0)\mathbf{i} + 3(1)\mathbf{j} + (2-0)\mathbf{k}$

Then $a^2 = (0)^2 + (3)^2 + (2)^2 = 13$

or $a = 3.61 \text{ ft/s}^2$ ◀

(*b*) If **r** and **v** are perpendicular, $\mathbf{r} \cdot \mathbf{v} = 0$

$$[(3t \cos t)\mathbf{i} + (3\sqrt{t^2+1})\mathbf{j} + (t \sin t)\mathbf{k}] \cdot [3(\cos t - t \sin t)\mathbf{i} + \left(3\frac{t}{\sqrt{t^2+1}}\right)\mathbf{j} + (\sin t + t \cos t)\mathbf{k}] = 0$$

or
$$(3t \cos t)[3(\cos t - t \sin t)] + (3\sqrt{t^2+1})\left(3\frac{t}{\sqrt{t^2+1}}\right) + (t \sin t)(\sin t + t \cos t) = 0$$

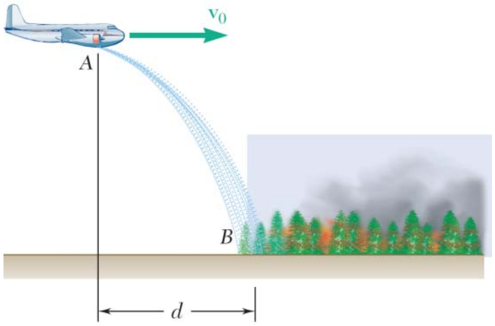
Expanding
$$(9t \cos^2 t - 9t^2 \sin t \cos t) + (9t) + (t \sin^2 t + t^2 \sin t \cos t) = 0$$

or (with $t \neq 0$)
$$10 + 8\cos^2 t - 8t \sin t \cos t = 0$$

or
$$7 + 2\cos 2t - 2t \sin 2t = 0$$

Using "trial and error" or numerical methods, the smallest root is $t = 3.82 \text{ s}$ ◀

Note: The next root is $t = 4.38$ s.



PROBLEM 11.97

An airplane used to drop water on brushfires is flying horizontally in a straight line at 180 mi/h at an altitude of 300 ft. Determine the distance d at which the pilot should release the water so that it will hit the fire at B.

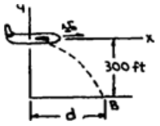
SOLUTION

First note $\quad v_0 = 180 \text{ km/h} = 264 \text{ ft/s}$

Place origin of coordinates at Point A.

Vertical motion. (Uniformly accelerated motion)

$$y = 0 + (0)t - \frac{1}{2}gt^2$$



At B: $\quad -300 \text{ ft} = -\frac{1}{2}(32.2 \text{ ft/s}^2)t^2$

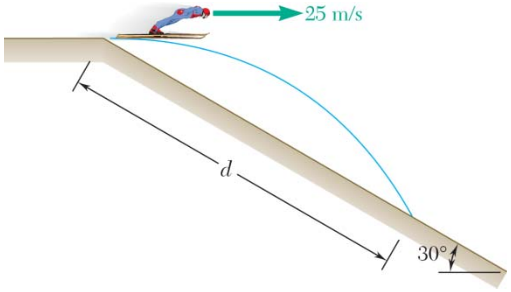
or $\quad t_B = 4.31666 \text{ s}$

Horizontal motion. (Uniform)

$$x = 0 + (v_x)_0 t$$

At B: $\quad d = (264 \text{ ft/s})(4.31666 \text{ s})$

or $\quad d = 1140 \text{ ft}$ ◀



PROBLEM 11.98

A ski jumper starts with a horizontal take-off velocity of 25 m/s and lands on a straight landing hill inclined at 30°. Determine (*a*) the time between take-off and landing, (*b*) the length *d* of the jump, (*c*) the maximum vertical distance between the jumper and the landing hill.

SOLUTION

(*a*) At the landing point, $y = -x\tan 30°$

Horizontal motion: $x = x_0 + (v_x)_0 t = v_0 t$

Vertical motion: $y = y_0 + (v_y)_0 t - \frac{1}{2}gt^2 = -\frac{1}{2}gt^2$

from which $t^2 = -\frac{2y}{g} = \frac{2x\tan 30°}{g} = \frac{2v_0 t\tan 30°}{g}$

Rejecting the $t = 0$ solution gives $t = \frac{2v_0\tan 30°}{g} = \frac{(2)(25)\tan 30°}{9.81}$ $t = 2.94\text{ s}$ ◀

(*b*) Landing distance: $d = \frac{x}{\cos 30°} = \frac{v_0 t}{\cos 30°} = \frac{(25)(2.94)}{\cos 30°}$ $d = 84.9\text{ m}$ ◀

(*c*) Vertical distance: $h = x\tan 30° + y$

or $h = v_0 t\tan 30° - \frac{1}{2}gt^2$

Differentiating and setting equal to zero,

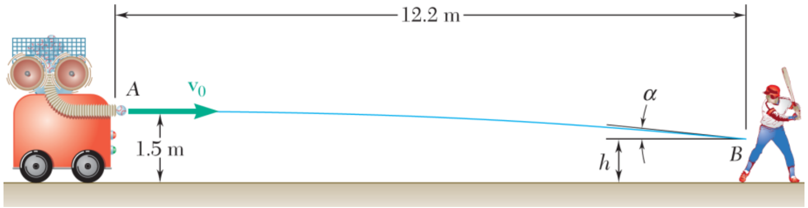
$$\frac{dh}{dt} = v_0\tan 30° - gt = 0 \qquad \text{or} \qquad t = \frac{v_o\tan 30°}{g}$$

Then,

$$h_{\max} = \frac{(v_0)(v_0\tan 30°)\tan 30°}{g} - \frac{1}{2}g\left(\frac{v_0\tan 30°}{g}\right)^2$$

$$= \frac{v_0^2\tan^2 30°}{2g} = \frac{(25)^2(\tan 30°)^2}{(2)(9.81)}$$

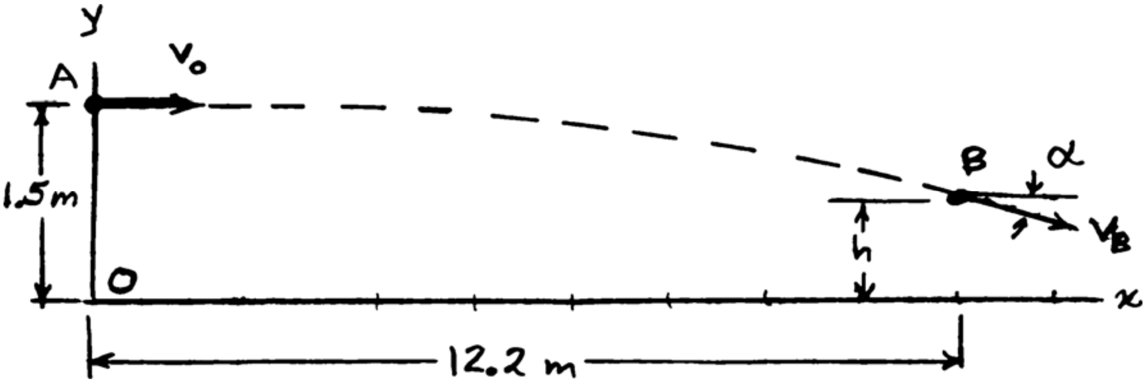
$h_{\max} = 10.62\text{ m}$ ◀



PROBLEM 11.99

A baseball pitching machine "throws" baseballs with a horizontal velocity $\mathbf{v}_0$. Knowing that height h varies between 788 mm and 1068 mm, determine (*a*) the range of values of v_0, (*b*) the values of α corresponding to $h = 788$ mm and $h = 1068$ mm.

SOLUTION



(*a*) Vertical motion: $y_0 = 1.5 \text{ m}, \ (v_y)_0 = 0$

$$y = y_0 + (v_y)_0 t - \frac{1}{2}gt^2 \quad \text{or} \quad t = \sqrt{\frac{2(y_0 - y)}{g}}$$

At Point B, $y = h$ or $t_B = \sqrt{\dfrac{2(y_0 - h)}{g}}$

When $h = 788 \text{ mm} = 0.788 \text{ m}$, $t_B = \sqrt{\dfrac{(2)(1.5 - 0.788)}{9.81}} = 0.3810 \text{ s}$

When $h = 1068 \text{ mm} = 1.068 \text{ m}$, $t_B = \sqrt{\dfrac{(2)(1.5 - 1.068)}{9.81}} = 0.2968 \text{ s}$

Horizontal motion: $x_0 = 0, \ (v_x)_0 = v_0,$

$$x = v_0 t \quad \text{or} \quad v_0 = \frac{x}{t} = \frac{x_B}{t_B}$$

PROBLEM 11.99 (Continued)

With $x_B = 12.2$ m, we get $v_0 = \dfrac{12.2}{0.3810} = 32.02$ m/s

and $v_0 = \dfrac{12.2}{0.2968} = 41.11$ m/s

$32.02 \text{ m/s} \le v_0 \le 41.11 \text{ m/s}$ or $115.3 \text{ km/h} \le v_0 \le 148.0 \text{ km/h}$ ◀

(*b*) Vertical motion: $v_y = (v_y)_0 - gt = -gt$

Horizontal motion: $v_x = v_0$

$$\tan\alpha = -\frac{dy}{dx} = -\frac{(v_y)_B}{(v_x)_B} = \frac{gt_B}{v_0}$$

For $h = 0.788$ m, $\tan\alpha = \dfrac{(9.81)(0.3810)}{32.02} = 0.11673,$ $\alpha = 6.66°$ ◀

For $h = 1.068$ m, $\tan\alpha = \dfrac{(9.81)(0.2968)}{41.11} = 0.07082,$ $\alpha = 4.05°$ ◀

B
7 ft
$5\frac{1}{3}$ ft

Vertical motion. (Uniformly accelerated motion)

$$y = 0 + (0)t - \frac{1}{2}gt^2$$

Horizontal motion. (Uniform)

$$x = 0 + (v_x)_0 t = v_0 t$$

At *B*: y: $-3\frac{1}{3}\text{ ft} = -\frac{1}{2}(32.2\text{ ft/s}^2)t^2$

or $t_B = 0.455016\text{ s}$

Then x: $7\text{ ft} = (v_0)_B(0.455016\text{ s})$

or $(v_0)_B = 15.38\text{ ft/s}$

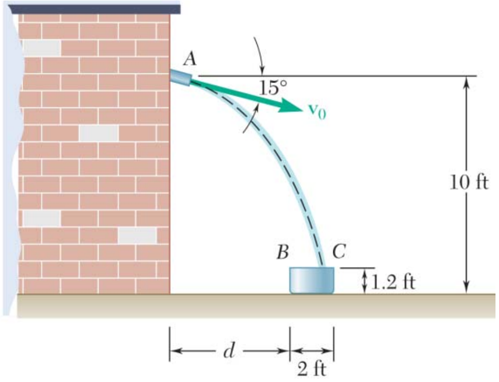
At *C*: y: $-2\text{ ft} = -\frac{1}{2}(32.2\text{ ft/s}^2)t^2$

or $t_C = 0.352454\text{ s}$

Then x: $12\frac{1}{3}\text{ ft} = (v_0)_C(0.352454\text{ s})$

or $(v_0)_C = 35.0\text{ ft/s}$

$15.38\text{ ft/s} < v_0 < 35.0\text{ ft/s}$ ◀



PROBLEM 11.101

Water flows from a drain spout with an initial velocity of 2.5 ft/s at an angle of 15° with the horizontal. Determine the range of values of the distance *d* for which the water will enter the trough *BC*.

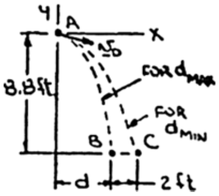
SOLUTION

First note

$$(v_x)_0 = (2.5\text{ ft/s})\cos 15° = 2.4148\text{ ft/s}$$

$$(v_y)_0 = -(2.5\text{ ft/s})\sin 15° = -0.64705\text{ ft/s}$$

Vertical motion. (Uniformly accelerated motion)



$$y = 0 + (v_y)_0 t - \frac{1}{2}gt^2$$

At the top of the trough

$$-8.8\text{ ft} = (-0.64705\text{ ft/s})t - \frac{1}{2}(32.2\text{ ft/s}^2)t^2$$

or $t_{BC} = 0.719491\text{ s}$ (the other root is negative)

Horizontal motion. (Uniform)

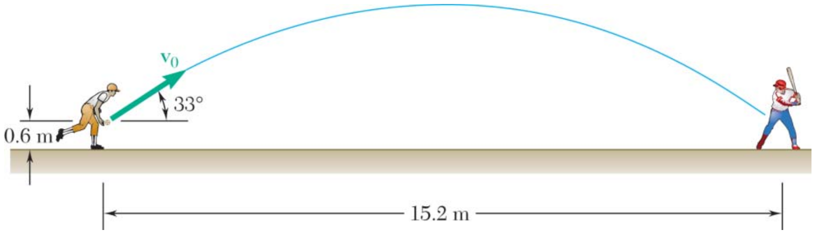
$$x = 0 + (v_x)_0 t$$

In time t_{BC} $\quad x_{BC} = (2.4148\text{ ft/s})(0.719491\text{ s}) = 1.737\text{ ft}$

Thus, the trough must be placed so that

$$x_B < 1.737\text{ ft or } x_C \geq 1.737\text{ ft}$$

Since the trough is 2 ft wide, it then follows that $0 < d < 1.737\text{ ft}$ ◀



PROBLEM 11.102

In slow pitch softball the underhand pitch must reach a maximum height of between 1.8 m and 3.7 m above the ground. A pitch is made with an initial velocity $\mathbf{v}_0$ of magnitude 13 m/s at an angle of 33° with the horizontal. Determine (*a*) if the pitch meets the maximum height requirement, (*b*) the height of the ball as it reaches the batter.

SOLUTION

$$v_0 = 13 \text{ m/s}, \ \alpha = 33°, \ x_0 = 0, \ y_0 = 0.6 \text{ m}$$

Vertical motion:

$$v_y = v_0 \sin\alpha - gt$$

$$y = y_0 + (v_0 \sin\alpha)t - \frac{1}{2}gt^2$$

At maximum height,

$$v_y = 0 \qquad \text{or} \qquad t = \frac{v_0 \sin\alpha}{g}$$

(*a*)

$$t = \frac{13\sin 33°}{9.81} = 0.7217 \text{ s}$$

$$y_{\max} = 0.6 + (13\sin 33°)(0.7217) - \frac{1}{2}(9.81)(0.7217)^2$$

$$y_{\max} = 3.16 \text{ m} \blacktriangleleft$$

$$1.8 \text{ m} < 3.16 \text{ m} < 3.7 \text{ m}$$

yes ◀

Horizontal motion:

$$x = x_0 + (v_0 \cos\alpha)t \qquad \text{or} \qquad t = \frac{x - x_0}{v_0 \cos\alpha}$$

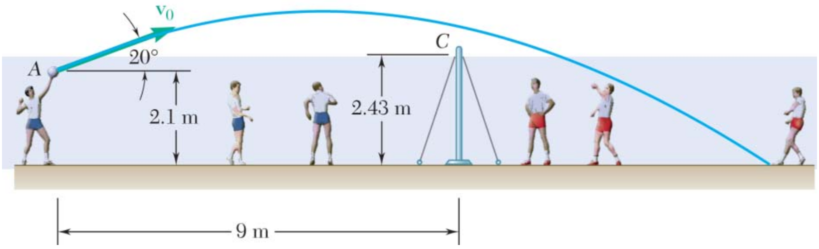
At $x = 15.2$ m,

$$t = \frac{15.2 - 0}{13\cos 33°} = 1.3941 \text{ s}$$

(*b*) Corresponding value of y:

$$y = 0.6 + (13\sin 33°)(1.3941) - \frac{1}{2}(9.81)(1.3941)^2$$

$$y = 0.937 \text{ m} \blacktriangleleft$$



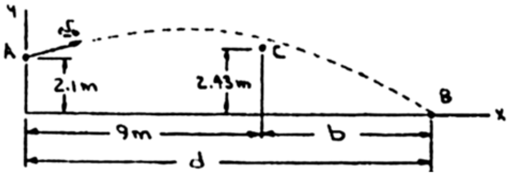
PROBLEM 11.103

A volleyball player serves the ball with an initial velocity $\mathbf{v}_0$ of magnitude 13.40 m/s at an angle of 20° with the horizontal. Determine (*a*) if the ball will clear the top of the net, (*b*) how far from the net the ball will land.

SOLUTION

First note

$$(v_x)_0 = (13.40 \text{ m/s}) \cos 20° = 12.5919 \text{ m/s}$$
$$(v_y)_0 = (13.40 \text{ m/s}) \sin 20° = 4.5831 \text{ m/s}$$



(*a*) Horizontal motion. (Uniform)

$$x = 0 + (v_x)_0 t$$

At *C*

$$9 \text{ m} = (12.5919 \text{ m/s})t \quad \text{or} \quad t_C = 0.71475 \text{ s}$$

Vertical motion. (Uniformly accelerated motion)

$$y = y_0 + (v_y)_0 t - \frac{1}{2} g t^2$$

At *C*:

$$\begin{aligned} y_C &= 2.1 \text{ m} + (4.5831 \text{ m/s})(0.71475 \text{ s}) \\ &\quad - \frac{1}{2}(9.81 \text{ m/s}^2)(0.71475 \text{ s})^2 \\ &= 2.87 \text{ m} \end{aligned}$$

$y_C > 2.43$ m (height of net) ⇒ ball clears net ◀

(*b*) At *B*, $y = 0$:

$$0 = 2.1 \text{ m} + (4.5831 \text{ m/s})t - \frac{1}{2}(9.81 \text{ m/s}^2)t^2$$

Solving

$$t_B = 1.271175 \text{ s} \quad \text{(the other root is negative)}$$

Then

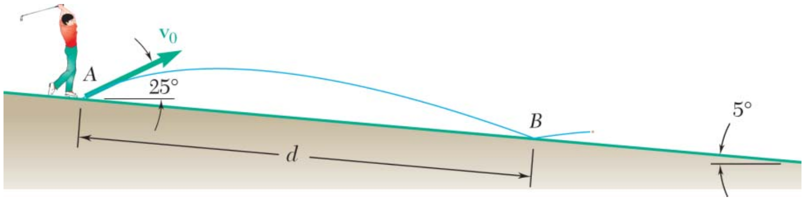
$$\begin{aligned} d &= (v_x)_0 t_B = (12.5919 \text{ m/s})(1.271175 \text{ s}) \\ &= 16.01 \text{ m} \end{aligned}$$

The ball lands

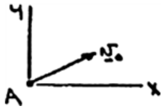
$b = (16.01 - 9.00)$ m $= 7.01$ m from the net ◀

PROBLEM 11.104

A golfer hits a golf ball with an initial velocity of 160 ft/s at an angle of 25° with the horizontal. Knowing that the fairway slopes downward at an average angle of 5°, determine the distance *d* between the golfer and Point *B* where the ball first lands.



SOLUTION



First note $$(v_x)_0 = (160 \text{ ft/s}) \cos 25°$$ $$(v_y)_0 = (160 \text{ ft/s}) \sin 25°$$

and at *B* $$x_B = d \cos 5° \quad y_B = -d \sin 5°$$

Now Horizontal motion. (Uniform)

$$x = 0 + (v_x)_0 t$$

At *B* $$d \cos 5° = (160 \cos 25°)t \quad \text{or} \quad t_B = \frac{\cos 5°}{160 \cos 25°} d$$

Vertical motion. (Uniformly accelerated motion)

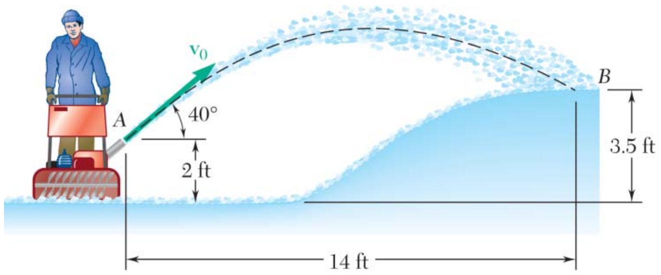
$$y = 0 + (v_y)_0 t - \frac{1}{2} g t^2 \quad (g = 32.2 \text{ ft/s}^2)$$

At *B*: $$-d \sin 5° = (160 \sin 25°) t_B - \frac{1}{2} g t_B^2$$

Substituting for t_B $$-d \sin 5° = (160 \sin 25°)\left(\frac{\cos 5°}{160 \cos 25°}\right) d - \frac{1}{2} g \left(\frac{\cos 5°}{160 \cos 25°}\right)^2 d^2$$

or $$d = \frac{2}{32.2 \cos 5°}(160 \cos 25°)^2 (\tan 5° + \tan 25°)$$ $$= 726.06 \text{ ft}$$

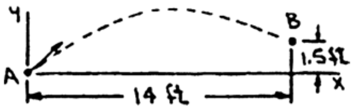
or $d = 242$ yd ◀



PROBLEM 11.105

A homeowner uses a snowblower to clear his driveway. Knowing that the snow is discharged at an average angle of 40° with the horizontal, determine the initial velocity v_0 of the snow.

SOLUTION



First note $(v_x)_0 = v_0 \cos 40°$

$(v_y)_0 = v_0 \sin 40°$

Horizontal motion. (Uniform)

$$x = 0 + (v_x)_0 t$$

At B: $14 = (v_0 \cos 40°)t \quad \text{or} \quad t_B = \dfrac{14}{v_0 \cos 40°}$

Vertical motion. (Uniformly accelerated motion)

$$y = 0 + (v_y)_0 t - \frac{1}{2}gt^2 \qquad (g = 32.2 \text{ ft/s}^2)$$

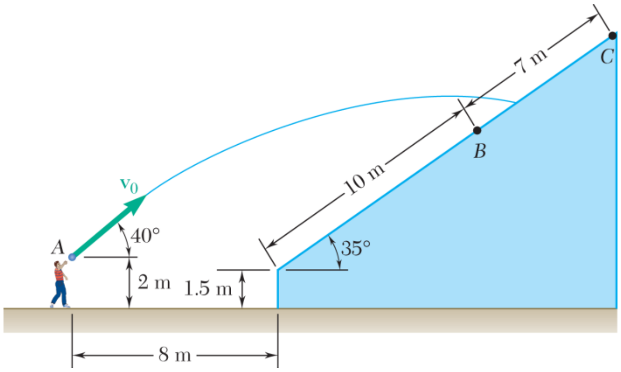
At B: $1.5 = (v_0 \sin 40°)t_B - \dfrac{1}{2}gt_B^2$

Substituting for t_B

$$1.5 = (v_0 \sin 40°)\left(\frac{14}{v_0 \cos 40°}\right) - \frac{1}{2}g\left(\frac{14}{v_0 \cos 40°}\right)^2$$

or $v_0^2 = \dfrac{\frac{1}{2}(32.2)(196)/\cos^2 40°}{-1.5 + 14 \tan 40°}$

or $v_0 = 22.9 \text{ ft/s}$ ◀



PROBLEM 11.106

At halftime of a football game souvenir balls are thrown to the spectators with a velocity $\mathbf{v}_0$. Determine the range of values of v_0 if the balls are to land between Points B and C.

SOLUTION

The motion is projectile motion. Place the origin of the xy-coordinate system at ground level just below Point A. The coordinates of Point A are $x_0 = 0,\ y_0 = 2\text{m}.$ The components of initial velocity are $(v_x)_0 = v_0 \cos 40°$ m/s and $(v_y)_0 = v_0 \sin 40°.$

Horizontal motion: $$x = x_0 + (v_x)_0 t = (v_0 \cos 40°)t \qquad (1)$$

Vertical motion: $$y = y_0 + (v_y)_0 t = \frac{1}{2} g t^2$$

$$= 2 + (v_0 \sin 40°) = -\frac{1}{2}(9.81)t^2 \qquad (2)$$

From (1), $$v_0 t = \frac{x}{\cos 40°} \qquad (3)$$

Then $$y = 2 + x \tan 40° - 4.905 t^2$$

$$t^2 = \frac{2 + x \tan 40° - y}{4.905} \qquad (4)$$

Point B: $$x = 8 + 10 \cos 35° = 16.1915 \text{ m}$$

$$y = 1.5 + 10 \sin 35° = 7.2358 \text{ m}$$

$$v_0 t = \frac{16.1915}{\cos 40°} = 21.1365 \text{ m}$$

$$t^2 = \frac{2 + 16.1915 \tan 40° - 7.2358}{4.905} \qquad t = 1.3048 \text{ s}$$

$$v_0 = \frac{21.1365}{1.3048} \qquad v_0 = 16.199 \text{ m/s}$$

PROBLEM 11.106 (Continued)

Point C:

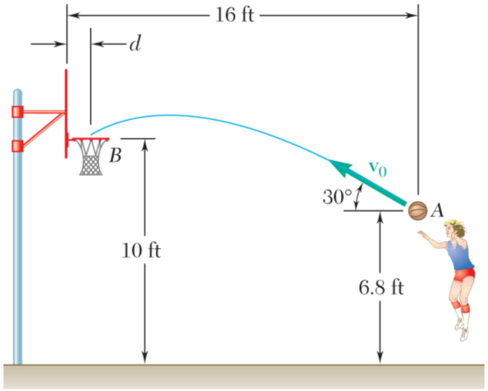
$$x = 8 + (10 + 7)\cos 35° = 21.9256 \text{ m}$$
$$y = 1.5 + (10 + 7)\sin 35° = 11.2508 \text{ m}$$

$$v_0 t = \frac{21.9256}{\cos 40°} = 28.622 \text{ m}$$

$$t^2 = \frac{2 + 21.9256 \tan 40° - 11.2508}{4.905} \qquad t = 1.3656 \text{ s}$$

$$v_0 = \frac{28.622}{1.3656} \qquad v_0 = 20.96 \text{ m/s}$$

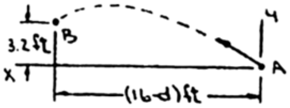
Range of values of v_0. $16.20 \text{ m/s} < v_0 < 21.0 \text{ m/s}$ ◀



PROBLEM 11.107

A basketball player shoots when she is 16 ft from the backboard. Knowing that the ball has an initial velocity $\mathbf{v}_0$ at an angle of 30° with the horizontal, determine the value of v_0 when d is equal to (*a*) 9 in., (*b*) 17 in.

SOLUTION



First note $\quad (v_x)_0 = v_0 \cos 30° \qquad (v_y)_0 = v_0 \sin 30°$

Horizontal motion. (Uniform) $\quad x = 0 + (v_x)_0 t$

At *B*: $\quad (16 - d) = (v_0 \cos 30°)t \quad \text{or} \quad t_B = \dfrac{16 - d}{v_0 \cos 30°}$

Vertical motion. (Uniformly accelerated motion) $\quad y = 0 + (v_y)_0 t - \dfrac{1}{2}gt^2 \quad (g = 32.2 \text{ ft/s}^2)$

At *B*: $\quad 3.2 = (v_0 \sin 30°)t_B - \dfrac{1}{2}gt_B^2$

Substituting for t_B $\quad 3.2 = (v_0 \sin 30°)\left(\dfrac{16 - d}{v_0 \cos 30°}\right) - \dfrac{1}{2}g\left(\dfrac{16 - d}{v_0 \cos 30°}\right)^2$

or

$$v_0^2 = \frac{2g(16 - d)^2}{3\left[\frac{1}{\sqrt{3}}(16 - d) - 3.2\right]}$$

(*a*) $\quad d = 9$ in.:

$$v_0^2 = \frac{2(32.2)\left(16 - \frac{9}{12}\right)^2}{3\left[\frac{1}{\sqrt{3}}\left(16 - \frac{9}{12}\right) - 3.2\right]}$$

$v_0 = 29.8$ ft/s ◀

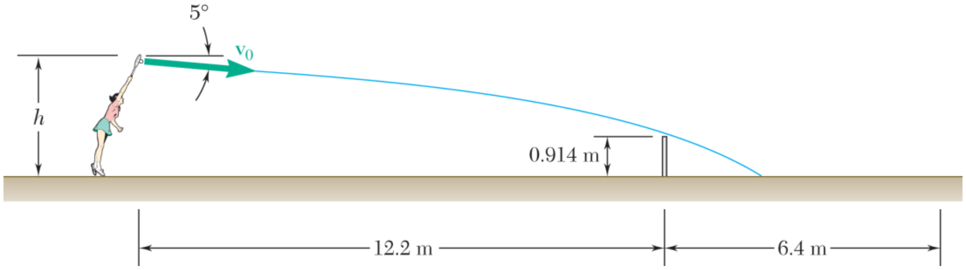
(*b*) $\quad d = 17$ in.:

$$v_0^2 = \frac{2(32.2)\left(16 - \frac{17}{12}\right)^2}{3\left[\frac{1}{\sqrt{3}}\left(16 - \frac{17}{12}\right) - 3.2\right]}$$

$v_0 = 29.6$ ft/s ◀

PROBLEM 11.108

A tennis player serves the ball at a height h = 2.5 m with an initial velocity of $\mathbf{v}_0$ at an angle of 5° with the horizontal. Determine the range for which of v_0 for which the ball will land in the service area which extends to 6.4 m beyond the net.



SOLUTION

The motion is projectile motion. Place the origin of the xy-coordinate system at ground level just below the point where the racket impacts the ball. The coordinates of this impact point are $x_0 = 0,\ y_0 = h = 2.5\text{ m}$. The components of initial velocity are $(v_x)_0 = v_0 \cos 5°$ and $(v_y)_0 = v_0 \sin 5°$.

Horizontal motion:

$$x = x_0 + (v_x)_0 t = (v_0 \cos 5°)t \qquad (1)$$

Vertical motion:

$$y = y_0 + (v_y)_0 t = \frac{1}{2} g t^2$$

$$= 2.5 - (v_0 \sin 5°)t = -\frac{1}{2}(9.81)t^2 \qquad (2)$$

From (1),

$$v_0 t = \frac{x}{\cos 5°} \qquad (3)$$

Then

$$y = 2.5 - x \tan 5° - 4.905 t^2$$

$$t^2 = \frac{2.5 - x \tan 5° - y}{4.905} \qquad (4)$$

At the minimum speed the ball just clears the net.

$$x = 12.2\text{ m}, \quad y = 0.914\text{ m}$$

$$v_0 t = \frac{12.2}{\cos 5°} = 12.2466\text{ m}$$

$$t^2 = \frac{2.5 - 12.2 \tan 5° - 0.914}{4.905} \qquad t = 0.32517\text{ s}$$

$$v_0 = \frac{12.2466}{0.32517} \qquad v_0 = 37.66\text{ m/s}$$

PROBLEM 11.108 (Continued)

At the maximum speed the ball lands 6.4 m beyond the net.

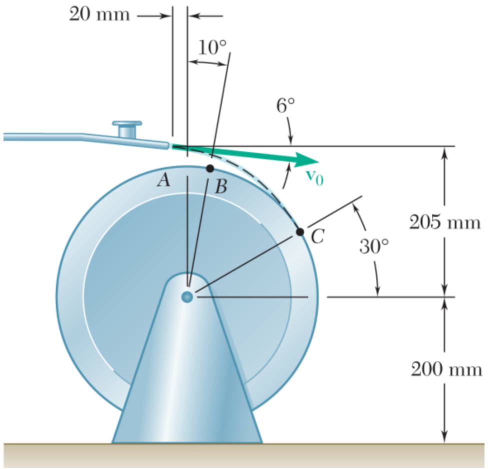
$$x = 12.2 + 6.4 = 18.6 \text{ m} \qquad y = 0$$

$$v_0 t = \frac{18.6}{\cos 5^\circ} = 18.6710 \text{ m}$$

$$t^2 = \frac{2.5 - 18.6 \tan 5^\circ - 0}{4.905} \qquad t = 0.42181 \text{ s}$$

$$v_0 = \frac{18.6710}{0.42181} \qquad v_0 = 44.26 \text{ m/s}$$

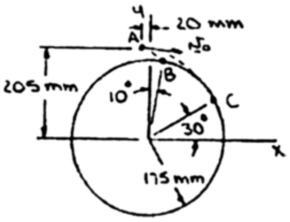
Range for v_0. $37.7 \text{ m/s} < v_0 < 44.3 \text{ m/s}$ ◀



PROBLEM 11.109

The nozzle at *A* discharges cooling water with an initial velocity $\mathbf{v}_0$ at an angle of 6° with the horizontal onto a grinding wheel 350 mm in diameter. Determine the range of values of the initial velocity for which the water will land on the grinding wheel between Points *B* and *C*.

SOLUTION



First note

$$(v_x)_0 = v_0 \cos 6°$$
$$(v_y)_0 = -v_0 \sin 6°$$

Horizontal motion. (Uniform)

$$x = x_0 + (v_x)_0 t$$

Vertical motion. (Uniformly accelerated motion)

$$y = y_0 + (v_y)_0 t - \frac{1}{2}gt^2 \quad (g = 9.81 \text{ m/s}^2)$$

At Point *B*:

$$x = (0.175 \text{ m}) \sin 10°$$
$$y = (0.175 \text{ m}) \cos 10°$$

$$x: \quad 0.175 \sin 10° = -0.020 + (v_0 \cos 6°)t$$

or

$$t_B = \frac{0.050388}{v_0 \cos 6°}$$

$$y: \quad 0.175 \cos 10° = 0.205 + (-v_0 \sin 6°)t_B - \frac{1}{2}gt_B^2$$

Substituting for t_B

$$-0.032659 = (-v_0 \sin 6°)\left(\frac{0.050388}{v_0 \cos 6°}\right) - \frac{1}{2}(9.81)\left(\frac{0.050388}{v_0 \cos 6°}\right)^2$$

PROBLEM 11.109 (Continued)

or $$v_0^2 = \frac{\frac{1}{2}(9.81)(0.050388)^2}{\cos^2 6°(0.032659 - 0.050388 \tan 6°)}$$

or $$(v_0)_B = 0.678 \text{ m/s}$$

At Point C: $$x = (0.175 \text{ m}) \cos 30°$$
$$y = (0.175 \text{ m}) \sin 30°$$

$$x: \quad 0.175 \cos 30° = -0.020 + (v_0 \cos 6°)t$$

or $$t_C = \frac{0.171554}{v_0 \cos 6°}$$

$$y: \quad 0.175 \sin 30° = 0.205 + (-v_0 \sin 6°)t_C - \frac{1}{2}gt_C^2$$

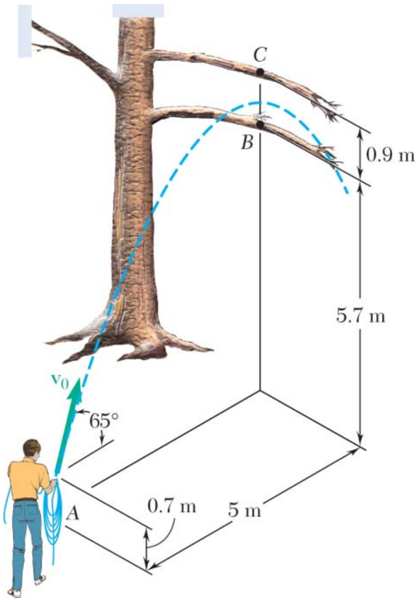
Substituting for t_C

$$-0.117500 = (-v_0 \sin 6°)\left(\frac{0.171554}{v_0 \cos 6°}\right) - \frac{1}{2}(9.81)\left(\frac{0.171554}{v_0 \cos 6°}\right)^2$$

or $$v_0^2 = \frac{\frac{1}{2}(9.81)(0.171554)^2}{\cos^2 6°(0.117500 - 0.171554 \tan 6°)}$$

or $$(v_0)_C = 1.211 \text{ m/s}$$

$$0.678 \text{ m/s} < v_0 < 1.211 \text{ m/s} \blacktriangleleft$$



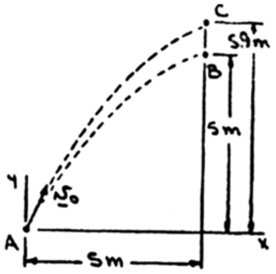
PROBLEM 11.110

While holding one of its ends, a worker lobs a coil of rope over the lowest limb of a tree. If he throws the rope with an initial velocity $\mathbf{v}_0$ at an angle of 65° with the horizontal, determine the range of values of v_0 for which the rope will go over only the lowest limb.

SOLUTION

First note

$$(v_x)_0 = v_0 \cos 65°$$
$$(v_y)_0 = v_0 \sin 65°$$



Horizontal motion. (Uniform)

$$x = 0 + (v_x)_0 t$$

At either B or C, $x = 5$ m

$$s = (v_0 \cos 65°)t_{B,C}$$

or
$$t_{B,C} = \frac{5}{(v_0 \cos 65°)}$$

Vertical motion. (Uniformly accelerated motion)

$$y = 0 + (v_y)_0 t - \frac{1}{2}gt^2 \qquad (g = 9.81 \text{ m/s}^2)$$

At the tree limbs, $t = t_{B,C}$

$$y_{B,C} = (v_0 \sin 65°)\left(\frac{5}{v_0 \cos 65°}\right) - \frac{1}{2}g\left(\frac{5}{v_0 \cos 65°}\right)^2$$

PROBLEM 11.110 (Continued)

or
$$v_0^2 = \frac{\frac{1}{2}(9.81)(25)}{\cos^2 65°(5 \tan 65° - y_{B,C})}$$
$$= \frac{686.566}{5 \tan 65° - y_{B,C}}$$

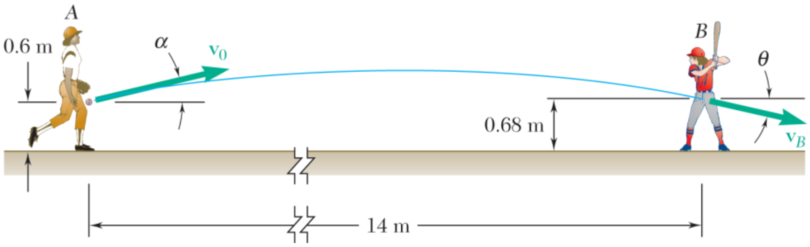
At Point *B*: $$v_0^2 = \frac{686.566}{5 \tan 65° - 5} \qquad \text{or} \qquad (v_0)_B = 10.95 \text{ m/s}$$

At Point *C*: $$v_0^2 = \frac{686.566}{5 \tan 65° - 5.9} \qquad \text{or} \qquad (v_0)_C = 11.93 \text{ m/s}$$

$10.95 \text{ m/s} < v_0 < 11.93 \text{ m/s}$ ◀

PROBLEM 11.111

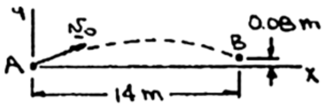
The pitcher in a softball game throws a ball with an initial velocity $\mathbf{v}_0$ of 72 km/h at an angle α with the horizontal. If the height of the ball at Point B is 0.68 m, determine (*a*) the angle α, (*b*) the angle θ that the velocity of the ball at Point B forms with the horizontal.



SOLUTION

First note

$$v_0 = 72 \text{ km/h} = 20 \text{ m/s}$$



and

$$(v_x)_0 = v_0 \cos\alpha = (20 \text{ m/s}) \cos\alpha$$
$$(v_y)_0 = v_0 \sin\alpha = (20 \text{ m/s}) \sin\alpha$$

(*a*) Horizontal motion. (Uniform)

$$x = 0 + (v_x)_0 t = (20 \cos\alpha)t$$

At Point B:

$$14 = (20\cos\alpha)t \quad \text{or} \quad t_B = \frac{7}{10\cos\alpha}$$

Vertical motion. (Uniformly accelerated motion)

$$y = 0 + (v_y)_0 t - \frac{1}{2}gt^2 = (20\sin\alpha)t - \frac{1}{2}gt^2 \quad (g = 9.81 \text{ m/s}^2)$$

At Point B:

$$0.08 = (20\sin\alpha)t_B - \frac{1}{2}gt_B^2$$

Substituting for t_B

$$0.08 = (20\sin\alpha)\left(\frac{7}{10\cos\alpha}\right) - \frac{1}{2}g\left(\frac{7}{10\cos\alpha}\right)^2$$

or

$$8 = 1400\tan\alpha - \frac{1}{2}g\frac{49}{\cos^2\alpha}$$

Now

$$\frac{1}{\cos^2\alpha} = \sec^2\alpha = 1 + \tan^2\alpha$$

PROBLEM 11.111 (Continued)

Then $$8 = 1400\tan\alpha - 24.5g(1+\tan^2\alpha)$$

or $$240.345\tan^2\alpha - 1400\tan\alpha + 248.345 = 0$$

Solving $$\alpha = 10.3786° \quad \text{and} \quad \alpha = 79.949°$$

Rejecting the second root because it is not physically reasonable, we have

$\alpha = 10.38°$ ◀

(*b*) We have $$v_x = (v_x)_0 = 20\cos\alpha$$

and $$v_y = (v_y)_0 - gt = 20\sin\alpha - gt$$

At Point *B*: $$(v_y)_B = 20\sin\alpha - gt_B$$

$$= 20\sin\alpha - \frac{7g}{10\cos\alpha}$$

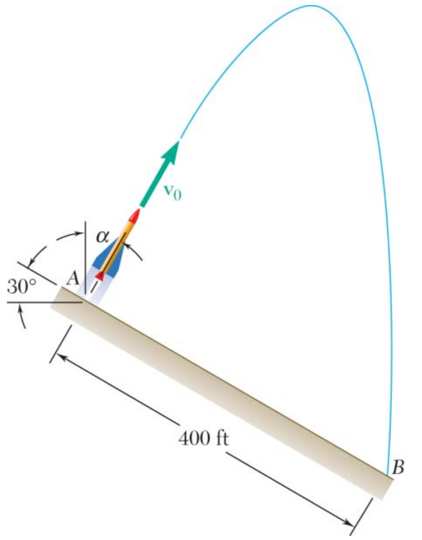
Noting that at Point *B*, $v_y < 0$, we have

$$\tan\theta = \frac{|(v_y)_B|}{v_x}$$

$$= \frac{\frac{7g}{10\cos\alpha} - 20\sin\alpha}{20\cos\alpha}$$

$$= \frac{\frac{7}{200}\frac{9.81}{\cos 10.3786°} - \sin 10.3786°}{\cos 10.3786°}$$

or $\theta = 9.74°$ ◀



PROBLEM 11.112

A model rocket is launched from Point A with an initial velocity $\mathbf{v}_0$ of 75 m/s. If the rocket's descent parachute does not deploy and the rocket lands a distance $d = 100$ m from A, determine (*a*) the angle α that $\mathbf{v}_0$ forms with the vertical, (*b*) the maximum height above Point A reached by the rocket, and (*c*) the duration of the flight.

SOLUTION

Set the origin at Point A. $\quad x_0 = 0, \quad y_0 = 0$

Horizontal motion: $\quad x = v_0 t \sin\alpha \qquad \sin\alpha = \dfrac{x}{v_0 t} \qquad (1)$

Vertical motion: $\quad y = v_0 t \cos\alpha - \dfrac{1}{2}gt^2$

$$\cos\alpha = \frac{1}{v_0 t}\left(y + \frac{1}{2}gt^2\right) \qquad (2)$$

$$\sin^2\alpha + \cos^2\alpha = \frac{1}{(v_0 t)^2}\left[x^2 + \left(y + \frac{1}{2}gt^2\right)^2\right] = 1$$

$$x^2 + y^2 + gyt^2 + \frac{1}{4}g^2t^4 = v_0^2 t^2$$

$$\frac{1}{4}g^2t^4 - \left(v_0^2 - gy\right)t^2 + (x^2 + y^2) = 0 \qquad (3)$$

At Point B, $\quad \sqrt{x^2 + y^2} = 100\text{ m}, \quad x = 100\cos 30°\text{ m}$

$$y = -100\sin 30° = -50\text{ m}$$

$$\frac{1}{4}(9.81)^2t^4 - [75^2 - (9.81)(-50)]t^2 + 100^2 = 0$$

$$24.0590\,t^4 - 6115.5\,t^2 + 10000 = 0$$

$$t^2 = 252.54\text{ s}^2 \quad \text{and} \quad 1.6458\text{ s}^2$$

$$t = 15.8916\text{ s} \quad \text{and} \quad 1.2829\text{ s}$$

PROBLEM 11.112 (Continued)

Restriction on α: $0 < \alpha < 120°$

$$\tan\alpha = \frac{x}{y + \frac{1}{2}gt^2} = \frac{100\cos 30°}{-50 + (4.905)(15.8916)^2} = 0.0729$$

$$\alpha = 4.1669°$$

and $$\frac{100\cos 30°}{-50 + (4.905)(1.2829)^2} = -2.0655$$

$$\alpha = 115.8331°$$

Use $\alpha = 4.1669°$ corresponding to the steeper possible trajectory.

(*a*) Angle α. $\alpha = 4.17°$ ◀

(*b*) Maximum height. $v_y = 0 \quad \text{at} \quad y = y_{\max}$

$$v_y = v_0\cos\alpha - gt = 0$$

$$t = \frac{v_0\cos\alpha}{g}$$

$$y_{\max} = v_0 t\cos\alpha - \frac{1}{2}gt = \frac{v_0^2\cos^2\alpha}{2g}$$

$$= \frac{(75)^2\cos^2 4.1669°}{(2)(9.81)}$$

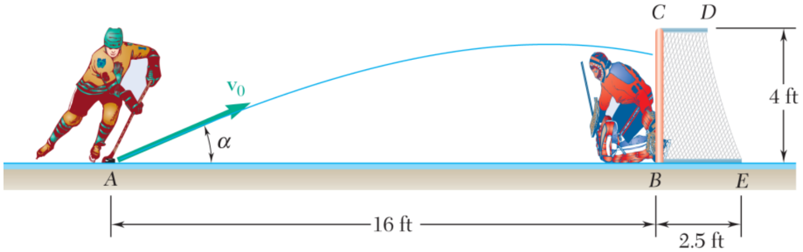
$y_{\max} = 285\text{ m}$ ◀

(*c*) Duration of the flight. (time to reach *B*)

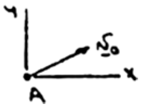
$t = 15.89\text{ s}$ ◀

PROBLEM 11.113

The initial velocity $\mathbf{v}_0$ of a hockey puck is 105 mi/h. Determine (*a*) the largest value (less than 45°) of the angle α for which the puck will enter the net, (*b*) the corresponding time required for the puck to reach the net.



SOLUTION



First note $\quad v_0 = 105 \text{ mi/h} = 154 \text{ ft/s}$

and

$$(v_x)_0 = v_0 \cos\alpha = (154 \text{ ft/s}) \cos\alpha$$

$$(v_y)_0 = v_0 \sin\alpha = (154 \text{ ft/s}) \sin\alpha$$

(*a*) Horizontal motion. (Uniform)

$$x = 0 + (v_x)_0 t = (154 \cos\alpha)t$$

At the front of the net, $\quad x = 16 \text{ ft}$

Then $\quad 16 = (154 \cos\alpha)t$

or

$$t_{\text{enter}} = \frac{8}{77 \cos\alpha}$$

Vertical motion. (Uniformly accelerated motion)

$$y = 0 + (v_y)_0 t - \frac{1}{2}gt^2$$

$$= (154 \sin\alpha)t - \frac{1}{2}gt^2 \quad (g = 32.2 \text{ ft/s}^2)$$

At the front of the net,

$$y_{\text{front}} = (154 \sin\alpha)t_{\text{enter}} - \frac{1}{2}gt_{\text{enter}}^2$$

$$= (154 \sin\alpha)\left(\frac{8}{77 \cos\alpha}\right) - \frac{1}{2}g\left(\frac{8}{77 \cos\alpha}\right)^2$$

$$= 16 \tan\alpha - \frac{32g}{5929 \cos^2\alpha}$$

Now $$\frac{1}{\cos^2\alpha} = \sec^2\alpha = 1 + \tan^2\alpha$$

Then $$y_{\text{front}} = 16\tan\alpha - \frac{32g}{5929}(1 + \tan^2\alpha)$$

or $$\tan^2\alpha - \frac{5929}{2g}\tan\alpha + \left(1 + \frac{5929}{32g}y_{\text{front}}\right) = 0$$

Then $$\tan\alpha = \frac{\frac{5929}{2g} \pm \left[\left(-\frac{5929}{2g}\right)^2 - 4\left(1 + \frac{5929}{32g}y_{\text{front}}\right)\right]^{1/2}}{2}$$

or $$\tan\alpha = \frac{5929}{4\times 32.2} \pm \left[\left(-\frac{5929}{4\times 32.2}\right)^2 - \left(1 + \frac{5929}{32\times 32.2}y_{\text{front}}\right)\right]^{1/2}$$

or $$\tan\alpha = 46.0326 \pm [(46.0326)^2 - (1 + 5.7541\, y_{\text{front}})]^{1/2}$$

Now $0 < y_{\text{front}} < 4$ ft so that the positive root will yield values of $\alpha > 45°$ for all values of y_{front}. When the negative root is selected, α increases as y_{front} is increased. Therefore, for $\alpha_{\max}$, set

$$y_{\text{front}} = y_C = 4 \text{ ft}$$

Then $$\tan\alpha = 46.0326 - [(46.0326)^2 - (1 + 5.7541 + 4)]^{1/2}$$

or $$\alpha_{\max} = 14.6604°$$

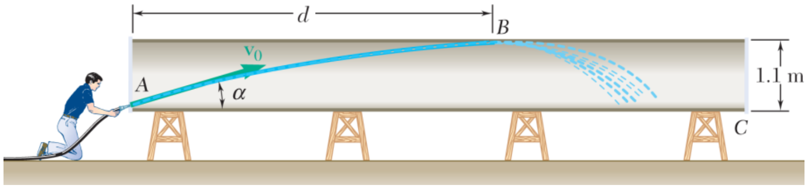
$\alpha_{\max} = 14.66°$ ◀

(*b*) We had found $$t_{\text{enter}} = \frac{8}{77\cos\alpha} = \frac{8}{77\cos 14.6604°}$$

or $t_{\text{enter}} = 0.1074 \text{ s}$ ◀

PROBLEM 11.114

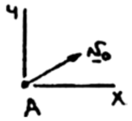
A worker uses high-pressure water to clean the inside of a long drainpipe. If the water is discharged with an initial velocity $\mathbf{v}_0$ of 11.5 m/s, determine (*a*) the distance *d* to the farthest Point *B* on the top of the pipe that the worker can wash from his position at *A*, (*b*) the corresponding angle α.



SOLUTION

First note

$$(v_x)_0 = v_0 \cos\alpha = (11.5 \text{ m/s})\cos\alpha$$
$$(v_y)_0 = v_0 \sin\alpha = (11.5 \text{ m/s})\sin\alpha$$



By observation, $d_{\max}$ occurs when $y_{\max} = 1.1$ m.

Vertical motion. (Uniformly accelerated motion)

$$v_y = (v_y)_0 - gt \qquad y = 0 + (v_y)_0 t - \frac{1}{2}gt^2$$
$$= (11.5 \sin\alpha) - gt \qquad = (11.5 \sin\alpha)t - \frac{1}{2}gt^2$$

When $y = y_{\max}$ at B, $(v_y)_B = 0$

Then $(v_y)_B = 0 = (11.5 \sin\alpha) - gt$

or $t_B = \dfrac{11.5 \sin\alpha}{g} \quad (g = 9.81 \text{ m/s}^2)$

and $y_B = (11.5 \sin\alpha)t_B - \dfrac{1}{2}gt_B^2$

Substituting for t_B and noting $y_B = 1.1$ m

$$1.1 = (11.5 \sin\alpha)\left(\frac{11.5 \sin\alpha}{g}\right) - \frac{1}{2}g\left(\frac{11.5 \sin\alpha}{g}\right)^2$$
$$= \frac{1}{2g}(11.5)^2 \sin^2\alpha$$

or $\sin^2\alpha = \dfrac{2.2 \times 9.81}{11.5^2} \qquad \alpha = 23.8265°$

PROBLEM 11.114 (Continued)

(*a*) Horizontal motion. (Uniform)

$$x = 0 + (v_x)_0 t = (11.5 \cos \alpha) t$$

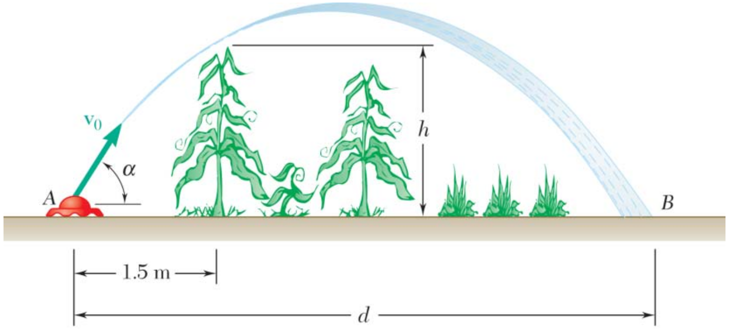
At Point *B*: $x = d_{\max} \quad \text{and} \quad t = t_B$

where $t_B = \dfrac{11.5}{9.81} \sin 23.8265° = 0.47356 \text{ s}$

Then $d_{\max} = (11.5)(\cos 23.8265°)(0.47356)$

or $d_{\max} = 4.98 \text{ m}$ ◀

(*b*) From above $\alpha = 23.8°$ ◀



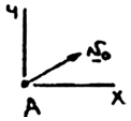
PROBLEM 11.115

An oscillating garden sprinkler which discharges water with an initial velocity $\mathbf{v}_0$ of 8 m/s is used to water a vegetable garden. Determine the distance d to the farthest Point B that will be watered and the corresponding angle α when (*a*) the vegetables are just beginning to grow, (*b*) the height h of the corn is 1.8 m.

SOLUTION

First note $(v_x)_0 = v_0 \cos\alpha = (8 \text{ m/s}) \cos\alpha$

$(v_y)_0 = v_0 \sin\alpha = (8 \text{ m/s}) \sin\alpha$



Horizontal motion. (Uniform)

$$x = 0 + (v_x)_0 t = (8\cos\alpha)t$$

At Point B: $x = d: \quad d = (8\cos\alpha)t$

or $t_B = \dfrac{d}{8\cos\alpha}$

Vertical motion. (Uniformly accelerated motion)

$$y = 0 + (v_y)_0 t - \frac{1}{2}gt^2$$

$$= (8\sin\alpha)t - \frac{1}{2}gt^2 \quad (g = 9.81 \text{ m/s}^2)$$

At Point B: $0 = (8\sin\alpha)t_B - \dfrac{1}{2}gt_B^2$

Simplifying and substituting for t_B

$$0 = 8\sin\alpha - \frac{1}{2}g\left(\frac{d}{8\cos\alpha}\right)$$

or $d = \dfrac{64}{g}\sin 2\alpha$ (1)

(*a*) When $h = 0$, the water can follow any physically possible trajectory. It then follows from Eq. (1) that d is maximum when $2\alpha = 90°$

or $\alpha = 45°$ ◀

Then $d = \dfrac{64}{9.81}\sin(2\times 45°)$

or $d_{\max} = 6.52 \text{ m}$ ◀

(*b*) Based on Eq. (1) and the results of Part *a*, it can be concluded that *d* increases in value as α increases in value from 0 to 45° and then *d* decreases as α is further increased. Thus, $d_{\max}$ occurs for the value of α closest to 45° and for which the water just passes over the first row of corn plants. At this row, $x_{\text{corn}} = 1.5$ m

so that

$$t_{\text{corn}} = \frac{1.5}{8\cos\alpha}$$

Also, with $y_{\text{corn}} = h,$ we have

$$h = (8\sin\alpha)t_{\text{corn}} - \frac{1}{2}gt_{\text{corn}}^2$$

Substituting for t_{corn} and noting $h = 1.8$ m,

$$1.8 = (8\sin\alpha)\left(\frac{1.5}{8\cos\alpha}\right) - \frac{1}{2}g\left(\frac{1.5}{8\cos\alpha}\right)^2$$

or

$$1.8 = 1.5\tan\alpha - \frac{2.25g}{128\cos^2\alpha}$$

Now

$$\frac{1}{\cos^2\alpha} = \sec^2\alpha = 1 + \tan^2\alpha$$

Then

$$1.8 = 1.5\tan\alpha - \frac{2.25(9.81)}{128}(1 + \tan^2\alpha)$$

or

$$0.172441\tan^2\alpha - 1.5\tan\alpha + 1.972441 = 0$$

Solving $\alpha = 58.229°$ and $\alpha = 81.965°$

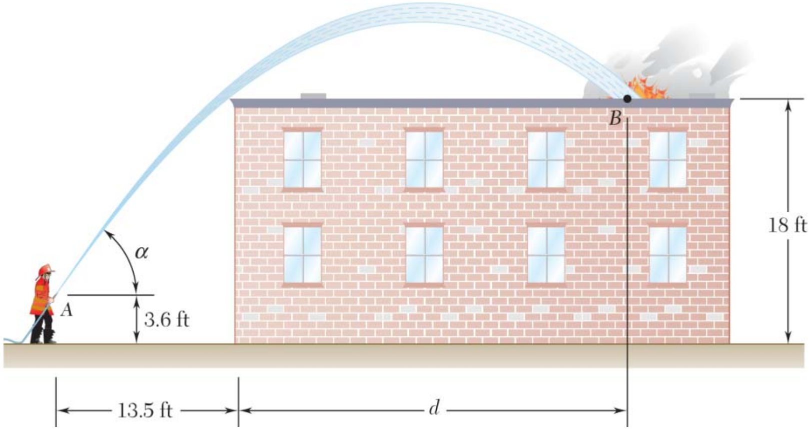
From the above discussion, it follows that $d = d_{\max}$ when

$\alpha = 58.2°$ ◀

Finally, using Eq. (1)

$$d = \frac{64}{9.81}\sin(2 \times 58.229°)$$

or $d_{\max} = 5.84$ m ◀



PROBLEM 11.116*

A nozzle at A discharges water with an initial velocity of 36 ft/s at an angle α with the horizontal. Determine (a) the distance d to the farthest point B on the roof that the water can reach, (b) the corresponding angle α. Check that the stream will clear the edge of the roof.

SOLUTION

Horizontal motion: $x = (v_0 \cos\alpha)t$ or $t = \dfrac{x}{v_0\cos\alpha}$

Vertical motion: $y = y_0 + (v_0 \sin\alpha)t - \dfrac{1}{2}gt^2 = y_0 + x\tan\alpha - \dfrac{1}{2}\dfrac{gx^2}{(v_0\cos\alpha)^2}$

$$y = y_0 + x\tan\alpha - \frac{gx^2}{2v_0^2}\left(1 + \tan^2\alpha\right)$$

Let $u = x\tan\alpha$ so that $y = y_0 + u - \dfrac{g}{2v_0^2}\left(x^2 + u^2\right)$

Solving for x^2: $x^2 = \dfrac{2v_0^2}{g}(u + y_0 - y) - u^2$

The maximum value of x^2 is required: $\dfrac{d\left(x^2\right)}{du} = 0.$

$$\frac{d\left(x^2\right)}{du} = \frac{2v_0^2}{g} - 2u = 0 \quad \text{or} \quad u = \frac{v_0^2}{g}$$

Data: $v_0 = 36$ ft/s, $y_0 = 3.6$ ft, $y_B = 18$ ft $u = \dfrac{(36)^2}{32.2} = 40.2484$ ft

$$(x_{\max})^2 = \frac{(2)(36)^2}{32.2}(40.2484 + 3.6 - 18) - (40.2484)^2 = 460.78 \text{ ft}^2 \qquad x_{\max} = 21.466 \text{ ft}$$

(a) Maximum distance: $d = x_{\max} - 13.5$ $d = 7.97$ ft ◀

PROBLEM 11.116* (Continued)

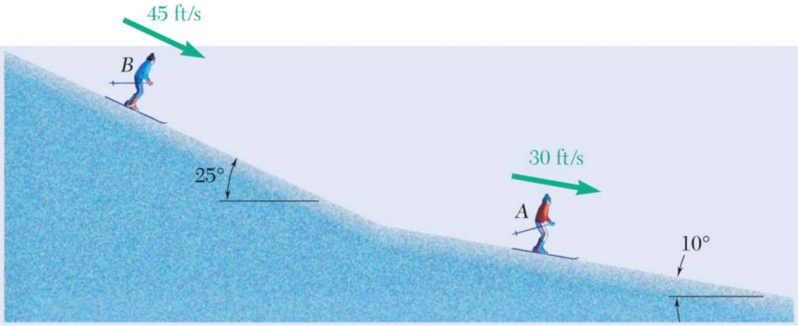
(*b*) Angle α. $$\tan\alpha = \frac{x_{\max}\tan\alpha}{x_{\max}} = \frac{u}{x_{\max}} = \frac{40.2484}{21.466} = 1.875$$

$$\alpha = 61.93°$$ $\alpha = 61.9°$ ◀

Check the edge. $$y = y_0 + x\tan\alpha + \frac{gx^2}{2(v_0\cos\alpha)^2}$$

$$y = 3.6 + (13.5)(1.875) - \frac{(32.2)(13.5)^2}{2[36\cos 61.93°]^2}$$ $y = 18.69$ ft ◀

Since $y > 18$ ft, the stream clears the edge.



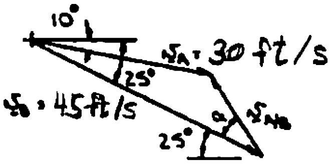
PROBLEM 11.117

The velocities of skiers *A* and *B* are as shown. Determine the velocity of *A* with respect to *B*.

SOLUTION

We have $\mathbf{v}_A = \mathbf{v}_B + \mathbf{v}_{A/B}$

The graphical representation of this equation is then as shown.



Then $\mathbf{v}_{A/B}^2 = 30^2 + 45^2 - 2(30)(45)\cos 15°$

or $v_{A/B} = 17.80450$ ft/s

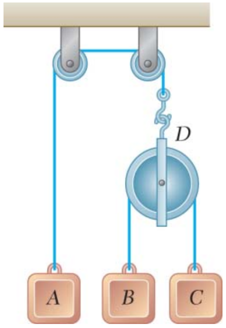
and $\dfrac{30}{\sin\alpha} = \dfrac{17.80450}{\sin 15°}$

or $\alpha = 25.8554°$

$\alpha + 25° = 50.8554°$ $\mathbf{v}_{A/B} = 17.8 \text{ ft/s} \measuredangle 50.9°$ ◀

Alternative solution.

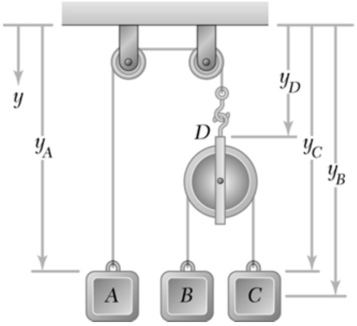
$$\begin{aligned}\mathbf{v}_{A/B} &= \mathbf{v}_A - \mathbf{v}_B\\ &= 30\cos 10°\,\mathbf{i} - 30\sin 10°\mathbf{j} - (45\cos 25°\mathbf{i} - 45°\sin 25°\mathbf{j})\\ &= 11.2396\mathbf{i} + 13.8084\,\mathbf{j}\\ &= 5.05 \text{ m/s} = 17.8 \text{ ft/s} \measuredangle 50.9°\end{aligned}$$



PROBLEM 11.118

The three blocks shown move with constant velocities. Find the velocity of each block, knowing that the relative velocity of *A* with respect to *C* is 300 mm/s upward and that the relative velocity of *B* with respect to *A* is 200 mm/s downward.

SOLUTION



From the diagram

Cable 1: $y_A + y_D = \text{constant}$

Then $v_A + v_D = 0$ (1)

Cable 2: $(y_B - y_D) + (y_C - y_D) = \text{constant}$

Then $v_B + v_C - 2v_D = 0$ (2)

Combining Eqs. (1) and (2) to eliminate v_D,

$$2v_A + v_B + v_C = 0 \quad (3)$$

Now $v_{A/C} = v_A - v_C = -300 \text{ mm/s}$ (4)

and $v_{B/A} = v_B - v_A = 200 \text{ mm/s}$ (5)

Then $(3) + (4) - (5) \Rightarrow$

$$(2v_A + v_B + v_C) + (v_A - v_C) - (v_B - v_A) = (-300) - (200)$$

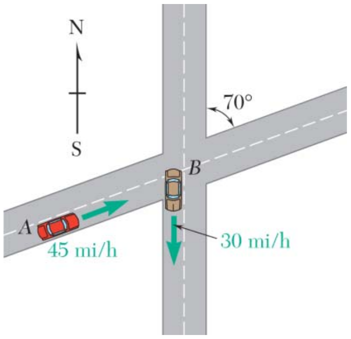
or $\mathbf{v}_A = 125 \text{ mm/s}\uparrow$ ◀

and using Eq. (5) $v_B - (-125) = 200$

or $\mathbf{v}_B = 75 \text{ mm/s}\downarrow$ ◀

Eq. (4) $-125 - v_C = -300$

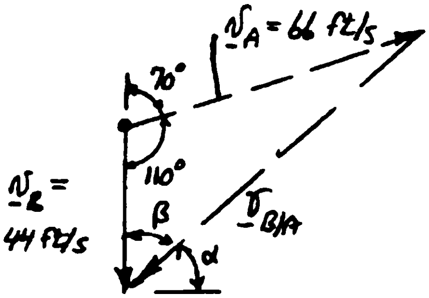
or $\mathbf{v}_C = 175 \text{ mm/s}\downarrow$ ◀



PROBLEM 11.119

Three seconds after automobile *B* passes through the intersection shown, automobile *A* passes through the same intersection. Knowing that the speed of each automobile is constant, determine (*a*) the relative velocity of *B* with respect to *A*, (*b*) the change in position of *B* with respect to *A* during a 4-s interval, (*c*) the distance between the two automobiles 2 s after *A* has passed through the intersection.

SOLUTION



$$v_A = 45 \text{ mi/h} = 66 \text{ ft/s}$$
$$v_B = 30 \text{ mi/h} = 44 \text{ ft/s}$$

Law of cosines

$$v_{B/A}^2 = 66^2 + 44^2 - 2(66)(44)\cos 110°$$
$$v_{B/A} = 90.99 \text{ ft/s}$$

$$v_B = v_A + v_{B/A}$$

Law of sines

$$\frac{\sin\beta}{66} = \frac{\sin 110°}{90.99} \qquad \beta = 42.97°$$
$$\alpha = 90° - \beta = 90° - 42.97° = 47.03°$$

(*a*) Relative velocity: $\mathbf{v}_{B/A} = 91.0$ ft/s ↙ 47.0° ◀

(*b*) Change in position for $\Delta t = 4$ s.

$$\Delta r_{B/A} = v_{B/A}\Delta t = (91.0 \text{ ft/s})(4 \text{ s})$$

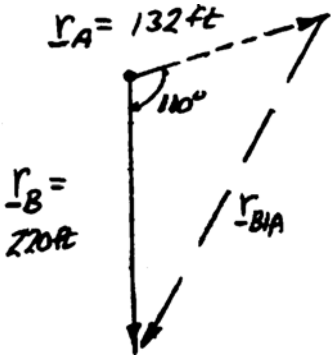
$\mathbf{r}_{B/A} = 364$ ft ↙ 47.0° ◀

(*c*) Distance between autos 2 seconds after auto *A* has passed intersection.

Auto *A* travels for 2 s.

$$v_A = 66 \text{ ft/s} \measuredangle 20°$$
$$r_A = v_A t = (66 \text{ ft/s})(2 \text{ s}) = 132 \text{ ft}$$
$$\mathbf{r}_A = 132 \text{ ft} \measuredangle 20°$$

PROBLEM 11.119 (Continued)



$\underline{r}_A = 132$ ft
110°
$\underline{r}_B =$ 220ft
$\underline{r}_{B/A}$

Auto *B*

$$\mathbf{v}_B = 44 \text{ ft/s}\downarrow$$

$$\mathbf{r}_B = \mathbf{v}_B t = (44 \text{ ft/s})(5 \text{ s}) = 220 \text{ ft}\downarrow$$

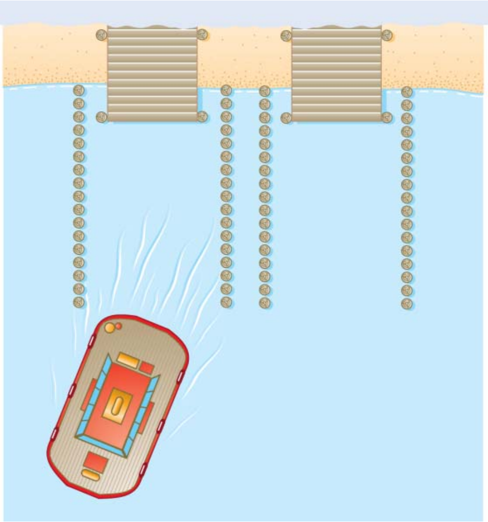
$$\mathbf{r}_B = \mathbf{r}_A + \mathbf{r}_{B/A}$$

Law of cosines

$$r_{B/A}^2 = (132)^2 + (220)^2 - 2(132)(220)\cos 110°$$

$$\mathbf{r}_{B/A} = 292.7 \text{ ft}$$

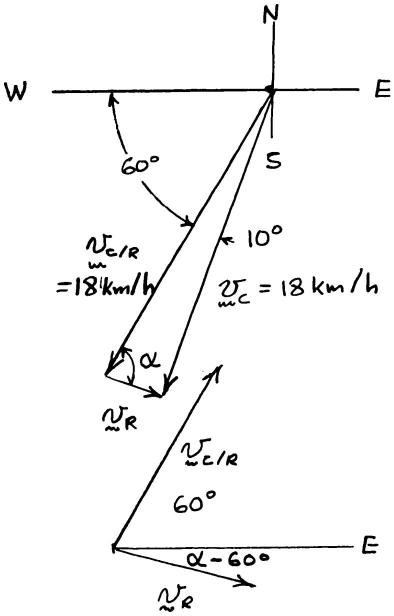
Distance between autos = 293 ft ◀



PROBLEM 11.120

Shore-based radar indicates that a ferry leaves its slip with a velocity $\mathbf{v} = 18$ km/h ↙ 70°, while instruments aboard the ferry indicate a speed of 18.4 km/h and a heading of 30° west of south relative to the river. Determine the velocity of the river.

SOLUTION



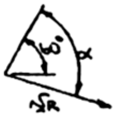
We have $\quad \mathbf{v}_F = \mathbf{v}_R + \mathbf{v}_{F/R} \quad$ or $\quad \mathbf{v}_F = \mathbf{v}_{F/R} + \mathbf{v}_R$

The graphical representation of the second equation is then as shown.

We have $\quad v_R^2 = 18^2 + 18.4^2 - 2(18)(18.4)\cos 10°$

or $\quad v_R = 3.1974$ km/h

and $\quad \dfrac{18}{\sin\alpha} = \dfrac{3.1974}{\sin 10°}$

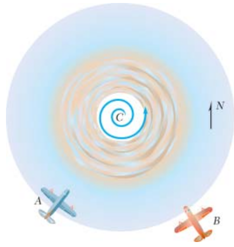


or $\quad \alpha = 77.84°$

Noting that

$\mathbf{v}_R = 3.20$ km/h ↘ 17.8° ◀

Alternatively one could use vector algebra.



PROBLEM 11.121

Airplanes A and B are flying at the same altitude and are tracking the eye of hurricane C. The relative velocity of C with respect to A is $\mathbf{v}_{C/A} = 350$ km/h ↙ 75°, and the relative velocity of C with respect to B is $\mathbf{v}_{C/B} = 400$ km/h ↘ 40°. Determine (a) the relative velocity of B with respect to A, (b) the velocity of A if ground-based radar indicates that the hurricane is moving at a speed of 30 km/h due north, (c) the change in position of C with respect to B during a 15-min interval.

SOLUTION

(a) We have $\mathbf{v}_C = \mathbf{v}_A + \mathbf{v}_{C/A}$

and $\mathbf{v}_C = \mathbf{v}_B + \mathbf{v}_{C/B}$

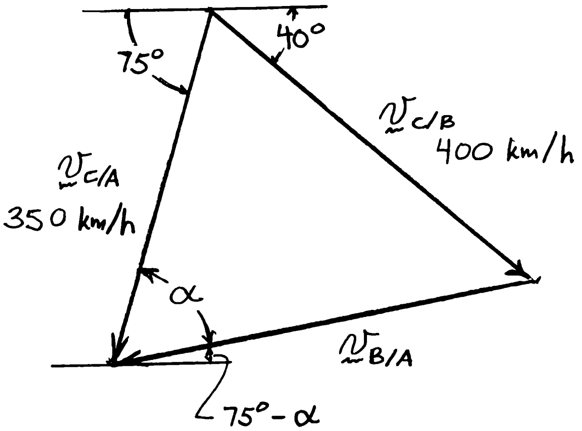
Then $\mathbf{v}_A + \mathbf{v}_{C/A} = \mathbf{v}_B + \mathbf{v}_{C/B}$

or $\mathbf{v}_B - \mathbf{v}_A = \mathbf{v}_{C/A} - \mathbf{v}_{C/B}$

Now $\mathbf{v}_B - \mathbf{v}_A = \mathbf{v}_{B/A}$

so that $\mathbf{v}_{B/A} = \mathbf{v}_{C/A} - \mathbf{v}_{C/B}$

or $\mathbf{v}_{C/A} = \mathbf{v}_{C/B} + \mathbf{v}_{B/A}$



The graphical representation of the last equation is then as shown.

We have $v_{B/A}^2 = 350^2 + 400^2 - 2(350)(400)\cos 65°$

or $v_{B/A} = 405.175$ km/h

and $\dfrac{400}{\sin\alpha} = \dfrac{405.175}{\sin 65°}$

or $\alpha = 63.474°$

$75° - \alpha = 11.526°$

$\mathbf{v}_{B/A} = 405$ km/h ↙ 11.53° ◀

PROBLEM 11.121 (Continued)

(*b*) We have $\mathbf{v}_C = \mathbf{v}_A + \mathbf{v}_{C/A}$

or $\mathbf{v}_A = (30\text{ km/h})\mathbf{j} - (350\text{ km/h})(-\cos 75°\mathbf{i} - \sin 75°\mathbf{j})$

$$\mathbf{v}_A = (90.587\text{ km/h})\mathbf{i} + (368.07\text{ km/h})\mathbf{j}$$

or $\mathbf{v}_A = 379$ km/h ↗ 76.17° ◀

(*c*) Noting that the velocities of *B* and *C* are constant, we have

$$\mathbf{r}_B = (\mathbf{r}_B)_0 + \mathbf{v}_B t \qquad \mathbf{r}_C = (\mathbf{r}_C)_0 + \mathbf{v}_C t$$

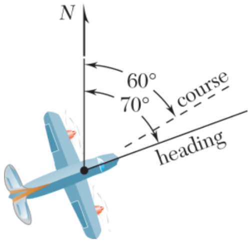
Now $\mathbf{r}_{C/B} = \mathbf{r}_C - \mathbf{r}_B = [(\mathbf{r}_C)_0 - (\mathbf{r}_B)_0] + (\mathbf{v}_C - \mathbf{v}_B)t$

$$= [(\mathbf{r}_C)_0 - (\mathbf{r}_B)_0] + \mathbf{v}_{C/B}t$$

Then $\Delta\mathbf{r}_{C/B} = (\mathbf{r}_{C/B})_{t_2} - (\mathbf{r}_{C/B})_{t_1} = \mathbf{v}_{C/B}(t_2 - t_1) = \mathbf{v}_{C/B}\Delta t$

For $\Delta t = 15$ min: $\Delta r_{C/B} = (400\text{ km/h})\left(\frac{1}{4}\text{h}\right) = 100\text{ km}$

$\Delta\mathbf{r}_{C/B} = 100$ km ↘ 40° ◀



PROBLEM 11.122

Instruments in an airplane which is in level flight indicate that the velocity relative to the air (airspeed) is 120 km/h and the direction of the relative velocity vector (heading) is 70° east of north. Instruments on the ground indicate that the velocity of the airplane (ground speed) is 110 km/h and the direction of flight (course) is 60° east of north. Determine the wind speed and direction.

SOLUTION

Let **i** and **j** be unit vectors in directions east and north respectively.

Velocity of plane relative to air.

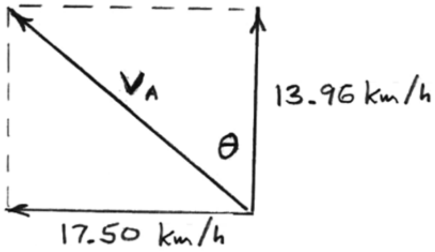
$$\mathbf{v}_{P/A} = (120 \text{ km/h})(\cos 20°\,\mathbf{i} + \sin 20°\,\mathbf{j})$$

Velocity of plane.

$$\mathbf{v}_P = (110 \text{ km/h})(\cos 30°\,\mathbf{i} + \sin 30°\,\mathbf{j})$$

But $\mathbf{v}_P = \mathbf{v}_A + \mathbf{v}_{P/A}$

Velocity of air. $\mathbf{v}_A = \mathbf{v}_P - \mathbf{v}_{P/A}$



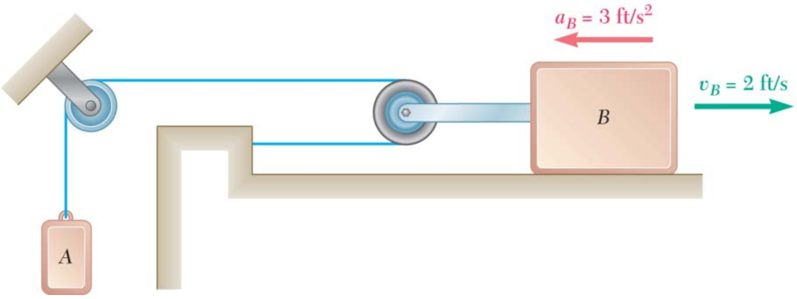
$$v_A = (110\cos 30° - 120\cos 20°)\mathbf{i} + (110\sin 30° - 120\sin 20°)\,\mathbf{j}$$

$$= (-17.50 \text{ km/h})\mathbf{i} + (13.96 \text{ km/h})\,\mathbf{j}$$

$$v_A = \sqrt{(17.50)^2 + (13.96)^2} = 22.4 \text{ km/h}$$

$$\tan\theta = \frac{17.50}{13.96} \qquad \theta = 51.4°$$

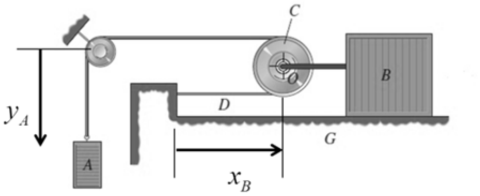
$\mathbf{v}_A = 22.4$ km/h at 51.4° west of north ◀



Problem 11.123

Knowing that at the instant shown block *B* has a velocity of 2 ft/s to the right and an acceleration of 3 ft/s^2 to the left, determine (*a*) the velocity of block *A*, (*b*) the acceleration of block A.

SOLUTION



Given: $v_B = 2 \text{ ft/s}, a_B = -3 \text{ ft/s}$

Length of Cable $L = y_A + 2x_B + \text{ constants}$

Differentiate Length Equation

$$0 = v_A + 2v_B \qquad (1)$$

Differentiate again $0 = a_A + 2a_B \qquad (2)$

(*e*) Rearrange (1)

$$v_A = -2v_B$$
$$= -2(2) \text{ ft/s}$$

$$v_A = -4 \text{ ft/s}$$

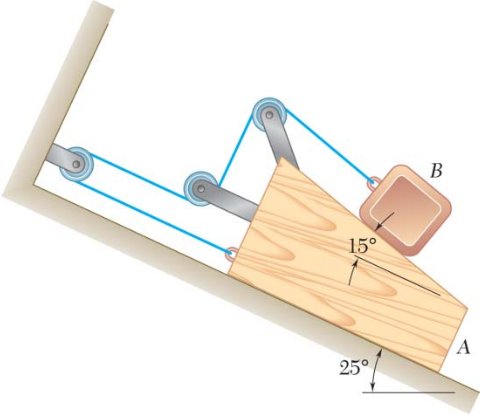
$$v_A = 4 \text{ ft/s} \uparrow \blacktriangleleft$$

(*f*) Rearrange (2)

$$a_A = -2a_B$$
$$= -2(-3) \text{ ft/s}^2$$

$$a_A = 6 \text{ ft/s}^2$$

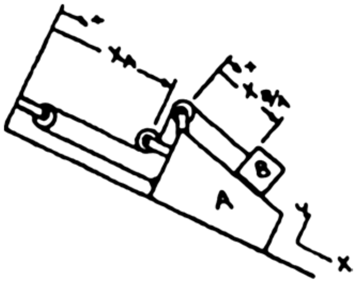
$$a_A = 6 \text{ ft/s}^2 \downarrow \blacktriangleleft$$



PROBLEM 11.124

Knowing that at the instant shown block A has a velocity of 8 in./s and an acceleration of 6 in./s^2 both directed down the incline, determine (a) the velocity of block B, (b) the acceleration of block B.

SOLUTION



From the diagram $\qquad 2x_A + x_{B/A} = \text{constant}$

Then $\qquad 2v_A + v_{B/A} = 0$

or $\qquad |v_{B/A}| = 16 \text{ in./s}$

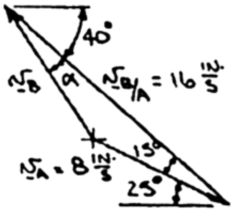
and $\qquad 2a_A + a_{B/A} = 0$

or $\qquad |a_{B/A}| = 12 \text{ in./s}^2$

Note that $\mathbf{v}_{B/A}$ and $\mathbf{a}_{B/A}$ must be parallel to the top surface of block A.

(a) We have $\qquad \mathbf{v}_B = \mathbf{v}_A + \mathbf{v}_{B/A}$

The graphical representation of this equation is then as shown. Note that because A is moving downward, B must be moving upward relative to A.



40°
v_B
α
$v_{B/A} = 16 \frac{\text{in.}}{\text{s}}$
$v_A = 8 \frac{\text{in.}}{\text{s}}$
15°
25°

We have $\qquad v_B^2 = 8^2 + 16^2 - 2(8)(16)\cos 15°$

or $\qquad v_B = 8.5278 \text{ in./s}$

and $\qquad \dfrac{8}{\sin\alpha} = \dfrac{8.5278}{\sin 15°}$

or $\qquad \alpha = 14.05°$

$\mathbf{v}_B = 8.53$ in./s ∠ 54.1° ◀

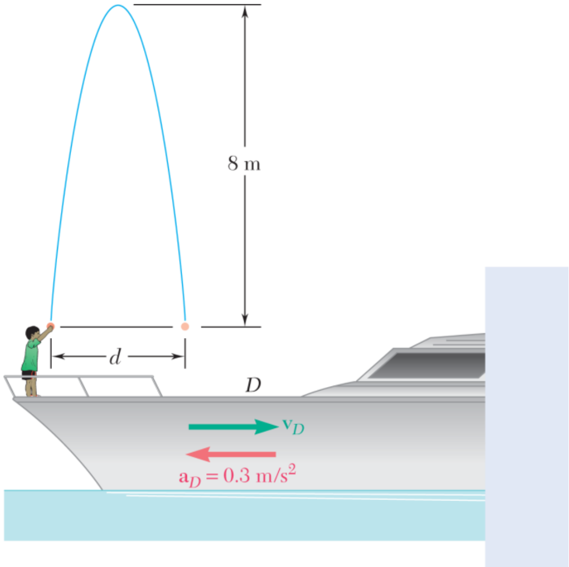
(b) The same technique that was used to determine $\mathbf{v}_B$ can be used to determine $\mathbf{a}_B$. An alternative method is as follows.

We have

$$\mathbf{a}_B = \mathbf{a}_A + \mathbf{a}_{B/A}$$
$$= (6\mathbf{i}) + 12(-\cos 15°\mathbf{i} + \sin 15°\mathbf{j})^*$$
$$= -(5.5911 \text{ in./s}^2)\mathbf{i} + (3.1058 \text{ in./s}^2)\mathbf{j}$$

or $\qquad \mathbf{a}_B = 6.40$ in./s^2 ∠ 54.1° ◀

* Note the orientation of the coordinate axes on the sketch of the system.



PROBLEM 11.125

A boat is moving to the right with a constant deceleration of 0.3 m/s^2 when a boy standing on the deck *D* throws a ball with an initial velocity relative to the deck which is vertical. The ball rises to a maximum height of 8 m above the release point and the boy must step forward a distance *d* to catch it at the same height as the release point. Determine (*a*) the distance *d*, (*b*) the relative velocity of the ball with respect to the deck when the ball is caught.

SOLUTION

Horizontal motion of the ball: $v_x = (v_x)_0, \quad x_{\text{ball}} = (v_x)_0 t$

Vertical motion of the ball: $v_y = (v_y)_0 - gt$

$$y_B = (v_y)_0 t - \frac{1}{2}gt^2, \quad (v_y)^2 - (v_y)_0^2 = -2gy$$

At maximum height, $v_y = 0$ and $y = y_{\max}$

$$(v_y)^2 = 2gy_{\max} = (2)(9.81)(8) = 156.96 \text{ m}^2/\text{s}^2$$

$$(v_y)_0 = 12.528 \text{ m/s}$$

At time of catch, $y = 0 = 12.528 - \frac{1}{2}(9.81)t^2$

or $t_{\text{catch}} = 2.554$ s and $v_y = 12.528$ m/s ↓

Motion of the deck: $v_x = (v_x)_0 + a_D t, \quad x_{\text{deck}} = (v_x)_0 t + \frac{1}{2}a_D t^2$

Motion of the ball relative to the deck:

$$(v_{B/D})_x = (v_x)_0 - [(v_x)_0 + a_D t] = -a_D t$$

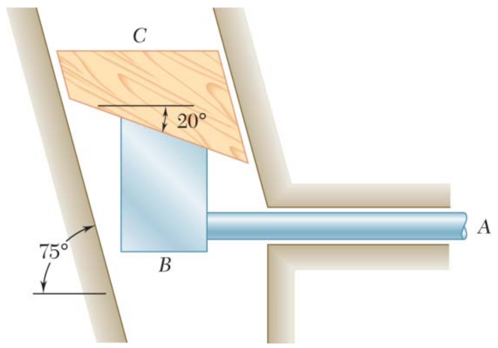
$$x_{B/D} = (v_x)_0 t - \left[(v_x)_0 t + \frac{1}{2}a_D t^2\right] = -\frac{1}{2}a_D t^2$$

$$(v_{B/D})_y = (v_y)_0 - gt, \quad y_{B/D} = y_B$$

(*a*) At time of catch, $d = x_{D/B} = -\frac{1}{2}(-0.3)(2.554)^2$ $d = 0.979$ m ◀

(*b*) $(v_{B/D})_x = -(-0.3)(2.554) = +0.766$ m/s or 0.766 m/s →

$(v_{B/D})_y = 12.528$ m/s ↓ $\mathbf{v}_{B/D} = 12.55$ m/s ↘ 86.5° ◀



PROBLEM 11.126

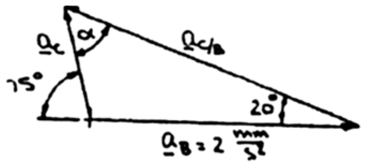
The assembly of rod *A* and wedge *B* starts from rest and moves to the right with a constant acceleration of 2 mm/s^2. Determine (*a*) the acceleration of wedge *C*, (*b*) the velocity of wedge *C* when $t = 10$ s.

SOLUTION

(*a*) We have

$$\mathbf{a}_C = \mathbf{a}_B + \mathbf{a}_{C/B}$$

The graphical representation of this equation is then as shown.



First note

$$\alpha = 180° - (20° + 105°)$$
$$= 55°$$

Then

$$\frac{a_C}{\sin 20°} = \frac{2}{\sin 55°}$$

$$a_C = 0.83506\ \text{mm/s}^2$$

$\mathbf{a}_C = 0.835\ \text{mm/s}^2$ ↘ 75° ◀

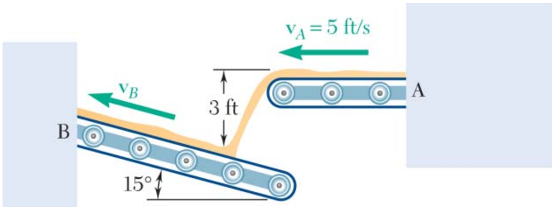
(*b*) For uniformly accelerated motion

$$v_C = 0 + a_C t$$

At $t = 10$ s:

$$v_C = (0.83506\ \text{mm/s}^2)(10\ \text{s})$$
$$= 8.3506\ \text{mm/s}$$

or $\mathbf{v}_C = 8.35\ \text{mm/s}$ ↘ 75° ◀



PROBLEM 11.127

Determine the required velocity of the belt *B* if the relative velocity with which the sand hits belt *B* is to be (*a*) vertical, (*b*) as small as possible.

SOLUTION

A grain of sand will undergo projectile motion.

$$v_{s_x} = v_{s_{x_0}} = \text{constant} = -5 \text{ ft/s}$$

y-direction. $$v_{s_y} = \sqrt{2gh} = \sqrt{(2)(32.2 \text{ ft/s}^2)(3 \text{ ft})} = 13.90 \text{ ft/s} \downarrow$$

Relative velocity. $$\mathbf{v}_{S/B} = \mathbf{v}_S - \mathbf{v}_B \qquad (1)$$

(*a*) If $v_{S/B}$ is vertical,

$$\begin{aligned} -v_{S/B}\mathbf{j} &= -5\mathbf{i} - 13.9\mathbf{j} - (-v_B \cos 15°\mathbf{i} + v_B \sin 15°\mathbf{j}) \\ &= -5\mathbf{i} - 13.9\mathbf{j} + v_B \cos 15°\mathbf{i} - v_B \sin 15°\mathbf{j} \end{aligned}$$

Equate components. $\mathbf{i}$: $0 = -5 + v_B \cos 15° \qquad v_B = \dfrac{5}{\cos 15°} = 5.176 \text{ ft/s}$

$$\mathbf{v}_B = 5.18 \text{ ft/s} \nwarrow 15° \blacktriangleleft$$

(*b*) $v_{S/C}$ is as small as possible, so make $v_{S/B} \perp$ to v_B into (1).

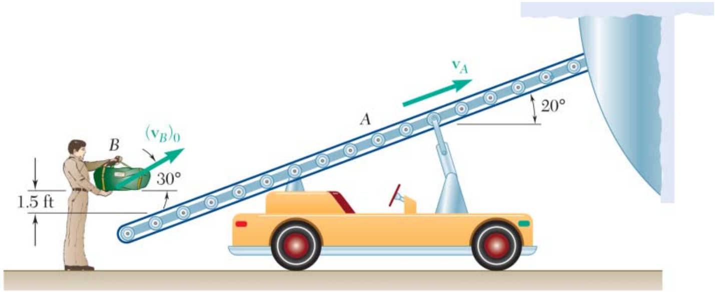
$$-v_{S/B} \sin 15°\mathbf{i} - v_{S/B} \cos 15°\mathbf{j} = -5\mathbf{i} - 13.9\mathbf{j} + v_B \cos 15°\mathbf{i} - v_B \sin 15°\mathbf{j}$$

Equate components and transpose terms.

$$(\sin 15°)\, v_{S/B} + (\cos 15°)\, v_B = 5$$
$$(\cos 15°)\, v_{S/B} - (\sin 15°)\, v_B = 13.90$$

Solving, $\qquad v_{S/B} = 14.72 \text{ ft/s} \qquad v_B = 1.232 \text{ ft/s}$

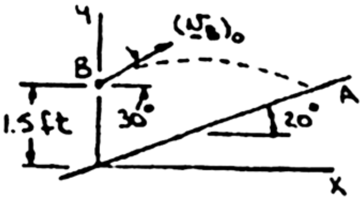
$$\mathbf{v}_B = 1.232 \text{ ft/s} \nwarrow 15° \blacktriangleleft$$



PROBLEM 11.128

Conveyor belt *A*, which forms a 20° angle with the horizontal, moves at a constant speed of 4 ft/s and is used to load an airplane. Knowing that a worker tosses duffel bag *B* with an initial velocity of 2.5 ft/s at an angle of 30° with the horizontal, determine the velocity of the bag relative to the belt as it lands on the belt.

SOLUTION



First determine the velocity of the bag as it lands on the belt. Now

$$[(v_B)_x]_0 = (v_B)_0 \cos 30^\circ$$
$$= (2.5 \text{ ft/s})\cos 30^\circ$$
$$[(v_B)_y]_0 = (v_B)_0 \sin 30^\circ$$
$$= (2.5 \text{ ft/s})\sin 30^\circ$$

Horizontal motion. (Uniform)

$$x = 0 + [(v_B)_x]_0\, t \qquad (v_B)_x = [(v_B)_x]_0$$
$$= (2.5 \cos 30^\circ)t \qquad = 2.5 \cos 30^\circ$$

Vertical motion. (Uniformly accelerated motion)

$$y = y_0 + [(v_B)_y]_0\, t - \frac{1}{2}gt^2 \qquad (v_B)_y = [(v_B)_y]_0 - gt$$
$$= 1.5 + (2.5 \sin 30^\circ)t - \frac{1}{2}gt^2 \qquad = 2.5 \sin 30^\circ - gt$$

The equation of the line collinear with the top surface of the belt is

$$y = x \tan 20^\circ$$

Thus, when the bag reaches the belt

$$1.5 + (2.5 \sin 30^\circ)t - \frac{1}{2}gt^2 = [(2.5 \cos 30^\circ)t] \tan 20^\circ$$

or
$$\frac{1}{2}(32.2)t^2 + 2.5(\cos 30^\circ \tan 20^\circ - \sin 30^\circ)t - 1.5 = 0$$

or
$$16.1t^2 - 0.46198t - 1.5 = 0$$

Solving $t = 0.31992$ s and $t = -0.29122$ s (Reject)

PROBLEM 11.128 (Continued)

The velocity $\mathbf{v}_B$ of the bag as it lands on the belt is then

$$\begin{aligned}\mathbf{v}_B &= (2.5\cos 30°)\mathbf{i} + [2.5\sin 30° - 32.2(0.319\,92)]\mathbf{j}\\ &= (2.1651\text{ ft/s})\mathbf{i} - (9.0514\text{ ft/s})\mathbf{j}\end{aligned}$$

Finally $$\mathbf{v}_B = \mathbf{v}_A + \mathbf{v}_{B/A}$$

or $$\begin{aligned}\mathbf{v}_{B/A} &= (2.1651\mathbf{i} - 9.0514\mathbf{j}) - 4(\cos 20°\mathbf{i} + \sin 20°\mathbf{j})\\ &= -(1.59367\text{ ft/s})\mathbf{i} - (10.4195\text{ ft/s})\mathbf{j}\end{aligned}$$

or $$\mathbf{v}_{B/A} = 10.54\text{ ft/s} \swarrow 81.3° \blacktriangleleft$$

PROBLEM 11.129

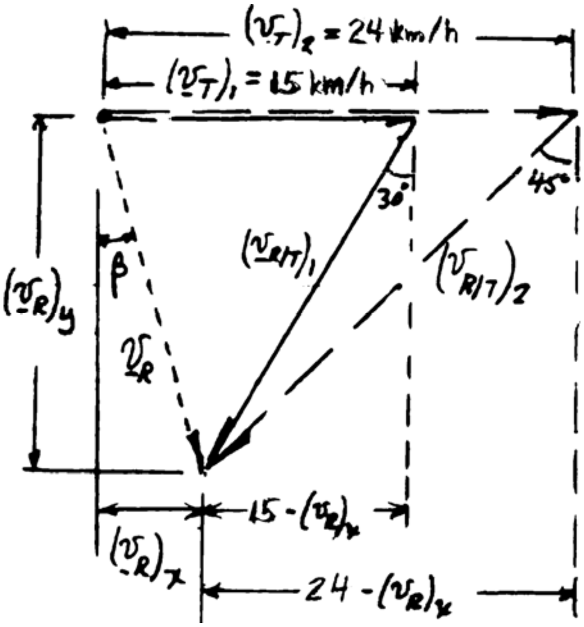
During a rainstorm the paths of the raindrops appear to form an angle of 30° with the vertical and to be directed to the left when observed from a side window of a train moving at a speed of 15 km/h. A short time later, after the speed of the train has increased to 24 km/h, the angle between the vertical and the paths of the drops appears to be 45°. If the train were stopped, at what angle and with what velocity would the drops be observed to fall?

SOLUTION

$$v_{\text{rain}} = v_{\text{train}} + v_{\text{rain/train}}$$

Case ①: $v_T = 15\text{ km/h} \longrightarrow; \quad v_{R/T} \swarrow 30^\circ$

Case ②: $v_T = 24\text{ km/h} \longrightarrow; \quad v_{R/T} \swarrow 45^\circ$



Case ①: $(v_R)_y \tan 30 = 15 - (v_R)_x$ (1)

Case ②: $(v_R)_y \tan 45^\circ = 24 - (v_R)_x$ (2)

Substract (1) from (2) $(v_R)_y (\tan 45^\circ - \tan 30^\circ) = 9$

$$(v_R)_y = 21.294\text{ km/h}$$

Eq. (2): $21.294 \tan 45^\circ = 25 - (v_R)_x$

$$(v_R)_x = 2.706\text{ km/h}$$

$$\tan\beta = \frac{3.706}{21.294}$$

$$\beta = 7.24^\circ$$

$$v_R = \frac{21.294}{\cos 7.24^\circ} = 21.47 \text{ km/h} = 5.96 \text{ m/s}$$

$v_R = 5.96 \text{ m/s} \searrow 82.8^\circ$ ◀

Alternate solution

Alternate, vector equation $\mathbf{v}_R = \mathbf{v}_T + \mathbf{v}_{R/T}$

For first case, $\mathbf{v}_R = 15\mathbf{i} + v_{R/T-1}(-\sin 30^\circ\mathbf{i} - \cos 30^\circ\mathbf{j})$

For second case, $\mathbf{v}_R = 24\mathbf{i} + v_{R/T-2}(-\sin 45^\circ\mathbf{i} - \cos 45^\circ\mathbf{j})$

Set equal

$$15\mathbf{i} + v_{R/T-1}(-\sin 30^\circ\mathbf{i} - \cos 30^\circ\mathbf{j}) = 24\mathbf{i} + v_{R/T-2}(-\sin 45^\circ\mathbf{i} - \cos 45^\circ\mathbf{j})$$

Separate into components:

i: $15 - v_{R/T-1}\sin 30^\circ = 24 - v_{R/T-2}\sin 45^\circ$

$$-v_{R/T-1}\sin 30^\circ + v_{R/T-2}\sin 45^\circ = 9 \qquad (3)$$

j: $-v_{R/T-1}\cos 30^\circ = -v_{R/T-2}\cos 45^\circ$

$$v_{R/T-1}\cos 30^\circ + v_{R/T-2}\cos 45^\circ = 0 \qquad (4)$$

Solving Eqs. (3) and (4) simultaneously,

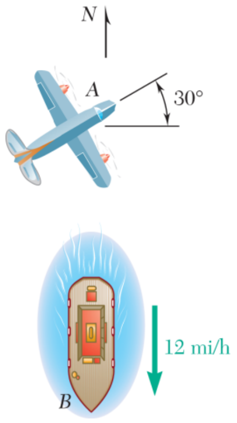
$v_{R/T-1} = 24.5885 \text{ km/h}$ $\qquad v_{R/T-2} = 30.1146 \text{ km/h}$

Substitute $\mathbf{v}_{R/T-2}$ back into equation for $\mathbf{v}_R$.

$$\mathbf{v}_R = 24\mathbf{i} + 30.1146(-\sin 45^\circ\mathbf{i} - \cos 45^\circ\mathbf{j})$$

$\mathbf{v}_R = 2.71\mathbf{i} - 21.29\mathbf{j}$ $\qquad \mathbf{v}_R = 21.4654 \text{ km/hr} = 5.96 \text{ m/s}$

$\theta = \tan^{-1}\left(\dfrac{-21.29}{2.71}\right) = -82.7585^\circ$ $\qquad \mathbf{v}_R = 5.96 \text{ m/s} \searrow 82.8^\circ$ ◀



PROBLEM 11.130

Instruments in airplane A indicate that with respect to the air the plane is headed 30° north of east with an airspeed of 300 mi/h. At the same time radar on ship B indicates that the relative velocity of the plane with respect to the ship is 280 mi/h in the direction 33° north of east. Knowing that the ship is steaming due south at 12 mi/h, determine (*a*) the velocity of the airplane, (*b*) the wind speed and direction.

SOLUTION

Let the x-axis be directed east, and the y-axis be directed north.

Airspeed: $\mathbf{v}_{A/W} = 300 \text{ mi/h} \measuredangle 30^\circ = 300(\cos 30^\circ \mathbf{i} + \sin 30^\circ \mathbf{j}) \text{ mi/h}$

Plane relative to ship: $\mathbf{v}_{A/B} = 280(\cos 33^\circ \mathbf{i} + \sin 33^\circ \mathbf{j}) \text{ mi/h}$

Ship: $\mathbf{v}_B = 12 \text{ mi/h} \downarrow = -12\mathbf{j}$

(*a*) Velocity of airplane.

$$\mathbf{v}_A = \mathbf{v}_B + \mathbf{v}_{A/B} = -12\mathbf{j} + 280(\cos 33^\circ \mathbf{i} + \sin 33^\circ \mathbf{j})$$

$$= 234.83\mathbf{i} + 140.50\mathbf{j}$$

$\mathbf{v}_A = 274 \text{ mi/h} \measuredangle 30.9^\circ$ ◀

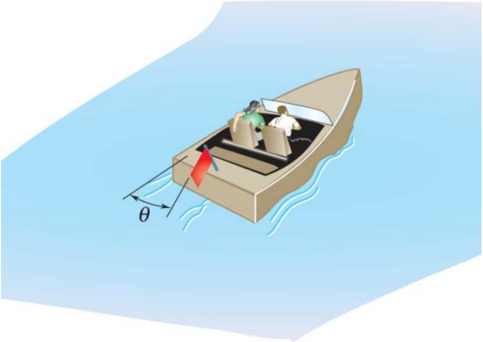
(*b*) Wind velocity.

$$\mathbf{v}_W = \mathbf{v}_A + \mathbf{v}_{W/A} = \mathbf{v}_A - \mathbf{v}_{A/W}$$

$$= 234.83\mathbf{i} + 140.50\mathbf{j} - 300(\cos 30^\circ \mathbf{i} + \sin 30^\circ \mathbf{j})$$

$$= -24.98\mathbf{i} - 9.50\mathbf{j}$$

$\mathbf{v}_W = 26.7 \text{ mi/h} \swarrow 20.8^\circ$ ◀



PROBLEM 11.131

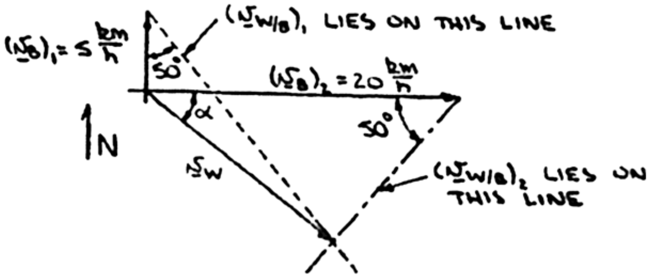
When a small boat travels north at 5 km/h, a flag mounted on its stern forms an angle $\theta = 50°$ with the centerline of the boat as shown. A short time later, when the boat travels east at 20 km/h, angle θ is again 50°. Determine the speed and the direction of the wind.

SOLUTION

We have

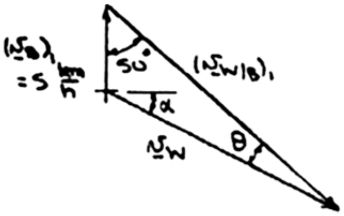
$$\mathbf{v}_W = \mathbf{v}_B + \mathbf{v}_{W/B}$$

Using this equation, the two cases are then graphically represented as shown.

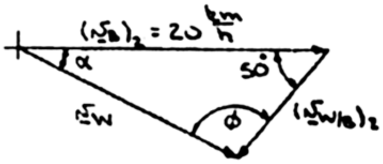


(v_B)_1 = 5 km/h
(v_W/B)_1 LIES ON THIS LINE
50°
(v_B)_2 = 20 km/h
N
α
50°
v_W
(v_W/B)_2 LIES ON THIS LINE

With $\mathbf{v}_W$ now defined, the above diagram is redrawn for the two cases for clarity.



(v_B)_1 = 5 km/h
50°
(v_W/B)_1
α
v_W
θ



(v_B)_2 = 20 km/h
α
50°
v_W
φ
(v_W/B)_2

Noting that

$$\theta = 180° - (50° + 90° + \alpha) \qquad \phi = 180° - (50° + \alpha)$$
$$= 40° - \alpha \qquad\qquad = 130° - \alpha$$

We have

$$\frac{v_W}{\sin 50°} = \frac{5}{\sin(40° - \alpha)} \qquad \frac{v_W}{\sin 50°} = \frac{20}{\sin(130° - \alpha)}$$

PROBLEM 11.131 (Continued)

Therefore
$$\frac{5}{\sin(40^\circ - \alpha)} = \frac{20}{\sin(130^\circ - \alpha)}$$

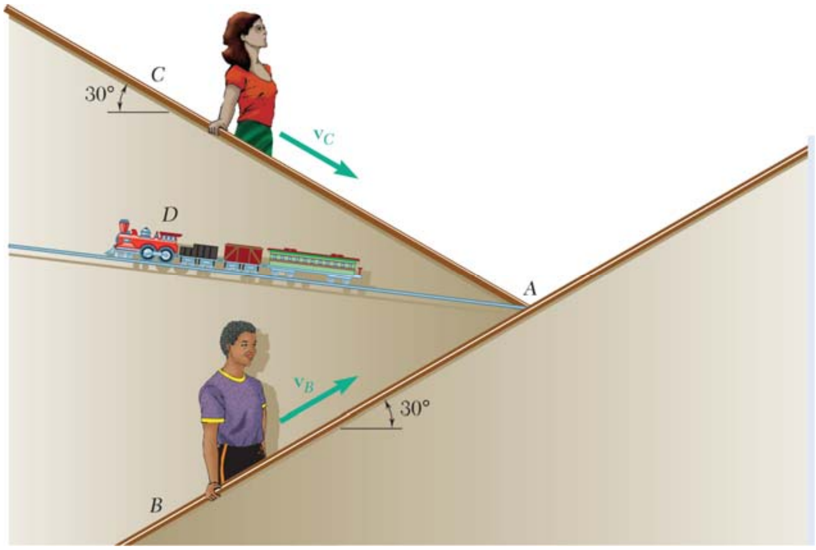
or
$$\sin 130^\circ \cos \alpha - \cos 130^\circ \sin \alpha = 4(\sin 40^\circ \cos \alpha - \cos 40^\circ \sin \alpha)$$

or
$$\tan \alpha = \frac{\sin 130^\circ - 4 \sin 40^\circ}{\cos 130^\circ - 4 \cos 40^\circ}$$

or
$$\alpha = 25.964^\circ$$

Then
$$v_W = \frac{5 \sin 50^\circ}{\sin(40^\circ - 25.964^\circ)} = 15.79 \text{ km/h}$$

$\mathbf{v}_W = 15.79$ km/h $\searrow$ 26.0° ◀



C
30°
$\mathbf{v}_C$
D
A
$\mathbf{v}_B$
30°
B

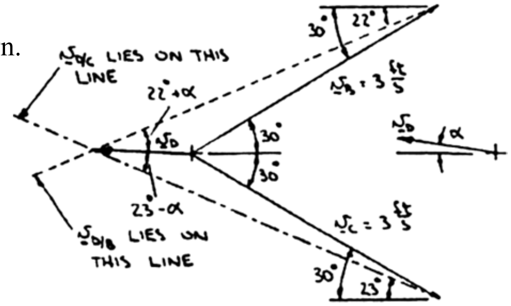
PROBLEM 11.132

As part of a department store display, a model train *D* runs on a slight incline between the store's up and down escalators. When the train and shoppers pass Point *A*, the train appears to a shopper on the up escalator *B* to move downward at an angle of 22° with the horizontal, and to a shopper on the down escalator *C* to move upward at an angle of 23° with the horizontal and to travel to the left. Knowing that the speed of the escalators is 3 ft/s, determine the speed and the direction of the train.

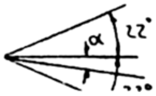
SOLUTION

We have
$$\mathbf{v}_D = \mathbf{v}_B + \mathbf{v}_{D/B}$$
$$\mathbf{v}_D = \mathbf{v}_C + \mathbf{v}_{D/C}$$

The graphical representations of these equations are then as shown.



$\mathbf{v}_{D/C}$ LIES ON THIS LINE
22°+α
$\mathbf{v}_D$
30°
22°
$\mathbf{v}_B = 3\frac{ft}{s}$
30°
30°
$\mathbf{v}_D$
α
23°-α
$\mathbf{v}_{D/B}$ LIES ON THIS LINE
$\mathbf{v}_C = 3\frac{ft}{s}$
30°
23°



Then $\dfrac{v_D}{\sin 8^\circ} = \dfrac{3}{\sin(22^\circ + \alpha)}$ $\qquad \dfrac{v_D}{\sin 7^\circ} = \dfrac{3}{\sin(23^\circ - \alpha)}$

Equating the expressions for $\dfrac{v_D}{3}$

$$\frac{\sin 8^\circ}{\sin(22^\circ + \alpha)} = \frac{\sin 7^\circ}{\sin(23^\circ - \alpha)}$$

or $\sin 8^\circ(\sin 23^\circ \cos\alpha - \cos 23^\circ \sin\alpha)$
$$= \sin 7^\circ(\sin 22^\circ \cos\alpha + \cos 22^\circ \sin\alpha)$$

or
$$\tan\alpha = \frac{\sin 8^\circ \sin 23^\circ - \sin 7^\circ \sin 22^\circ}{\sin 8^\circ \cos 23^\circ + \sin 7^\circ \cos 22^\circ}$$

or
$$\alpha = 2.0728^\circ$$

Then
$$v_D = \frac{3 \sin 8^\circ}{\sin(22^\circ + 2.0728^\circ)} = 1.024 \text{ ft/s}$$

$\mathbf{v}_D = 1.024$ ft/s ↘ 2.07° ◀

Alternate solution using components.

$$\mathbf{v}_B = (3\text{ ft/s}) \nearrow 30^\circ = (2.5981\text{ ft/s})\mathbf{i} + (1.5\text{ ft/s})\mathbf{j}$$

$$\mathbf{v}_C = (3\text{ ft/s}) \searrow 30^\circ = (2.5981\text{ ft/s})\mathbf{i} - (1.5\text{ ft/s})\mathbf{j}$$

$$\mathbf{v}_{D/B} = u_1 \swarrow 22^\circ = -(u_1 \cos 22^\circ)\mathbf{i} - (u_1 \sin 22^\circ)\mathbf{j}$$

$$\mathbf{v}_{D/C} = u_2 \nwarrow 23^\circ = -(u_2 \cos 23^\circ)\mathbf{i} + (u_2 \sin 23^\circ)\mathbf{j}$$

$$\mathbf{v}_D = v_D \nwarrow \alpha = -(v_D \cos \alpha)\mathbf{i} + (v_D \sin \alpha)\mathbf{j}$$

$$\mathbf{v}_D = \mathbf{v}_B + \mathbf{v}_{D/B} = \mathbf{v}_C + \mathbf{v}_{D/C}$$

$$2.5981\mathbf{i} + 1.5\mathbf{j} - (u_1 \cos 22^\circ)\mathbf{i} - (u_1 \sin 22^\circ)\mathbf{j} = 2.5981\mathbf{i} - 1.5\mathbf{j} - (u_2 \cos 23^\circ)\mathbf{i} + (u_2 \sin 23^\circ)\mathbf{j}$$

Separate into components, transpose, and change signs.

$$u_1 \cos 22^\circ - u_2 \cos 23^\circ = 0$$

$$u_1 \sin 22^\circ + u_1 \sin 23^\circ = 3$$

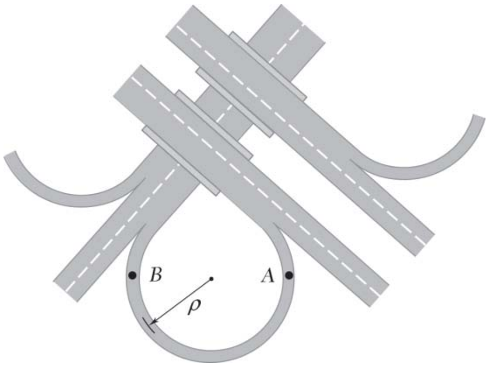
Solving for u_1 and u_2, $\quad u_1 = 3.9054\text{ ft/s} \qquad u_2 = 3.9337\text{ ft/s}$

$$\begin{aligned}\mathbf{v}_D &= 2.5981\mathbf{i} + 1.5\mathbf{j} - (3.9054 \cos 22^\circ)\mathbf{i} - (3.9054 \sin 22^\circ)\mathbf{j} \\ &= -(1.0229\text{ ft/s})\mathbf{i} + (0.0370\text{ ft/s})\mathbf{j}\end{aligned}$$

or

$$\begin{aligned}\mathbf{v}_D &= 2.5981\mathbf{i} - 1.5\mathbf{j} - (3.9337 \cos 23^\circ)\mathbf{i} + (3.9337 \sin 23^\circ)\mathbf{j} \\ &= -(1.0229\text{ ft/s})\mathbf{i} + (0.0370\text{ ft/s})\mathbf{j}\end{aligned}$$

$$\mathbf{v}_D = 1.024\text{ ft/s} \nwarrow 2.07^\circ \blacktriangleleft$$



PROBLEM 11.133

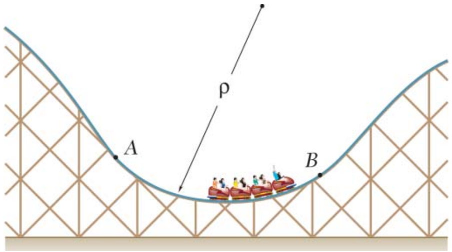
Determine the smallest radius that should be used for a highway if the normal component of the acceleration of a car traveling at 72 km/h is not to exceed 0.8 m/s^2.

SOLUTION

$$a_n = \frac{v^2}{\rho} \qquad a_n = 0.8 \text{ m/s}^2$$

$$v = 72 \text{ km/h} = 20 \text{ m/s}$$

$$0.8 \text{ m/s}^2 = \frac{(20 \text{ m/s})^2}{\rho} \qquad \rho = 500 \text{ m} \blacktriangleleft$$



PROBLEM 11.134

Determine the maximum speed that the cars of the roller-coaster can reach along the circular portion *AB* of the track if ρ is 25 m and the normal component of their acceleration cannot exceed 3 g.

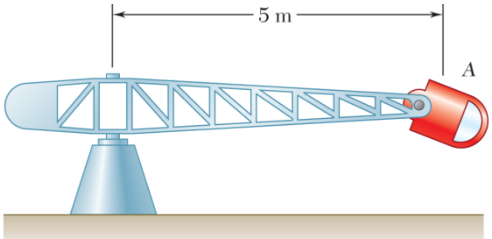
SOLUTION

We have $$a_n = \frac{v^2}{\rho}$$

Then $$(v_{\max})^2_{AB} = (3 \times 9.81\ \text{m/s}^2)(25\ \text{m})$$

or $$(v_{\max})_{AB} = 27.124\ \text{m/s}$$

or $$(v_{\max})_{AB} = 97.6\ \text{km/h} \blacktriangleleft$$



Problem 11.135

Human centrifuges are often used to simulate different acceleration levels for pilots and astronauts. Space shuttle pilots typically face inwards towards the center of the gondola in order to experience a simulated 3*g* forward acceleration. Knowing that the astronaut sits 5 m from the axis of rotation and experiences 3 g's inward, determine her velocity.

SOLUTION

Given: $a_n = 3g,\ \rho = 5 \text{ m}$

$$a_n = \frac{v^2}{\rho}$$

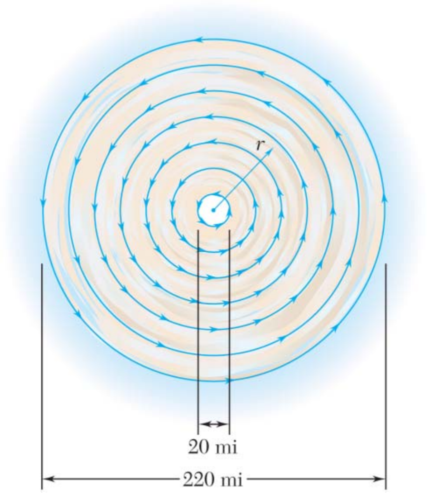
Rearrange $v = \sqrt{\rho a_n}$

$$v = \sqrt{\rho 3g}$$

Substitute in known values $v = \sqrt{5*3*9.81} \text{ m/s}$

$$v_A = 12.13 \text{ m/s} \blacktriangleleft$$

PROBLEM 11.136



The diameter of the eye of a stationary hurricane is 20 mi and the maximum wind speed is 100 mi/h at the eye wall, $r = 10$ mi. Assuming that the wind speed is constant for constant r and decreases uniformly with increasing r to 40 mi/h at $r = 110$ mi, determine the magnitude of the acceleration of the air at (*a*) $r = 10$ mi, (*b*) $r = 60$ mi, (*c*) $r = 110$ mi.

SOLUTION

(*a*) $$r = 10 \text{ mi} = 52800 \text{ ft}, \quad v = 100 \text{ mi/h} = 146.67 \text{ ft/s}$$

$$a = \frac{v^2}{r} = \frac{(146.67)^2}{52800} \qquad a = 0.407 \text{ ft/s}^2 \blacktriangleleft$$

(*b*) $$r = 60 \text{ mi} = 316800 \text{ ft}, \quad v = 100 - \frac{40-100}{110-10}(60-10) = 70 \text{ mi/h} = 102.67 \text{ ft/s}$$

$$a = \frac{v^2}{r} = \frac{(102.67)^2}{316800} \qquad a = 0.0333 \text{ ft/s}^2 \blacktriangleleft$$

(*c*) $$r = 110 \text{ mi} = 580800 \text{ ft}, \quad v = 40 \text{ mi/h} = 58.67 \text{ ft/s}$$

$$a = \frac{v^2}{r} = \frac{(58.67)^2}{580800} \qquad a = 0.00593 \text{ ft/s}^2 \blacktriangleleft$$

PROBLEM 11.137

The peripheral speed of the tooth of a 10-in.-diameter circular saw blade is 150 ft/s when the power to the saw is turned off. The speed of the tooth decreases at a constant rate, and the blade comes to rest in 9 s. Determine the time at which the total acceleration of the tooth is 130 ft/s^2.

SOLUTION

For uniformly decelerated motion: $v = v_0 + a_t t$

At $t = 9$ s, $0 = 150 - a_t(9)$, or $a_t = -16.667$ ft/s^2

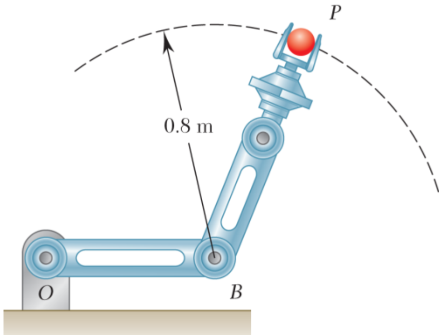
Total acceleration: $a^2 = a_t^2 + a_n^2$

$$a_n = \left[a^2 - a_t^2\right]^{1/2} = \left[(130)^2 - (-16.667)^2\right]^{1/2} = 128.93 \text{ ft/s}^2$$

Normal acceleration: $a_n = \dfrac{v^2}{\rho}$, where $\rho = \dfrac{1}{2}$ diameter $= \dfrac{5}{12}$ ft

$$v^2 = \rho a_n = \left(\frac{5}{12}\right)(128.93) = 53.72 \text{ ft}^2/\text{s}^2, \quad v = 7.329 \text{ ft/s}$$

Time: $t = \dfrac{v - v_0}{a_t} = \dfrac{7.329 - 150}{-16.667}$ $t = 8.56$ s ◀



PROBLEM 11.138

A robot arm moves so that P travels in a circle about Point B, which is not moving. Knowing that P starts from rest, and its speed increases at a constant rate of 10 mm/s^2, determine (*a*) the magnitude of the acceleration when $t = 4$ s, (*b*) the time for the magnitude of the acceleration to be 80 mm/s^2.

SOLUTION

Tangential acceleration: $a_t = 10 \text{ mm/s}^2$

Speed: $v = a_t t$

Normal acceleration: $a_n = \dfrac{v^2}{\rho} = \dfrac{a_t^2 t^2}{\rho}$

where $\rho = 0.8 \text{ m} = 800 \text{ mm}$

(*a*) When $t = 4$ s $\quad v = (10)(4) = 40 \text{ mm/s}$

$$a_n = \frac{(40)^2}{800} = 2 \text{ mm/s}^2$$

Acceleration: $a = \sqrt{a_t^2 + a_n^2} = \sqrt{(10)^2 + (2)^2}$

$a = 10.20 \text{ mm/s}^2$ ◀

(*b*) Time when $a = 80 \text{ mm/s}^2$

$$a^2 = a_n^2 + a_t^2$$

$$(80)^2 = \left[\frac{(10)^2 t^2}{800}\right]^2 + 10^2 \qquad t^4 = 403200 \text{ s}^4$$

$t = 25.2$ s ◀

PROBLEM 11.139

A monorail train starts from rest on a curve of radius 400 m and accelerates at the constant rate a_t. If the maximum total acceleration of the train must not exceed 1.5 m/s^2, determine (*a*) the shortest distance in which the train can reach a speed of 72 km/h, (*b*) the corresponding constant rate of acceleration a_t.

SOLUTION

When $v = 72\text{ km/h} = 20\text{ m/s}$ and $\rho = 400\text{ m}$,

$$a_n = \frac{v^2}{\rho} = \frac{(20)^2}{400} = 1.000\text{ m/s}^2$$

But $$a = \sqrt{a_n^2 + a_t^2}$$

$$a_t = \sqrt{a^2 - a_n^2} = \sqrt{(1.5)^2 - (1.000)^2} = \pm 1.11803\text{ m/s}^2$$

Since the train is accelerating, reject the negative value.

(*a*) Distance to reach the speed.

$$v_0 = 0$$

Let $$x_0 = 0$$

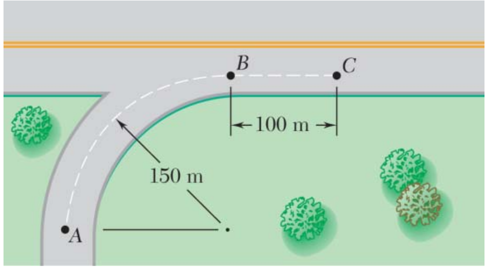
$$v_1^2 = v_0^2 + 2a_t(x_1 - x_0) = 2a_t x_1$$

$$x_1 = \frac{v_1^2}{2a_t} = \frac{(20)^2}{(2)(1.11803)}$$

$x_1 = 178.9\text{ m}$ ◀

(*b*) Corresponding tangential acceleration.

$a_t = 1.118\text{ m/s}^2$ ◀



PROBLEM 11.140

A motorist starts from rest at Point *A* on a circular entrance ramp when $t = 0$, increases the speed of her automobile at a constant rate and enters the highway at Point *B*. Knowing that her speed continues to increase at the same rate until it reaches 100 km/h at Point *C*, determine (*a*) the speed at Point *B*, (*b*) the magnitude of the total acceleration when $t = 20$ s.

SOLUTION

Speeds: $v_0 = 0 \qquad v_1 = 100 \text{ km/h} = 27.78 \text{ m/s}$

Distance: $s = \dfrac{\pi}{2}(150) + 100 = 335.6 \text{ m}$

Tangential component of acceleration: $v_1^2 = v_0^2 + 2a_t s$

$$a_t = \frac{v_1^2 - v_0^2}{2s} = \frac{(27.78)^2 - 0}{(2)(335.6)} = 1.1495 \text{ m/s}^2$$

At Point *B*, $v_B^2 = v_0^2 + 2a_t s_B$ where $s_B = \dfrac{\pi}{2}(150) = 235.6 \text{ m}$

$$v_B^2 = 0 + (2)(1.1495)(235.6) = 541.69 \text{ m}^2/\text{s}^2$$

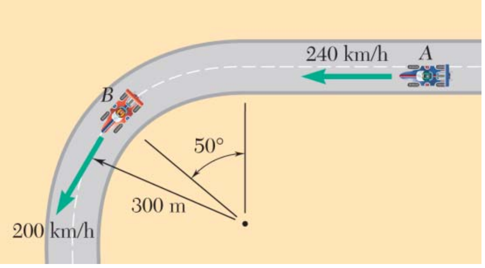
$v_B = 23.27 \text{ m/s}$ $\qquad v_B = 83.8 \text{ km/h}$ ◀

(*a*) At $t = 20$ s, $v = v_0 + a_t t = 0 + (1.1495)(20) = 22.99 \text{ m/s}$

Since $v < v_B$, the car is still on the curve. $\rho = 150 \text{ m}$

Normal component of acceleration: $a_n = \dfrac{v^2}{\rho} = \dfrac{(22.99)^2}{150} = 3.524 \text{ m/s}^2$

(*b*) Magnitude of total acceleration: $|a| = \sqrt{a_t^2 + a_n^2} = \sqrt{(1.1495)^2 + (3.524)^2}$ $\qquad |a| = 3.71 \text{ m/s}^2$ ◀



PROBLEM 11.141

Racecar A is traveling on a straight portion of the track while racecar B is traveling on a circular portion of the track. At the instant shown, the speed of A is increasing at the rate of 10 m/s^2, and the speed of B is decreasing at the rate of 6 m/s^2. For the position shown, determine (*a*) the velocity of B relative to A, (*b*) the acceleration of B relative to A.

SOLUTION

Speeds:

$$v_A = 240 \text{ km/h} = 66.67 \text{ m/s}$$
$$v_B = 200 \text{ km/h} = 55.56 \text{ m/s}$$

Velocities:

$$\mathbf{v}_A = 66.67 \text{ m/s} \longleftarrow$$
$$\mathbf{v}_B = 55.56 \text{ m/s} \swarrow 50^\circ$$

(*a*) Relative velocity:

$$\mathbf{v}_{B/A} = \mathbf{v}_B - \mathbf{v}_A$$

$$\mathbf{v}_{B/A} = (55.56\cos 50^\circ) \leftarrow + \; 55.56\sin 50^\circ \downarrow + \; 66.67 \longrightarrow$$

$$= 30.96 \rightarrow + \; 42.56 \downarrow$$

$$= 52.63 \text{ m/s} \searrow 53.96^\circ$$

$$\mathbf{v}_{B/A} = 189.5 \text{ km/h} \searrow 54.0^\circ \blacktriangleleft$$

Tangential accelerations:

$$(\mathbf{a}_A)_t = 10 \text{ m/s}^2 \longleftarrow$$
$$(\mathbf{a}_B)_t = 6 \text{ m/s}^2 \nearrow 50^\circ$$

Normal accelerations:

$$a_n = \frac{v^2}{\rho}$$

Car A: $(\rho = \infty)$ $\quad (\mathbf{a}_A)_n = 0$

Car B: $(\rho = 300 \text{ m})$

$$(\mathbf{a}_B)_n = \frac{(55.56)^2}{300} = 10.288 \qquad (\mathbf{a}_B)_n = 10.288 \text{ m/s}^2 \searrow 40^\circ$$

(*b*) Acceleration of B relative to A:

$$\mathbf{a}_{B/A} = \mathbf{a}_B - \mathbf{a}_A$$

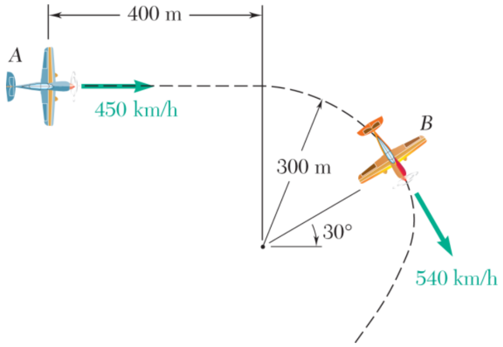
$$\mathbf{a}_{B/A} = (\mathbf{a}_B)_t + (\mathbf{a}_B)_n - (\mathbf{a}_A)_t - (\mathbf{a}_A)_n$$

$$= 6 \nearrow 50^\circ + 10.288 \searrow 40^\circ + 10 \rightarrow + \; 0$$

$$= (6\cos 50^\circ + 10.288\cos 40^\circ + 10) \longrightarrow$$

$$+ \; (6\sin 50^\circ - 10.288\sin 40^\circ) \uparrow$$

$$= 21.738 \rightarrow + \; 2.017 \downarrow \qquad \mathbf{a}_{B/A} = 21.8 \text{ m/s}^2 \searrow 5.3^\circ \blacktriangleleft$$



PROBLEM 11.142

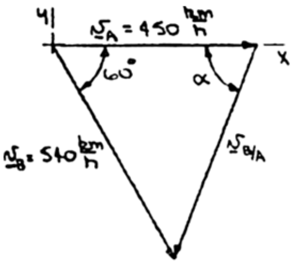
At a given instant in an airplane race, airplane *A* is flying horizontally in a straight line, and its speed is being increased at the rate of 8 m/s^2. Airplane *B* is flying at the same altitude as airplane *A* and, as it rounds a pylon, is following a circular path of 300-m radius. Knowing that at the given instant the speed of *B* is being decreased at the rate of 3 m/s^2, determine, for the positions shown, (*a*) the velocity of *B* relative to *A*, (*b*) the acceleration of *B* relative to *A*.

SOLUTION

First note $v_A = 450\ \text{km/h} \quad v_B = 540\ \text{km/h} = 150\ \text{m/s}$

(*a*) We have $\mathbf{v}_B = \mathbf{v}_A + \mathbf{v}_{B/A}$

The graphical representation of this equation is then as shown.



y
$v_A = 450\ \frac{\text{km}}{\text{h}}$
x
60°
α
$v_B = 540\ \frac{\text{km}}{\text{h}}$
$v_{B/A}$

We have $v_{B/A}^2 = 450^2 + 540^2 - 2(450)(540)\cos 60°$

$$v_{B/A} = 501.10\ \text{km/h}$$

and $\dfrac{540}{\sin\alpha} = \dfrac{501.10}{\sin 60°}$

$$\alpha = 68.9°$$

$$\mathbf{v}_{B/A} = 501\ \text{km/h} \swarrow 68.9° \blacktriangleleft$$

(*b*) First note $\mathbf{a}_A = 8\ \text{m/s}^2 \longrightarrow \qquad (\mathbf{a}_B)_t = 3\ \text{m/s}^2 \nwarrow 60°$

Now $(a_B)_n = \dfrac{v_B^2}{\rho_B} = \dfrac{(150\ \text{m/s})^2}{300\ \text{m}}$

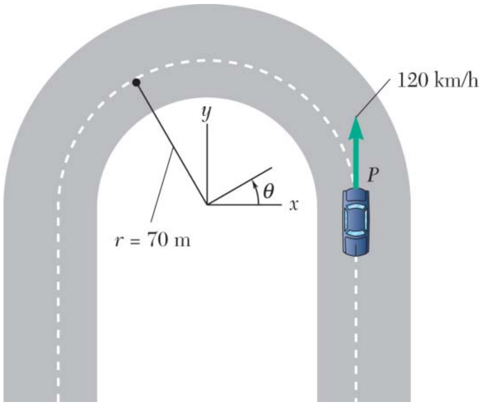
$$(\mathbf{a}_B)_n = 75\ \text{m/s}^2 \swarrow 30°$$

Then
$$\begin{aligned}\mathbf{a}_B &= (\mathbf{a}_B)_t + (\mathbf{a}_B)_n\\ &= 3(-\cos 60°\ \mathbf{i} + \sin 60°\mathbf{j}) + 75(-\cos 30°\,\mathbf{i} - \sin 30°\mathbf{j})\\ &= -(66.452\ \text{m/s}^2)\mathbf{i} - (34.902\ \text{m/s}^2)\mathbf{j}\end{aligned}$$

Finally
$$\mathbf{a}_B = \mathbf{a}_A + \mathbf{a}_{B/A}$$

$$\begin{aligned}\mathbf{a}_{B/A} &= (-66.452\mathbf{i} - 34.902\mathbf{j}) - (8\mathbf{i})\\ &= -(74.452\ \text{m/s}^2)\mathbf{i} - (34.902\ \text{m/s}^2)\mathbf{j}\end{aligned}$$

$$\mathbf{a}_{B/A} = 82.2\ \text{m/s}^2 \swarrow 25.1° \blacktriangleleft$$



PROBLEM 11.143

A race car enters the circular portion of a track that has a radius of 70 m. When the car enters the curve at point P, it is travelling with a speed of 120 km/h that is increasing at 5 m/s^2. Three seconds later, determine (a) the total acceleration of the car in xy components, (b) the linear velocity of the car in xy components.

SOLUTION

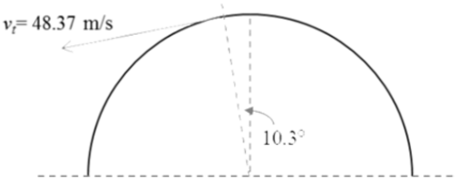
Speeds: $v_{t_o} = 120 \text{ km/h} = 33.33 \text{ m/s}$

$$v_t = v_{t_o} + a_t t$$

$$v_t = 33.33 + 5(3) = 48.33 \text{ m/s}$$

Distance: $s = s_o + v_{t_o} t + \frac{1}{2} a_t t^2$

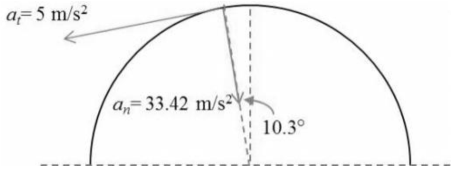
$$s = 33.33(3) + \frac{1}{2}(5)(3)^2 = 122.5 \text{ m}$$



Location: $s = R\theta$

$$\theta = \frac{s}{R} = \frac{122.5}{70} = 1.75 \text{ rad}$$

$$\theta = 100.3°$$



Tangential Acceleration: $a_t = 5 \text{ m/s}^2$

Normal Acceleration: $a_n = \dfrac{v^2}{\rho}$

$$a_n = \frac{48.33^2}{70} = 33.37 \text{ m/s}^2$$

(a) Accelerations: $a_x = -5\cos(10.3°) + 33.37\sin(10.3°)$

$$a_x = 1.047 \text{ m/s}^2 \blacktriangleleft$$

$$a_y = -5\sin(10.3°) - 33.37\cos(10.3°)$$

$$a_y = -33.726 \text{ m/s}^2 \blacktriangleleft$$

(b) Velocities: $v_x = -48.33\cos(10.3°)$

$$v_x = -47.55 \text{ m/s} \blacktriangleleft$$

$$v_y = -48.33\sin(10.3°)$$

$$v_y = -8.64 \text{ m/s} \blacktriangleleft$$

PROBLEM 11.144

An airplane flying at a constant speed of 240 m/s makes a banked horizontal turn. What is the minimum allowable radius of the turn if the structural specifications require that the acceleration of the airplane shall never exceed 4*g*?

SOLUTION

Given: $v = 240\text{ m/s},\ a_{\max} = 4g$

Acceleration: $a_n = \dfrac{v^2}{\rho}$

Rearrange: $\rho = \dfrac{v^2}{a_n}$

Substitute in known values: $\rho = \dfrac{240^2}{4*9.81}m$

$\rho = 1467.9\text{ m}$ ◀

$\underline{a}_A = -g\underline{j}$
$\underline{e}_n$
B
$\underline{v}_B = (\underline{v}_A)_x$
$(\underline{a}_B)_n = \underline{a}_B = -g\underline{j}$

(*a*) We have $(a_A)_n = \dfrac{v_A^2}{\rho_A}$

or $\rho_A = \dfrac{(50\text{ m/s})^2}{(9.81\text{ m/s}^2)\cos 25°}$

or $\rho_A = 281\text{ m}$ ◀

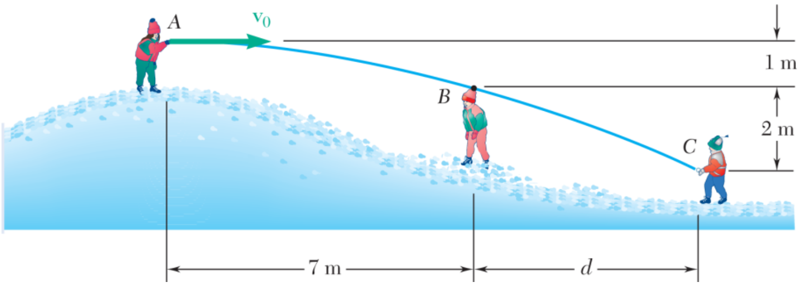
(*b*) We have $(a_B)_n = \dfrac{v_B^2}{\rho_B}$

where Point *B* is the highest point of the trajectory, so that

$$v_B = (v_A)_x = v_A \cos 25°$$

Then $\rho_B = \dfrac{[(50\text{ m/s})\cos 25°]^2}{9.81\text{ m/s}^2}$

or $\rho_B = 209\text{ m}$ ◀



PROBLEM 11.146

Three children are throwing snowballs at each other. Child *A* throws a snowball with a horizontal velocity $\mathbf{v}_0$. If the snowball just passes over the head of child *B* and hits child C, determine the radius of curvature of the trajectory described by the snowball (*a*) at Point *B*, (*b*) at Point *C*.

SOLUTION

The motion is projectile motion. Place the origin at Point *A*.

Horizontal motion: $\mathbf{v}_x = v_0 \qquad x = v_0 t$

Vertical motion: $y_0 = 0, \qquad (v_y) = 0$

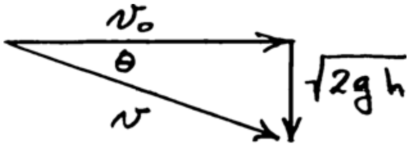
$$v_y = -gt \qquad y = -\frac{1}{2}gt^2$$

$$t = \sqrt{\frac{2h}{g}}, \qquad \text{where } h \text{ is the vertical distance fallen.}$$

$$|v_y| = \sqrt{2gh}$$

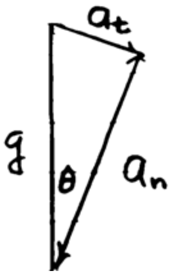
Speed: $v^2 = v_x^2 + v_y^2 = v_0^2 + 2gh$

Direction of velocity.



$$\cos\theta = \frac{v_0}{v}$$

Direction of normal acceleration.



$$a_n = g\cos\theta = \frac{gv_0}{v} = \frac{v^2}{\rho}$$

Radius of curvature: $\rho = \dfrac{v^3}{gv_0}$

At Point *B*, $h_B = 1 \text{ m}; \quad x_B = 7 \text{ m}$

$$t_B = \sqrt{\frac{(2)(1 \text{ m})}{9.81 \text{ m/s}^2}} = 0.45152 \text{ s}$$

$$x_B = v_0 t_B \qquad v_0 = \frac{x_B}{t_B} = \frac{7 \text{ m}}{0.45152 \text{ s}} = 15.504 \text{ m/s}$$

$$v_B^2 = (15.504)^2 + (2)(9.81)(1) = 259.97 \text{ m}^2/\text{s}^2$$

(*a*) Radius of curvature at Point *B*.

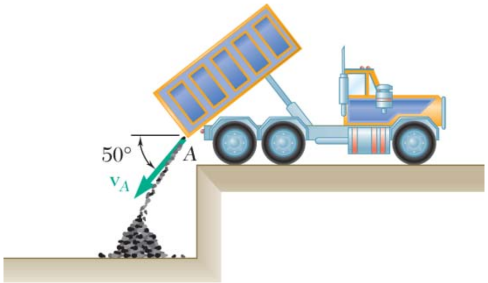
$$\rho_B = \frac{(259.97\ \text{m}^2/\text{s}^2)^{3/2}}{(9.81\ \text{m/s}^2)(15.504\ \text{m/s})} \qquad \rho_B = 27.6\ \text{m} \blacktriangleleft$$

At Point *C* $h_C = 1\ \text{m} + 2\ \text{m} = 3\ \text{m}$

$$v_C^2 = (15.504)^2 + (2)(9.81)(3) = 299.23\ \text{m}^2/\text{s}^2$$

(*b*) Radius of curvature at Point *C*.

$$\rho_C = \frac{(299.23\ \text{m}^2/\text{s}^2)^{3/2}}{(9.81\ \text{m/s}^2)(15.504\ \text{m/s})} \qquad \rho_C = 34.0\ \text{m} \blacktriangleleft$$



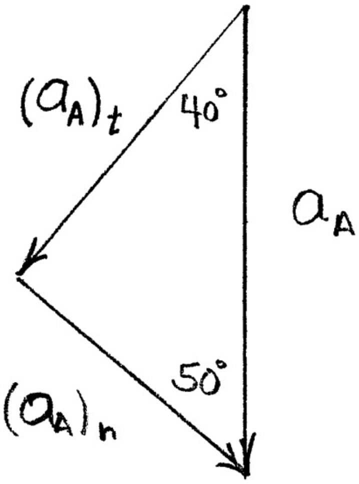
PROBLEM 11.147

Coal is discharged from the tailgate A of a dump truck with an initial velocity $\mathbf{v}_A = 2\text{ m/s} \nearrow 50°$. Determine the radius of curvature of the trajectory described by the coal (a) at Point A, (b) at the point of the trajectory 1 m below Point A.

SOLUTION

(a) At Point A. $a_A = g\downarrow = 9.81\text{ m/s}^2\downarrow$

Sketch tangential and normal components of acceleration at A.



$$(a_A)_n = g\cos 50°$$

$$\rho_A = \frac{v_A^2}{(a_A)_n} = \frac{(2)^2}{9.81\cos 50°}$$

$\rho_A = 0.634\text{ m}$ ◀

(b) At Point B, 1 meter below Point A.

Horizontal motion: $(v_B)_x = (v_A)_x = 2\cos 50° = 1.286\text{ m/s} \leftarrow$

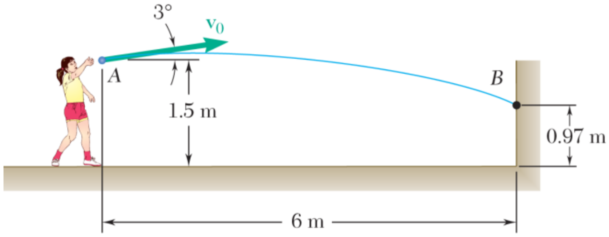
(*b*) We have $(a_B)_n = \dfrac{v_B^2}{\rho_B}$

Where $v_B = (v_A)_x = \dfrac{4}{5}v_A$

Then $\rho_B = \dfrac{\left(\frac{4}{5} \times 14.0071\text{ m/s}\right)^2}{9.81\text{ m/s}^2}$

or $\rho_B = 12.80\text{ m}$ ◀



PROBLEM 11.149

A child throws a ball from point *A* with an initial velocity $\mathbf{v}_0$ at an angle of 3° with the horizontal. Knowing that the ball hits a wall at point *B*, determine (*a*) the magnitude of the initial velocity, (*b*) the minimum radius of curvature of the trajectory.

SOLUTION

Horizontal motion. $v_x = v_0 \cos\alpha \qquad x = v_0 t \cos\alpha$

Vertical motion. $v_y = v_0 \sin\alpha - gt$

$$y = y_0 + v_0 t \sin\alpha - \frac{1}{2}gt^2$$

Eliminate *t*.

$$y = y_0 + x\tan\alpha - \frac{gx^2}{2v_0^2\cos^2\alpha} \qquad (1)$$

Solving (1) for v_0 and applying result at point *B*

$$v_0 = \sqrt{\frac{gx^2}{2(y_0 + x\tan\alpha - y)\cos^2\alpha}} = \sqrt{\frac{(9.81)(6)^2}{(2)(1.5 + 6\tan 3° - 0.97)(\cos^2 3°)}}$$

(*a*) Magnitude of initial velocity. $v_0 = 14.48 \text{ m/s}$ ◀

(*b*) Minimum radius of curvature of trajectory.

$$a_n = g = \frac{v^2}{\rho} \qquad \rho = \frac{v^2}{a_n} = \frac{v^2}{g\cos\theta} \qquad (2)$$

where θ is the slope angle of the trajectory.

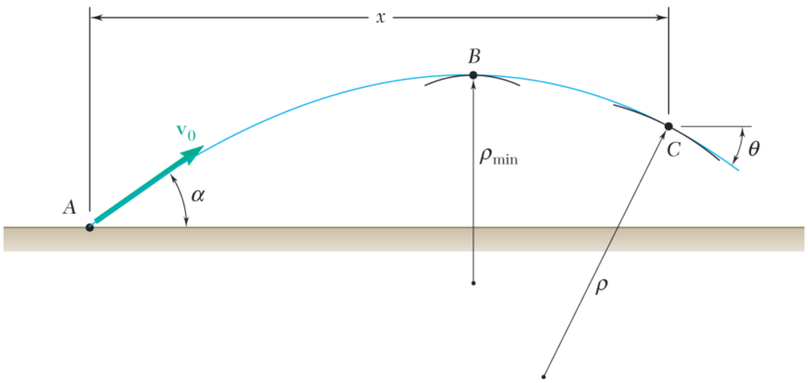
The minimum value of ρ occurs at the highest point of the trajectory where $\cos\theta = 1$

and $v = v_x = v_0\cos\alpha$

Then

$$\rho_{\min} = \frac{v_0^2\cos^2\alpha}{g} = \frac{(14.48)^2\cos^2 3°}{9.81}$$

$\rho_{\min} = 21.3 \text{ m}$ ◀

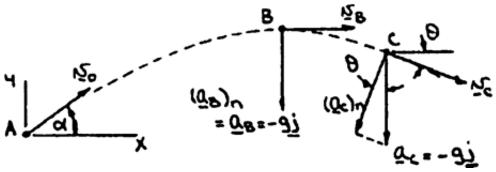


PROBLEM 11.150

A projectile is fired from Point A with an initial velocity $\mathbf{v}_0$. (a) Show that the radius of curvature of the trajectory of the projectile reaches its minimum value at the highest Point B of the trajectory. (b) Denoting by θ the angle formed by the trajectory and the horizontal at a given Point C, show that the radius of curvature of the trajectory at C is $\rho = \rho_{\min}/\cos^3\theta$.

SOLUTION

For the arbitrary Point C, we have



$$(a_C)_n = \frac{v_C^2}{\rho_C}$$

or $$\rho_C = \frac{v_C^2}{g\cos\theta}$$

Noting that the horizontal motion is uniform, we have

$$(v_A)_x = (v_C)_x$$

where $$(v_A)_x = v_0\cos\alpha \qquad (v_C)_x = v_C\cos\theta$$

Then $$v_0\cos\alpha = v_C\cos\theta$$

or $$v_C = \frac{\cos\alpha}{\cos\theta}v_0$$

so that $$\rho_C = \frac{1}{g\cos\theta}\left(\frac{\cos\alpha}{\cos\theta}v_0\right)^2 = \frac{v_0^2\cos^2\alpha}{g\cos^3\theta}$$

(a) In the expression for ρ_C, v_0, α, and g are constants, so that ρ_C is minimum where $\cos\theta$ is maximum. By observation, this occurs at Point B where $\theta = 0$.

$$\rho_{\min} = \rho_B = \frac{v_0^2\cos^2\alpha}{g}$$ Q.E.D. ◀

(b) $$\rho_C = \frac{1}{\cos^3\theta}\left(\frac{v_0^2\cos^2\alpha}{g}\right)$$

$$\rho_C = \frac{\rho_{\min}}{\cos^3\theta}$$ Q.E.D. ◀

PROBLEM 11.151*

Determine the radius of curvature of the path described by the particle of Problem 11.95 when $t = 0$.

PROBLEM 11.95 The three-dimensional motion of a particle is defined by the position vector $\mathbf{r} = (Rt \cos \omega_n t)\mathbf{i} + ct\mathbf{j} + (Rt \sin \omega_n t)\mathbf{k}$. Determine the magnitudes of the velocity and acceleration of the particle. (The space curve described by the particle is a conic helix.)

SOLUTION

We have $$\mathbf{v} = \frac{d\mathbf{r}}{dt} = R(\cos\omega_n t - \omega_n t \sin\omega_n t)\mathbf{i} + c\mathbf{j} + R(\sin\omega_n t + \omega_n t \cos\omega_n t)\mathbf{k}$$

and $$\mathbf{a} = \frac{d\mathbf{v}}{dt} = R\left(-\omega_n \sin \omega_n t - \omega_n \sin \omega_n t - \omega_n^2 t \cos \omega_n t\right)\mathbf{i}$$
$$+ R\left(\omega_n \cos \omega_n t + \omega_n \cos \omega_n t - \omega_n^2 t \sin \omega_n t\right)\mathbf{k}$$

or $$\mathbf{a} = \omega_n R[-(2 \sin \omega_n t + \omega_n t \cos \omega_n t)\mathbf{i} + (2 \cos \omega_n t - \omega_n t \sin \omega_n t)\mathbf{k}]$$

Now $$v^2 = R^2(\cos \omega_n t - \omega_n t \sin \omega_n t)^2 + c^2 + R^2(\sin \omega_n t + \omega_n t \cos \omega_n t)^2$$
$$= R^2\left(1 + \omega_n^2 t^2\right) + c^2$$

Then $$v = \left[R^2\left(1 + \omega_n^2 t^2\right) + c^2\right]^{1/2}$$

and $$\frac{dv}{dt} = \frac{R^2 \omega_n^2 t}{\left[R^2\left(1 + \omega_n^2 t^2\right) + c^2\right]^{1/2}}$$

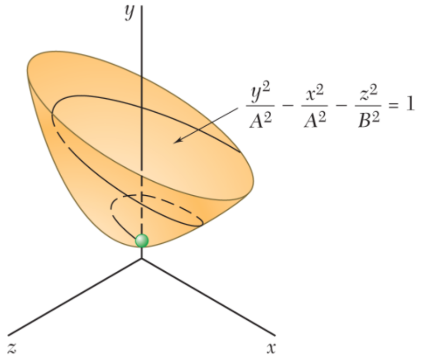
Now $$a^2 = a_t^2 + a_n^2 = \left(\frac{dv}{dt}\right)^2 + \left(\frac{v^2}{\rho}\right)^2$$

At $t = 0$: $$\frac{dv}{dt} = 0$$
$$\mathbf{a} = \omega_n R(2\mathbf{k}) \quad \text{or} \quad a = 2\omega_n R$$
$$v^2 = R^2 + c^2$$

Then, with $$\frac{dv}{dt} = 0,$$

we have $$a = \frac{v^2}{\rho}$$

or $$2\omega_n R = \frac{R^2 + c^2}{\rho}$$ $$\rho = \frac{R^2 + c^2}{2\omega_n R} \blacktriangleleft$$



PROBLEM 11.152*

Determine the radius of curvature of the path described by the particle of Problem 11.96 when $t = 0$, $A = 3$, and $B = 1$.

PROBLEM 11.96

The three-dimensional motion of a particle is defined by the position vector $\mathbf{r} = (At\cos t)\mathbf{i} + (A\sqrt{t^2+1})\mathbf{j} + (Bt\sin t)\mathbf{k}$, where r and t are expressed in feet and seconds, respectively. Show that the curve described by the particle lies on the hyperboloid $(y/A)^2 - (x/A)^2 - (z/B)^2 = 1$. For $A = 3$ and $B = 1$, determine (*a*) the magnitudes of the velocity and acceleration when $t = 0$, (*b*) the smallest nonzero value of t for which the position vector and the velocity are perpendicular to each other.

SOLUTION

With $$A = 3, \quad B = 1$$

we have $$\mathbf{r} = (3t\cos t)\mathbf{i} + \left(3\sqrt{t^2+1}\right)\mathbf{j} + (t\sin t)\mathbf{k}$$

Now $$\mathbf{v} = \frac{d\mathbf{r}}{dt} = 3(\cos t - t\sin t)\mathbf{i} + \left(\frac{3t}{\sqrt{t^2+1}}\right)\mathbf{j} + (\sin t + t\cos t)\mathbf{k}$$

and $$\mathbf{a} = \frac{d\mathbf{v}}{dt} = 3(-\sin t - \sin t - t\cos t)\mathbf{i} + 3\left[\frac{\sqrt{t^2+1} - t\left(\frac{t}{\sqrt{t^2+1}}\right)}{t^2+1}\right]\mathbf{j}$$

$$+ (\cos t + \cos t - t\sin t)\mathbf{k}$$

$$= -3(2\sin t + t\cos t)\mathbf{i} + 3\frac{1}{(t^2+1)^{1/2}}\mathbf{j}$$

$$+ (2\cos t - t\sin t)\mathbf{k}$$

Then $$v^2 = 9(\cos t - t\sin t)^2 + 9\frac{t^2}{t^2+1} + (\sin t + t\cos t)^2$$

Expanding and simplifying yields

$$v^2 = t^4 + 19t^2 + 1 + 8(\cos^2 t + t^4\sin^2 t) - 8(t^3 + t)\sin 2t$$

Then $$v = [t^4 + 19t^2 + 1 + 8(\cos^2 t + t^4\sin^2 t) - 8(t^3 + t)\sin 2t]^{1/2}$$

and $$\frac{dv}{dt} = \frac{4t^3 + 38t + 8(-2\cos t\sin t + 4t^3\sin^2 t + 2t^4\sin t\cos t) - 8[(3t^2+1)\sin 2t + 2(t^3+t)\cos 2t]}{2[t^4 + 19t^2 + 1 + 8(\cos^2 t + t^4\sin^2 t) - 8(t^3+t)\sin 2t]^{1/2}}$$

PROBLEM 11.152* (Continued)

Now $$a^2 = a_t^2 + a_n^2 = \left(\frac{dv}{dt}\right)^2 + \left(\frac{v^2}{\rho}\right)^2$$

At $t = 0$: $$\mathbf{a} = 3\mathbf{j} + 2\mathbf{k}$$

or $$a = \sqrt{13}\ \text{ft/s}^2$$

$$\frac{dv}{dt} = 0$$

$$v^2 = 9\ (\text{ft/s})^2$$

Then, with $$\frac{dv}{dt} = 0,$$

we have $$a = \frac{v^2}{\rho}$$

or $$\rho = \frac{9\ \text{ft}^2/\text{s}^2}{\sqrt{13}\ \text{ft/s}^2}$$ $\rho = 2.50$ ft ◀

PROBLEM 11.153

A satellite will travel indefinitely in a circular orbit around a planet if the normal component of the acceleration of the satellite is equal to $g(R/r)^2$, where g is the acceleration of gravity at the surface of the planet, R is the radius of the planet, and r is the distance from the center of the planet to the satellite. Knowing that the diameter of the sun is 1.39 Gm and that the acceleration of gravity at its surface is 274 m/s^2, determine the radius of the orbit of the indicated planet around the sun assuming that the orbit is circular.

Earth: $(v_{\text{mean}})_{\text{orbit}} = 107 \text{ Mm/h}$.

SOLUTION

For the sun, $g = 274 \text{ m/s}^2$,

and $$R = \frac{1}{2}D = \left(\frac{1}{2}\right)(1.39 \times 10^9) = 0.695 \times 10^9 \text{ m}$$

Given that $a_n = \dfrac{gR^2}{r^2}$ and that for a circular orbit $a_n = \dfrac{v^2}{r}$

Eliminating a_n and solving for r, $$r = \frac{gR^2}{v^2}$$

For the planet Earth, $$v = 107 \times 10^6 \text{m/h} = 29.72 \times 10^3 \text{ m/s}$$

Then $$r = \frac{(274)(0.695 \times 10^9)^2}{(29.72 \times 10^3)^2} = 149.8 \times 10^9 \text{ m}$$

$r = 149.8 \text{ Gm}$ ◀

PROBLEM 11.154

A satellite will travel indefinitely in a circular orbit around a planet if the normal component of the acceleration of the satellite is equal to $g(R/r)^2$, where g is the acceleration of gravity at the surface of the planet, R is the radius of the planet, and r is the distance from the center of the planet to the satellite. Knowing that the diameter of the sun is 1.39 Gm and that the acceleration of gravity at its surface is 274 m/s^2, determine the radius of the orbit of the indicated planet around the sun assuming that the orbit is circular.

Saturn: $(\upsilon_{\text{mean}})_{\text{orbit}} = 34.7\text{ Mm/h}$.

SOLUTION

For the sun, $$g = 274\text{ m/s}^2$$

and $$R = \frac{1}{2}D = \left(\frac{1}{2}\right)(1.39\times 10^9) = 0.695\times 10^9\text{ m}$$

Given that $a_n = \dfrac{gR^2}{r^2}$ .and that for a circular orbit: $a_n = \dfrac{v^2}{r}$

Eliminating a_n and solving for r, $$r = \frac{gR^2}{v^2}$$

For the planet Saturn, $$v = 34.7\times 10^6\text{m/h} = 9.639\times 10^3\text{m/s}$$

Then, $$r = \frac{(274)(0.695\times 10^9)^2}{(9.639\times 10^3)^2} = 1.425\times 10^{12}\text{ m}$$ $$r = 1425\text{ Gm} \blacktriangleleft$$

PROBLEM 11.155

Determine the speed of a satellite relative to the indicated planet if the satellite is to travel indefinitely in a circular orbit 100 mi above the surface of the planet. (See information given in Problems 11.153–11.154).

Venus: $g = 29.20\text{ ft/s}^2, \ R = 3761\text{ mi.}$

SOLUTION

From Problems 11.153 and 11.154, $a_n = \dfrac{gR^2}{r^2}$

For a circular orbit, $a_n = \dfrac{v^2}{r}$

Eliminating a_n and solving for v, $v = R\sqrt{\dfrac{g}{r}}$

For Venus, $g = 29.20\text{ ft/s}^2$

$$R = 3761\text{ mi} = 19.858 \times 10^6\text{ ft.}$$

$$r = 3761 + 100 = 3861\text{ mi} = 20.386 \times 10^6\text{ ft}$$

Then, $$v = 19.858 \times 10^6\sqrt{\frac{29.20}{20.386 \times 10^6}} = 23.766 \times 10^3\text{ ft/s}$$

$v = 16200\text{ mi/h}$ ◀

PROBLEM 11.156

Determine the speed of a satellite relative to the indicated planet if the satellite is to travel indefinitely in a circular orbit 100 mi above the surface of the planet. (See information given in Problems 11.153–11.154).

Mars: $g = 12.17 \text{ ft/s}^2, \; R = 2102 \text{ mi}.$

SOLUTION

From Problems 11.153 and 11.154, $$a_n = \frac{gR^2}{r^2}$$

For a circular orbit, $$a_n = \frac{v^2}{r}$$

Eliminating a_n and solving for v, $$v = R\sqrt{\frac{g}{r}}$$

For Mars, $g = 12.17 \text{ ft/s}^2$

$R = 2102 \text{ mi} = 11.0986 \times 10^6 \text{ ft}$

$r = 2102 + 100 = 2202 \text{ mi} = 11.6266 \times 10^6 \text{ ft}$

Then, $$v = 11.0986 \times 10^6 \sqrt{\frac{12.17}{11.6266 \times 10^6}} = 11.35 \times 10^3 \text{ ft/s}$$

$v = 7740 \text{ mi/h}$ ◀

PROBLEM 11.157

Determine the speed of a satellite relative to the indicated planet if the satellite is to travel indefinitely in a circular orbit 100 mi above the surface of the planet. (See information given in Problems 11.153–11.154).

Jupiter: $g = 75.35 \text{ ft/s}^2$, $R = 44,432$ mi.

SOLUTION

From Problems 11.153 and 11.154,

$$a_n = \frac{gR^2}{r^2}$$

For a circular orbit,

$$a_n = \frac{v^2}{r}$$

Eliminating a_n and solving for v,

$$v = R\sqrt{\frac{g}{r}}$$

For Jupiter,

$$g = 75.35 \text{ ft/s}^2$$

$$R = 44432 \text{ mi} = 234.60 \times 10^6 \text{ ft}$$

$$r = 44432 + 100 = 44532 \text{ mi} = 235.13 \times 10^6 \text{ ft}$$

Then,

$$v = (234.60 \times 10^6)\sqrt{\frac{75.35}{235.13 \times 10^6}} = 132.8 \times 10^3 \text{ ft/s}$$

$$v = 90600 \text{ mi/h} \blacktriangleleft$$

PROBLEM 11.158

A satellite will travel indefinitely in a circular orbit around the earth if the normal component of its acceleration is equal to $g\left(R / r\right)^2$, where $g = 9.81\text{ m/s}^2$, R = radius of the earth = 6370 km, and r = distance from the center of the earth to the satellite. Assuming that the orbit of the moon is a circle of radius $384 \times 10^3\text{ km}$, determine the speed of the moon relative to the earth.

SOLUTION

Normal acceleration: $$a_n = \frac{gR^2}{r^2} \quad \text{and} \quad a_n = \frac{v^2}{\rho} = \frac{v^2}{r}$$

Solve for v^2: $$v^2 = ra_n = \frac{gR^2}{r}$$

Data: $$g = 9.81\text{ m/s}^2, \qquad R = 6370\text{ km} = 6.370 \times 10^6\text{ m}$$

$$r = 384 \times 10^3\text{ km} = 384 \times 10^6\text{ m}$$

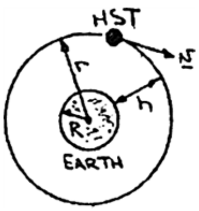
$$v^2 = \frac{(9.81)\left(6.370 \times 10^6\right)^2}{384 \times 10^6} = 1.0366 \times 10^6\text{ m}^2/\text{s}^2$$

$v = 1.018\text{ m/s}$ $\qquad v = 3670\text{ km/h}$ ◀

PROBLEM 11.159

Knowing that the radius of the earth is 6370 km, determine the time of one orbit of the Hubble Space Telescope, knowing that the telescope travels in a circular orbit 590 km above the surface of the earth. (See information given in Problems 11.153–11.155.)

SOLUTION



We have $$a_n = g\frac{R^2}{r^2} \quad \text{and} \quad a_n = \frac{v^2}{r}$$

Then $$g\frac{R^2}{r^2} = \frac{v^2}{r}$$

or $$v = R\sqrt{\frac{g}{r}} \quad \text{where} \quad r = R + h$$

The circumference s of the circular orbit is equal to

$$s = 2\pi r$$

Assuming that the speed of the telescope is constant, we have

$$s = vt_{\text{orbit}}$$

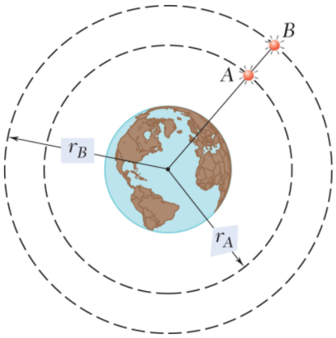
Substituting for s and v

$$2\pi r = R\sqrt{\frac{g}{r}}\,t_{\text{orbit}}$$

or $$t_{\text{orbit}} = \frac{2\pi}{R}\frac{r^{3/2}}{\sqrt{g}}$$

$$= \frac{2\pi}{6370\text{ km}}\frac{[(6370+590)\text{ km}]^{3/2}}{[9.81\times 10^{-3}\text{ km/s}^2]^{1/2}} \times \frac{1\text{ h}}{3600\text{ s}}$$

or $$t_{\text{orbit}} = 1.606\text{ h} \blacktriangleleft$$



PROBLEM 11.160

Satellites *A* and *B* are traveling in the same plane in circular orbits around the earth at altitudes of 120 and 200 mi, respectively. If at $t = 0$ the satellites are aligned as shown and knowing that the radius of the earth is $R = 3960$ mi, determine when the satellites will next be radially aligned. (See information given in Problems 11.153–11.155.)

SOLUTION

We have $$a_n = g\frac{R^2}{r^2} \quad \text{and} \quad a_n = \frac{v^2}{r}$$

Then $$g\frac{R^2}{r^2} = \frac{v^2}{r} \qquad \text{or} \qquad v = R\sqrt{\frac{g}{r}}$$

where $$r = R + h$$

The circumference *s* of a circular orbit is equal to $$s = 2\pi r$$

Assuming that the speeds of the satellites are constant, we have

$$s = vT$$

Substituting for *s* and *v*

$$2\pi r = R\sqrt{\frac{g}{r}}T$$

or $$T = \frac{2\pi}{R}\frac{r^{3/2}}{\sqrt{g}} = \frac{2\pi}{R}\frac{(R+h)^{3/2}}{\sqrt{g}}$$

Now $$h_B > h_A \Rightarrow (T)_B > (T)_A$$

Next let time T_C be the time at which the satellites are next radially aligned. Then, if in time T_C satellite *B* completes *N* orbits, satellite *A* must complete $(N+1)$ orbits.

Thus,

$$T_C = N(T)_B = (N+1)(T)_A$$

or $$N\left[\frac{2\pi}{R}\frac{(R+h_B)^{3/2}}{\sqrt{g}}\right] = (N+1)\left[\frac{2\pi}{R}\frac{(R+h_A)^{3/2}}{\sqrt{g}}\right]$$

or
$$N = \frac{(R+h_A)^{3/2}}{(R+h_B)^{3/2}-(R+h_A)^{3/2}} = \frac{1}{\left(\frac{R+h_B}{R+h_A}\right)^{3/2}-1}$$

$$= \frac{1}{\left(\frac{3960+200}{3960+120}\right)^{3/2}-1} = 33.835 \text{ orbits}$$

Then
$$T_C = N(T)_B = N\frac{2\pi}{R}\frac{(R+h_B)^{3/2}}{\sqrt{g}}$$

$$= 33.835\frac{2\pi}{3960 \text{ mi}}\frac{[(3960+200)\text{ mi}]^{3/2}}{\left(32.2 \text{ ft/s}^2 \times \frac{1 \text{ mi}}{5280 \text{ ft}}\right)^{1/2}} \times \frac{1 \text{ h}}{3600 \text{s}}$$

or $T_C = 51.2 \text{ h}$ ◀

Alternative solution

From above, we have $(T)_B > (T)_A$. Thus, when the satellites are next radially aligned, the angles θ_A and θ_B swept out by radial lines drawn to the satellites must differ by 2π. That is,

$$\theta_A = \theta_B + 2\pi$$

For a circular orbit $s = r\theta$

From above $s = vt$ and $v = R\sqrt{\frac{g}{r}}$

Then
$$\theta = \frac{s}{r} = \frac{vt}{r} = \frac{1}{r}\left(R\sqrt{\frac{g}{r}}\right)t = \frac{R\sqrt{g}}{r^{3/2}}t = \frac{R\sqrt{g}}{(R+h)^{3/2}}t$$

At time T_C:
$$\frac{R\sqrt{g}}{(R+h_A)^{3/2}}T_C = \frac{R\sqrt{g}}{(R+h_B)^{3/2}}T_C + 2\pi$$

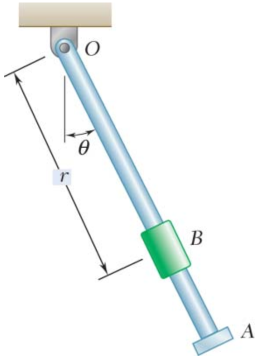
or
$$T_C = \frac{2\pi}{R\sqrt{g}\left[\frac{1}{(R+h_A)^{3/2}} - \frac{1}{(R+h_B)^{3/2}}\right]}$$

$$= \frac{2\pi}{(3960 \text{ mi})\left(32.2 \text{ ft/s}^2 \times \frac{1 \text{ mi}}{5280 \text{ ft}}\right)^{1/2}}$$

$$\times \frac{1}{\frac{1}{[(3960+120)\text{ mi}]^{3/2}} - \frac{1}{[(3960+200)\text{ mi}]^{3/2}}}$$

$$\times \frac{1 \text{ h}}{3600 \text{ s}}$$

or $T_C = 51.2 \text{ h}$ ◀



PROBLEM 11.161

The oscillation of rod OA about O is defined by the relation $\theta = (3/\pi)(\sin \pi t)$, where θ and t are expressed in radians and seconds, respectively. Collar B slides along the rod so that its distance from O is $r = 6(1 - e^{-2t})$ where r and t are expressed in inches and seconds, respectively. When $t = 1$ s, determine (*a*) the velocity of the collar, (*b*) the acceleration of the collar, (*c*) the acceleration of the collar relative to the rod.

SOLUTION

Calculate the derivatives with respect to time.

$$r = 6 - 6e^{-2t}\text{in.} \qquad \theta = \frac{3}{\pi}\sin \pi t \text{ rad}$$

$$\dot{r} = 12e^{-2t}\text{in/s} \qquad \dot{\theta} = 3\cos \pi t \text{ rad/s}$$

$$\ddot{r} = -24e^{-2t}\text{in/s}^2 \qquad \ddot{\theta} = -3\pi \sin \pi t \text{ rad/s}^2$$

At $t = 1$ s,

$$r = 6 - 6e^{-2} = 5.1880 \text{ in.} \qquad \theta = \frac{3}{\pi}\sin \pi = 0$$

$$\dot{r} = 12e^{-2} = 1.6240 \text{ in/s} \qquad \dot{\theta} = 3\cos \pi = -3 \text{ rad/s}$$

$$\ddot{r} = -24e^{-2} = -3.2480 \text{ in/s}^2 \qquad \ddot{\theta} = -3\pi \sin \pi = 0$$

(*a*) *Velocity of the collar*.

$$\mathbf{v} = \dot{r}\mathbf{e}_r + r\dot{\theta}\mathbf{e}_\theta = 1.6240\,\mathbf{e}_r + (5.1880)(-3)\mathbf{e}_\theta$$

$$\mathbf{v} = (1.624 \text{ in/s})\mathbf{e}_r + (15.56 \text{ in/s})\mathbf{e}_\theta \blacktriangleleft$$

(*b*) *Acceleration of the collar*.

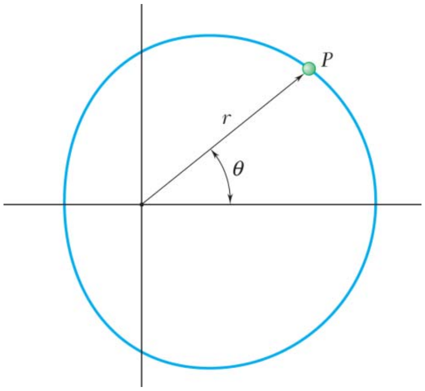
$$\mathbf{a} = (\ddot{r} - r\dot{\theta}^2)\mathbf{e}_r + (r\ddot{\theta} + 2\dot{r}\dot{\theta})\mathbf{e}_\theta$$

$$= [-3.2480 - (5.1880)(-3)^2]\mathbf{e}_r + (5.1880)(0) + (2)(1.6240)(-3)]\mathbf{e}_\theta$$

$$(-49.9 \text{ in/s}^2)\mathbf{e}_r + (-9.74 \text{ in/s}^2)\mathbf{e}_\theta \blacktriangleleft$$

(*c*) *Acceleration of the collar relative to the rod*.

$$\mathbf{a}_{B/OA} = \ddot{r}\mathbf{e}_r \qquad \mathbf{a}_{B/OA} = (-3.25 \text{ in/s}^2)\mathbf{e}_r \blacktriangleleft$$



PROBLEM 11.162

The path of a particle P is a limaçon. The motion of the particle is defined by the relations $r = b(2 + \cos \pi t)$ and $\theta = \pi t$, where t and θ are expressed in seconds and radians, respectively. Determine (a) the velocity and the acceleration of the particle when $t = 2$ s, (b) the value of θ for which the magnitude of the velocity is maximum.

SOLUTION

Differentiate the expressions for r and θ with respect to time.

$$r = b(2 + \cos \pi t),$$

$$\dot{r} = -\pi b \sin \pi t,$$

$$\ddot{r} = -\pi^2 b \cos \pi t$$

$$\theta = \pi t,$$

$$\dot{\theta} = \pi,$$

$$\ddot{\theta} = 0$$

(a) At $t = 2$ s, $\sin \pi t = 0, \quad \cos \pi t = 1$

$$r = 3b, \quad \dot{r} = 0, \quad \ddot{r} = -\pi^2 b, \quad \theta = 2\pi \text{ rad}, \quad \dot{\theta} = \pi \text{ rad/s}$$

$$v_r = \dot{r} = 0, \quad v_\theta = r\dot{\theta} = 3\pi b, \qquad \mathbf{v} = 3\pi b\mathbf{e}_\theta \blacktriangleleft$$

$$a_r = \ddot{r} - r\dot{\theta}^2 = -\pi^2 b - (3b)\pi^2 = -4\pi^2 b$$

$$a_\theta = r\ddot{\theta} + 2\dot{r}\dot{\theta} = 0, \qquad \mathbf{a} = -4\pi^2 b\mathbf{e}_r \blacktriangleleft$$

(b) Values of θ for which v is maximum.

$$v_r = \dot{r} = -\pi b \sin \pi t$$

$$v_\theta = r\dot{\theta} = -b(2 + \cos \pi t)\pi$$

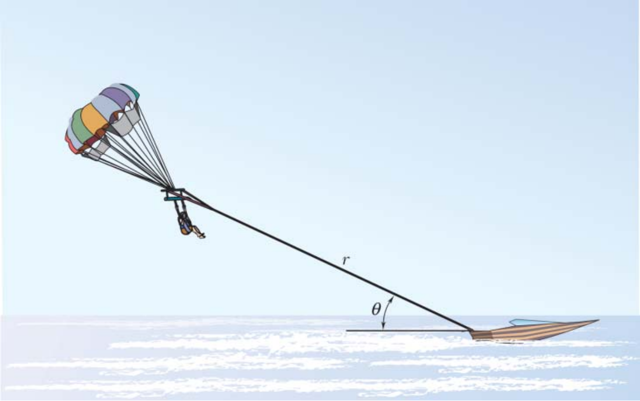
$$v^2 = v_r^2 + v_\theta^2 = \pi^2 b^2 \left[\sin^2 \pi t + (2 + \cos \pi t)^2\right]$$

$$= \pi^2 b^2 \left[\sin^2 \pi t + 4 + 4\cos \pi t + \cos^2 \pi t\right]$$

$$= \pi^2 b^2 (5 + 4\cos \pi t)$$

is maximum when $\cos \pi t = 1$ or $\pi t = 0, \ 2\pi, \ 4\pi, \ 6\pi,$ etc

$\theta = \pi t$, hence $\theta = 2N\pi, \ N = 0, 1, 2, \ldots \blacktriangleleft$



PROBLEM 11.163

During a parasailing ride, the boat is traveling at a constant 30 km/hr with a 200 m long tow line. At the instant shown, the angle between the line and the water is 30° and is increasing at a constant rate of 2°/s. Determine the velocity and acceleration of the parasailer at this instant.

SOLUTION

Given:

$\mathbf{v}_B = 30\mathbf{i}$ km/hr = $8.333\mathbf{i}$ m/s

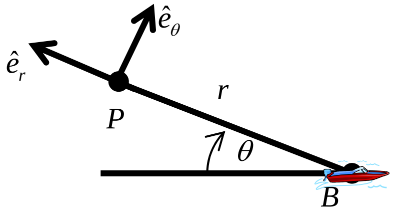
$\mathbf{a}_B = 0$

$r = 200$ m, $\dot{r} = 0$, $\ddot{r} = 0$

$\theta = 30°$

$\dot{\theta} = 2°/s = 0.0349$ rad/s

$\ddot{\theta} = 0$



Relative Motion relations:

$$\mathbf{v}_P = \mathbf{v}_B + \mathbf{v}_{P/B}$$

$$\mathbf{a}_P = \mathbf{a}_B + \mathbf{a}_{P/B}$$

Using Radial and Transverse components:

$$\mathbf{v}_{P/B} = \dot{r}\mathbf{e}_r + r\dot{\theta}\mathbf{e}_\theta$$

$$\mathbf{a}_{P/B} = \left(\ddot{r} - r\dot{\theta}^2\right)\mathbf{e}_r + \left(r\ddot{\theta} + 2\dot{r}\dot{\theta}\right)\mathbf{e}_\theta$$

Substitute in known values:

$$\mathbf{v}_{P/B} = 6.981\mathbf{e}_\theta \text{ m/s}$$

$$\mathbf{a}_{P/B} = -0.2437\mathbf{e}_r \text{ m/s}^2$$

Change to rectangular coordinates:

$$\mathbf{v}_{P/B} = 6.981 * \sin 30°\mathbf{i} + 6.981 * \cos 30°\mathbf{j} \text{ m/s}$$

$$= 3.491\mathbf{i} + 6.046\mathbf{j} \text{ m/s}$$

$$\mathbf{a}_{P/B} = -0.2437 * \left(-\cos 30°\right)\mathbf{i} - 0.2437 * \sin 30°\mathbf{j} \text{ m/s}^2$$

$$= 0.2111\mathbf{i} - 0.1219\mathbf{j} \text{ m/s}^2$$

Substitute into Relative Motion relations:

$$\mathbf{v}_P = 8.33\mathbf{i} + 3.491\mathbf{i} + 6.046\mathbf{j} \text{ m/s}$$

$$= 11.824\mathbf{i} + 6.046\mathbf{j} \text{ m/s}$$

$$\mathbf{a}_P = 0 + 0.2111\mathbf{i} - 0.1219\mathbf{j} \text{ m/s}^2$$

$$= 0.2111\mathbf{i} - 0.1219\mathbf{j} \text{ m/s}^2$$

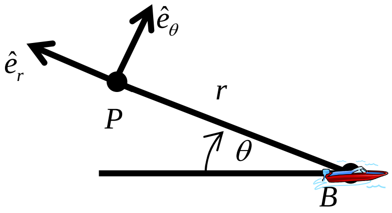
Velocity: $v_P = 13.280 \text{ m/s} \measuredangle 27.08°$ ◀

Acceleration: $a_P = 0.2437 \text{ m/s}^2 \measuredangle 30.00°$ ◀

PROBLEM 11.164

Some parasailing systems use a winch to pull the rider back to the boat. During the interval when θ is between 20^o and 40^o, (where t = 0 at $\theta = 20^\mathrm{o}$) the angle increases at the constant rate of 2 $^\mathrm{o}$/s. During this time, the length of the rope is defined by the relationship$r = 600 - \frac{1}{8}t^{5/2}$, where r and t are expressed in ft and s, respectively. Knowing that the boat is travelling at a constant rate of 15 knots (where 1 knot = 1.15 mi/h), (*a*) plot the magnitude of the velocity of the parasailer as a function of time (b) determine the magnitude of the acceleration of the parasailer when t = 5 s.

SOLUTION



Given:

$$\mathbf{v}_B = 15\mathbf{i}\ \text{knots}*\frac{1.15\text{mph}}{\text{knot}}*\frac{5280\,ft/mi}{3600s/hr} = 25.30\mathbf{i}\ \text{ft/s}$$

$$\mathbf{a}_B = 0$$

$$r = 600 - \frac{1}{8}t^{5/2}\ \text{m}$$

$$20° \le \theta \le 40°$$

$$\dot{\theta} = 2°/s = 0.0349\ \text{rad/s}$$

$$\ddot{\theta} = 0$$

Take Derivatives of r(t):

$$\dot{r} = -\frac{5}{16}t^{3/2}\ \text{m/s}$$

$$\ddot{r} = -\frac{15}{32}t^{1/2}\ \text{m/s}^2$$

Relative Motion relations:

$$\mathbf{v}_P = \mathbf{v}_B + \mathbf{v}_{P/B}$$

$$\mathbf{a}_P = \mathbf{a}_B + \mathbf{a}_{P/B}$$

Using Radial and Transverse components:

$$\mathbf{v}_{P/B} = \dot{r}\mathbf{e}_r + r\dot{\theta}\mathbf{e}_\theta$$

$$\mathbf{a}_{P/B} = \left(\ddot{r} - r\dot{\theta}^2\right)\mathbf{e}_r + \left(r\ddot{\theta} + 2\dot{r}\dot{\theta}\right)\mathbf{e}_\theta$$

Change velocity to rectangular coordinates:

$$\mathbf{v}_{P/B} = \dot{r}(-\cos\theta\mathbf{i} + \sin\theta\mathbf{j}) + r\dot{\theta}\left(\sin\theta\mathbf{i} + \cos\theta\mathbf{j}\right)$$

Substitute into Relative Motion relations:

$$\mathbf{v}_P = \left(v_B - \dot{r}\cos\theta + r\dot{\theta}\sin\theta\right)\mathbf{i} + \left(\dot{r}\sin\theta + r\dot{\theta}\cos\theta\right)\mathbf{j}$$

$$\mathbf{a}_P = \left(\ddot{r} - r\dot{\theta}^2\right)\mathbf{e}_r + \left(r\ddot{\theta} + 2\dot{r}\dot{\theta}\right)\mathbf{e}_\theta$$

Note that:

$$\mathbf{v}_P = v_{Px}\mathbf{i} + v_{Py}\mathbf{j}$$

$$\mathbf{a}_P = a_r\mathbf{e}_r + a_\theta\mathbf{e}_\theta$$

PROBLEM 11.164 (Continued)

Where:

$$v_{Px} = v_B - \dot{r}\cos\theta + r\dot{\theta}\sin\theta$$

$$v_{Py} = \dot{r}\sin\theta + r\dot{\theta}\cos\theta$$

$$a_r = \ddot{r} - r\dot{\theta}^2$$

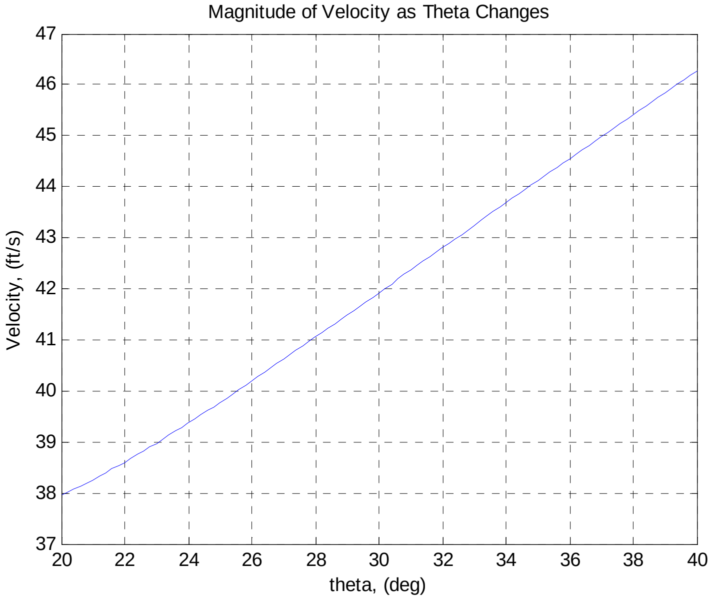
$$a_\theta = r\ddot{\theta} + 2\dot{r}\dot{\theta}$$

Magnitude of velocity:

$$\mathbf{v}_P = \sqrt{v_{Px}^2 + v_{Py}^2}$$

$$\mathbf{a}_P = \sqrt{a_r^2 + a_\theta^2}$$

(a) Plot of Velocity as a function of theta:



(b) Magnitude of Acceleration at t=5s:

$$r = 600 - \frac{1}{8}(5)^{5/2} = \ 593.012 \text{ m}$$

$$\dot{r} = -\frac{5}{16}(5)^{3/2} = \text{-}3.494 \text{ m/s}$$

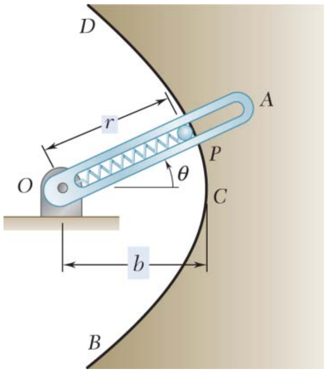
$$\ddot{r} = -\frac{15}{32}(5)^{1/2} = \text{-}1.048 \text{ m/s}^2$$

$$a_r = \left(\ddot{r} - r\dot{\theta}^2\right) = -1.771 \text{ m/s}^2$$

$$a_\theta = \left(r\ddot{\theta} + 2\dot{r}\dot{\theta}\right) = -0.2439 \text{ m/s}^2$$

$$\mathbf{a}_P = \sqrt{-1.771^2 + -0.2439^2}$$

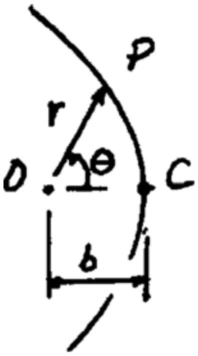
$$a_P = 1.787 \text{ m/s}^2 \blacktriangleleft$$



PROBLEM 11.165

As rod *OA* rotates, pin *P* moves along the parabola *BCD*. Knowing that the equation of this parabola is $r = 2b/(1+\cos\theta)$ and that $\theta = kt$, determine the velocity and acceleration of *P* when (*a*) $\theta = 0$, (*b*) $\theta = 90°$.

SOLUTION



$$r = \frac{2b}{1+\cos kt} \qquad \theta = kt$$

$$\dot{r} = \frac{2bk\sin kt}{(1+\cos kt)^2} \qquad \dot{\theta} = k \qquad \ddot{\theta} = 0$$

$$\ddot{r} = \frac{2bk}{(1+\cos kt)^4}[(1+\cos kt)^2 k\cos kt + (\sin kt)2(1+\cos kt)(k\sin kt)]$$

(*a*) When $\theta = kt = 0$:

$$r = b \qquad \dot{r} = 0 \qquad \ddot{r} = \frac{2bk}{(2)^4}[(2)^2 k(1)+0] = \frac{1}{2}bk^2$$

$$\theta = 0 \qquad \dot{\theta} = k \qquad \ddot{\theta} = 0$$

$$v_r = \dot{r} = 0 \qquad v_\theta = r\dot{\theta} = bk$$

$\mathbf{v} = bk\,\mathbf{e}_\theta$ ◀

$$\left.\begin{aligned} a_r &= \ddot{r} - r\dot{\theta}^2 = \frac{1}{2}bk^2 - bk^2 = -\frac{1}{2}bk^2 \\ a_\theta &= r\ddot{\theta} + 2\dot{r}\dot{\theta} = b(0) + 2(0) = 0 \end{aligned}\right\}$$

$\mathbf{a} = -\frac{1}{2}bk^2\mathbf{e}_r$ ◀

(*b*) When $\theta = kt = 90°$:

$$r = 2b \qquad \dot{r} = 2bk \qquad \ddot{r} = \frac{2bk}{19}[0+2k] = 4bk^2$$

$$\theta = 90° \qquad \dot{\theta} = k \qquad \ddot{\theta} = 0$$

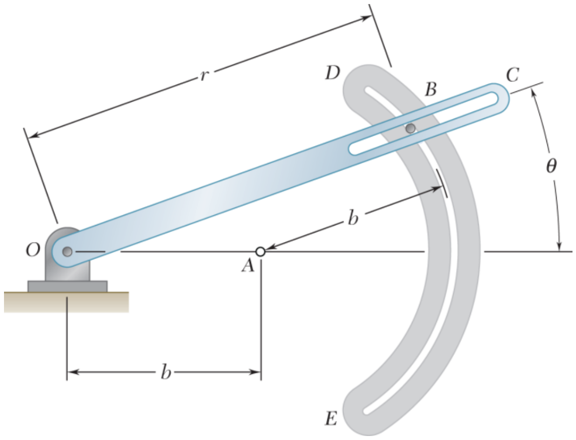
$$v_r = \dot{r} = 2bk \qquad v_\theta = r\dot{\theta} = 2bk$$

$\mathbf{v} = 2bk\,\mathbf{e}_r + 2bk\,\mathbf{e}_\theta$ ◀

$$a_r = \ddot{r} - r\dot{\theta}^2 = 4bk^2 - 2bk^2 = 2bk^2$$

$$a_\theta = r\ddot{\theta} + 2\dot{r}\dot{\theta} = 2b(0) + 2(2bk)k = 4bk^2$$

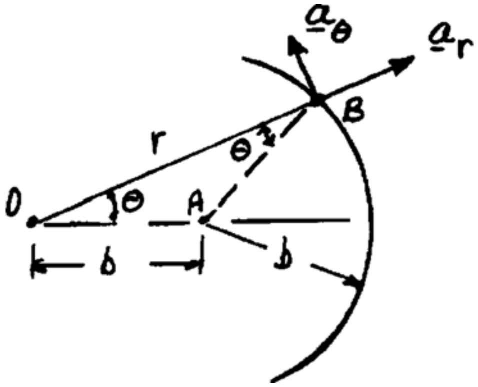
$\mathbf{a} = 2bk^2\mathbf{e}_r + 4bk^2\mathbf{e}_\theta$ ◀



PROBLEM 11.166

The pin at B is free to slide along the circular slot DE and along the rotating rod OC. Assuming that the rod OC rotates at a constant rate $\dot{\theta}$, (*a*) show that the acceleration of pin B is of constant magnitude, (*b*) determine the direction of the acceleration of pin B.

SOLUTION



From the sketch:

$$r = 2b\cos\theta$$

$$\dot{r} = -2b\sin\theta\,\dot{\theta}$$

Since $\dot{\theta} = \text{constant}$, $\quad \ddot{\theta} = 0$

$$\ddot{r} = -2b\cos\theta\,\dot{\theta}^2$$

$$a_r = \ddot{r} - r\dot{\theta}^2 = -2b\cos\theta\,\dot{\theta}^2 - (2b\cos\theta)\dot{\theta}^2$$

$$a_r = -4b\cos\theta\,\dot{\theta}^2$$

$$a_\theta = r\ddot{\theta} + 2\dot{r}\dot{\theta} = (2b\cos\theta)(0) + 2(-2b\sin\theta)\dot{\theta}^2$$

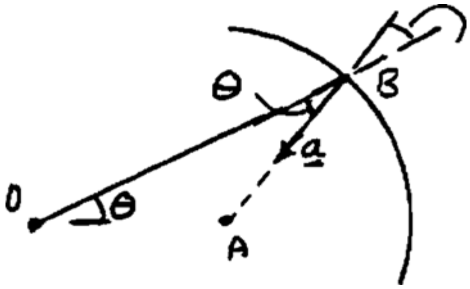
$$a_\theta = -4b\sin\theta\,\dot{\theta}^2$$

$$a = \sqrt{a_r^2 + a_\theta^2} = 4b\dot{\theta}^2\sqrt{(-\cos\theta)^2 + (-\sin\theta)^2}$$

$$a = 4b\dot{\theta}^2$$

Since both b and $\dot{\theta}$ are constant, we find that

$a = \text{constant}$ ◀

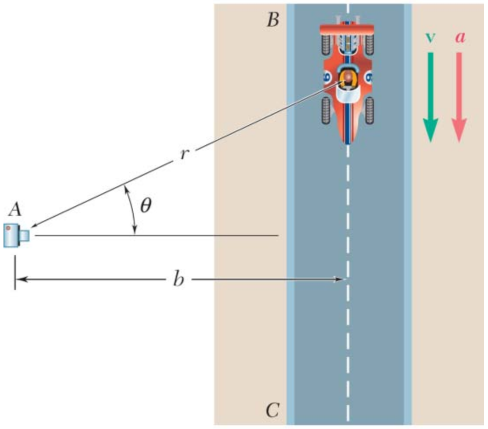


$$\gamma = \tan^{-1}\frac{a_\theta}{a_r} = \tan^{-1}\left(\frac{-4b\sin\theta\,\dot{\theta}^2}{-4b\cos\theta\,\dot{\theta}^2}\right)$$

$$\gamma = \tan^{-1}(\tan\theta)$$

$$\gamma = \theta$$

Thus, **a** is directed toward A ◀

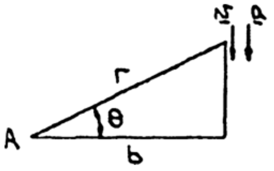


PROBLEM 11.167

To study the performance of a racecar, a high-speed camera is positioned at Point *A*. The camera is mounted on a mechanism which permits it to record the motion of the car as the car travels on straightway *BC*. Determine (*a*) the speed of the car in terms of *b*, θ, and $\dot{\theta}$, (*b*) the magnitude of the acceleration in terms of *b*, θ, $\dot{\theta}$, and $\ddot{\theta}$.

SOLUTION

(*a*) We have $$r = \frac{b}{\cos\theta}$$



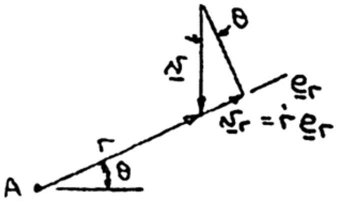
Then $$\dot{r} = \frac{b\dot{\theta}\sin\theta}{\cos^2\theta}$$

We have
$$v^2 = v_r^2 + v_\theta^2 = (\dot{r})^2 + (r\dot{\theta})^2$$
$$= \left(\frac{b\dot{\theta}\sin\theta}{\cos^2\theta}\right)^2 + \left(\frac{b\dot{\theta}}{\cos\theta}\right)^2$$
$$= \frac{b^2\dot{\theta}^2}{\cos^2\theta}\left(\frac{\sin^2\theta}{\cos^2\theta} + 1\right) = \frac{b^2\dot{\theta}^2}{\cos^4\theta}$$

or $$v = \pm\frac{b\dot{\theta}}{\cos^2\theta}$$

For the position of the car shown, θ is decreasing; thus, the negative root is chosen. $$v = -\frac{b\dot{\theta}}{\cos^2\theta} \blacktriangleleft$$

Alternative solution.



From the diagram $$\dot{r} = -v\sin\theta$$

or $$\frac{b\dot{\theta}\sin\theta}{\cos^2\theta} = -v\sin\theta$$

or $$v = -\frac{b\dot{\theta}}{\cos^2\theta} \blacktriangleleft$$

PROBLEM 11.167 (Continued)

(*b*) For rectilinear motion $a = \dfrac{dv}{dt}$

Using the answer from Part *a*

$$v = -\frac{b\dot{\theta}}{\cos^2\theta}$$

Then
$$a = \frac{d}{dt}\left(-\frac{b\dot{\theta}}{\cos^2\theta}\right)$$
$$= -b\frac{\ddot{\theta}\cos^2\theta - \dot{\theta}(-2\dot{\theta}\cos\theta\sin\theta)}{\cos^4\theta}$$

or
$$a = -\frac{b}{\cos^2\theta}(\ddot{\theta} + 2\dot{\theta}^2\tan\theta) \;◀$$

Alternative solution

From above
$$r = \frac{b}{\cos\theta} \qquad \dot{r} = \frac{b\dot{\theta}\sin\theta}{\cos^2\theta}$$

Then
$$\ddot{r} = b\frac{(\ddot{\theta}\sin\theta + \dot{\theta}^2\cos\theta)(\cos^2\theta) - (\dot{\theta}\sin\theta)(-2\dot{\theta}\cos\theta\sin\theta)}{\cos^4\theta}$$
$$= b\left[\frac{\ddot{\theta}\sin\theta}{\cos^2\theta} + \frac{\dot{\theta}^2(1+\sin^2\theta)}{\cos^3\theta}\right]$$

Now
$$a^2 = a_r^2 + a_\theta^2$$

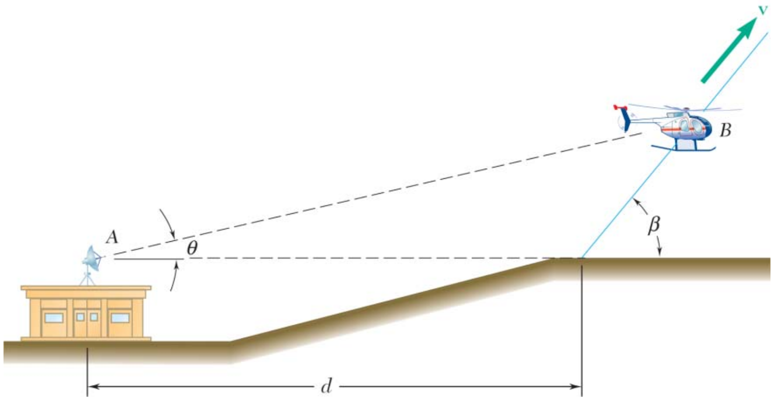
where
$$a_r = \ddot{r} - r\dot{\theta}^2 = b\left[\frac{\ddot{\theta}\sin\theta}{\cos^2\theta} + \frac{\dot{\theta}^2(1+\sin^2\theta)}{\cos^2\theta}\right] - \frac{b\dot{\theta}^2}{\cos\theta}$$
$$= \frac{b}{\cos^2\theta}\left(\ddot{\theta}\sin\theta + \frac{2\dot{\theta}^2\sin^2\theta}{\cos\theta}\right)$$
$$a_r = \frac{b\sin\theta}{\cos^2\theta}(\ddot{\theta} + 2\dot{\theta}^2\tan\theta)$$

and
$$a_\theta = r\ddot{\theta} + 2\dot{r}\dot{\theta} = \frac{b\ddot{\theta}}{\cos\theta} + 2\frac{b\dot{\theta}^2\sin\theta}{\cos^2\theta}$$
$$= \frac{b\cos\theta}{\cos^2\theta}(\ddot{\theta} + 2\dot{\theta}\tan\theta)$$

Then
$$a = \pm\frac{b}{\cos^2\theta}(\ddot{\theta} + 2\dot{\theta}^2\tan\theta)[(\sin\theta)^2 + (\cos\theta)^2]^{1/2}$$

For the position of the car shown, $\ddot{\theta}$ is negative; for *a* to be positive, the negative root is chosen.

$$a = -\frac{b}{\cos^2\theta}(\ddot{\theta} + 2\dot{\theta}^2\tan\theta) \;◀$$



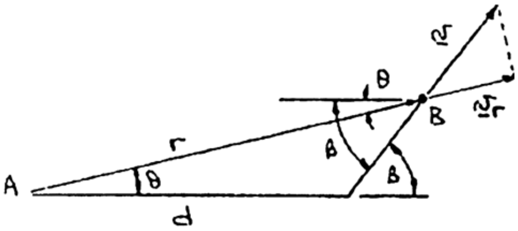
PROBLEM 11.168

After taking off, a helicopter climbs in a straight line at a constant angle β. Its flight is tracked by radar from Point A. Determine the speed of the helicopter in terms of d, β, θ, and $\dot{\theta}$.

SOLUTION

From the diagram

$$\frac{r}{\sin(180^\circ - \beta)} = \frac{d}{\sin(\beta - \theta)}$$



or $$d \sin\beta = r(\sin\beta\cos\theta - \cos\beta\sin\theta)$$

or $$r = d\,\frac{\tan\beta}{\tan\beta\cos\theta - \sin\theta}$$

Then $$\dot{r} = d\tan\beta\,\frac{-(-\tan\beta\sin\theta - \cos\theta)}{(\tan\beta\cos\theta - \sin\theta)^2}\,\dot{\theta}$$

$$= d\dot{\theta}\tan\beta\,\frac{\tan\beta\sin\theta + \cos\theta}{(\tan\beta\cos\theta - \sin\theta)^2}$$

From the diagram

$$v_r = v\cos(\beta - \theta) \qquad \text{where} \qquad v_r = \dot{r}$$

Then

$$d\dot{\theta}\tan\beta\,\frac{\tan\beta\sin\theta + \cos\theta}{(\tan\beta\cos\theta - \sin\theta)^2} = v(\cos\beta\cos\theta + \sin\beta\sin\theta)$$

$$= v\cos\beta\,(\tan\beta\sin\theta + \cos\theta)$$

or $$v = \frac{d\dot{\theta}\tan\beta\sec\beta}{(\tan\beta\cos\theta - \sin\theta)^2} \quad ◀$$

Alternative solution.

We have $$v^2 = v_r^2 + v_\theta^2 = (\dot{r})^2 + (r\dot{\theta})^2$$

PROBLEM 11.168 (Continued)

Using the expressions for r and $\dot{r}$ from above

$$v = \left[d\dot{\theta} \tan\beta \frac{\tan\beta \sin\theta + \cos\theta}{(\tan\beta \cos\theta - \sin\theta)^2} \right]^2$$

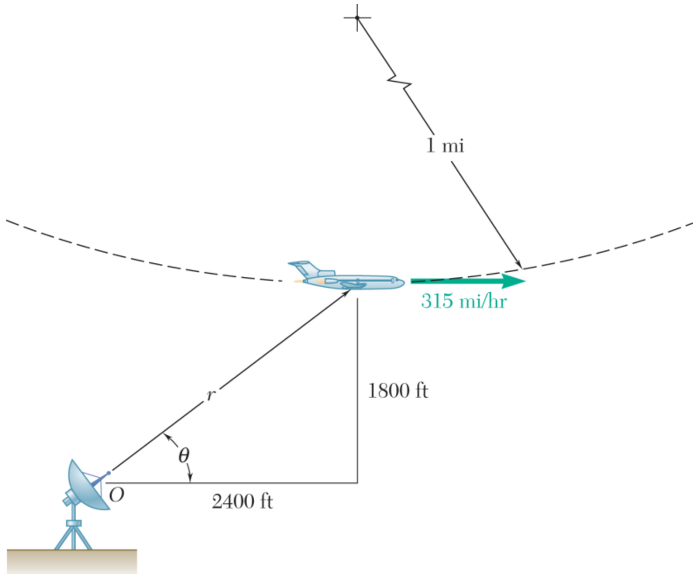
or

$$v = \pm \frac{d\dot{\theta} \tan\beta}{(\tan\beta \cos\theta - \sin\theta)} \left[\frac{(\tan\beta \sin\theta + \cos\theta)^2}{(\tan\beta \cos\theta - \sin\theta)^2} + 1 \right]^{1/2}$$

$$= \pm \frac{d\dot{\theta} \tan\beta}{(\tan\beta \cos\theta - \sin\theta)} \left[\frac{\tan^2\beta + 1}{(\tan\beta \cos\theta - \sin\theta)^2} \right]^{1/2}$$

Note that as θ increases, the helicopter moves in the indicated direction. Thus, the positive root is chosen.

$$v = \frac{d\dot{\theta} \tan\beta \sec\beta}{(\tan\beta \cos\theta - \sin\theta)^2} \blacktriangleleft$$



PROBLEM 11.169

At the bottom of a loop in the vertical plane, an airplane has a horizontal velocity of 315 mi/h and is speeding up at a rate of 10 ft/s^2. The radius of curvature of the loop is 1 mi. The plane is being tracked by radar at *O*. What are the recorded values of $\dot{r}$, $\ddot{r}$, $\dot{\theta}$ and $\ddot{\theta}$ for this instant?

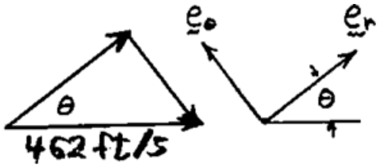
SOLUTION

Geometry. The polar coordinates are

$$r = \sqrt{(2400)^2 + (1800)^2} = 3000 \text{ ft} \qquad \theta = \tan^{-1}\left(\frac{1800}{2400}\right) = 36.87°$$

Velocity Analysis.

$$\mathbf{v} = 315 \text{ mi/h} = 462 \text{ ft/s} \longrightarrow$$



$$v_r = 462\cos\theta = 369.6 \text{ ft/s}$$

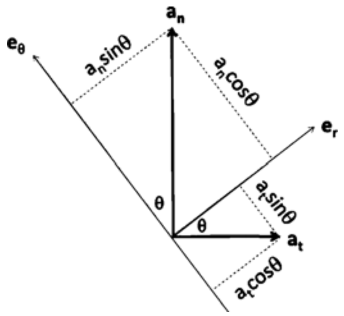
$$v_\theta = -462\sin\theta = -277.2 \text{ ft/s}$$

$$v_r = \dot{r} \qquad \dot{r} = 370 \text{ ft/s} \blacktriangleleft$$

$$v_\theta = r\dot{\theta} \qquad \dot{\theta} = \frac{v_\theta}{r} = -\frac{277.2}{3000}$$

$$\dot{\theta} = -0.0924 \text{ rad/s} \blacktriangleleft$$

Acceleration analysis.



$$a_t = 10 \text{ ft/s}^2$$

$$a_n = \frac{v^2}{\rho} = \frac{(462)^2}{5280} = 40.425 \text{ ft/s}^2$$

PROBLEM 11.169 (Continued)

$$a_r = a_t \cos\theta + a_n \sin\theta = 10 \cos 36.87° + 40.425 \sin 36.87° = 32.255 \text{ ft/s}^2$$

$$a_\theta = -a_t \sin\theta + a_n \cos\theta = -10 \sin 36.87° + 40.425 \cos 36.87° = 26.34 \text{ ft/s}^2$$

$$a_r = \ddot{r} - r\dot{\theta}^2 \quad \ddot{r} = a_r + r\dot{\theta}^2$$

$$\ddot{r} = 32.255 + (3000)(-0.0924)^2$$

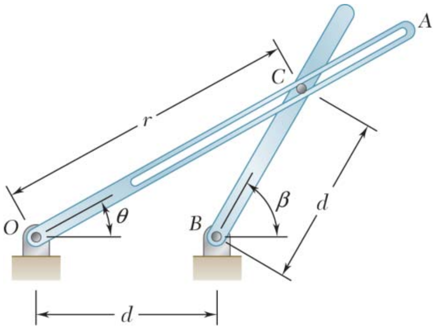
$\ddot{r} = 57.9 \text{ ft/s}^2$ ◀

$$a_\theta = r\ddot{\theta} + 2\dot{r}\dot{\theta}$$

$$\ddot{\theta} = \frac{a_\theta}{r} - \frac{2\dot{r}\dot{\theta}}{r}$$

$$= \frac{26.34}{3000} - \frac{(2)(369.6)(-0.0924)}{3000}$$

$\ddot{\theta} = 0.0315 \text{ rad/s}^2$ ◀



PROBLEM 11.170

Pin *C* is attached to rod *BC* and slides freely in the slot of rod *OA* which rotates at the constant rate ω. At the instant when $\beta = 60°$, determine (*a*) $\dot{r}$ and $\dot{\theta}$, (*b*) $\ddot{r}$ and $\ddot{\theta}$. Express your answers in terms of *d* and ω.

SOLUTION

Looking at *d* and β as polar coordinates with $\dot{d} = 0$,

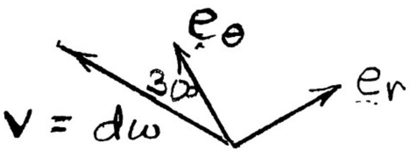
$$v_\beta = d\dot{\beta} = d\omega, \qquad v_d = \dot{d} = 0$$

$$a_\beta = d\ddot{\beta} + 2\dot{d}\dot{\beta} = 0, \qquad a_d = \ddot{d} - d\dot{\beta}^2 = -d\omega^2$$

Geometry analysis: $r = d\sqrt{3}$ for angles shown.

(*a*) Velocity analysis:

Sketch the directions of $\mathbf{v}$, $\mathbf{e}_r$ and $\mathbf{e}_\theta$.



$$v_r = \dot{r} = \mathbf{v}\cdot\mathbf{e}_r = d\omega\cos 120°$$

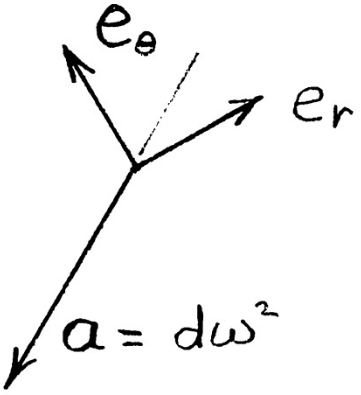
$$\dot{r} = -\frac{1}{2}d\omega \blacktriangleleft$$

$$v_\theta = r\dot{\theta} = \mathbf{v}\cdot\mathbf{e}_\theta = d\omega\cos 30°$$

$$\dot{\theta} = \frac{d\omega\cos 30°}{r} = \frac{d\omega\frac{\sqrt{3}}{2}}{d\sqrt{3}} \qquad \dot{\theta} = \frac{1}{2}\omega \blacktriangleleft$$

(*b*) Acceleration analysis:

Sketch the directions of $\mathbf{a}$, $\mathbf{e}_r$ and $\mathbf{e}_\theta$.



$$a_r = \mathbf{a}\cdot\mathbf{e}_r = a\cos 150° = -\frac{\sqrt{3}}{2}d\omega^2$$

$$\ddot{r} - r\dot{\theta}^2 = -\frac{\sqrt{3}}{2}d\omega^2$$

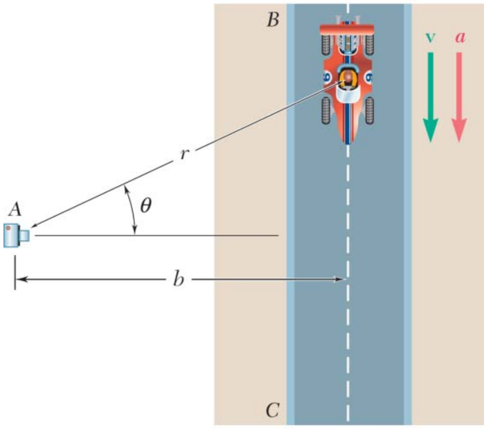
$$\ddot{r} = -\frac{\sqrt{3}}{2}d\omega^2 + r\dot{\theta}^2 = -\frac{\sqrt{3}}{2}d\omega^2 + d\sqrt{3}\left(\frac{1}{2}\omega\right)^2$$

$$\ddot{r} = -\frac{\sqrt{3}}{4}d\omega^2 \blacktriangleleft$$

$$a_\theta = \mathbf{a}\cdot\mathbf{e}_\theta = d\omega^2\cos 120° = -\frac{1}{2}d\omega^2$$

$$a_\theta = r\ddot{\theta} + 2\dot{r}\dot{\theta}$$

$$\ddot{\theta} = \frac{1}{r}(a_\theta - 2\dot{r}\dot{\theta}) = \frac{1}{\sqrt{3}d}\left[-\frac{1}{2}d\omega^2 - (2)\left(-\frac{1}{2}d\omega\right)\left(\frac{1}{2}\omega\right)\right] \qquad \ddot{\theta} = 0 \blacktriangleleft$$



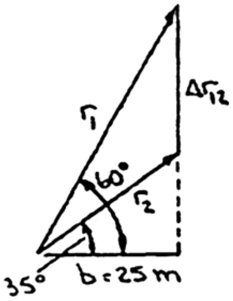
PROBLEM 11.171

For the racecar of Problem 11.167, it was found that it took 0.5 s for the car to travel from the position $\theta = 60°$ to the position $\theta = 35°$. Knowing that $b = 25$ m, determine the average speed of the car during the 0.5-s interval.

PROBLEM 11.167 To study the performance of a racecar, a high-speed camera is positioned at Point *A*. The camera is mounted on a mechanism which permits it to record the motion of the car as the car travels on straightway *BC*. Determine (*a*) the speed of the car in terms of b, θ, and $\dot{\theta}$, (*b*) the magnitude of the acceleration in terms of b, θ, $\dot{\theta}$, and $\ddot{\theta}$.

SOLUTION

From the diagram:



$$\Delta r_{12} = 25 \tan 60° - 25 \tan 35°$$

$$= 25.796 \text{ m}$$

Now

$$v_{\text{ave}} = \frac{\Delta r_{12}}{\Delta t_{12}}$$

$$= \frac{25.796 \text{ m}}{0.5 \text{ s}}$$

$$= 51.592 \text{ m/s}$$

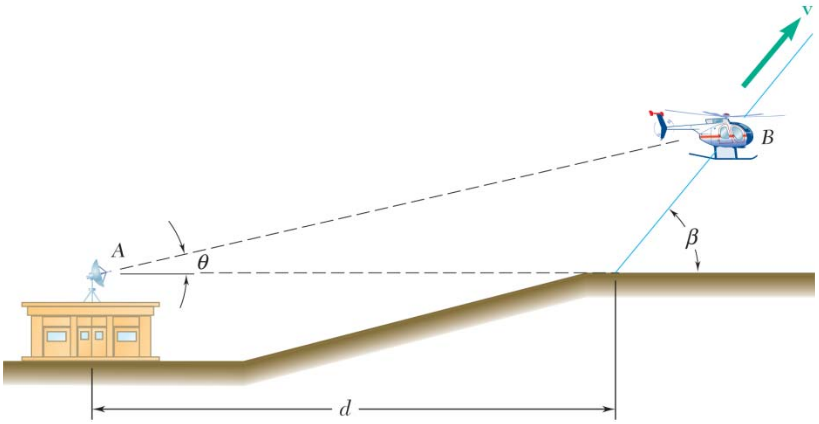
or

$$v_{\text{ave}} = 185.7 \text{ km/h} \blacktriangleleft$$

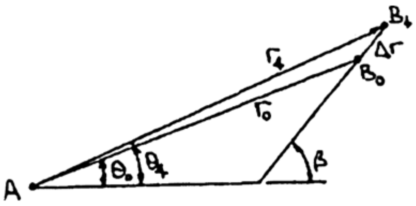
PROBLEM 11.172

For the helicopter of Problem 11.168, it was found that when the helicopter was at *B*, the distance and the angle of elevation of the helicopter were $r = 3000$ ft and $\theta = 20°$, respectively. Four seconds later, the radar station sighted the helicopter at $r = 3320$ ft and $\theta = 23.1°$. Determine the average speed and the angle of climb β of the helicopter during the 4-s interval.

PROBLEM 11.168 After taking off, a helicopter climbs in a straight line at a constant angle β. Its flight is tracked by radar from Point *A*. Determine the speed of the helicopter in terms of d, β, θ, and $\dot{\theta}$.



SOLUTION



We have $r_0 = 3000$ ft $\theta_0 = 20°$

$r_4 = 3320$ ft $\theta_4 = 23.1°$

From the diagram:

$$\Delta r^2 = 3000^2 + 3320^2 - 2(3000)(3320)\cos(23.1° - 20°)$$

or $\Delta r = 362.70$ ft

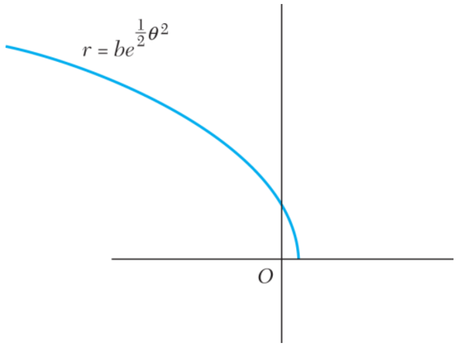
Now
$$v_{\text{ave}} = \frac{\Delta r}{\Delta t} = \frac{362.70 \text{ ft}}{4 \text{ s}} = 90.675 \text{ ft/s}$$

or $v_{\text{ave}} = 61.8$ mi/h ◀

Also, $\Delta r \cos\beta = r_4 \cos\theta_4 - r_0 \cos\theta_0$

or
$$\cos\beta = \frac{3320 \cos 23.1° - 3000 \cos 20°}{362.70}$$

or $\beta = 49.7°$ ◀



PROBLEM 11.173

A particle moves along the spiral shown. Determine the magnitude of the velocity of the particle in terms of $b,\ \theta,$ and $\dot{\theta}.$

SOLUTION

Given:

$$r = be^{\frac{1}{2}\theta^2}$$

Take time derivative

$$\dot{r} = be^{\frac{1}{2}\theta^2}\theta\dot{\theta}$$

Radial and Transverse Components

$$v_r = \dot{r} = be^{\frac{1}{2}\theta^2}\theta\dot{\theta}$$

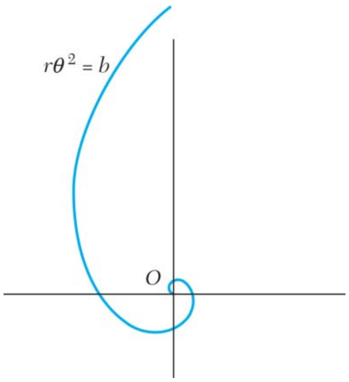
$$v_\theta = r\dot{\theta} = be^{\frac{1}{2}\theta^2}\dot{\theta}$$

Magnitude of Velocity

$$v^2 = v_r^2 + v_\theta^2$$

$$= \left(be^{\frac{1}{2}\theta^2}\right)^2\left(\theta^2 + 1\right)\dot{\theta}^2$$

$$v = \left|be^{\frac{1}{2}\theta^2}\left(\theta^2 + 1\right)^{1/2}\dot{\theta}\right| ◀$$



PROBLEM 11.174

A particle moves along the spiral shown. Determine the magnitude of the velocity of the particle in terms of b, θ, and $\dot{\theta}$.

SOLUTION

Given: $r = \dfrac{b}{\theta^2}$

Take time derivative $\dot{r} = -\dfrac{2b}{\theta^3}\dot{\theta}$

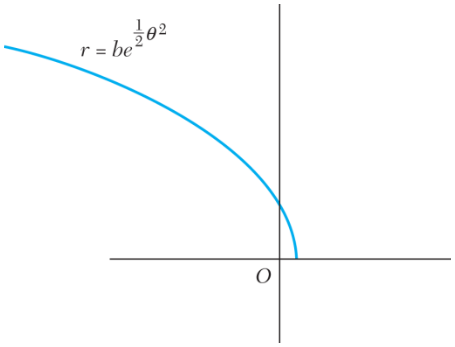
Radial and Transverse Components $v_r = \dot{r} = -\dfrac{2b}{\theta^3}\dot{\theta}$

$$v_\theta = r\dot{\theta} = \frac{b}{\theta^2}\dot{\theta}$$

Magnitude of Velocity

$$\begin{aligned} v^2 &= v_r^2 + v_\theta^2 \\ &= \frac{4b^2}{\theta^6}\dot{\theta}^2 + \frac{b^2}{\theta^4}\dot{\theta}^2 \\ &= \frac{b^2}{\theta^6}\left(4 + \theta^2\right)\dot{\theta}^2 \end{aligned}$$

$$v = \left|\frac{b}{\theta^3}\left(4 + \theta^2\right)^{1/2}\dot{\theta}\right| \blacktriangleleft$$



PROBLEM 11.175

A particle moves along the spiral shown. Knowing that $\dot{\theta}$ is constant and denoting this constant by ω, determine the magnitude of the acceleration of the particle in terms of b, θ, and $\dot{\theta}$.

SOLUTION

Given:

$$r = be^{\frac{1}{2}\theta^2}$$

$$\dot{\theta} = \omega \qquad \text{and} \qquad \ddot{\theta} = 0$$

Take time derivatives

$$\dot{r} = be^{\frac{1}{2}\theta^2}\theta\dot{\theta}$$

$$\ddot{r} = be^{\frac{1}{2}\theta^2}\left[\left(\theta\dot{\theta}\right)^2 + \dot{\theta}^2 + \theta\ddot{\theta}\right]$$

Radial Component of Acceleration

$$a_r = \ddot{r} - r\dot{\theta}^2$$

$$= be^{\frac{1}{2}\theta^2}\left[\left(\theta\dot{\theta}\right)^2 + \dot{\theta}^2 + \theta\ddot{\theta} - \dot{\theta}^2\right]$$

$$= be^{\frac{1}{2}\theta^2}\left[\left(\theta\dot{\theta}\right)^2 + \theta\ddot{\theta}\right]$$

Transverse Component of Acceleration

$$a_\theta = r\ddot{\theta} + 2\dot{r}\dot{\theta}$$

$$= be^{\frac{1}{2}\theta^2}\ddot{\theta} + 2be^{\frac{1}{2}\theta^2}\theta\dot{\theta}^2$$

$$= be^{\frac{1}{2}\theta^2}\left[\ddot{\theta} + 2\theta\dot{\theta}^2\right]$$

Substitute Given Values

$$\dot{\theta} = \omega \qquad \text{and} \qquad \ddot{\theta} = 0$$

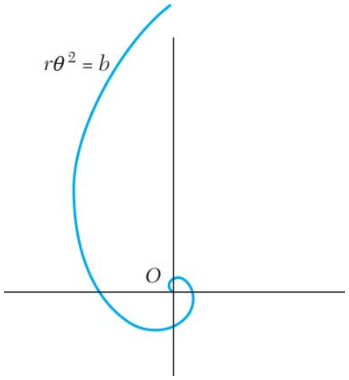
$$a_r = be^{\frac{1}{2}\theta^2}\left(\theta\omega\right)^2 \qquad \text{and} \qquad a_\theta = be^{\frac{1}{2}\theta^2}\left(2\theta\omega^2\right)$$

Magnitude of Acceleration

$$a^2 = a_r^2 + a_\theta^2$$

$$= \left(be^{\frac{1}{2}\theta^2}\right)^2\left(\theta^4 + 4\theta^2\right)\omega^4$$

$$a = be^{\frac{1}{2}\theta^2}\theta\left(\theta^2 + 4\right)^{\frac{1}{2}}\omega^2 \blacktriangleleft$$



PROBLEM 11.176

A particle moves along the spiral shown. Knowing that $\dot{\theta}$ is constant and denoting this constant by ω, determine the magnitude of the acceleration of the particle in terms of b, θ, and $\dot{\theta}$.

SOLUTION

Given:

$$r = \frac{b}{\theta^2}, \quad \dot{\theta} = \omega \text{ and } \ddot{\theta} = 0$$

Take time derivatives

$$\dot{r} = -\frac{2b}{\theta^3}\dot{\theta}$$

$$\ddot{r} = -\frac{2b}{\theta^3}\ddot{\theta} + \frac{6b}{\theta^4}\dot{\theta}^2$$

Radial Component of Acceleration

$$\begin{aligned} a_r &= \ddot{r} - r\dot{\theta}^2 \\ &= -\frac{2b}{\theta^3}\ddot{\theta} + \frac{6b}{\theta^4}\dot{\theta}^2 - \frac{b}{\theta^2}\dot{\theta}^2 \\ &= \frac{b}{\theta^4}\left(-2\theta\ddot{\theta} + 6\dot{\theta}^2 - \theta^2\dot{\theta}^2\right) \end{aligned}$$

Transverse Component of Acceleration

$$\begin{aligned} a_\theta &= r\ddot{\theta} + 2\dot{r}\dot{\theta} \\ &= \frac{b}{\theta^2}\ddot{\theta} + (2)\left(-\frac{2b}{\theta^3}\right)\dot{\theta}^2 \\ &= \frac{b}{\theta^3}\left(\theta\ddot{\theta} - 4\dot{\theta}^2\right) \end{aligned}$$

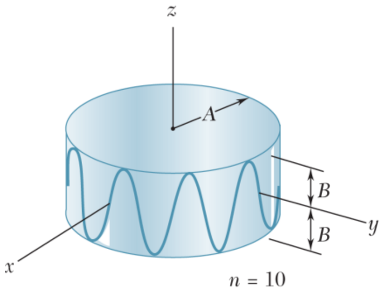
Substitute Given Values

$$a_r = \frac{b}{\theta^4}\left(6 - \theta^2\right)\omega^2 \qquad \text{and} \qquad a_\theta = -\frac{4b}{\theta^3}\omega^2$$

Magnitude of Acceleration

$$\begin{aligned} a^2 &= a_r^2 + a_\theta^2 \\ &= \frac{b^2}{\theta^8}\left(36 - 12\theta^2 + \theta^4\right)\omega^4 + \frac{16b^2}{\theta^6}\omega^4 \\ &= \frac{b^2}{\theta^8}\left(36 + 4\theta^2 + \theta^4\right)\omega^4 \end{aligned}$$

$$a = \frac{b}{\theta^4}\left(36 + 4\theta^2 + \theta^4\right)^{1/2}\omega^2 \blacktriangleleft$$



PROBLEM 11.177

The motion of a particle on the surface of a right circular cylinder is defined by the relations $R = A$, $\theta = 2\pi t$, and $z = B\sin 2\pi nt$, where A and B are constants and n is an integer. Determine the magnitudes of the velocity and acceleration of the particle at any time t.

SOLUTION

$$R = A \qquad \theta = 2\pi t \qquad z = B\sin 2\pi nt$$

$$\dot{R} = 0 \qquad \dot{\theta} = 2\pi \qquad \dot{z} = 2\pi n\, B\cos 2\pi nt$$

$$\ddot{R} = 0 \qquad \ddot{\theta} = 0 \qquad \ddot{z} = -4\pi^2 n^2\, B\sin 2\pi nt$$

Velocity (Eq. 11.49)

$$\mathbf{v} = \dot{R}\mathbf{e}_R + R\dot{\theta}\mathbf{e}_\theta + \dot{z}\mathbf{k}$$

$$\mathbf{v} = \quad + A(2\pi)\mathbf{e}_\theta + 2\pi n\, B\cos 2\pi nt\,\mathbf{k}$$

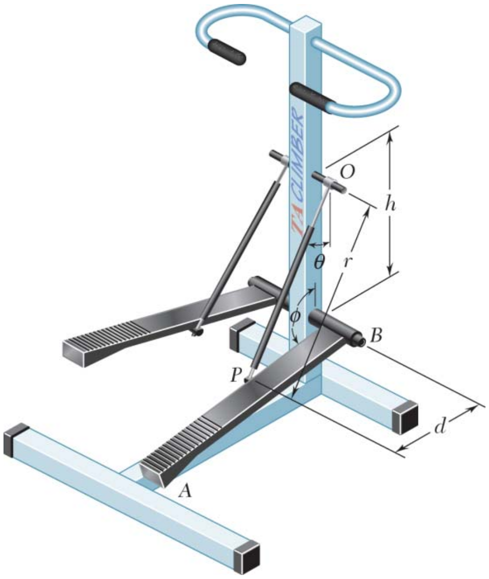
$$v = 2\pi\sqrt{A^2 + n^2B^2\cos^2 2\pi nt} \blacktriangleleft$$

Acceleration (Eq. 11.50)

$$\mathbf{a} = (\ddot{R} - R\dot{\theta}^2)\mathbf{e}_R + (R\ddot{\theta} + 2\dot{R}\dot{\theta})\mathbf{e}_\theta + \ddot{z}\mathbf{k}$$

$$\mathbf{a} = -4\pi^2 A\mathbf{e}_k - 4\pi^2 n^2\, B\sin 2\pi nt\,\mathbf{k}$$

$$a = 4\pi^2\sqrt{A^2 + n^4B^2\sin^2 2\pi nt} \blacktriangleleft$$



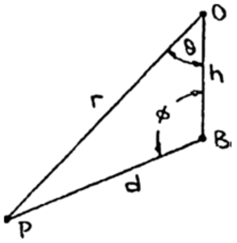
PROBLEM 11.178

Show that $\dot{r} = h\dot{\phi}\sin\theta$ knowing that at the instant shown, step *AB* of the step exerciser is rotating counterclockwise at a constant rate $\dot{\phi}$.

SOLUTION

From the diagram

$$r^2 = d^2 + h^2 - 2dh\cos\phi$$



Then $$2r\dot{r} = 2dh\dot{\phi}\sin\phi$$

Now $$\frac{r}{\sin\phi} = \frac{d}{\sin\theta}$$

or $$r = \frac{d\sin\phi}{\sin\theta}$$

Substituting for r in the expression for $\dot{r}$

$$\left(\frac{d\sin\phi}{\sin\theta}\right)\dot{r} = dh\dot{\phi}\sin\phi$$

or $$\dot{r} = h\dot{\phi}\sin\theta \qquad \text{Q.E.D.}$$ ◀

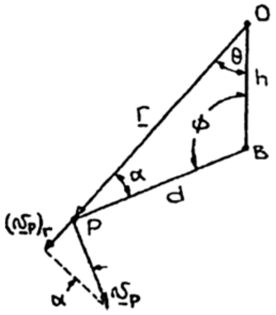
Alternative solution.

First note $$\alpha = 180^\circ - (\phi + \theta)$$

Now $$\mathbf{v} = \mathbf{v}_r + \mathbf{v}_\theta = \dot{r}\mathbf{e}_r + r\dot{\theta}\mathbf{e}_\theta$$

With B as the origin

$$v_P = d\dot{\phi} \qquad (d = \text{constant} \Rightarrow \dot{d} = 0)$$



With O as the origin $(v_P)_r = \dot{r}$

where $(v_P)_r = v_P \sin\alpha$

Then $\dot{r} = d\dot{\phi}\sin\alpha$

Now $\dfrac{h}{\sin\alpha} = \dfrac{d}{\sin\theta}$

or $d\sin\alpha = h\sin\theta$

substituting $\dot{r} = h\dot{\phi}\sin\theta$ Q.E.D.

PROBLEM 11.179

The three-dimensional motion of a particle is defined by the relations $R = A(1-e^{-t}), \theta = 2\pi t,$ and $z = B(1-e^{-t})$. Determine the magnitudes of the velocity and acceleration when (*a*) $t = 0$, (*b*) $t = \infty$.

SOLUTION

$$R = A(1-e^{-t}) \qquad \theta = 2\pi t \qquad z = B(1-e^{-t})$$

$$\dot{R} = Ae^{-t} \qquad \dot{\theta} = 2\pi \qquad \dot{z} = Be^{-t}$$

$$\ddot{R} = -Ae^{-t} \qquad \ddot{\theta} = 0 \qquad \ddot{z} = -Be^{-t}$$

Velocity (Eq. 11.49)

$$\mathbf{v} = \dot{R}\mathbf{e}_R + R\dot{\theta}\mathbf{e}_\theta + \dot{z}\mathbf{k}$$

$$\mathbf{v} = Ae^{-t}\mathbf{e}_R + 2\pi A(1-e^{-t})\mathbf{e}_\theta + Be^{-t}\mathbf{k}$$

(*a*) When $t = 0$: $e^{-t} = e^0 = 1$; $\mathbf{v} = A\mathbf{e}_R + B\mathbf{k}$ $\qquad v = \sqrt{A^2 + B^2}$ ◀

(*b*) When $t = \infty$: $e^{-t} = e^{-\infty} = 0$ $\quad \mathbf{v} = 2\pi A\mathbf{e}_\theta$ $\qquad v = 2\pi A$ ◀

Acceleration (Eq. 11.50)

$$\mathbf{a} = (\ddot{R} - R\dot{\theta}^1)\mathbf{e}_R + (R\ddot{\theta} + 2\dot{R}\dot{\theta})\mathbf{e}_\theta + \ddot{z}\,\mathbf{k}$$

$$= [-Ae^{-t} - A(1-e^{-t})4\pi^2]\mathbf{e}_R + [0 + 2Ae^{-t}(2\pi)]\mathbf{e}_\theta - Be^{-t}\mathbf{k}$$

(*a*) When $t = 0$: $e^{-t} = e^0 = 1$

$$\mathbf{a} = -A\mathbf{e}_R + 4\pi A\mathbf{e}_\theta - B\,\mathbf{k}$$

$$a = \sqrt{A^2 + (4\pi A)^2 + B^2} \qquad a = \sqrt{(1+16\pi^2)A^2 + B^2}$$ ◀

(*b*) When $t = \infty$: $e^{-t} = e^{-\infty} = 0$

$$\mathbf{a} = -4\pi^2 A\mathbf{e}_R \qquad a = 4\pi^2 A$$ ◀

PROBLEM 11.180*

For the conic helix of Problem 11.95, determine the angle that the osculating plane forms with the *y* axis.

PROBLEM 11.95 The three-dimensional motion of a particle is defined by the position vector $\mathbf{r} = (Rt\cos\omega_n t)\mathbf{i} + ct\mathbf{j} + (Rt\sin\omega_n t)\mathbf{k}$. Determine the magnitudes of the velocity and acceleration of the particle. (The space curve described by the particle is a conic helix.)

SOLUTION

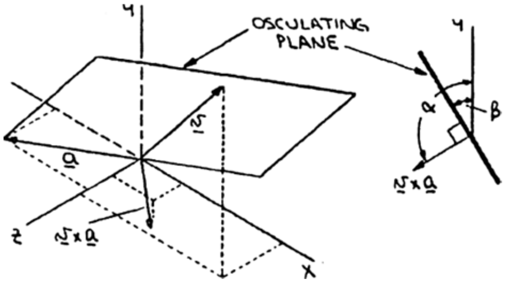
First note that the vectors **v** and **a** lie in the osculating plane.

Now $$\mathbf{r} = (Rt\cos\omega_n t)\mathbf{i} + ct\mathbf{j} + (Rt\sin\omega_n t)\mathbf{k}$$

Then $$\mathbf{v} = \frac{dr}{dt} = R(\cos\omega_n t - \omega_n t\sin\omega_n t)\mathbf{i} + c\mathbf{j} + R(\sin\omega_n t + \omega_n t\cos\omega_n t)\mathbf{k}$$

and $$\begin{aligned}\mathbf{a} &= \frac{dv}{dt}\\ &= R\left(-\omega_n\sin\omega_n t - \omega_n\sin\omega_n t - \omega_n^2 t\cos\omega_n t\right)\mathbf{i}\\ &\quad + R\left(\omega_n\cos\omega_n t + \omega_n\cos\omega_n t - \omega_n^2 t\sin\omega_n t\right)\mathbf{k}\\ &= \omega_n R[-(2\sin\omega_n t + \omega_n t\cos\omega_n t)\mathbf{i} + (2\cos\omega_n t - \omega_n t\sin\omega_n t)\mathbf{k}]\end{aligned}$$

It then follows that the vector $(\mathbf{v}\times\mathbf{a})$ is perpendicular to the osculating plane.



$$(\mathbf{v}\times\mathbf{a}) = \omega_n R\begin{vmatrix}\mathbf{i} & \mathbf{j} & \mathbf{k}\\ R(\cos\omega_n t - \omega_n t\sin\omega_n t) & c & R(\sin\omega_n t + \omega_n t\cos\omega_n t)\\ -(2\sin\omega_n t + \omega_n t\cos\omega_n t) & 0 & (2\cos\omega_n t - \omega_n t\sin\omega_n t)\end{vmatrix}$$

$$\begin{aligned}&= \omega_n R\{c(2\cos\omega_n t - \omega_n t\sin\omega_n t)\mathbf{i} + R[-(\sin\omega_n t + \omega_n t\cos\omega_n t)(2\sin\omega_n t + \omega_n t\cos\omega_n t)\\ &\quad - (\cos\omega_n t - \omega_n t\sin\omega_n t)(2\cos\omega_n t - \omega_n t\sin\omega_n t)]\mathbf{j} + c(2\sin\omega_n t + \omega_n t\cos\omega_n t)\mathbf{k}\\ &= \omega_n R\left[c(2\cos\omega_n t - \omega_n t\sin\omega_n t)\mathbf{i} - R\left(2 + \omega_n^2 t^2\right)\mathbf{j} + c(2\sin\omega_n t + \omega_n t\cos\omega_n t)\mathbf{k}\right]\end{aligned}$$

PROBLEM 11.180* (Continued)

The angle α formed by the vector $(\mathbf{v}\times\mathbf{a})$ and the y axis is found from

$$\cos\alpha = \frac{(\mathbf{v}\times\mathbf{a})\cdot\mathbf{j}}{|(\mathbf{v}\times\mathbf{a})||\mathbf{j}|}$$

Where $$|\mathbf{j}| = 1$$

$$(\mathbf{v}\times\mathbf{a})\cdot\mathbf{j} = -\omega_n R^2\left(2+\omega_n^2 t^2\right)$$

$$|(\mathbf{v}\times\mathbf{a})| = \omega_n R\left[c^2(2\cos\omega_n t - \omega_n t\sin\omega_n t)^2 + R^2\left(2+\omega_n^2 t^2\right)^2 + c^2(2\sin\omega_n t + \omega_n t\cos\omega_n t)^2\right]^{1/2}$$

$$= \omega_n R\left[c^2\left(4+\omega_n^2 t^2\right) + R^2\left(2+\omega_n^2 t^2\right)^2\right]^{1/2}$$

Then $$\cos\alpha = \frac{-\omega_n R^2\left(2+\omega_n^2 t^2\right)}{\omega_n R\left[c^2\left(4+\omega_n^2 t^2\right) + R^2\left(2+\omega_n^2 t^2\right)^2\right]^{1/2}}$$

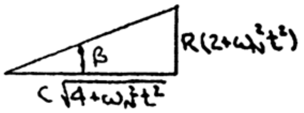
$$= \frac{-R\left(2+\omega_n^2 t^2\right)}{\left[c^2\left(4+\omega_n^2 t^2\right) + R^2\left(2+\omega_n^2 t^2\right)^2\right]^{1/2}}$$

The angle β that the osculating plane forms with y axis (see the above diagram) is equal to

$$\beta = \alpha - 90°$$

Then $$\cos\alpha = \cos(\beta + 90°) = -\sin\beta$$

$$-\sin\beta = \frac{-R\left(2+\omega_n^2 t^2\right)}{\left[c^2\left(4+\omega_n^2 t^2\right) + R^2\left(2+\omega_n^2 t^2\right)^2\right]^{1/2}}$$



Then $$\tan\beta = \frac{R\left(2+\omega_n^2 t^2\right)}{c\sqrt{4+\omega_n^2 t^2}}$$

or $$\beta = \tan^{-1}\left[\frac{R\left(2+\omega_n^2 t^2\right)}{c\sqrt{4+\omega_n^2 t^2}}\right] \blacktriangleleft$$

PROBLEM 11.181*

Determine the direction of the binormal of the path described by the particle of Problem 11.96 when (*a*) $t = 0$, (*b*) $t = \pi/2$ s.

SOLUTION

Given:
$$\mathbf{r} = (At\cos t)\mathbf{i} + \left(A\sqrt{t^2+1}\right)\mathbf{j} + (Bt\sin t)\mathbf{k}$$

$$r - \text{ft}, \quad t - \text{s}; \quad A = 3, \quad B - 1$$

First note that $\mathbf{e}_b$ is given by

$$\mathbf{e}_b = \frac{\mathbf{v}\times\mathbf{a}}{|\mathbf{v}\times\mathbf{a}|}$$

Now
$$\mathbf{r} = (3t\cos t)\mathbf{i} + \left(3\sqrt{t^2+1}\right)\mathbf{j} + (t\sin t)\mathbf{k}$$

Then
$$\mathbf{v} = \frac{d\mathbf{r}}{dt}$$
$$= 3(\cos t - t\sin t)\mathbf{i} + \frac{3t}{\sqrt{t^2+1}}\mathbf{j} + (\sin t + t\cos t)\mathbf{k}$$

and
$$\mathbf{a} = \frac{d\mathbf{v}}{dt} = 3(-\sin t - \sin t - t\cos t)\mathbf{i} + 3\frac{\sqrt{t^2+1} - t\left(\frac{t}{\sqrt{t^2+1}}\right)}{t^2+1}\mathbf{j}$$
$$+ (\cos t + \cos t - t\sin t)\mathbf{k}$$
$$= -3(2\sin t + t\cos t)\mathbf{i} + \frac{3}{(t^2+1)^{3/2}}\mathbf{j} + (2\cos t - t\sin t)\mathbf{k}$$

(*a*) At $t = 0$:
$$\mathbf{v} = (3 \text{ ft/s})\mathbf{i}$$
$$\mathbf{a} = (3 \text{ ft/s}^2)\mathbf{j} + (2 \text{ ft/s}^2)\mathbf{k}$$

Then
$$\mathbf{v}\times\mathbf{a} = 3\mathbf{i}\times(3\mathbf{j} + 2\mathbf{k})$$
$$= 3(-2\mathbf{j} + 3\mathbf{k})$$

and
$$|\mathbf{v}\times\mathbf{a}| = 3\sqrt{(-2)^2 + (3)^2} = 3\sqrt{13}$$

Then
$$\mathbf{e}_b = \frac{3(-2\mathbf{j} + 3\mathbf{k})}{3\sqrt{13}} = \frac{1}{\sqrt{13}}(-2\mathbf{j} + 3\mathbf{k})$$

$$\cos\theta_x = 0 \qquad \cos\theta_y = -\frac{2}{\sqrt{13}} \qquad \cos\theta_z = \frac{3}{\sqrt{13}}$$

or
$$\theta_x = 90° \qquad \theta_y = 123.7° \qquad \theta_z = 33.7°$$ ◀

(*b*) At $t = \frac{\pi}{2}$ s:

$$\mathbf{v} = -\left(\frac{3\pi}{2}\ \text{ft/s}\right)\mathbf{i} + \left(\frac{3\pi}{\sqrt{\pi^2+4}}\ \text{ft/s}\right)\mathbf{j} + (1\ \text{ft/s})\mathbf{k}$$

$$\mathbf{a} = -(6\ \text{ft/s}^2)\mathbf{i} + \left[\frac{24}{(\pi^2+4)^{3/2}}\ \text{ft/s}^2\right]\mathbf{j} - \left(\frac{\pi}{2}\ \text{ft/s}^2\right)\mathbf{k}$$

Then

$$\mathbf{v}\times\mathbf{a} = \begin{vmatrix} \mathbf{i} & \mathbf{j} & \mathbf{k} \\ -\frac{3\pi}{2} & \frac{3\pi}{(\pi^2+4)^{1/2}} & 1 \\ -6 & \frac{24}{(\pi^2+4)^{3/2}} & -\frac{\pi}{2} \end{vmatrix}$$

$$= -\left[\frac{3\pi^2}{2(\pi^2+4)^{1/2}} + \frac{24}{(\pi^2+4)^{3/2}}\right]\mathbf{i} - \left(6 + \frac{3\pi^2}{4}\right)\mathbf{j}$$

$$+\left[-\frac{36\pi}{(\pi^2+4)^{3/2}} + \frac{18\pi}{(\pi^2+4)^{1/2}}\right]\mathbf{k}$$

$$= -4.43984\mathbf{i} - 13.40220\mathbf{j} + 12.99459\mathbf{k}$$

and

$$|\mathbf{v}\times\mathbf{a}| = [(-4.43984)^2 + (-13.40220)^2 + (12.99459)^2]^{1/2}$$

$$= 19.18829$$

Then

$$\mathbf{e}_b = \frac{1}{19.1829}(-4.43984\mathbf{i} - 13.40220\mathbf{j} + 12.99459\mathbf{k})$$

$$\cos\theta_x = -\frac{4.43984}{19.18829} \quad \cos\theta_y = -\frac{13.40220}{19.18829} \quad \cos\theta_z = \frac{12.99459}{19.18829}$$

or $\theta_x = 103.4°$ $\theta_y = 134.3°$ $\theta_z = 47.4°$ ◀

PROBLEM 11.182

The motion of a particle is defined by the relation $x = 2t^3 - 15t^2 + 24t + 4$, where x and t are expressed in meters and seconds, respectively. Determine (*a*) when the velocity is zero, (*b*) the position and the total distance traveled when the acceleration is zero.

SOLUTION

$$x = 2t^3 - 15t^2 + 24t + 4$$

so $$v = \frac{dx}{dt} = 6t^2 - 30t + 24$$

$$a = \frac{dv}{dt} = 12t - 30$$

(*a*) Times when $v = 0$. $\quad 0 = 6t^2 - 30t + 24 = 6\,(t^2 - 5t + 4)$

$$(t-4)(t-1) = 0$$

$t = 1.00\text{ s}, \quad t = 4.00\text{ s}$ ◀

(*b*) Position and distance traveled when $a = 0$.

$$a = 12t - 30 = 0 \qquad t = 2.5\text{ s}$$

so $$x_2 = 2(2.5)^3 - 15(2.5)^2 + 24(2.5) + 4$$

Final position $\quad x = 1.50\text{ m}$ ◀

For $\quad 0 \le t \le 1\text{ s}, \quad v > 0.$

For $\quad 1\text{ s} \le t \le 2.5\text{ s}, \quad v \le 0.$

At $\quad t = 0, \quad x_0 = 4\text{ m}.$

At $\quad t = 1\text{ s}, \quad x_1 = (2)(1)^3 - (15)(1)^2 + (24)(1) + 4 = 15\text{ m}$

Distance traveled over interval: $x_1 - x_0 = 11\text{ m}$

For $\quad 1\text{ s} \le t \le 2.5\text{ s}, \qquad v \le 0$

Distance traveled over interval

$$|x_2 - x_1| = |1.5 - 15| = 13.5\text{ m}$$

Total distance: $\quad d = 11 + 13.5 \quad\quad d = 24.5\text{ m}$ ◀

PROBLEM 11.183

A drag car starts from rest and starts down the racetrack with and acceleration defined by $a = 50 - 10\,t$, where a and t are in m/s^2 and s, respectively. After reaching a speed of 125 m/s, a parachute is deployed to help slow down the dragster. Knowing that this deceleration is defined by the relationship $a = -0.02v^2$, where v is the velocity in m/s, determine (*a*) the total time from the beginning of the race until the car slows back down to 10 m/s, (*b*) the total distance the car travels during this time.

SOLUTION

Given:

$$a_{1-2} = 50 - 10t \text{ m/s}^2 \text{ for } 0 \le v \le 125 \text{ m/s}$$

$$a_{2-3} = -0.02v^2 \text{ after } v = 125 \text{ m/s}$$

Find v(t) as car speeds up

$$a = \frac{dv}{dt} \Rightarrow dv = adt$$

$$\int_0^{v(t)} dv = \int_0^t (50 - 10t)dt$$

$$v(t) = 50t - 5t^2$$

Find time to reach v=125 m/s

Rearrange and solve for t:

$$125 = 50t - 5t^2$$

$$t_2^2 - 10t_2 + 25 = 0$$

$$(t_2 - 5)^2 = 0$$

$$t_2 = 5 \text{ s}$$

Find distance to reach-125 m/s:

$$dx = vdt$$

$$\int_0^{x_2} dx = \int_0^{t_2} (50t - 5t^2)dt$$

$$x_2 = 25t^2 - \frac{5}{3}t^3\Big|_0^5$$

$$x_2 = 416.7 \text{ m}$$

(a) Find total time to slow down 10 m/s:

$$a = \frac{dv}{dt} \Rightarrow dt = \frac{dv}{a}$$

$$\int_5^{t_3} dt = -50\int_{125}^{10} \frac{dv}{v^2}$$

$$t_3 - 5 = \frac{50}{v}\Big|_{125}^{10}$$

$t_3 = 9.6$ s ◀

PROBLEM 11.183 (Continued)

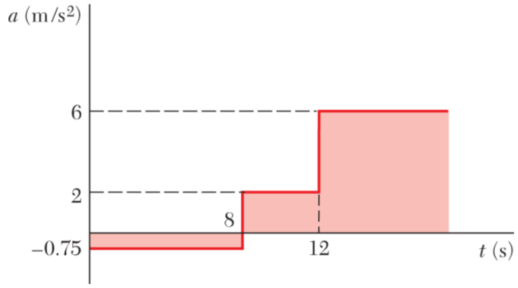
(b) Find total distance to slow down to 10 m/s

$$a\,dx = v\,dv \Rightarrow dx = \frac{v\,dv}{a}$$

$$\int_{x_2}^{x_3} dx = -50\int_{v_2}^{v_3} \frac{dv}{v}$$

$$x_3 - 416.7 = -50\ln v\Big|_{125}^{10}$$

$x_3 = 543.0$ m ◀

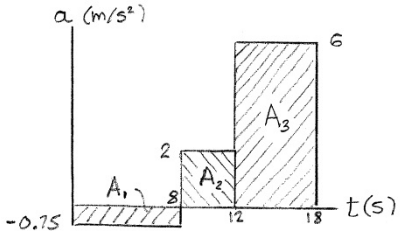


PROBLEM 11.184

A particle moves in a straight line with the acceleration shown in the figure. Knowing that the particle starts from the origin with $v_0 = -2$ m/s, (*a*) construct the $v-t$ and $x-t$ curves for $0 < t < 18$ s, (*b*) determine the position and the velocity of the particle and the total distance traveled when $t = 18$ s.

SOLUTION

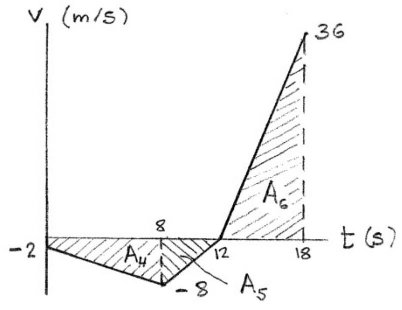
Compute areas under $a-t$ curve.



$$A_1 = (-0.75)(8) = -6 \text{ m/s}$$
$$A_2 = (2)(4) = 8 \text{ m/s}$$
$$A_3 = (6)(6) = 36 \text{ m/s}$$

$$v_0 = -2 \text{ m/s}$$
$$v_8 = v_0 + A_1 = -8 \text{ m/s}$$
$$v_{12} = v_8 + A_2 = 0$$
$$v_{18} = v_{12} + A_3$$

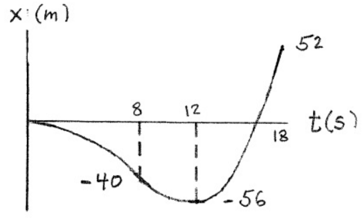
$v_{18} = 36$ m/s ◀



Sketch $v-t$ curve using straight line portions over the constant acceleration periods.

Compute areas under the $v-t$ curve.

$$A_4 = \frac{1}{2}(-2-8)(8) = -40 \text{ m}$$
$$A_5 = \frac{1}{2}(-8)(4) = -16 \text{ m}$$
$$A_6 = \frac{1}{2}(36)(6) = 108 \text{ m}$$

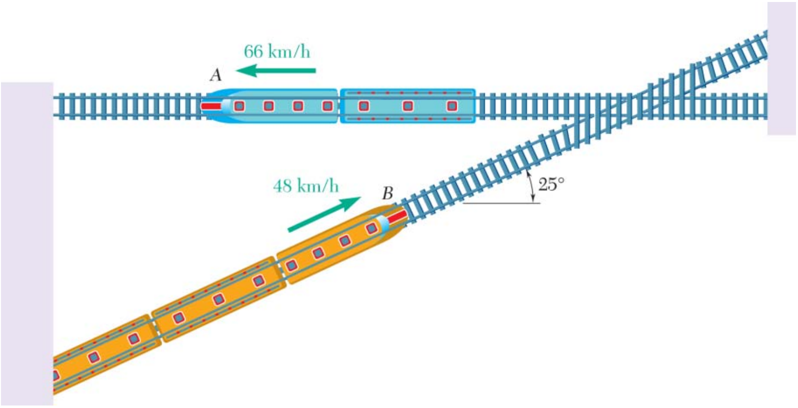


$$x_0 = 0$$
$$x_8 = x_0 + A_4 = -40 \text{ m}$$
$$x_{12} = x_8 + A_5 = -56 \text{ m}$$
$$x_{18} = x_{12} + A_6$$

$x_{18} = 52$ m ◀

Total distance traveled $= 56 + 108$

$d = 164$ m ◀



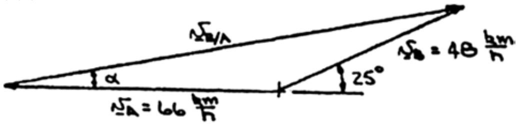
PROBLEM 11.185

The velocities of commuter trains *A* and *B* are as shown. Knowing that the speed of each train is constant and that *B* reaches the crossing 10 min after *A* passed through the same crossing, determine (*a*) the relative velocity of *B* with respect to *A*, (*b*) the distance between the fronts of the engines 3 min after *A* passed through the crossing.

SOLUTION

(*a*) We have $\mathbf{v}_B = \mathbf{v}_A + \mathbf{v}_{B/A}$

The graphical representation of this equation is then as shown.



$v_{B/A}$
α
$v_A = 66\ \frac{\text{km}}{\text{h}}$
25°
$v_B = 48\ \frac{\text{km}}{\text{h}}$

Then $$v_{B/A}^2 = 66^2 + 48^2 - 2(66)(48)\cos 155°$$

or $$v_{B/A} = 111.366 \text{ km/h}$$

and $$\frac{48}{\sin\alpha} = \frac{111.366}{\sin 155°}$$

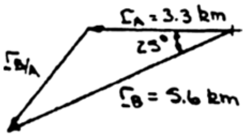
or $$\alpha = 10.50°$$

$$\mathbf{v}_{B/A} = 111.4 \text{ km/h} \measuredangle\ 10.50° \blacktriangleleft$$

(*b*) First note that

at $t = 3$ min, *A* is $(66 \text{ km/h})\left(\frac{3}{60}\right) = 3.3$ km west of the crossing.

at $t = 3$ min, *B* is $(48 \text{ km/h})\left(\frac{7}{60}\right) = 5.6$ km southwest of the crossing.

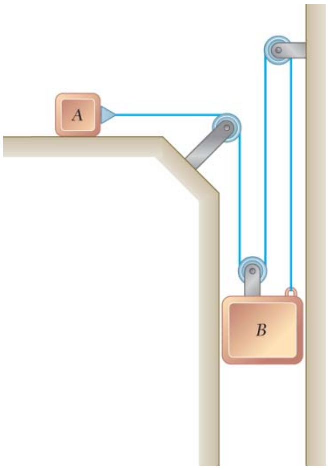


Now $$\mathbf{r}_B = \mathbf{r}_A + \mathbf{r}_{B/A}$$

Then at $t = 3$ min, we have

$$r_{B/A}^2 = 3.3^2 + 5.6^2 - 2(3.3)(5.6)\cos 25°$$

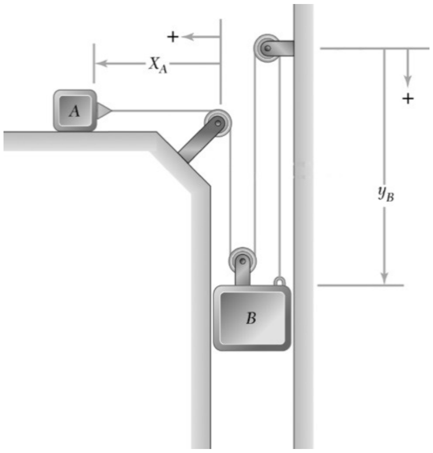
or $$r_{B/A} = 2.96 \text{ km} \blacktriangleleft$$



PROBLEM 11.186

Knowing that slider block *A* starts from rest and moves to the left with a constant acceleration of 1 ft/s^2, determine (*a*) the relative acceleration of block *A* with respect to block *B*, (*b*) the velocity of block *B* after 2 s.

SOLUTION



Given: $a_A = 1\text{ ft/s}^2$

From the diagram can write an expression for the length of the cable

$$L = x_A + 3y_B + \text{ constants}$$

Differentiate:

$$0 = \dot{x}_A + 3\dot{y}_B$$
$$0 = v_A + 3v_B$$

Differentiate again:

$$0 = a_A + 3a_B$$

Find the acceleration of B:

$$a_B = -\frac{1}{3}a_A$$
$$= -\frac{1}{3}\text{ft/s}^2$$

Write accelerations as vectors:

$$\mathbf{a}_A = -1\mathbf{i}\text{ ft/s}^2$$
$$\mathbf{a}_B = \frac{1}{3}\mathbf{j}\text{ ft/s}^2$$

(c) Find relative accelerations:

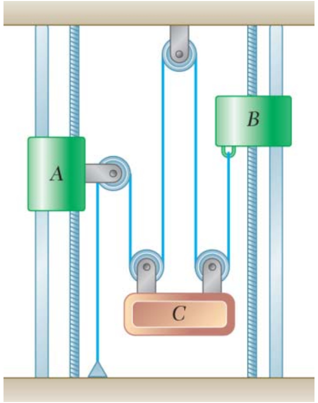
$$\mathbf{a}_{A/B} = \mathbf{a}_A - \mathbf{a}_B$$
$$= -1\mathbf{i} - \frac{1}{3}\mathbf{j}\text{ ft/s}^2$$

$$\text{a}_{A/B} = 1.054\text{ ft/s}^2 \swarrow 18.43° \blacktriangleleft$$

(d) Find speed at t=2 s:

$$v_B = (v_B)_o + a_Bt$$
$$= 0 + \frac{1}{3}(2)$$
$$= \frac{2}{3}\text{ m/s}$$

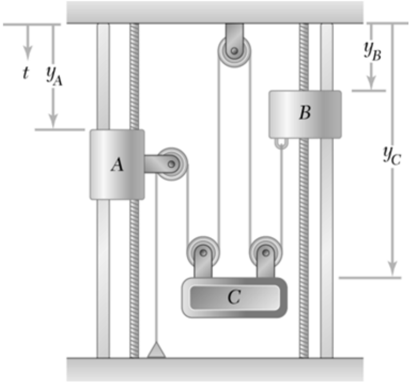
$$v_b = 0.667\text{ m/s}\uparrow \blacktriangleleft$$



PROBLEM 11.187

Collar A starts from rest at $t = 0$ and moves downward with a constant acceleration of 7 in./s^2. Collar B moves upward with a constant acceleration, and its initial velocity is 8 in./s. Knowing that collar B moves through 20 in. between $t = 0$ and $t = 2$ s, determine (*a*) the accelerations of collar B and block C, (*b*) the time at which the velocity of block C is zero, (*c*) the distance through which block C will have moved at that time.

SOLUTION



From the diagram

$$-y_A + (y_C - y_A) + 2y_C + (y_C - y_B) = \text{constant}$$

Then $$-2v_A - v_B + 4v_C = 0 \qquad (1)$$

and $$-2a_A - a_B + 4a_C = 0 \qquad (2)$$

Given: $$(v_A)_0 = 0$$

$$(\mathbf{a}_A) = 7\text{ in./s}^2\downarrow$$

$$(\mathbf{v}_B)_0 = 8\text{ in./s}\uparrow$$

$$\mathbf{a}_B = \text{constant}\uparrow$$

At $t = 2$ s $$y - (y_B)_0 = 20\text{ in.}\uparrow$$

(*a*) We have $$y_B = (y_B)_0 + (v_B)_0 t + \frac{1}{2}a_B t^2$$

At $t = 2$ s: $$-20\text{ in.} = (-8\text{ in./s})(2\text{ s}) + \frac{1}{2}a_B(2\text{ s})^2$$

$$a_B = -4\text{ in./s}^2 \quad \text{or} \quad \mathbf{a}_B = 2\text{ in./s}^2\uparrow \blacktriangleleft$$

Then, substituting into Eq. (2)

$$-2(7\text{ in./s}^2) - (-2\text{ in./s}^2) + 4a_C = 0$$

$$a_C = 3\text{ in./s}^2 \quad \text{or} \quad \mathbf{a}_C = 3\text{ in./s}^2\downarrow \blacktriangleleft$$

PROBLEM 11.187 (Continued)

(*b*) Substituting into Eq. (1) at $t = 0$

$$-2(0) - (-8 \text{ in./s}) + 4(v_C)_0 = 0 \quad \text{or} \quad (v_C)_0 = -2 \text{ in./s}$$

Now $$v_C = (v_C)_0 + a_C t$$

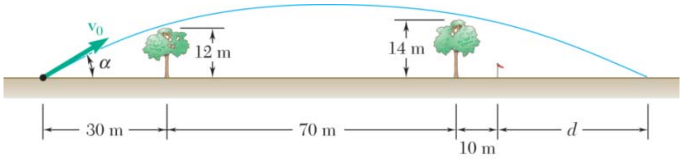
When $v_C = 0$: $$0 = (-2 \text{ in./s}) + (3 \text{ in./s}^2)t$$

or $$t = \frac{2}{3} \text{ s}$$ $t = 0.667$ s ◀

(*c*) We have $$y_C = (y_C)_0 + (v_C)_0 t + \frac{1}{2} a_C t^2$$

At $t = \frac{2}{3}$ s: $$y_C - (y_C)_0 = (-2 \text{ in./s})\left(\frac{2}{3} \text{ s}\right) + \frac{1}{2}(3 \text{ in./s}^2)\left(\frac{2}{3} \text{ s}\right)^2$$

$$= -0.667 \text{ in.}$$ or $\mathbf{y}_C - (\mathbf{y}_C)_0 = 0.667 \text{ in.} \uparrow$ ◀



PROBLEM 11.188

A golfer hits a ball with an initial velocity of magnitude v_0 at an angle α with the horizontal. Knowing that the ball must clear the tops of two trees and land as close as possible to the flag, determine v_0 and the distance d when the golfer uses (*a*) a six-iron with $\alpha = 31°$, (*b*) a five-iron with $\alpha = 27°$.

SOLUTION

The horizontal and vertical motions are

$$x = (v_0 \cos\alpha)t \qquad \text{or} \qquad v_0 = \frac{x}{t\cos\alpha} \tag{1}$$

$$y = (v_0 \sin\alpha)t - \frac{1}{2}gt^2 = x\tan\alpha - \frac{1}{2}gt^2$$

or

$$t^2 = \frac{2(x\tan\alpha - y)}{g} \tag{2}$$

At the landing Point C:

$$y_C = 0, \qquad t = \frac{2v_0 \sin\alpha}{g}$$

And

$$x_C = (v_0\cos\alpha)t = \frac{2v_0^2 \sin\alpha\cos\alpha}{g} \tag{3}$$

(*a*) $\alpha = 31°$

To clear tree A:

$$x_A = 30 \text{ m}, \; y_A = 12 \text{ m}$$

From (2),

$$t_A^2 = \frac{2(30\tan 31° - 12)}{9.81} = 1.22851 \text{ s}^2, \qquad t_A = 1.1084 \text{ s}$$

From (1),

$$(v_0)_A = \frac{30}{1.1084\cos 31°} = 31.58 \text{ m/s}$$

To clear tree B:

$$x_B = 100 \text{ m}, \quad y_B = 14 \text{ m}$$

From (2),

$$(t_B)^2 = \frac{2(100\tan 31° - 14)}{9.81} = 9.3957 \text{ s}^2, \qquad t_B = 3.0652 \text{ s}$$

From (1),

$$(v_0)_B = \frac{100}{3.0652\cos 31°} = 38.06 \text{ m/s}$$

The larger value governs,

$$v_0 = 38.06 \text{ m/s}$$

$v_0 = 38.1$ m/s ◀

From (3),

$$x_C = \frac{(2)(38.06)^2 \sin 31° \cos 31°}{9.81} = 130.38 \text{ m}$$

$$d = x_C - 110$$

$d = 20.4$ m ◀

PROBLEM 11.188 (Continued)

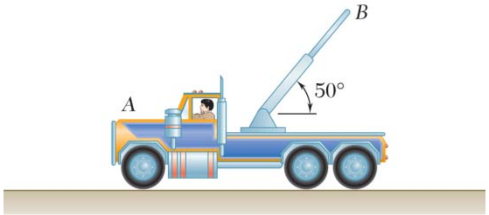
(*b*) $\alpha = 27°$

By a similar calculation, $t_A = 0.81846 \text{ s}, \quad (v_0)_A = 41.138 \text{ m/s},$

$t_B = 2.7447 \text{ s}, \quad (v_0)_B = 40.890 \text{ m/s},$

$v_0 = 41.138 \text{ m/s}$ $\qquad v_0 = 41.1 \text{ m/s}$ ◀

$x_C = 139.56 \text{ m},$ $\qquad d = 29.6 \text{ m}$ ◀



PROBLEM 11.189

As the truck shown begins to back up with a constant acceleration of 4 ft/s^2, the outer section B of its boom starts to retract with a constant acceleration of 1.6 ft/s^2 relative to the truck. Determine (*a*) the acceleration of section B, (*b*) the velocity of section B when $t = 2$ s.

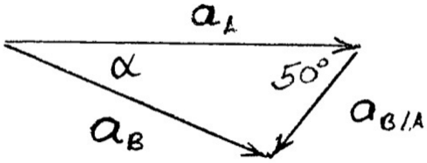
SOLUTION

For the truck, $\mathbf{a}_A = 4 \text{ ft/s}^2 \longrightarrow$

For the boom, $\mathbf{a}_{B/A} = 1.6 \text{ ft/s}^2 \swarrow 50°$

(*a*) $\mathbf{a}_B = \mathbf{a}_A + \mathbf{a}_{B/A}$

Sketch the vector addition.



By law of cosines:

$$a_B^2 = a_A^2 + a_{B/A}^2 - 2a_A a_{B/A} \cos 50°$$

$$= 4^2 + 1.6^2 - 2(4)(1.6) \cos 50°$$

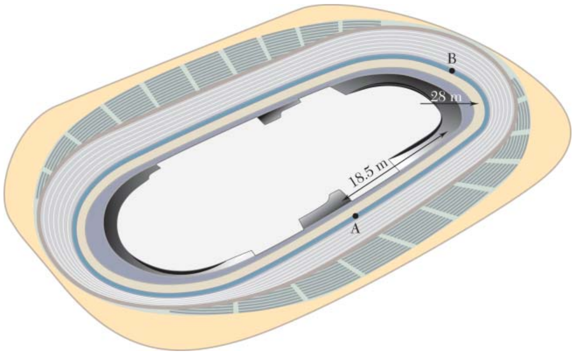
$$a_B = 3.214 \text{ ft/s}^2$$

Law of sines: $\sin\alpha = \dfrac{a_{B/A} \sin 50°}{a_B} = \dfrac{1.6 \sin 50°}{3.214} = 0.38131$

$\alpha = 22.4°$, $\mathbf{a}_B = 3.21 \text{ ft/s}^2 \searrow 22.4°$ ◀

(*b*) $\mathbf{v}_B = (v_B)_0 + a_B t = 0 + (3.214)(2)$

$\mathbf{v}_B = 6.43 \text{ ft/s}^2 \searrow 22.4°$ ◀



PROBLEM 11.190

A velodrome is a specially designed track used in bicycle racing. If a rider starts from rest and accelerates between points *A* and *B* according to the relationship $a_t = (11.46 - 0.01878\, v^2)$ m/s^2, what is her acceleration at point *B*?

SOLUTION

Given:

$$a_t = \left(11.46 \ - \ 0.01878v^2\right) \ \text{m/s}^2$$

Distance traveled between points A and B:

$$\begin{aligned} s_B &= 18.5 + r\theta \ \text{m} \\ &= 18.5 + 28 * \frac{\pi}{2} \ \text{m} \\ &= 62.48 \ \text{m} \end{aligned}$$

Find velocity at point B:

$$ads = vdv \Rightarrow ds = \frac{vdv}{a}$$

$$\int_0^{62.48} ds = \int_0^{v_B} \frac{vdv}{11.46 \ - \ 0.01878v^2}$$

$$62.48 = \frac{1}{-(2)0.01878} \ln\left(11.46 - 0.01878v^2\right)\Big|_0^{v_B}$$

$$-2.347 = \ln\left(11.46 - 0.01878v_B^2\right) - \ln\left(11.46\right)$$

$$e^{0.09211} = 11.46 - 0.01878v_B^2$$

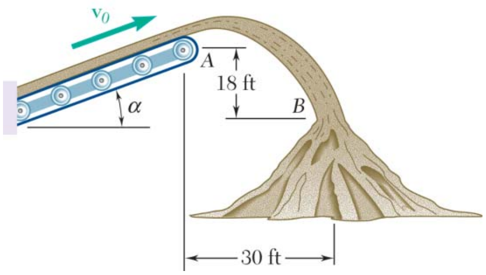
$$v_B = 23.49 \ \text{m/s}$$

Acceleration:

$$\mathbf{a}_B = a_t\mathbf{e}_t + \frac{v_B^2}{\rho}\mathbf{e}_n$$

$$= \left(11.46 \ - \ 0.01878v_B^2\right)\mathbf{e}_t + \frac{(23.49)^2}{28}\mathbf{e}_n$$

$$\mathbf{a}_B = 1.097\mathbf{e}_t + 19.71\mathbf{e}_n \ \text{m/s}^2 \blacktriangleleft$$



PROBLEM 11.191

Sand is discharged at A from a conveyor belt and falls onto the top of a stockpile at B. Knowing that the conveyor belt forms an angle $\alpha = 25°$ with the horizontal, determine (*a*) the speed v_0 of the belt, (*b*) the radius of curvature of the trajectory described by the sand at Point B.

SOLUTION

The motion is projectile motion. Place the origin at Point A. Then $x_0 = 0$ and $y_0 = 0$.
The coordinates of Point B are $x_B = 30$ ft and $y_B = -18$ ft.

Horizontal motion: $$v_x = v_0 \cos 25° \qquad (1)$$

$$x = v_0 t \cos 25° \qquad (2)$$

Vertical motion: $$v_y = v_0 \sin 25° - gt \qquad (3)$$

$$y = v_0 t \sin 25° - \frac{1}{2} g t^2 \qquad (4)$$

At Point B, Eq. (2) gives

$$v_0 t_B = \frac{x_B}{\cos 25°} = \frac{30}{\cos 25°} = 33.101 \text{ ft}$$

Substituting into Eq. (4),

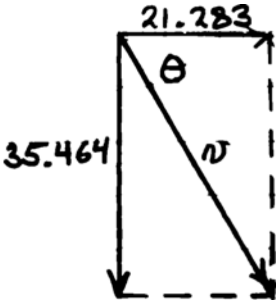
$$-18 = (33.101)(\sin 25°) - \frac{1}{2}(32.2) t_B^2$$

$$t_B = 1.40958 \text{ s}$$

(*a*) Speed of the belt. $$v_0 = \frac{v_0 t_B}{t_B} = \frac{33.101}{1.40958} = 23.483$$

$v_0 = 23.4$ ft/s ◀

Eqs. (1) and (3) give



$$v_x = 23.483 \cos 25° = 21.283 \text{ ft/s}$$

$$v_y = (23.483)\sin 25° - (32.2)(1.40958) = -35.464 \text{ ft/s}$$

$$\tan\theta \frac{-v_y}{v_x} = 1.66632 \qquad \theta = 59.03°$$

$$v = 41.36 \text{ ft/s}$$

PROBLEM 11.191 (Continued)

Components of acceleration.

$$\mathbf{a} = 32.2 \text{ ft/s}^2 \downarrow \qquad a_t = 32.2\sin\theta$$

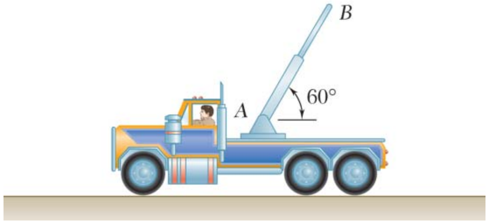
$$a_n = 32.2\cos\theta = 32.2\cos 59.03° = 16.57 \text{ ft/s}^2$$

(*b*) Radius of curvature at *B*.

$$a_n = \frac{v^2}{\rho}$$

$$\rho = \frac{v^2}{a_n} = \frac{(41.36)^2}{16.57}$$

$\rho = 103.2$ ft ◀



PROBLEM 11.192

The end Point B of a boom is originally 5 m from fixed Point A when the driver starts to retract the boom with a constant radial acceleration of $\ddot{r} = -1.0\text{ m/s}^2$ and lower it with a constant angular acceleration $\ddot{\theta} = -0.5\text{ rad/s}^2$. At $t = 2$ s, determine (*a*) the velocity of Point B, (*b*) the acceleration of Point B, (*c*) the radius of curvature of the path.

SOLUTION

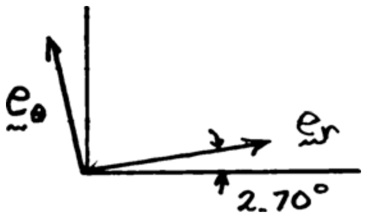
Radial motion.
$$r_0 = 5\text{ m}, \quad \dot{r}_0 = 0, \quad \ddot{r} = -1.0\text{ m/s}^2$$
$$r = r_0 + \dot{r}_0 t + \frac{1}{2}\ddot{r}t^2 = 5 + 0 - 0.5t^2$$
$$\dot{r} = \dot{r}_0 + \ddot{r}t = 0 - 1.0t$$

At $t = 2$ s,
$$r = 5 - (0.5)(2)^2 = 3\text{ m}$$
$$\dot{r} = (-1.0)(2) = -2\text{ m/s}$$

Angular motion.
$$\theta_0 = 60° = \frac{\pi}{3}\text{rad}, \quad \dot{\theta}_0 = 0, \quad \ddot{\theta} = -0.5\text{ rad/s}^2$$
$$\theta = \theta_0 + \dot{\theta}_0 + \frac{1}{2}\ddot{\theta}t^2 = \frac{\pi}{3} + 0 - 0.25t^2$$
$$\dot{\theta} = \dot{\theta}_0 + \ddot{\theta}t = 0 - 0.5t$$

At $t = 2$ s,
$$\theta = \frac{\pi}{3} + 0 - (0.25)(2)^2 = 0.047198\text{ rad} = 2.70°$$
$$\dot{\theta} = -(0.5)(2) = -1.0\text{ rad/s}$$

Unit vectors $\mathbf{e}_r$ and $\mathbf{e}_\theta$.



(*a*) Velocity of Point B at $t = 2$ s.
$$\mathbf{v}_B = \dot{r}\mathbf{e}_r + r\dot{\theta}\mathbf{e}_\theta$$
$$= -(2\text{ m/s})\mathbf{e}_r + (3\text{ m})(-1.0\text{ rad/s})\mathbf{e}_\theta$$

$$\mathbf{v}_B = (-2.00\text{ m/s})\mathbf{e}_r + (-3.00\text{ m/s})\mathbf{e}_\theta \blacktriangleleft$$

$$\tan\alpha = \frac{v_\theta}{v_r} = \frac{-3.0}{-2.0} = 1.5 \qquad \alpha = 56.31°$$
$$v = \sqrt{v_r^2 + v_\theta^2} = \sqrt{(-2)^2 + (-3)^2} = 3.6055\text{ m/s}$$

PROBLEM 11.192 (Continued)

Direction of velocity.

$$\mathbf{e}_t = \frac{\mathbf{v}}{v} = \frac{-2\mathbf{e}_r - 3\mathbf{e}_\theta}{3.6055} = -0.55470\mathbf{e}_r - 0.83205\mathbf{e}_\theta$$

$$\theta + \alpha = 2.70 + 56.31° = 59.01°$$

$$\mathbf{v}_B = 3.61 \text{ m/s} \measuredangle 59.0° \blacktriangleleft$$

(*b*) Acceleration of Point *B* at *t* = 2 s.

$$\mathbf{a}_B = (\ddot{r} - r\dot{\theta}^2)\mathbf{e}_r + (r\ddot{\theta} + 2\dot{r}\dot{\theta})\mathbf{e}_\theta$$

$$= [-1.0 - (3)(-1)^2]\mathbf{e}_r + [(3)(-0.5) + (2)(-1.0)(-0.5)]\mathbf{e}_\theta$$

$$\mathbf{a}_B = (-4.00 \text{ m/s}^2)\mathbf{e}_r + (2.50 \text{ m/s}^2)\mathbf{e}_\theta \blacktriangleleft$$

$$\tan\beta = \frac{a_\theta}{a_r} = \frac{2.50}{-4.00} = -0.625 \qquad \beta = -32.00°$$

$$a = \sqrt{a_r^2 + a_\theta^2} = \sqrt{(-4)^2 + (2.5)^2} = 4.7170 \text{ m/s}^2$$

$$\theta + \beta = 2.70° - 32.00° = -29.30°$$

$$\mathbf{a}_B = 4.72 \text{ m/s}^2 \measuredangle 29.3° \blacktriangleleft$$

Tangential component: $\mathbf{a}_t = (\mathbf{a} \cdot \mathbf{e}_t)\mathbf{e}_t$

$$\mathbf{a}_t = (-4\mathbf{e}_r + 2.5\mathbf{e}_\theta) \cdot (-0.55470\mathbf{e}_r - 0.83205\mathbf{e}_\theta)\mathbf{e}_t$$

$$= [(-4)(-0.55470) + (2.5)(-0.83205)]\mathbf{e}_t$$

$$= (0.138675 \text{ m/s}^2)\mathbf{e}_t = 0.1389 \text{ m/s}^2 \measuredangle 59.0°$$

Normal component: $\mathbf{a}_n = \mathbf{a} - \mathbf{a}_t$

$$\mathbf{a}_n = -4\mathbf{e}_r + 2.5\mathbf{e}_\theta - (0.138675)(-0.55470\mathbf{e}_r - 0.83205\mathbf{e}_\theta)$$

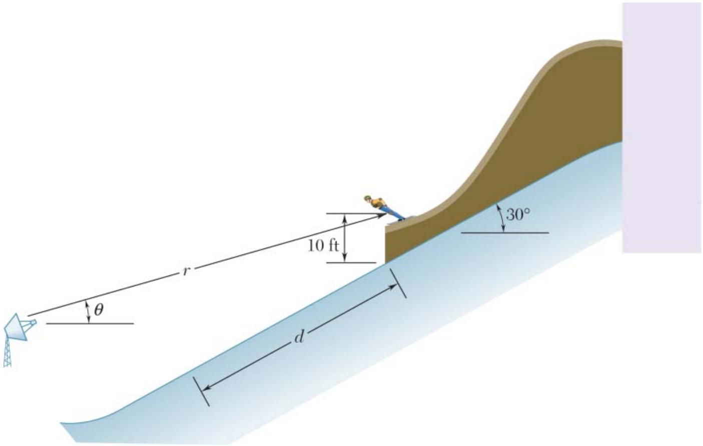
$$= (-3.9231 \text{ m/s}^2)\mathbf{e}_r + (2.6154 \text{ m/s}^2)\mathbf{e}_\theta$$

$$a_n = \sqrt{(3.9231)^2 + (2.6154)^2} = 4.7149 \text{ m/s}^2$$

(*c*) Radius of curvature of the path.

$$a_n = \frac{v^2}{\rho}$$

$$\rho = \frac{v^2}{a_n} = \frac{(3.6055 \text{ m/s})^2}{4.7149 \text{ m/s}} \qquad \rho = 2.76 \text{ m} \blacktriangleleft$$



PROBLEM 11.193

A telemetry system is used to quantify kinematic values of a ski jumper immediately before she leaves the ramp. According to the system $r = 500$ ft, $\dot{r} = -105$ ft/s, $\ddot{r} = -10$ ft/s^2, $\theta = 25°$, $\dot{\theta} = 0.07$ rad/s, $\ddot{\theta} = 0.06$ rad/s^2. Determine (*a*) the velocity of the skier immediately before she leaves the jump, (*b*) the acceleration of the skier at this instant, (*c*) the distance of the jump *d* neglecting lift and air resistance.

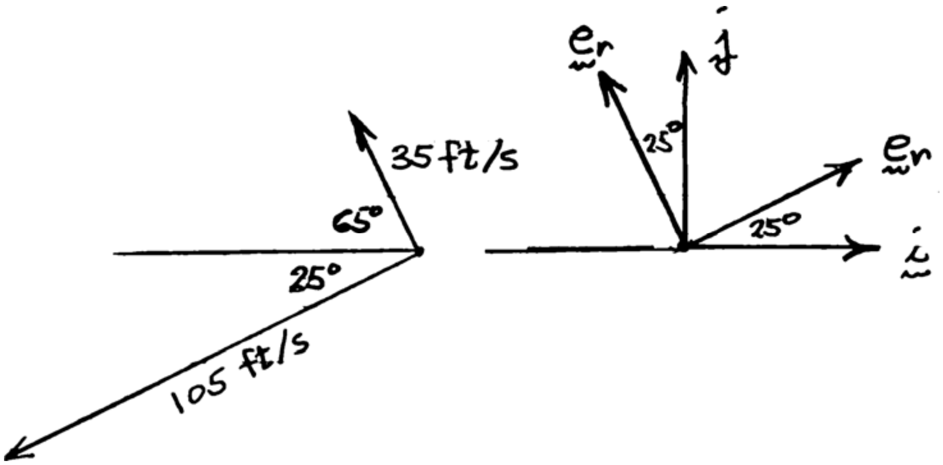
SOLUTION

(*a*) Velocity of the skier. $(r = 500 \text{ ft}, \quad \theta = 25°)$

$$\mathbf{v} = v_r\mathbf{e}_r + v_\theta\mathbf{e}_\theta = \dot{r}\mathbf{e}_r + r\dot{\theta}\mathbf{e}_\theta$$
$$= (-105 \text{ ft/s})\mathbf{e}_r + (500 \text{ ft})(0.07 \text{ rad/s})\mathbf{e}_\theta$$

$$\mathbf{v} = (-105 \text{ ft/s})\mathbf{e}_r + (35 \text{ ft/s})\mathbf{e}_\theta \quad ◀$$

Direction of velocity:



$$\mathbf{v} = (-105\cos 25° - 35\cos 65°)\mathbf{i} + (35\sin 65° - 105\sin 25°)\mathbf{j}$$
$$= (-109.95 \text{ ft/s})\mathbf{i} + (-12.654 \text{ ft/s})\mathbf{j}$$

$$\tan\alpha = \frac{v_y}{v_x} = \frac{-12.654}{-109.95} \qquad \alpha = 6.565°$$

$$v = \sqrt{(105)^2 + (35)^2} = 110.68 \text{ ft/s}$$

$$v = 110.7 \text{ ft/s} \measuredangle 6.57° \quad ◀$$

PROBLEM 11.193 (Continued)

(*b*) Acceleration of the skier.

$$\mathbf{a} = a_r\mathbf{e}_r + a_\theta\mathbf{e}_\theta = (\ddot{r} - r\dot{\theta}^2)\mathbf{e}_r + (r\ddot{\theta} + 2\dot{r}\dot{\theta})\mathbf{e}_\theta$$
$$a_r = -10 - (500)(0.07)^2 = -12.45 \text{ ft/s}^2$$
$$a_\theta = (500)(0.06) + (2)(-105)(0.07) = 15.30 \text{ ft/s}^2$$

$\mathbf{a} = (-12.45 \text{ ft/s}^2)\mathbf{e}_r + (15.30 \text{ ft/s}^2)\mathbf{e}_\theta$ ◀

$$\mathbf{a} = (-12.45)(\mathbf{i}\cos 25° + \mathbf{j}\sin 25°) + (15.30)(-\mathbf{i}\cos 65° + \mathbf{j}\sin 65°)$$
$$= (-17.750 \text{ ft/s}^2)\mathbf{i} + (8.6049 \text{ ft/s}^2)\mathbf{j}$$
$$\tan\beta = \frac{a_y}{a_x} = \frac{8.6049}{-17.750} \qquad \beta = -25.9°$$
$$a = \sqrt{(12.45)^2 + (15.30)^2} = 19.725 \text{ ft/s}^2$$

$a = 19.73 \text{ ft/s}^2$ ↙ 25.9° ◀

(*c*) Distance of the jump *d*.

Projectile motion. Place the origin of the *xy*-coordinate system at the end of the ramp with the *x*-coordinate horizontal and positive to the left and the *y*-coordinate vertical and positive downward.

Horizontal motion: (Uniform motion)

$$x_0 = 0$$
$$\dot{x}_0 = 109.95 \text{ ft/s} \qquad \text{(from Part } a\text{)}$$
$$x = x_0 + \dot{x}_0 t = 109.95t$$

Vertical motion: (Uniformly accelerated motion)

$$y_0 = 0$$
$$\dot{y}_0 = 12.654 \text{ ft/s} \qquad \text{(from Part } a\text{)}$$
$$\ddot{y} = 32.2 \text{ ft/s}^2$$
$$y = y_0 + \dot{y}_0 t + \frac{1}{2}\ddot{y}t^2 = 12.654t - 16.1t^2$$

At the landing point,

$$x = d\cos 30° \qquad (1)$$
$$y = 10 + d\sin 30° \quad \text{or} \quad y - 10 = d\sin 30° \qquad (2)$$

Multiply Eq. (1) by sin 30° and Eq. (2) by cos 30° and subtract

$$x\sin 30° - (y - 10)\cos 30° = 0$$

$$(109.95t)\sin 30° - (12.654t + 16.1t^2 - 10)\cos 30° = 0$$

$$-13.943t^2 + 44.016t + 8.6603 = 0$$

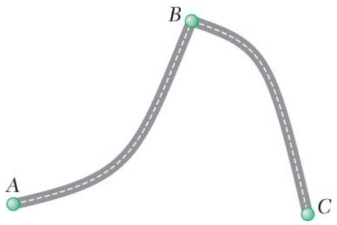
$$t = -0.1858 \text{ s} \quad \text{and} \quad 3.3427 \text{ s}$$

Reject the negative root.

$$x = (109.95 \text{ ft/s})(3.3427 \text{ s}) = 367.53 \text{ ft}$$

$$d = \frac{x}{\cos 30°}$$

$d = 424$ ft ◀



PROBLEM 11.CQ1

A bus travels the 100 miles between *A* and *B* at 50 mi/h and then another 100 miles between *B* and *C* at 70 mi/h. The average speed of the bus for the entire 200-mile trip is:

(*a*) more than 60 mi/h

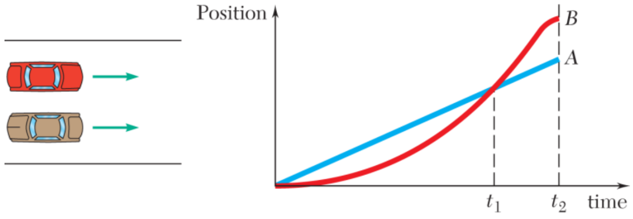
(*b*) equal to 60 mi/h

(*c*) less than 60 mi/h

SOLUTION

The time required for the bus to travel from *A* to *B* is 2 h and from *B* to *C* is 100/70 = 1.43 h, so the total time is 3.43 h and the average speed is 200/3.43 = 58 mph.

Answer: (*c*) ◀



PROBLEM 11CQ2

Two cars A and B race each other down a straight road. The position of each car as a function of time is shown. Which of the following statements are true (more than one answer can be correct)?

(*a*) At time t_2 both cars have traveled the same distance

(*b*) At time t_1 both cars have the same speed

(*c*) Both cars have the same speed at some time $t < t_1$

(*d*) Both cars have the same acceleration at some time $t < t_1$

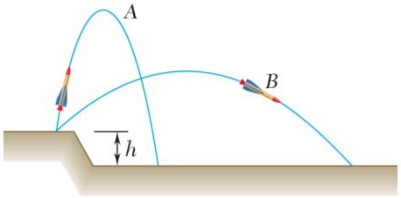
(*e*) Both cars have the same acceleration at some time $t_1 < t < t_2$

SOLUTION

The speed is the slope of the curve, so answer c) is true.

The acceleration is the second derivative of the position. Since A's position increases linearly the second derivative will always be zero. The second derivative of curve B is zero at the pont of inflection which occurs between t_1 and t_2.

Answers: (*c*) and (*e*) ◀



PROBLEM 11.CQ3

Two model rockets are fired simultaneously from a ledge and follow the trajectories shown. Neglecting air resistance, which of the rockets will hit the ground first?

(*a*) *A*

(*b*) *B*

(*c*) They hit at the same time.

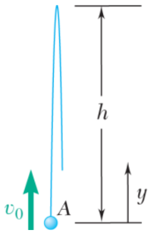
(*d*) The answer depends on *h*.

SOLUTION

The motion in the vertical direction depends on the initial velocity in the *y*-direction. Since *A* has a larger initial velocity in this direction it will take longer to hit the ground.

Answer: (*b*) ◀

PROBLEM 11.CQ4



Ball *A* is thrown straight up. Which of the following statements about the ball are true at the highest point in its path?

(*a*) The velocity and acceleration are both zero.

(*b*) The velocity is zero, but the acceleration is not zero.

(*c*) The velocity is not zero, but the acceleration is zero.

(*d*) Neither the velocity nor the acceleration are zero.

SOLUTION

At the highest point the velocity is zero. The acceleration is never zero.

Answer: (*b*) ◀

PROBLEM 11.CQ5

Ball *A* is thrown straight up with an initial speed v_0 and reaches a maximum elevation *h* before falling back down. When *A* reaches its maximum elevation, a second ball is thrown straight upward with the same initial speed v_0. At what height, *y*, will the balls cross paths?

(*a*) $y = h$

(*b*) $y > h/2$

(*c*) $y = h/2$

(*d*) $y < h/2$

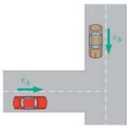
(*e*) $y = 0$

SOLUTION

When the ball is thrown up in the air it will be constantly slowing down until it reaches its apex, at which point it will have a speed of zero. So, the time it will take to travel the last half of the distance to the apex will be longer than the time it takes for the first half. This same argument can be made for the ball falling from the maximum elevation. It will be speeding up, so the first half of the distance will take longer than the second half. Therefore, the balls should cross above the half-way point.

Answer: (*b*) ◀

PROBLEM 11.CQ6

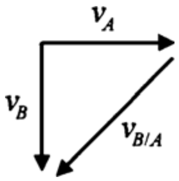


Two cars are approaching an intersection at constant speeds as shown. What velocity will car *B* appear to have to an observer in car *A*?

(*a*) → (*b*) ↘ (*c*) ↖ (*d*) ↗ (*e*) ↙

SOLUTION

Since $\mathbf{v}_B = \mathbf{v}_A + \mathbf{v}_{B/A}$ we can draw the vector triangle and see



$\mathbf{v}_B = \mathbf{v}_A + \mathbf{v}_{B/A}$

Answer: (*e*) ◀

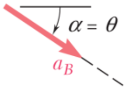
PROBLEM 11.CQ7

Blocks *A* and *B* are released from rest in the positions shown. Neglecting friction between all surfaces, which figure below best indicates the direction α of the acceleration of block *B*?

a.

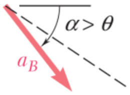
b.

c.



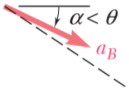
$\alpha = \theta$
a_B

d.

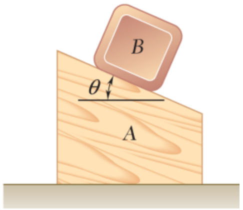


$\alpha > \theta$
a_B

e.

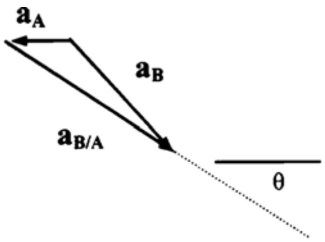


$\alpha < \theta$
a_B



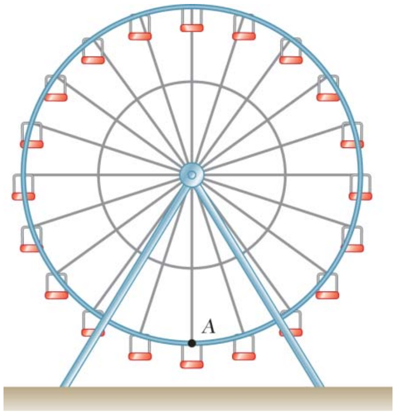
SOLUTION

Since $\vec{a}_B = \vec{a}_A + \vec{a}_{B/A}$ we get



$\mathbf{a_A}$
$\mathbf{a_B}$
$\mathbf{a_{B/A}}$
θ

Answer: (*d*) ◀



PROBLEM 11.CQ8

The Ferris wheel is rotating with a constant angular velocity ω. What is the direction of the acceleration of Point A?

(*a*) →

(*b*) ↑

(*c*) ↓

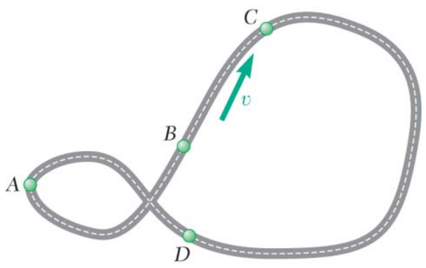
(*d*) ←

(*e*) The acceleration is zero.

SOLUTION

The tangential acceleration is zero since the speed is constant, so there will only be normal acceleration pointed upwards.

Answer: (*b*) ◀



PROBLEM 11.CQ9

A racecar travels around the track shown at a constant speed. At which point will the racecar have the largest acceleration?

(*a*) A

(*b*) B

(*c*) C

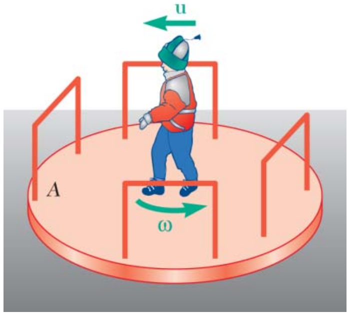
(*d*) The acceleration will be zero at all the points.

SOLUTION

The tangential acceleration is zero since the speed is constant, so there will only be normal acceleration. The normal acceleration will be maximum where the radius of curvature is a minimum that is at Point A.

Answer: (*a*) ◀

PROBLEM 11.CQ10



A child walks across merry-go-round *A* with a constant speed *u* relative to *A*. The merry-go-round undergoes fixed axis rotation about its center with a constant angular velocity ω counterclockwise. When the child is at the center of *A*, as shown, what is the direction of his acceleration when viewed from above.

(*a*) →

(*b*) ←

(*c*) ↑

(*d*) ↓

(*e*) The acceleration is zero.

SOLUTION

Polar coordinates are most natural for this problem, that is,

$$\vec{a} = (\ddot{r} - r\dot{\theta}^2)\mathbf{e}_r + (r\ddot{\theta} + 2\dot{r}\dot{\theta})\mathbf{e}_\theta \qquad (1)$$

From the information given, we know $\ddot{r} = 0,\ \ddot{\theta} = 0,\ r = 0,\ \dot{\theta} = \omega,\ \dot{r} = -u.$ When we substitute these values into (1), we will only have a term in the $-\theta$ direction.

Answer: (*d*) ◀

CHAPTER 12

PROBLEM 12.1

Astronauts who landed on the moon during the Apollo 15, 16 and 17 missions brought back a large collection of rocks to the earth. Knowing the rocks weighed 139 lb when they were on the moon, determine (*a*) the weight of the rocks on the earth, (*b*) the mass of the rocks in slugs. The acceleration due to gravity on the moon is 5.30 ft/s^2.

SOLUTION

Since the rocks weighed 139 lb on the moon, their mass is

$$m = \frac{W_{\text{moon}}}{g_{\text{moon}}} = \frac{139 \text{ lb}}{5.30 \text{ ft/s}^2} = 26.226 \text{ lb} \cdot \text{s}^2/\text{ft}$$

(*a*) On the earth, $W_{\text{earth}} = mg_{\text{earth}}$

$$w = (26.226 \text{ lb} \cdot \text{s}^2/\text{ft})(32.2 \text{ ft/s}^2) \qquad w = 844 \text{ lb} \blacktriangleleft$$

(*b*) Since $1 \text{ slug} = 1 \text{ lb} \cdot \text{s}^2/\text{ft}$, $\qquad m = 26.2 \text{ slugs} \blacktriangleleft$

PROBLEM 12.2

The value of g at any latitude ϕ may be obtained from the formula

$$g = 32.09(1 + 0.0053\ \sin^2\phi)\ \text{ft/s}^2$$

which takes into account the effect of the rotation of the earth, as well as the fact that the earth is not truly spherical. Knowing that the weight of a silver bar has been officially designated as 5 lb, determine to four significant figures (*a*) the mass is slugs, (*b*) the weight in pounds at the latitudes of 0°, 45°, and 60°.

SOLUTION

$$g = 32.09(1 + 0.0053\ \sin^2\phi)\ \text{ft/s}^2$$

$\phi = 0°$: $\quad g = 32.09\ \text{ft/s}^2$

$\phi = 45°$: $\quad g = 32.175\ \text{ft/s}^2$

$\phi = 90°$: $\quad g = 32.26\ \text{ft/s}^2$

(a) Mass at all latitudes: $\quad m = \dfrac{5.00\ \text{lb}}{32.175\ \text{ft/s}^2}$ $\quad m = 0.1554\ \text{lb}\cdot\text{s}^2/\text{ft}$ ◀

(*b*) Weight: $\quad W = mg$

$\phi = 0°$: $\quad W = (0.1554\ \text{lb}\cdot\text{s}^2/\text{ft})(32.09\ \text{ft/s}^2) = 4.987\ \text{lb}$ ◀

$\phi = 45°$: $\quad W = (0.1554\ \text{lb}\cdot\text{s}^2/\text{ft})(32.175\ \text{ft/s}^2) = 5.000\ \text{lb}$ ◀

$\phi = 90°$: $\quad W = (0.1554\ \text{lb}\cdot\text{s}^2/\text{ft})(32.26\ \text{ft/s}^2) = 5.013\ \text{lb}$ ◀

PROBLEM 12.3

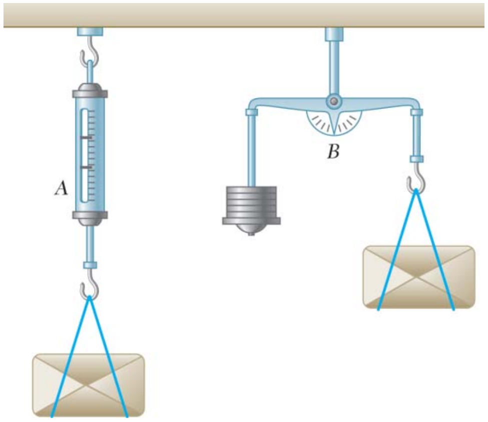
A 400-kg satellite has been placed in a circular orbit 1500 km above the surface of the earth. The acceleration of gravity at this elevation is 6.43 m/s^2. Determine the linear momentum of the satellite, knowing that its orbital speed is 25.6×10^3 km/h.

SOLUTION

Mass of satellite is independent of gravity: $m = 400$ kg

$$\begin{aligned} v &= 25.6\times10^3 \text{ km/h} \\ &= (25.6\times10^6 \text{ m/h})\left(\frac{1 \text{ h}}{3600 \text{ s}}\right) = 7.111\times10^3 \text{ m/s} \end{aligned}$$

$$L = mv = (400 \text{ kg})(7.111\times10^3 \text{ m/s}) \qquad L = 2.84\times10^6 \text{ kg}\cdot\text{m/s} \blacktriangleleft$$



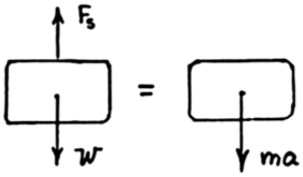
PROBLEM 12.4

A spring scale *A* and a lever scale *B* having equal lever arms are fastened to the roof of an elevator, and identical packages are attached to the scales as shown. Knowing that when the elevator moves downward with an acceleration of $1\ \text{m/s}^2$ the spring scale indicates a load of 60 N, determine (*a*) the weight of the packages, (*b*) the load indicated by the spring scale and the mass needed to balance the lever scale when the elevator moves upward with an acceleration of $1\ \text{m/s}^2$.

SOLUTION

Assume $$g = 9.81\ \text{m/s}^2$$

$$m = \frac{W}{g}$$



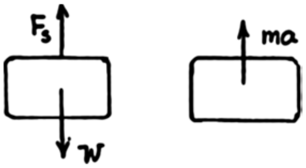
$$+\uparrow\ \Sigma F = ma:\quad F_s - W = -\frac{W}{g}a$$

$$W\left(1 - \frac{a}{g}\right) = F_s$$

or $$W = \frac{F_s}{1 - \frac{a}{g}} = \frac{60}{1 - \frac{1}{9.81}}$$

$$W = 66.8\ \text{N} \blacktriangleleft$$

(*b*)



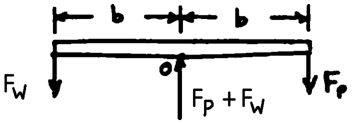
$$\Sigma F = ma:\quad F_s - W = \frac{W}{g}a$$

$$F_s = W\left(1 + \frac{a}{g}\right)$$

$$= 66.81\left(1 + \frac{1}{9.81}\right)$$

$$F_s = 73.6\ \text{N} \blacktriangleleft$$

For the balance system *B*,



$$\Sigma M_0 = 0:\quad bF_w - bF_p = 0$$

$$F_w = F_p$$

PROBLEM 12.4 (Continued)

But $$F_w = W_w\left(1+\frac{a}{g}\right)$$

and $$F_p = W_p\left(1+\frac{a}{g}\right)$$

so that $$W_w = W_p$$

and $$m_w = \frac{W_p}{g} = \frac{66.81}{9.81}$$

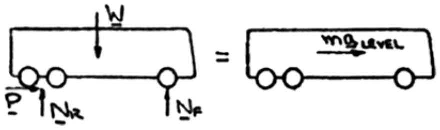
$m_w = 6.81\text{ kg}$ ◀

PROBLEM 12.5

In anticipation of a long 7° upgrade, a bus driver accelerates at a constant rate of 3 ft/s^2 while still on a level section of the highway. Knowing that the speed of the bus is 60 mi/h as it begins to climb the grade and that the driver does not change the setting of his throttle or shift gears, determine the distance traveled by the bus up the grade when its speed has decreased to 50 mi/h.

SOLUTION

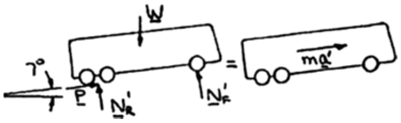
First consider when the bus is on the level section of the highway.



$$a_{\text{level}} = 3\text{ ft/s}^2$$

We have $\xrightarrow{+} \Sigma F_x = ma\text{:} \quad P = \dfrac{W}{g} a_{\text{level}}$

Now consider when the bus is on the upgrade.



We have $+\nearrow \Sigma F_x = ma\text{:} \quad P - W\sin 7° = \dfrac{W}{g} a'$

Substituting for P $\quad \dfrac{W}{g} a_{\text{level}} - W\sin 7° = \dfrac{W}{g} a'$

or

$$\begin{aligned} a' &= a_{\text{level}} - g\sin 7° \\ &= (3 - 32.2\sin 7°)\text{ ft/s}^2 \\ &= -0.92419\text{ ft/s}^2 \end{aligned}$$

For the uniformly decelerated motion

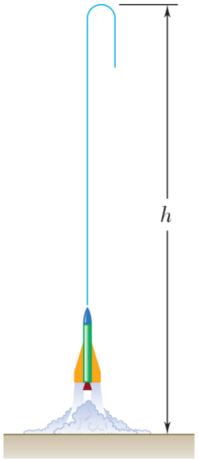
$$v^2 = (v_0)^2_{\text{upgrade}} + 2a'(x_{\text{upgrade}} - 0)$$

Noting that $60\text{ mi/h} = 88\text{ ft/s},$ then when $v = 50\text{ mi/h}\left(= \dfrac{5}{6} v_0\right),$ we have

$$\left(\frac{5}{6} \times 88\text{ ft/s}\right)^2 = (88\text{ ft/s})^2 + 2(-0.92419\text{ ft/s}^2)x_{\text{upgrade}}$$

or $\quad x_{\text{upgrade}} = 1280.16\text{ ft}$

or $\quad x_{\text{upgrade}} = 0.242\text{ mi}$ ◀



PROBLEM 12.6

A 0.2-lb model rocket is launched vertically from rest at time $t = 0$ with a constant thrust of 2 lb for one second and no thrust for $t > 1$ s. Neglecting air resistance and the decrease in mass of the rocket, determine (*a*) the maximum height *h* reached by the rocket, (*b*) the time required to reach this maximum height.

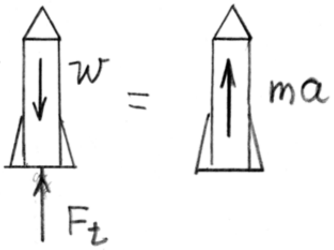
SOLUTION

Given: $W = 0.2$ lbs

For $0 \le t \le 1$ s $\quad F_t = 2$ lbs

For $t > 1$ s $\quad F_t = 0$ lbs

Free Body Diagram:



For the thrust phase, $0 \le t \le 1$ s: $+\!\uparrow \; \Sigma F = ma: \quad F_t - W = ma = \dfrac{W}{g}a$

$$a = g\left(\frac{F_t}{W} - 1\right) = (32.2)\left(\frac{2}{0.2} - 1\right) = 289.8 \text{ ft/s}^2$$

At $t = 1$ s: $\quad v = at = (289.8)(1) = 289.8$ ft/s

$$y = \frac{1}{2}at^2 = \frac{1}{2}(289.8)(1)^2 = 144.9 \text{ ft}$$

For free flight phase, $t > 1$ s: $\quad a = -g = -32.2$ ft/s

$$v = v_1 + a(t-1) = 289.8 + (-32.2)(t-1)$$

(*a*) At maximum height: $\quad v = 0, \quad t - 1 = \dfrac{289.8}{32.2} = 9.00 \text{ s}, \quad t = 10.00 \text{ s}$

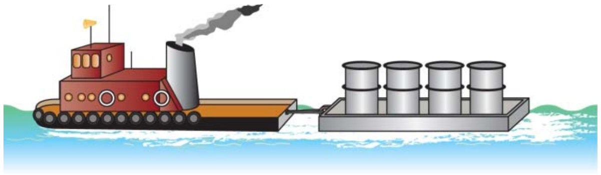
$$v^2 - v_1^2 = 2a(y - y_1) = -2g(y - y_1)$$

$$y - y_1 = -\frac{v^2 - v_1^2}{2g} = -\frac{0 - (289.8)^2}{(2)(32.2)} = 1304.1 \text{ ft}$$

$$y_{\max} = h = 1304.1 + 144.9$$

$h = 1449$ ft ◀

(*b*) Time to reach max height: $\quad t = 10.00$ s ◀



PROBLEM 12.7

A tugboat pulls a small barge through a harbor. The propeller thrust minus the drag produces a net thrust that varies linearly with speed. Knowing that the combined weight of the tug and barge is 3600 kN, determine (*a*) the time required to increase the speed from an initial value v_1 = 1.0 m/s to a final value v_2 = 2.5 m/s, (*b*) the distance traveled during this time interval.

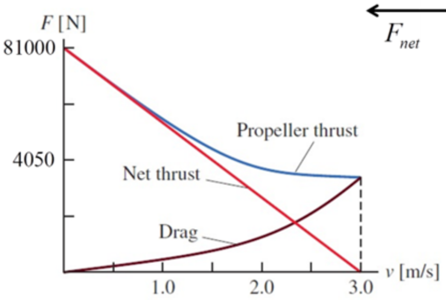
SOLUTION

Given:

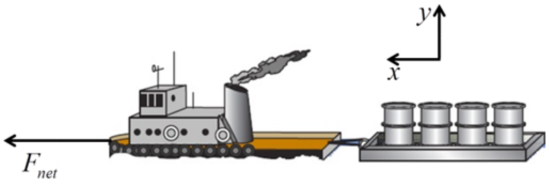
$$W = 3600 \text{ kN}$$

$$m = \frac{W}{g} \Rightarrow m = 366972.5 \text{ kg}$$

$$v_1 = 1.0 \text{ m/s}, \; v_2 = 2.5 \text{ m/s}$$



Free Body Diagram:



From Graph:

$$F_{net} = 81000 - \frac{81000}{3}v = 81000 - 27000v \text{ N}$$

From FBD:

$$\Sigma F_x = ma_x \Rightarrow \quad F_{net} = ma_x \Rightarrow a_x = \frac{F_{net}}{m}$$

$$a_x = \frac{81000 - 27000v}{m}$$

$$= \frac{27000}{m}(3 - v) \text{ m/s}^2$$

(*a*) From Kinematics:

$$a_x = \frac{dv}{dt} \Rightarrow dt = \frac{dv}{a_x}$$

$$\int_0^t dt = \frac{m}{27000}\int_{v_1}^{v_2} \frac{dv}{3 - v}$$

$$t = -\frac{m}{27000}\ln(3 - v)\Big|_1^{2.5}$$

$$t = 18.84 \text{ s} \blacktriangleleft$$

PROBLEM 12.7 (Continued)

(b) From Kinematics: $a_x dx = v dv \Rightarrow dx = \dfrac{v dv}{a_x}$

$$\int_0^x dx = \frac{m}{27000}\int_{v_1}^{v_2}\frac{v dv}{3-v}$$

$$x = \frac{m}{27000}\left(3 - v - 3\ln\left|3-v\right|\right)\Big|_1^{2.5}$$

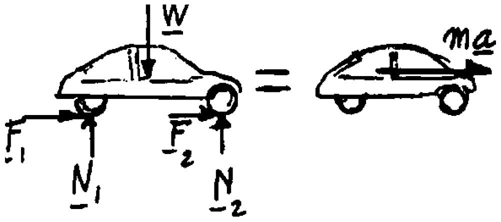
$x = 36.14$ m ◀

PROBLEM 12.8

Determine the maximum theoretical speed that may be achieved over a distance of 60 m by a car starting from rest, knowing that the coefficient of static friction is 0.80 between the tires and the pavement and that 60 percent of the weight of the car is distributed over its front wheels and 40 percent over its rear wheels. Assume (*a*) four-wheel drive, (*b*) front-wheel drive, (*c*) rear-wheel drive.

SOLUTION

(*a*) Four-wheel drive



$$+\uparrow \Sigma F_y = 0: \quad N_1 + N_2 - W = 0$$

$$F_1 + F_2 = \mu N_1 + \mu N_2$$
$$= \mu(N_1 + N_2) = \mu w$$

$$\xrightarrow{+} \Sigma F_x = ma: \quad F_1 + F_2 = ma$$

$$\mu w = ma$$

$$a = \frac{\mu W}{m} = \mu \frac{mg}{m} = \mu g = 0.80(9.81)$$

$$a = 7.848 \text{ m/s}^2$$

$$v^2 = 2ax = 2(7.848 \text{ m/s}^2)(60 \text{ m}) = 941.76 \text{ m}^2/\text{s}^2$$

$v = 30.69$ m/s $\qquad v = 110.5$ km/h ◀

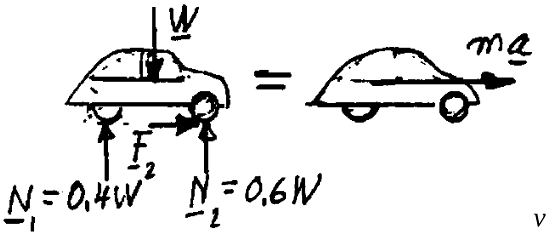
(*b*) Front-wheel drive

$$F_2 = ma$$

$$\mu(0.6\ W) = ma$$

$$a = \frac{0.6\mu W}{m} = \frac{0.6\mu mg}{m}$$
$$= 0.6\mu g = 0.6(0.80)(9.81)$$

$$a = 4.709 \text{ m/s}^2$$

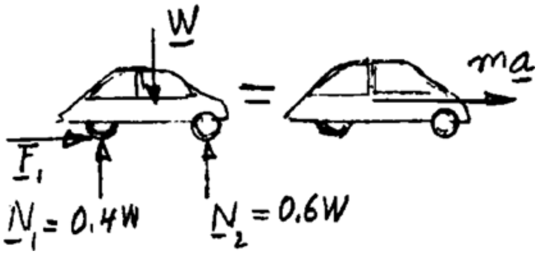


$$v^2 = 2ax = 2(4.709 \text{ m/s}^2)(60 \text{ m}) = 565.1 \text{ m}^2/\text{s}^2$$

$v = 23.77$ m/s $\qquad v = 85.6$ km/h ◀

PROBLEM 12.8 (Continued)

(*c*) Rear-wheel drive



$$F_1 = ma$$

$$\mu(0.4\ W) = ma$$

$$a = \frac{0.4\mu W}{m} = \frac{0.4\mu mg}{m}$$

$$= 0.4\mu g = 0.4(0.80)(9.81)$$

$$a = 3.139 \text{ m/s}^2$$

$$v^2 = 2ax = 2(3.139 \text{ m/s}^2)(60 \text{ m}) = 376.7 \text{ m}^2/\text{s}^2$$

$$v = 19.41 \text{ m/s} \qquad v = 69.9 \text{ km/h} \blacktriangleleft$$

PROBLEM 12.9

If an automobile's braking distance from 90 km/h is 45 m on level pavement, determine the automobile's braking distance from 90 km/h when it is (*a*) going up a 5° incline, (*b*) going down a 3-percent incline. Assume the braking force is independent of grade.

SOLUTION

Assume uniformly decelerated motion in all cases.

For braking on the level surface,

$$v_0 = 90 \text{ km/h} = 25 \text{ m/s}, \quad v_f = 0$$

$$x_f - x_0 = 45 \text{ m}$$

$$v_f^2 = v_0^2 + 2a(x_f - x_0)$$

$$a = \frac{v_f^2 - v_0^2}{2(x_f - x_0)} = \frac{0 - (25)^2}{(2)(45)} = -6.9444 \text{ m/s}^2$$

Braking force.

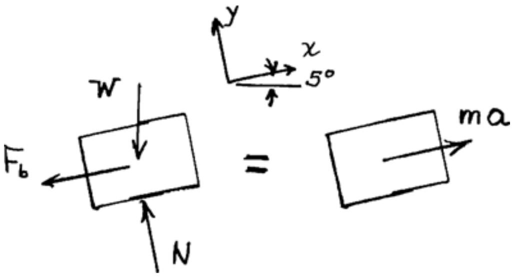
$$F_b = ma = \frac{W}{g}a = -\frac{6.944}{9.81}W = -0.70789W$$

(*a*) Going up a 5° incline.

$$\nearrow \Sigma F = ma$$

$$-F_b - W\sin 5° = \frac{W}{g}a$$

$$a = -\frac{F_b + W \sin 5°}{W}g = -(0.70789 + \sin 5°)(9.81) = -7.79944 \text{ m/s}^2$$

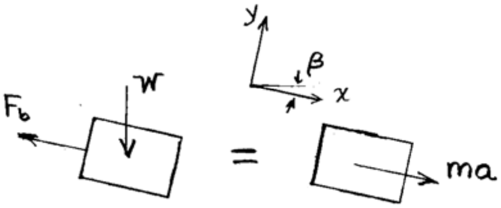


$$x_f - x_0 = \frac{v_f^2 - v_0^2}{2a} = \frac{0 - (25)^2}{(2)(-7.79944)}$$

$$x_f - x_0 = 40.1 \text{ m} \blacktriangleleft$$

PROBLEM 12.9 (Continued)

(*b*) Going down a 3 percent incline.



$$\tan\beta = \frac{3}{100} \qquad \beta = 1.71835°$$

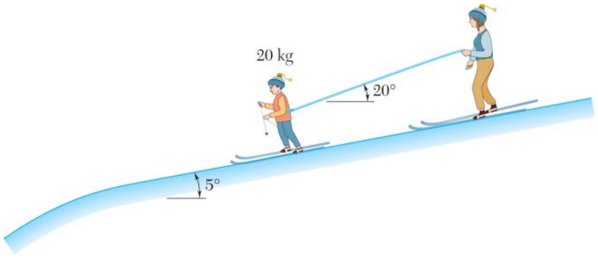
$$-F_b + W\sin\beta = \frac{W}{g}a$$

$$a = -(0.70789 - \sin\beta)(9.81)$$

$$= -6.65028 \text{ m/s}$$

$$x_f = x_0 = \frac{0-(25)^2}{(2)(-6.65028)}$$

$x_f - x_0 = 47.0$ m ◀

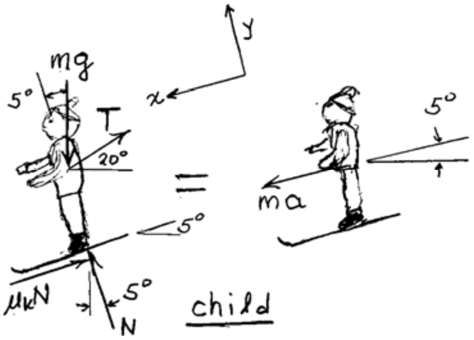


PROBLEM 12.10

A mother and her child are skiing together, and the mother is holding the end of a rope tied to the child's waist. They are moving at a speed of 7.2 km/h on a gently sloping portion of the ski slope when the mother observes that they are approaching a steep descent. She pulls on the rope with an average force of 7 N. Knowing the coefficient of friction between the child and the ground is 0.1 and the angle of the rope does not change, determine (*a*) the time required for the child's speed to be cut in half, (*b*) the distance traveled in this time.

SOLUTION

Draw free body diagram of child.



$\Sigma \mathbf{F} = m\mathbf{a}$:

x-direction: $mg\sin 5° - \mu_k N - T\cos 15° = ma$

y-direction: $N - mg\cos 5° + T\sin 15° = 0$

From y-direction,

$$N = mg\cos 5° - T\sin 15° = (20\text{ kg})(9.81\text{ m/s}^2)\cos 5° - (7\text{ N})\sin 15° = 193.64\text{ N}$$

From x-direction,

$$a = g\sin 5° - \frac{\mu_k N}{m} - \frac{T\cos 15°}{m}$$

$$= (9.81\text{ m/s}^2)\sin 5° - \frac{(0.1)(193.64\text{ N})}{20\text{ kg}} - \frac{(7\text{ N})\cos 15°}{20\text{ kg}}$$

$$= -0.45128\text{ m/s}^2 \qquad \text{(in } x\text{-direction.)}$$

$$v_0 = 7.2\text{ km/h} = 2\text{ m/s} \qquad x_0 = 0$$

$$v_f = \frac{1}{2}v_0 = 1\text{ m/s}$$

$$v_f = v_0 + at \qquad t = \frac{v_f - v_0}{a} = \frac{-1\text{ m/s}}{-0.45128\text{ m/s}^2} = 2.2159\text{ s}$$

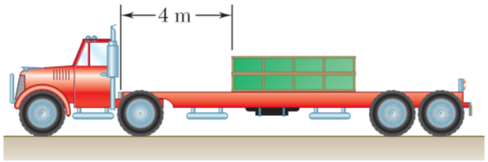
(*a*) *Time elapsed.* $t = 2.22\text{ s}$ ◀

(*b*) *Corresponding distance.*

$$x = x_0 + v_0 t + \frac{1}{2}at^2$$

$$= 0 + (2\text{ m/s})(2.2159\text{ s}) + \frac{1}{2}(-0.45128\text{ m/s}^2)(2.2159\text{ s})^2$$

$x = 3.32\text{ m}$ ◀

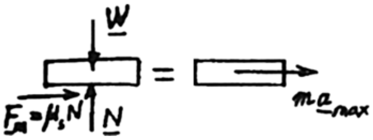


PROBLEM 12.11

The coefficients of friction between the load and the flat-bed trailer shown are $\mu_s = 0.40$ and $\mu_k = 0.30$. Knowing that the speed of the rig is 72 km/h, determine the shortest distance in which the rig can be brought to a stop if the load is not to shift.

SOLUTION

Load: We assume that sliding of load relative to trailer is impending:



$$F = F_m$$
$$= \mu_s N$$

Deceleration of load is same as deceleration of trailer, which is the maximum allowable deceleration $\mathbf{a}_{\max}$.

$$+\!\uparrow \Sigma F_y = 0: \quad N - W = 0 \quad N = W$$

$$F_m = \mu_s N = 0.40\,W$$

$$\xrightarrow{+} \Sigma F_x = ma: \quad F_m = ma_{\max}$$

$$0.40\ W = \frac{W}{g} a_{\max} \qquad a_{\max} = 3.924 \text{ m/s}^2$$

$$\mathbf{a}_{\max} = 3.92 \text{ m/s}^2 \longrightarrow$$

Uniformly accelerated motion.

$$v^2 = v_0^2 + 2ax \quad \text{with} \quad v = 0 \qquad\qquad v_0 = 72 \text{ km/h} = 20 \text{ m/s}$$

$$a = -a_{\max} = 3.924 \text{ m/s}^2$$

$$0 = (20)^2 + 2(-3.924)x \qquad\qquad x = 51.0 \text{ m} \blacktriangleleft$$

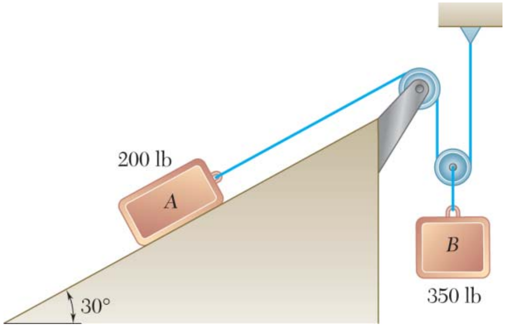
$\xrightarrow{+} \Sigma F_x = ma$: $30 \times 10^3 + P = (25 \times 10^3)a$

$P = (25 \times 10^3)(1.333) - 30 \times 10^3$

Coupling force: $\qquad P = +3332 \text{ N} \qquad P = 3.33 \text{ kN (tension)}$ ◀



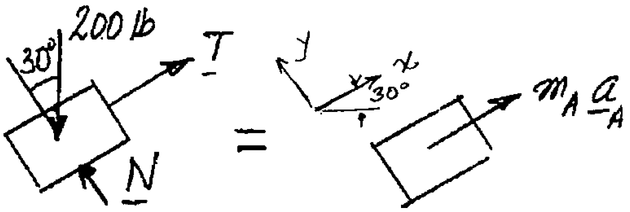
PROBLEM 12.13

The two blocks shown are originally at rest. Neglecting the masses of the pulleys and the effect of friction in the pulleys and between block *A* and the incline, determine (*a*) the acceleration of each block, (*b*) the tension in the cable.

SOLUTION

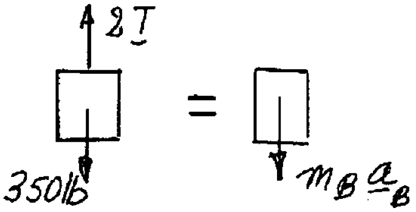
(*a*) We note that $a_B = \frac{1}{2}a_A$.

Block *A*



$$\nearrow\!+\ \Sigma F_x = m_A a_A: \quad T - (200\text{ lb})\sin 30° = \frac{200}{32.2}a_A \tag{1}$$

Block *B*



$$+\!\downarrow \Sigma F_y = m_B a_B: \quad 350\text{ lb} - 2T = \frac{350}{32.2}\left(\frac{1}{2}a_A\right) \tag{2}$$

(*a*) Multiply Eq. (1) by 2 and add Eq. (2) in order to eliminate *T*:

$$-2(200)\sin 30° + 350 = 2\frac{200}{32.2}a_A + \frac{350}{32.2}\left(\frac{1}{2}a_A\right)$$

$$150 = \frac{575}{32.2}a_A$$

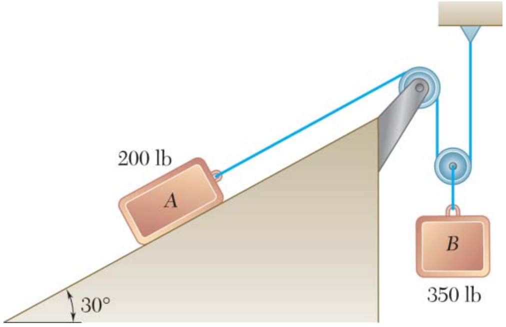
$\mathbf{a}_A = 8.40\text{ ft/s}^2 \measuredangle 30°$ ◀

$$a_B = \frac{1}{2}a_A = \frac{1}{2}(8.40\text{ ft/s}^2),$$

$\mathbf{a}_B = 4.20\text{ ft/s}^2\downarrow$ ◀

(*b*) From Eq. (1), $T - (200)\sin 30° = \dfrac{200}{32.2}(8.40)$

$T = 152.2\text{ lb}$ ◀



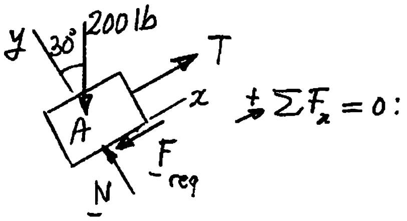
PROBLEM 12.14

Solve Problem 12.13, assuming that the coefficients of friction between block *A* and the incline are $\mu_s = 0.25$ and $\mu_k = 0.20$.

PROBLEM 12.13 The two blocks shown are originally at rest. Neglecting the masses of the pulleys and the effect of friction in the pulleys and between block *A* and the incline, determine (*a*) the acceleration of each block, (*b*) the tension in the cable.

SOLUTION

We first determine whether the blocks move by computing the friction force required to maintain block A in equilibrium. *T* = 175 lb. When *B* in equilibrium,



$$+\nearrow \Sigma F_x = 0: \quad 175 - 200\sin 30° - F_{\text{req}} = 0$$

$$F_{\text{req}} = 75.0 \text{ lb}$$

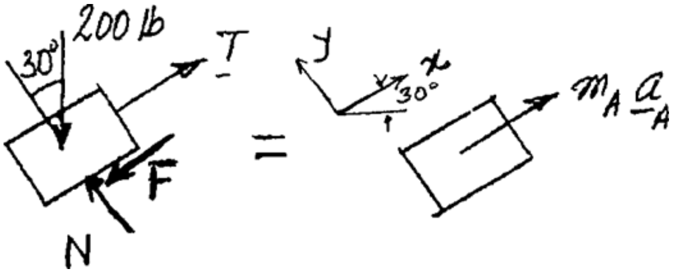
$$+\nwarrow \Sigma F_y = 0: \quad N - 200\cos 30° = 0 \quad N = 173.2 \text{ lb}$$

$$F_M = \mu_s N = 0.25(173.2 \text{ lb}) = 43.3 \text{ lb}$$

Since $F_{\text{req}} > \mathbf{F}_m$, blocks will move (*A* up and *B* down).

We note that $a_B = \frac{1}{2} a_A$.

Block *A*

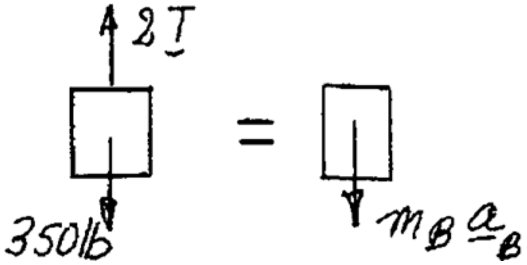


$$F = \mu_k N = (0.20)(173.2) = 34.64 \text{ lb.}$$

$$+\nearrow \Sigma F_x = m_A 0_A: \quad -200\sin 30° - 34.64 + T = \frac{200}{32.2} a_A \qquad (1)$$

PROBLEM 12.14 (Continued)

Block *B*



$$+\downarrow \Sigma F_y = m_B a_B: \quad 350\,\text{lb} - 2T = \frac{350}{32.2}\left(\frac{1}{2}a_A\right) \qquad (2)$$

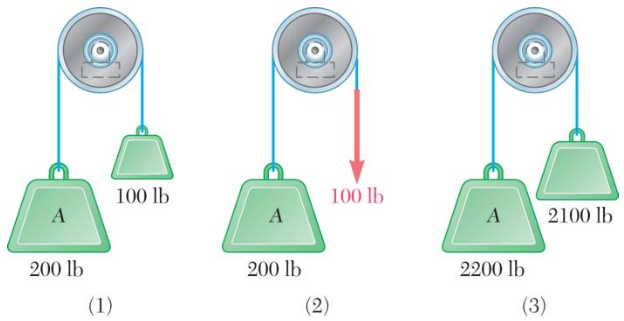
(*a*) Multiply Eq. (1) by 2 and add Eq. (2) in order to eliminate *T*:

$$-2(200)\sin 30^\circ - 2(34.64) + 350 = 2\frac{200}{32.2}a_A + \frac{350}{32.2}\left(\frac{1}{2}a_A\right)$$

$81.32 = \frac{575}{32.2}a_A$ $\qquad$ $a_A = 4.55\ \text{ft/s}^2 \measuredangle 30^\circ$ ◀

$a_B = \frac{1}{2}a_A = \frac{1}{2}(4.52\ \text{ft/s}^2),$ $\qquad$ $a_B = 2.28\ \text{ft/s}^2 \downarrow$ ◀

(*b*) From Eq. (1), $T - (200)\sin 30^\circ - 34.64 = \frac{200}{32.2}(4.52)$ $\qquad$ $T = 162.9$ lb ◀



PROBLEM 12.15

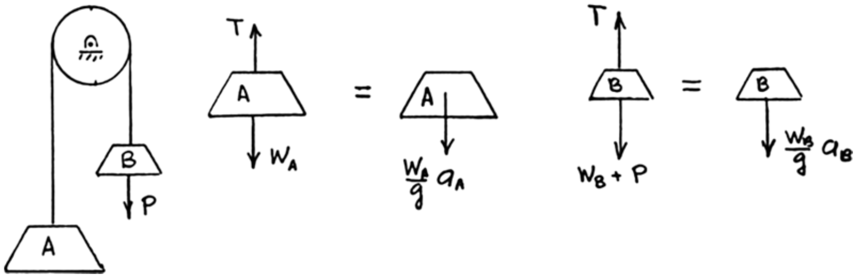
Each of the systems shown is initially at rest. Neglecting axle friction and the masses of the pulleys, determine for each system (*a*) the acceleration of block *A*, (*b*) the velocity of block *A* after it has moved through 10 ft, (*c*) the time required for block *A* to reach a velocity of 20 ft/s.

SOLUTION

Let y be positive downward for both blocks.

Constraint of cable: $y_A + y_B = \text{constant}$

$$a_A + a_B = 0 \qquad \text{or} \qquad a_B = -a_A$$



For blocks *A* and *B*, $+\!\downarrow \Sigma F = ma$:

Block *A*: $$W_A - T = \frac{W_A}{g}a_A \qquad \text{or} \qquad T = W_A - \frac{W_A}{g}a_A$$

Block *B*: $$P + W_B - T = \frac{W_B}{g}a_B = -\frac{W_B}{g}a_A$$

$$P + W_B - W_A + \frac{W_A}{g}a_A = -\frac{W_B}{g}a_A$$

Solving for a_A, $$a_A = \frac{W_A - W_B - P}{W_A + W_B}g \qquad (1)$$

$$v_A^2 - (v_A)_0^2 = 2a_A[y_A - (y_A)_0] \quad \text{with} \quad (v_A)_0 = 0$$

$$v_A = \sqrt{2a_A[y_A - (y_A)_0]} \qquad (2)$$

$$v_A - (v_A)_0 = a_A t \quad \text{with} \quad (v_A)_0 = 0$$

$$t = \frac{v_A}{a_A} \qquad (3)$$

PROBLEM 12.15 (Continued)

(*a*) Acceleration of block *A*.

System (1): $W_A = 200 \text{ lb}, \quad W_B = 100 \text{ lb}, \quad P = 0$

By formula (1), $(a_A)_1 = \dfrac{200-100}{200+100}(32.2)$ $\quad (\mathbf{a}_A)_1 = 10.73 \text{ ft/s}^2 \downarrow$ ◀

System (2): $W_A = 200 \text{ lb}, \quad W_B = 0, \quad P = 50 \text{ lb}$

By formula (1), $(a_A)_2 = \dfrac{200-100}{200}(32.2)$ $\quad (\mathbf{a}_A)_2 = 16.10 \text{ ft/s}^2 \downarrow$ ◀

System (3): $W_A = 2200 \text{ lb}, \quad W_B = 2100 \text{ lb}, \quad P = 0$

By formula (1), $(a_A)_3 = \dfrac{2200-2100}{2200+2100}(32.2)$ $\quad (\mathbf{a}_A)_3 = 0.749 \text{ ft/s}^2 \downarrow$ ◀

(*b*) v_A at $y_A - (y_A)_0 = 10$ ft. Use formula (2).

System (1): $(v_A)_1 = \sqrt{(2)(10.73)(10)}$ $\quad (v_A)_1 = 14.65 \text{ ft/s} \downarrow$ ◀

System (2): $(v_A)_2 = \sqrt{(2)(16.10)(10)}$ $\quad (v_A)_2 = 17.94 \text{ ft/s} \downarrow$ ◀

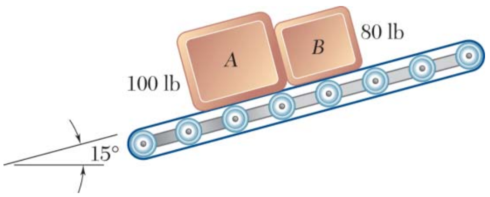
System (3): $(v_A)_3 = \sqrt{(2)(0.749)(10)}$ $\quad (v_A)_3 = 3.87 \text{ ft/s} \downarrow$ ◀

(*c*) Time at $v_A = 20$ ft/s. Use formula (3).

System (1): $t_1 = \dfrac{20}{10.73}$ $\quad t_1 = 1.864 \text{ s}$ ◀

System (2): $t_2 = \dfrac{20}{16.10}$ $\quad t_2 = 1.242 \text{ s}$ ◀

System (3): $t_3 = \dfrac{20}{0.749}$ $\quad t_3 = 26.7 \text{ s}$ ◀



PROBLEM 12.16

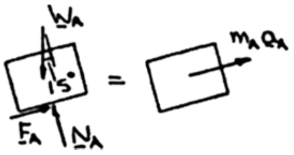
Boxes *A* and *B* are at rest on a conveyor belt that is initially at rest. The belt is suddenly started in an upward direction so that slipping occurs between the belt and the boxes. Knowing that the coefficients of kinetic friction between the belt and the boxes are $(\mu_k)_A = 0.30$ and $(\mu_k)_B = 0.32$, determine the initial acceleration of each box.

SOLUTION

Assume that $a_B > a_A$ so that the normal force N_{AB} between the boxes is zero.

A: $+\nwarrow \Sigma F_y = 0: \quad N_A - W_A \cos 15° = 0$

A:



or $N_A = W_A \cos 15°$

Slipping: $F_A = (\mu_k)_A N_A$

$= 0.3 W_A \cos 15°$

$+\nearrow \Sigma F_x = m_A a_A: \quad F_A - W_A \sin 15° = m_A a_A$

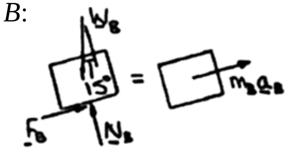
or $0.3 W_A \cos 15° - W_A \sin 15° = \dfrac{W_A}{g} a_A$

or $a_A = (32.2\ \text{ft/s}^2)(0.3 \cos 15° - \sin 15°)$

$= 0.997\ \text{ft/s}^2$

B: $+\nwarrow \Sigma F_y = 0: \quad N_B - W_B \cos 15° = 0$

B:



or $N_B = W_B \cos 15°$

Slipping: $F_B = (\mu_k)_B N_B$

$= 0.32 W_B \cos 15°$

$+\nearrow \Sigma F_x = m_B a_B: \quad F_B - W_B \sin 15° = m_B a_B$

or $0.32 W_B \cos 15° - W_B \sin 15° = \dfrac{W_B}{g} a_B$

or $a_B = (32.2\ \text{ft/s}^2)(0.32 \cos 15° - \sin 15°) = 1.619\ \text{ft/s}^2$

$a_B > a_A \Rightarrow$ assumption is correct

$\mathbf{a}_A = 0.997\ \text{ft/s}^2 \nearrow 15°$ ◀

$\mathbf{a}_B = 1.619\ \text{ft/s}^2 \nearrow 15°$ ◀

PROBLEM 12.16 (Continued)

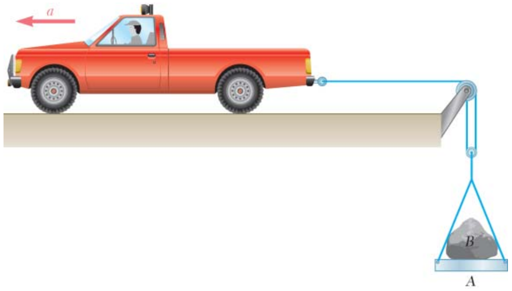
Note: If it is assumed that the boxes remain in contact $(N_{AB} \neq 0)$, then assuming N_{AB} to be compression,

$$a_A = a_B \quad \text{and find} \quad (\Sigma F_x = ma) \text{ for each box.}$$

A: $$0.3W_A \cos 15° - W_A \sin 15° - N_{AB} = \frac{W_A}{g}a$$

B: $$0.32W_B \cos 15° - W_B \sin 15° + N_{AB} = \frac{W_B}{g}a$$

Solving yields $a = 1.273 \text{ ft/s}^2$ and $N_{AB} = -0.859$ lb, which contradicts the assumption.



PROBLEM 12.17

A 5000-lb truck is being used to lift a 1000 lb boulder *B* that is on a 200 lb pallet *A*. Knowing the acceleration of the truck is $1\ \text{ft/s}^2$, determine (*a*) the horizontal force between the tires and the ground, (*b*) the force between the boulder and the pallet.

SOLUTION

Kinematics:

$$\mathbf{a}_T = 1\ \text{m/s}^2 \leftarrow$$

$$\mathbf{a}_A = \mathbf{a}_B = 0.5\ \text{m/s}^2 \uparrow$$

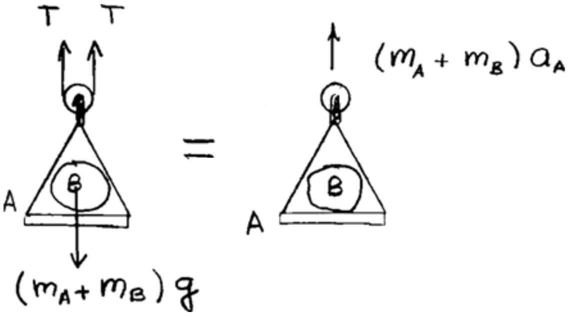
Masses:

$$m_T = \frac{5000}{32.2} = 155.28\ \text{slugs}$$

$$m_A = \frac{200}{32.2} = 6.211\ \text{slugs}$$

$$m_B = \frac{1000}{32.2} = 31.056\ \text{slugs}$$

Let *T* be the tension in the cable. Apply Newton's second law to the lower pulley, pallet and boulder.



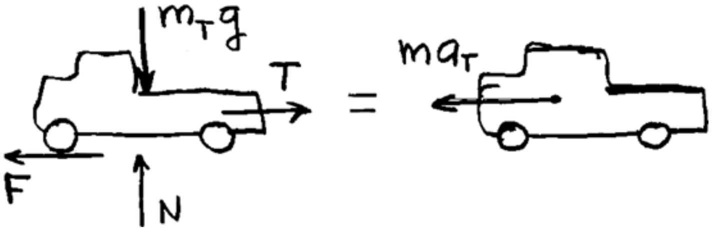
Vertical components $+\uparrow$:

$$2T - (m_A + m_B)g = (m_A + m_B)a_A$$

$$2T - (37.267)(32.2) = (37.267)(0.5)$$

$$T = 609.32\ \text{lb}$$

Apply Newton's second law to the truck.



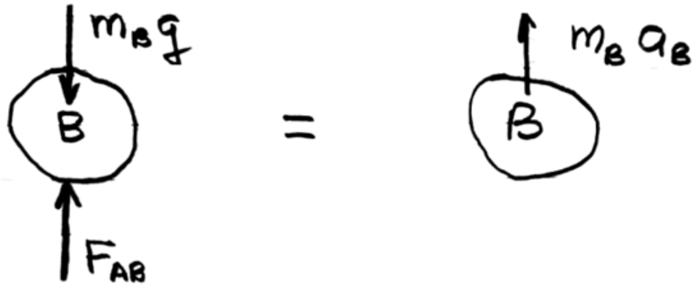
PROBLEM 12.17 (Continued)

Horizontal components $\overset{+}{\leftarrow}$: $F - T = m_T a_T$

(*a*) Horizontal friction force between tires and ground.

$$F = T + m_T a_T = 609.32 + (155.28)(1.0) \qquad F = 765 \text{ lb} \blacktriangleleft$$

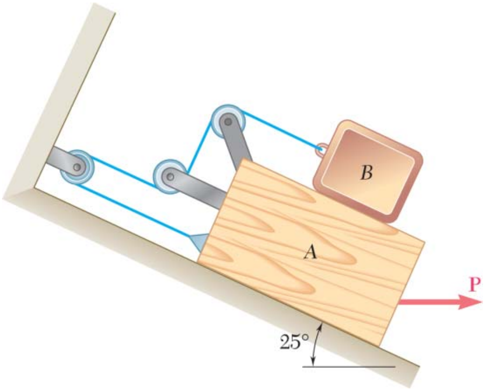
Apply Newton's second law to the boulder.



Vertical components $+\uparrow$: $F_{AB} - m_B g = m_B a_B$

$$F_{AB} = m_B(g + a) = 31.056(32.2 + 0.5)$$

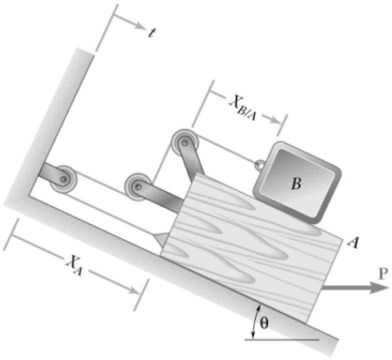
(*b*) Contact force between boulder and pallet: $F_{AB} = 1016 \text{ lb} \blacktriangleleft$



PROBLEM 12.18

Block A has a mass of 40 kg, and block B has a mass of 8 kg. The coefficients of friction between all surfaces of contact are $\mu_s = 0.20$ and $\mu_k = 0.15$. If $P = 0$, determine (*a*) the acceleration of block B, (*b*) the tension in the cord.

SOLUTION



From the constraint of the cord:

$$2x_A + x_{B/A} = \text{constant}$$

Then $$2v_A + v_{B/A} = 0$$

and $$2a_A + a_{B/A} = 0$$

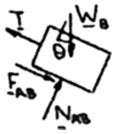
Now $$\mathbf{a}_B = \mathbf{a}_A + \mathbf{a}_{B/A}$$

Then $$a_B = a_A + (-2a_A)$$

or $$a_B = -a_A \qquad (1)$$

First we determine if the blocks will move for the given value of θ. Thus, we seek the value of θ for which the blocks are in impending motion, with the impending motion of A down the incline.

B:



B: $$+\nearrow \Sigma F_y = 0: \quad N_{AB} - W_B \cos\theta = 0$$

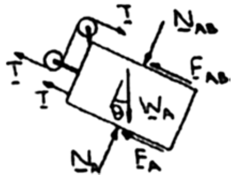
or $$N_{AB} = m_B g \cos\theta$$

Now $$F_{AB} = \mu_s N_{AB}$$
$$= 0.2 m_B g \cos\theta$$

$$\overset{+}{\searrow} \Sigma F_x = 0: \quad -T + F_{AB} + W_B \sin\theta = 0$$

or $$T = m_B g (0.2\cos\theta + \sin\theta)$$

A:



A: $$+\nearrow \Sigma F_y = 0: \quad N_A - N_{AB} - W_A \cos\theta = 0$$

or $$N_A = (m_A + m_B) g \cos\theta$$

Now $$F_A = \mu_s N_A$$
$$= 0.2(m_A + m_B) g \cos\theta$$

$$\overset{+}{\searrow} \Sigma F_x = 0: \quad -T - F_A - F_{AB} + W_A \sin\theta = 0$$

PROBLEM 12.18 (Continued)

or $$T = m_A g\sin\theta - 0.2(m_A + m_B)g\cos\theta - 0.2 m_B g\cos\theta$$
$$= g[m_A\sin\theta - 0.2(m_A + 2m_B)\cos\theta]$$

Equating the two expressions for T

$$m_B g(0.2\cos\theta + \sin\theta) = g[m_A\sin\theta - 0.2(m_A + 2m_B)\cos\theta]$$

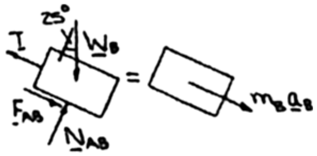
or $$8(0.2 + \tan\theta) = [40\tan\theta - 0.2(40 + 2\times 8)]$$

or $$\tan\theta = 0.4$$

or $\theta = 21.8^\circ$ for impending motion. Since $\theta < 25^\circ$, the blocks will move. Now consider the motion of the blocks.

(*a*) $+\nearrow\ \Sigma F_y = 0:\quad N_{AB} - W_B\cos 25^\circ = 0$

B:



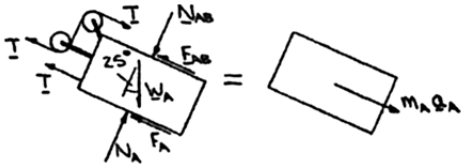
or $$N_{AB} = m_B g\cos 25^\circ$$

Sliding: $$F_{AB} = \mu_k N_{AB} = 0.15 m_B g\cos 25^\circ$$

$$+\searrow\ \Sigma F_x = m_B a_B:\quad -T + F_{AB} + W_B\sin 25^\circ = m_B a_B$$

or $$T = m_B[g(0.15\cos 25^\circ + \sin 25^\circ) - a_B]$$
$$= 8[9.81(0.15\cos 25^\circ + \sin 25^\circ) - a_B]$$
$$= 8(5.47952 - a_B) \qquad \text{(N)}$$

A:



$$+\nearrow\ \Sigma F_y = 0:\quad N_A - N_{AB} - W_A\cos 25^\circ = 0$$

or $$N_A = (m_A + m_B)g\cos 25^\circ$$

Sliding: $$F_A = \mu_k N_A = 0.15(m_A + m_B)g\cos 25^\circ$$

$$+\searrow\ \Sigma F_x = m_A a_A:\quad -T - F_A - F_{AB} + W_A\sin 25^\circ = m_A a_A$$

Substituting and using Eq. (1)

$$T = m_A g\ \sin 25^\circ - 0.15(m_A + m_B)g\ \cos 25^\circ$$
$$-0.15 m_B g\ \cos 25^\circ - m_A(-a_B)$$
$$= g[m_A\ \sin 25^\circ - 0.15(m_A + 2m_B)\cos 25^\circ] + m_A a_B$$
$$= 9.81[40\ \sin 25^\circ - 0.15(40 + 2\times 8)\cos 25^\circ] + 40a_B$$
$$= 91.15202 + 40a_B \qquad \text{(N)}$$

Equating the two expressions for T

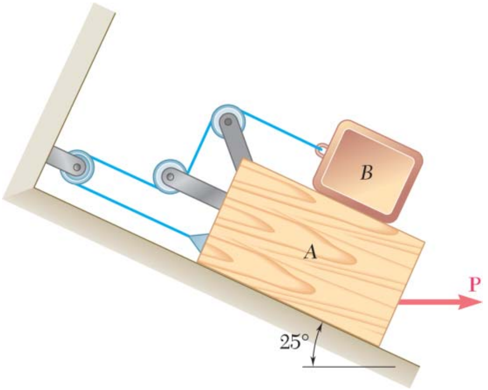
$$8(5.47952 - a_B) = 91.15202 + 40a_B$$

or $$a_B = -0.98575\ \text{m/s}^2$$

$\mathbf{a}_B = 0.986\ \text{m/s}^2 \searrow 25^\circ$ ◀

(*b*) We have $$T = 8[5.47952 - (-0.98575)]$$

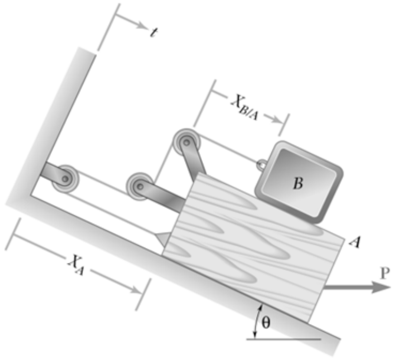
or $T = 51.7\ \text{N}$ ◀



PROBLEM 12.19

Block A has a mass of 40 kg, and block B has a mass of 8 kg. The coefficients of friction between all surfaces of contact are $\mu_s = 0.20$ and $\mu_k = 0.15$. If $P = 40\text{ N} \longrightarrow$, determine ($a$) the acceleration of block B, (b) the tension in the cord.

SOLUTION



From the constraint of the cord.

$$2x_A + x_{B/A} = \text{constant}$$

Then $$2v_A + v_{B/A} = 0$$

and $$2a_A + a_{B/A} = 0$$

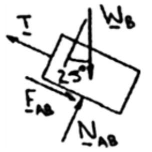
Now $$\mathbf{a}_B = \mathbf{a}_A + \mathbf{a}_{B/A}$$

Then $$a_B = a_A + (-2a_A)$$

or $$a_B = -a_A \qquad (1)$$

First we determine if the blocks will move for the given value of P. Thus, we seek the value of P for which the blocks are in impending motion, with the impending motion of a down the incline.

B:

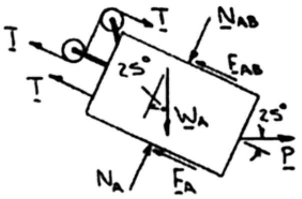


B: $$+\nearrow \Sigma F_y = 0: \quad N_{AB} - W_B \cos 25° = 0$$

or $$N_{AB} = m_B g \cos 25°$$

Now $$F_{AB} = \mu_s N_{AB}$$
$$= 0.2\, m_B g \cos 25°$$

A:



$$\overset{+}{\searrow} \Sigma F_x = 0: \quad -T + F_{AB} + W_B \sin 25° = 0$$

or $$T = 0.2\, m_B g \cos 25° + m_B g \sin 25°$$
$$= (8\text{ kg})(9.81\text{ m/s}^2)(0.2 \cos 25° + \sin 25°)$$
$$= 47.39249\text{ N}$$

A: $$+\nearrow \Sigma F_y = 0: \quad N_A - N_{AB} - W_A \cos 25° + P \sin 25° = 0$$

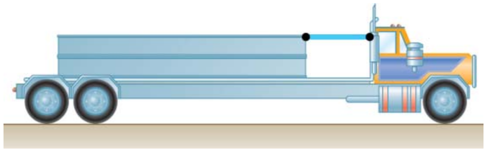
or $$a_B = -1.79383 \text{ m/s}^2$$

$$\mathbf{a}_B = 1.794 \text{ m/s}^2 \searrow 25° ◀$$

(*b*) We have $$T = 8[5.47952 - (-1.79383)]$$

or $$T = 58.2 \text{ N} ◀$$

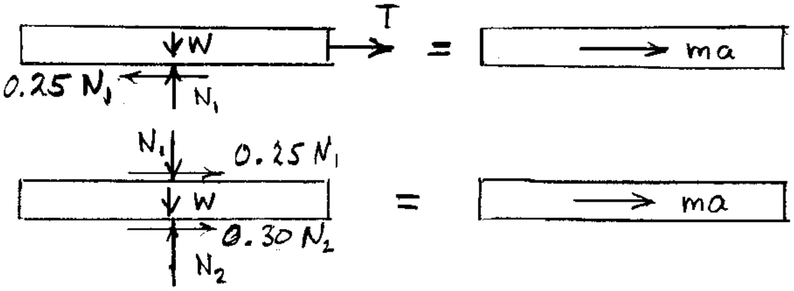


PROBLEM 12.20

The flat-bed trailer carries two 1500-kg beams with the upper beam secured by a cable. The coefficients of static friction between the two beams and between the lower beam and the bed of the trailer are 0.25 and 0.30, respectively. Knowing that the load does not shift, determine (*a*) the maximum acceleration of the trailer and the corresponding tension in the cable, (*b*) the maximum deceleration of the trailer.

SOLUTION

(*a*) Maximum acceleration. The cable secures the upper beam to the cab; the lower beam has impending slip.



For the upper beam, $+\uparrow \Sigma F_y = 0: \quad N_1 - W = 0$

$$N_1 = W = mg$$

For the lower beam, $+\uparrow \Sigma F_y = 0: \quad N_2 - N_1 - W = 0 \quad \text{or} \quad N_2 = 2W = 2mg$

$$\xrightarrow{+} \Sigma F_x = ma: \quad 0.25\,N_1 + 0.30\,N_2 = (0.25 + 0.60)mg = ma$$

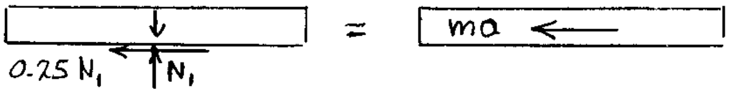
$a = 0.85g = (0.85)(9.81) \quad a = 8.34 \text{ m/s}^2 \longrightarrow$ ◀

For the upper beam, $\xrightarrow{+} \Sigma F_x = ma: \quad T - 0.25\,N_1 = ma$

$T = 0.25mg + ma = (0.25)(1500)(9.81) + (1500)(8.34) = 16.19 \times 10^3 \text{ N}$ $\qquad T = 16.19 \text{ kN}$ ◀

(*b*) Maximum deceleration of trailer.

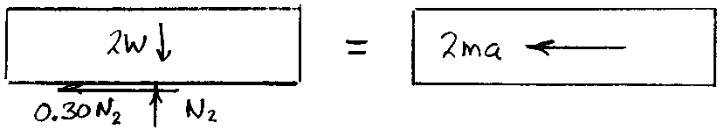
Case 1: Assume that only the top beam has impending motion. As in Part (*a*) $N_1 = mg$.



$$\xleftarrow{+} \Sigma F = ma: \quad 0.25mg = ma$$

$$a = 0.25g = 2.45 \text{ m/s}^2$$

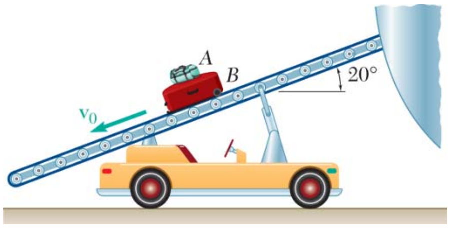
Case 2: Assume that both beams have impending slip. As before $N_2 = 2mg$.



$$\overset{+}{\longleftarrow} \Sigma F = (2m)a: \quad (0.30)(2mg) = (2m)a$$

$$a = 0.30g = 2.94 \text{ m/s}^2$$

The smaller of deceleration value of Case 1 governs. $a = 2.45 \text{ m/s}^2 \leftarrow$ ◀



PROBLEM 12.21

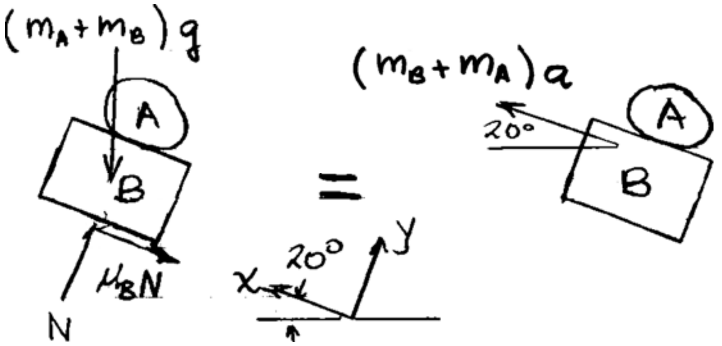
A baggage conveyor is used to unload luggage from an airplane. The 10-kg duffel bag *A* is sitting on top of the 20-kg suitcase *B*. The conveyor is moving the bags down at a constant speed of 0.5 m/s when the belt suddenly stops. Knowing that the coefficient of friction between the belt and *B* is 0.3 and that bag *A* does not slip on suitcase *B*, determine the smallest allowable coefficient of static friction between the bags.

SOLUTION

Since bag *A* does not slide on suitcase *B*, both have the same acceleration.

$$\mathbf{a} = a \nwarrow 20^\circ$$

Apply Newton's second law to the bag *A* – suitcase *B* combination treated as a single particle.



$$+\nearrow \Sigma F_y = ma_y: \quad -(m_B + m_A)g\cos 20^\circ + N = 0$$

$$N = (m_A + m_B)g\cos 30^\circ = (30)(9.81)\cos 20^\circ = 276.55 \text{ N}$$

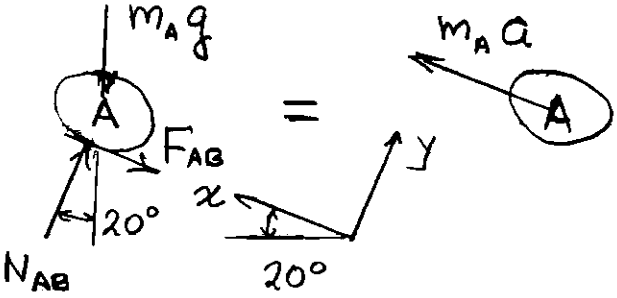
$$\mu_B N = (0.3)(276.55) = 82.965 \text{ N}$$

$$+\nwarrow \Sigma F_x = ma_x: \quad \mu_B N + (m_A + m_B)g\sin 20^\circ = (m_A + m_B)a$$

$$a = g\sin 20^\circ + \frac{\mu_B N}{m_A m_B} = 9.81\sin 20^\circ - \frac{82.965}{30}$$

$$a = 0.58972 \text{ m/s}^2 \qquad \mathbf{a} = 0.58972 \text{ m/s}^2 \swarrow 20^\circ$$

Apply Newton's second law to bag *A* alone.



PROBLEM 12.21 (Continued)

$$+\nearrow \ \Sigma F_y = ma_y: \quad N_{AB} - m_A g \cos 20° = 0$$

$$N_{AB} = m_a g \sin 20° = (10)(9.81)\cos 20° = 92.184 \text{ N}$$

$$+\nwarrow \ ZF_x = ma_x: \quad M_A g \sin 20° - F_{AB} = m_A a$$

$$F_{AB} = m_A(g \sin 20° - a) = (10)(9.81 \sin 20° - 0.58972)$$

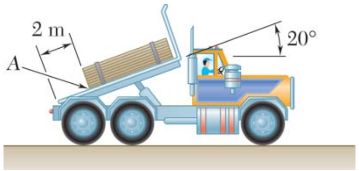
$$= 27.655 \text{ N}$$

Since bag *A* does not slide on suitcase *B*,

$$\mu_s > \frac{F_{AB}}{N_{AB}} = \frac{27.655}{92.184} = 0.300$$

$\mu_s > 0.300$ ◀

PROBLEM 12.22



To unload a bound stack of plywood from a truck, the driver first tilts the bed of the truck and then accelerates from rest. Knowing that the coefficients of friction between the bottom sheet of plywood and the bed are $\mu_s = 0.40$ and $\mu_k = 0.30$, determine (*a*) the smallest acceleration of the truck which will cause the stack of plywood to slide, (*b*) the acceleration of the truck which causes corner *A* of the stack to reach the end of the bed in 0.9 s.

SOLUTION

Let $\mathbf{a}_P$ be the acceleration of the plywood, $\mathbf{a}_T$ be the acceleration of the truck, and $\mathbf{a}_{P/T}$ be the acceleration of the plywood relative to the truck.

(*a*) Find the value of $\mathbf{a}_T$ so that the relative motion of the plywood with respect to the truck is impending.

$$a_P = a_T \text{ and } F_1 = \mu_s N_1 = 0.40 N_1$$

$$+\nwarrow \Sigma F_y = m_P a_y: \quad N_1 - W_P \cos 20^\circ = -m_P a_T \sin 20^\circ$$

$$N_1 = m_P (g \cos 20^\circ - a_T \sin 20^\circ)$$

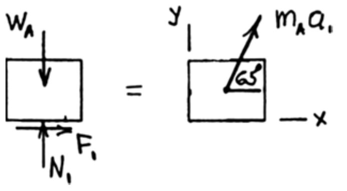
PROBLEM 12.23

To transport a series of bundles of shingles *A* to a roof, a contractor uses a motor-driven lift consisting of a horizontal platform *BC* which rides on rails attached to the sides of a ladder. The lift starts from rest and initially moves with a constant acceleration $\mathbf{a}_1$ as shown. The lift then decelerates at a constant rate $\mathbf{a}_2$ and comes to rest at *D*, near the top of the ladder. Knowing that the coefficient of static friction between a bundle of shingles and the horizontal platform is 0.30, determine the largest allowable acceleration $\mathbf{a}_1$ and the largest allowable deceleration $\mathbf{a}_2$ if the bundle is not to slide on the platform.

SOLUTION

Acceleration $\mathbf{a}_1$: Impending slip. $F_1 = \mu_s N_1 = 0.30 N_1$



$\Sigma F_y = m_A a_y$: $N_1 - W_A = m_A a_1 \sin 65°$

$$N_1 = W_A + m_A a_1 \sin 65°$$

$$= m_A (g + a_1 \sin 65°)$$

$\xrightarrow{+} \Sigma F_x = m_A a_x$: $F_1 = m_A a_1 \cos 65°$

$$F_1 = \mu_s N$$

or $m_A a_1 \cos 65° = 0.30 m_A (g + a_1 \sin 65°)$

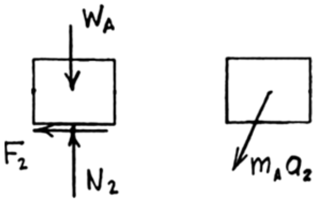
$$a_1 = \frac{0.30g}{\cos 65° - 0.30 \sin 65°}$$

$$= (1.990)(9.81)$$

$$= 19.53 \text{ m/s}^2$$

$\mathbf{a}_1 = 19.53 \text{ m/s}^2 \measuredangle 65°$ ◀

Deceleration $\mathbf{a}_2$: Impending slip. $F_2 = \mu_s N_2 = 0.30 N_2$



$\Sigma F_y = m a_y$: $N_1 - W_A = -m_A a_2 \sin 65°$

$$N_1 = W_A - m_A a_2 \sin 65°$$

$\xleftarrow{+} \Sigma F_x = m a_x$: $F_2 = m_A a_2 \cos 65°$

$$F_2 = \mu_s N_2$$

PROBLEM 12.23 (Continued)

or $$m_A a_2 \cos 65° = 0.30\, m_A (g - a_2 \cos 65°)$$

$$a_2 = \frac{0.30g}{\cos 65° + 0.30 \sin 65°}$$

$$= (0.432)(9.81)$$

PROBLEM 12.24

An airplane has a mass of 25 Mg and its engines develop a total thrust of 40 kN during take-off. If the drag **D** exerted on the plane has a magnitude $D = 2.25v^2$, where v is expressed in meters per second and D in newtons, and if the plane becomes airborne at a speed of 240 km/h, determine the length of runway required for the plane to take off.

SOLUTION

$$F = ma: \quad 40\times10^3 \text{ N} - 2.25v^2 = (25\times10^3 \text{ kg})a$$

Substituting

$$a = v\frac{dv}{dx}: \quad 40\times10^3 - 2.25\ v^2 = (25\times10^3)\ v\frac{dv}{dx}$$

$$\int_0^{x_1} dx = \int_0^{v_1} \frac{(25\times10^3)vdv}{40\times10^3 - 2.25v^2}$$

$$x_1 = -\frac{25\times10^3}{2(2.25)}[\ln(40\times10^3 - 2.25v^2)]_0^{v_1}$$

$$= \frac{25\times10^3}{4.5}\ln\frac{40\times10^3}{40\times10^3 - 2.25v_1^2}$$

For $v_1 = 240 \text{ km/h} = 66.67 \text{ m/s}$

$$x_1 = \frac{25\times10^3}{4.5}\ln\frac{40\times10^3}{40\times10^3 - 2.25(66.67)^2} = 5.556\ln 1.333$$

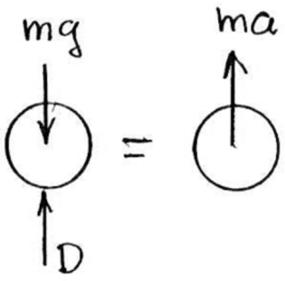
$$= 1.5982\times10^3 \text{ m}$$

$x_1 = 1.598 \text{ km}$ ◀

PROBLEM 12.25

A 4-kg projectile is fired vertically with an initial velocity of 90 m/s, reaches a maximum height and falls to the ground. The aerodynamic drag **D** has a magnitude $D = 0.0024\,v^2$ where D and v are expressed in newtons and m/s, respectively. Knowing that the direction of the drag is always opposite to the direction of the velocity, determine (*a*) the maximum height of the trajectory, (*b*) the speed of the projectile when it reaches the ground.

SOLUTION



Let y be the position coordinate of the projectile measured upward from the ground. The velocity and acceleration a taken to positive upward. $D = kv^2$.

(*a*) Upward motion. $+\!\uparrow \Sigma F_y = ma$:

$$-D - mg = ma$$

$$a = -\left(g + \frac{D}{m}\right) = -\left(g + \frac{kv^2}{m}\right)$$

$$v\frac{dv}{dy} = -\left(g + \frac{kv^2}{m}\right) = -\frac{k}{m}\left(v^2 + \frac{mg}{k}\right)$$

$$\frac{v\,dv}{v^2 + \frac{mg}{k}} = -\frac{k}{m}dy$$

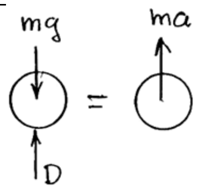
$$\int_{v_0}^{0} \frac{v\,dv}{v^2 + \frac{mg}{k}} = -\frac{k}{m}\int_0^h dy$$

$$\frac{1}{2}\ln\left(v^2 + \frac{mg}{k}\right)\Bigg|_{v_0}^{0} = -\frac{kh}{m}$$

$$\frac{1}{2}\ln\frac{\frac{mg}{k}}{v_0^2 + \frac{mg}{k}} = -\frac{1}{2}\ln\left(\frac{kv_0^2}{mg} + 1\right) = -\frac{kh}{m}$$

$$h = \frac{m}{2k}\ln\left(\frac{kv_0^2}{mg} + 1\right) = \frac{4}{(2)(0.0024)}\ln\left[\frac{(0.0024)(90)^2}{(4)(9.81)} + 1\right]$$

$= 335.36$ m $\qquad h = 335$ m ◀



PROBLEM 12.25 (Continued)

(*b*) Downward motion. $+\uparrow\ \Sigma F = ma$:

$$D - mg = ma$$

$$a = \frac{D}{m} - g = \frac{kv^2}{m} - g$$

$$v\frac{dv}{dy} = \frac{kv^2}{m} - g = -\frac{k}{m}\left(\frac{mg}{k} - v^2\right)$$

$$\frac{v\,dv}{\frac{mg}{k} - v^2} = -\frac{k}{m}dy$$

$$\int_0^{v_f} \frac{v\,dv}{mg} = -\frac{k}{m}\int_h^0 dy$$

$$\frac{1}{2}\ln\left(\frac{mg}{k} - v^2\right)\Bigg|_0^{v_f} = \frac{kh}{m}$$

$$-\frac{1}{2}\ln\left(\frac{\frac{mg}{k} - v_f^2}{\frac{mg}{k}}\right) = \frac{kh}{m}$$

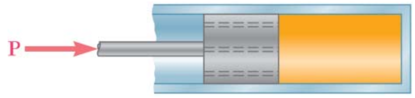
$$\ln\left(1 - \frac{kv_f^2}{mg}\right) = -\frac{2\,kh}{m}$$

$$1 - \frac{kv_f^2}{mg} = e^{-2\,kh/m}$$

$$v_f = \pm\sqrt{\frac{mg}{k}\left(1 - e^{-2\,kh/m}\right)}$$

$$v_f = \sqrt{\frac{(4)(9.81)}{0.0024}\left[1 - e^{-(2)(0.0024)(335.36)/4}\right]}$$

$$= 73.6 \text{ m/s} \qquad v_f = 73.6 \text{ m/s}\downarrow \blacktriangleleft$$

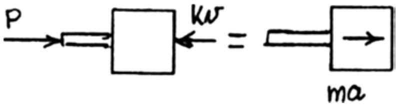


PROBLEM 12.26

A constant force **P** is applied to a piston and rod of total mass m to make them move in a cylinder filled with oil. As the piston moves, the oil is forced through orifices in the piston and exerts on the piston a force of magnitude kv in a direction opposite to the motion of the piston. Knowing that the piston starts from rest at $t = 0$ and $x = 0$, show that the equation relating x, v, and t, where x is the distance traveled by the piston and v is the speed of the piston, is linear in each of these variables.

SOLUTION

$$\xrightarrow{+} \Sigma F = ma: \quad P - kv = ma$$



$$\frac{dv}{dt} = a = \frac{P - kv}{m}$$

$$\int_0^t dt = \int_0^v \frac{m\,dv}{P - kv}$$

$$= -\frac{m}{k}\ln(P - kv)\Big|_0^v$$

$$= -\frac{m}{k}[\ln(P - kv) - \ln P]$$

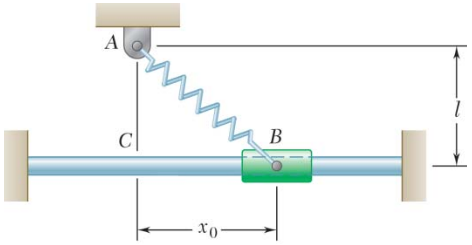
$$t = -\frac{m}{k}\ln\frac{P - kv}{P} \qquad \text{or} \qquad \ln\frac{P - kv}{m} = -\frac{kt}{m}$$

$$\frac{P - kv}{m} = e^{-kt/m} \qquad \text{or} \qquad v = \frac{P}{k}(1 - e^{-kt/m})$$

$$x = \int_0^t v\,dt = \frac{Pt}{k}\Bigg|_0^t - \frac{P}{k}\left(-\frac{k}{m}e^{-kt/m}\right)\Bigg|_0^t$$

$$= \frac{Pt}{k} + \frac{P}{m}(e^{-kt/m} - 1) = \frac{Pt}{k} - \frac{P}{m}(1 - e^{-kt/m})$$

$$x = \frac{Pt}{k} - \frac{kv}{m}, \quad \text{which is linear.} \qquad \blacktriangleleft$$



PROBLEM 12.27

A spring *AB* of constant *k* is attached to a support at *A* and to a collar of mass *m*. The unstretched length of the spring is ℓ. Knowing that the collar is released from rest at $x = x_0$ and neglecting friction between the collar and the horizontal rod, determine the magnitude of the velocity of the collar as it passes through Point *C*.

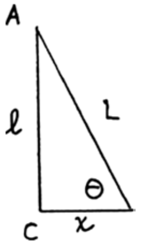
SOLUTION

Choose the origin at Point *C* and let *x* be positive to the right. Then *x* is a position coordinate of the slider *B* and x_0 is its initial value. Let *L* be the stretched length of the spring. Then, from the right triangle

$$L = \sqrt{\ell^2 + x^2}$$

The elongation of the spring is $e = L - \ell$, and the magnitude of the force exerted by the spring is

$$F_s = ke = k(\sqrt{\ell^2 + x^2} - \ell)$$

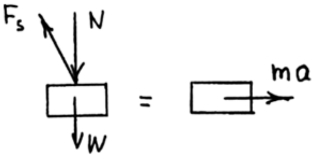


By geometry,

$$\cos\theta = \frac{x}{\sqrt{\ell^2 + x^2}}$$

$$\xrightarrow{+} \Sigma F_x = ma_x : \quad -F_s \cos\theta = ma$$

$$-k(\sqrt{\ell^2 + x^2} - \ell)\frac{x}{\sqrt{\ell^2 + x^2}} = ma$$



$$a = -\frac{k}{m}\left(x - \frac{\ell x}{\sqrt{\ell^2 + x^2}}\right)$$

$$\int_0^v v\,dv = \int_{x_0}^0 a\,dx$$

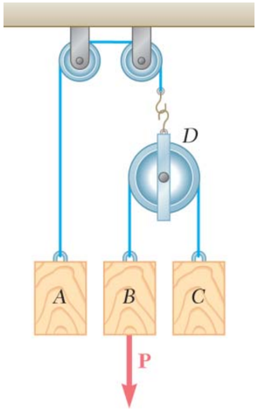
$$\frac{1}{2}v^2\bigg|_0^v = -\frac{k}{m}\int_{x_0}^0 \left(x - \frac{\ell x}{\sqrt{\ell^2 + x^2}}\right)dx = -\frac{k}{m}\left(\frac{1}{2}x^2 - \ell\sqrt{\ell^2 + x^2}\right)\bigg|_{x_0}^0$$

$$\frac{1}{2}v^2 = -\frac{k}{m}\left(0 - \ell^2 - \frac{1}{2}x_0^2 + \ell\sqrt{\ell^2 + x_0^2}\right)$$

$$v^2 = \frac{k}{m}\left(2\ell^2 + x_0^2 - 2\ell\sqrt{\ell^2 + x_0^2}\right)$$

$$= \frac{k}{m}\left[\left(\ell^2 + x_0^2\right) - 2\ell\sqrt{\ell^2 + x_0^2} + \ell^2\right]$$

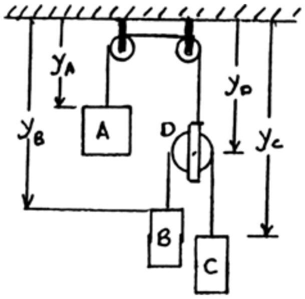
answer: $v = \sqrt{\frac{k}{m}}\left(\sqrt{\ell^2 + x_0^2} - \ell\right)$ ◀



PROBLEM 12.28

Block *A* has a mass of 10 kg, and blocks *B* and *C* have masses of 5 kg each. Knowing that the blocks are initially at rest and that *B* moves through 3 m in 2 s, determine (*a*) the magnitude of the force **P**, (*b*) the tension in the cord *AD*. Neglect the masses of the pulleys and axle friction.

SOLUTION



Let the position coordinate *y* be positive downward.

Constraint of cord *AD*: $y_A + y_D = \text{constant}$

$$v_A + v_D = 0, \quad a_A + a_D = 0$$

Constraint of cord *BC*: $(y_B - y_D) + (y_C - y_D) = \text{constant}$

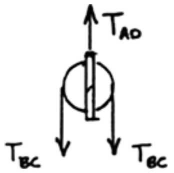
$$v_B + v_C - 2v_D = 0, \quad a_B + a_C - 2a_D = 0$$

Eliminate a_D. $$2a_A + a_B + a_C = 0 \tag{1}$$

We have uniformly accelerated motion because all of the forces are constant.

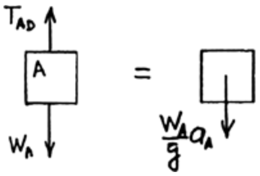
$$y_B = (y_B)_0 + (v_B)_0 t + \frac{1}{2}a_B t^2, \quad (v_B)_0 = 0$$

$$a_B = \frac{2[y_B - (y_B)_0]}{t^2} = \frac{(2)(3)}{(2)^2} = 1.5 \text{ m/s}^2$$



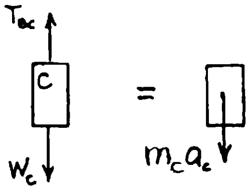
Pulley *D*: $+\!\downarrow \Sigma F_y = 0: \quad 2T_{BC} - T_{AD} = 0$

$$T_{AD} = 2T_{BC}$$

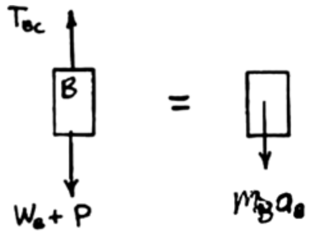


Block *A*: $+\!\downarrow \Sigma F_y = ma_y: \quad W_A - T_{AD} = m_A a_A$

or $$a_A = \frac{W_A - T_{AD}}{m_A} = \frac{W_A - 2T_{BC}}{m_A} \tag{2}$$



PROBLEM 12.28 (Continued)



Block *C*: $+\downarrow \Sigma F_y = ma_y: \quad W_C - T_{BC} = m_C a_C$

or
$$a_C = \frac{W_C - T_{BC}}{m_C} \qquad (3)$$

Substituting the value for a_B and Eqs. (2) and (3) into Eq. (1), and solving for T_{BC},

$$2\left(\frac{W_A - 2T_{BC}}{m_A}\right) + a_B + \left(\frac{W_C - T_{BC}}{m_C}\right) = 0$$

$$2\left(\frac{m_A g - 2T_{BC}}{m_A}\right) + a_B + \left(\frac{m_C g - T_{BC}}{m_C}\right) = 0$$

$$\left(\frac{4}{m_A} + \frac{1}{m_C}\right) T_{BC} = 3g + a_B$$

$$\left(\frac{4}{10} + \frac{1}{5}\right) T_{BC} = 3(9.81) + 1.5 \quad \text{or} \quad T_{BC} = 51.55 \text{ N}$$

Block *B*: $+\downarrow \Sigma F_y = ma_y: \quad P + W_B - T_{BC} = m_B a_B$

(*a*) Magnitude of *P*.

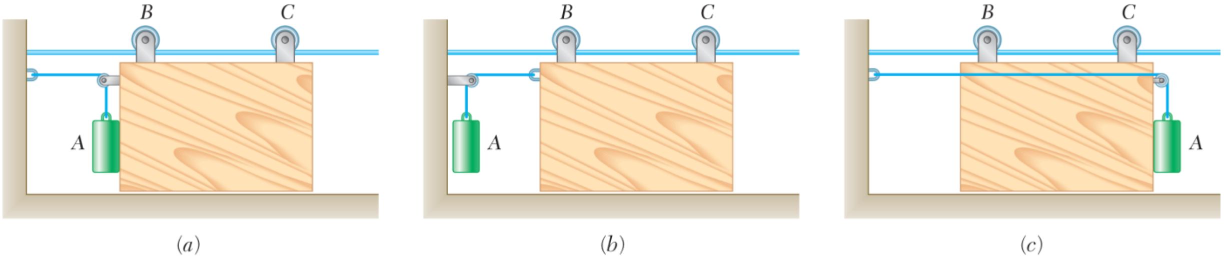
$$P = T_{BC} - W_B + m_B a_B$$
$$= 51.55 - 5(9.81) + 5(1.5) \qquad P = 10.00 \text{ N} \blacktriangleleft$$

(*b*) Tension in cord *AD*.

$$T_{AD} = 2T_{BC} = (2)(51.55) \qquad T_{AD} = 103.1 \text{ N} \blacktriangleleft$$

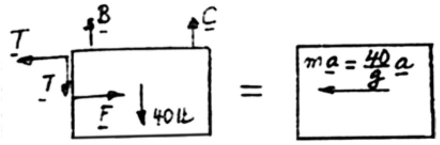
PROBLEM 12.29

A 40-lb sliding panel is supported by rollers at *B* and *C*. A 25-lb counterweight *A* is attached to a cable as shown and, in cases *a* and *c*, is initially in contact with a vertical edge of the panel. Neglecting friction, determine in each case shown the acceleration of the panel and the tension in the cord immediately after the system is released from rest.



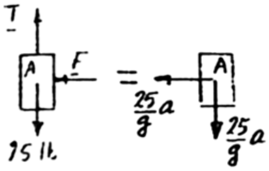
SOLUTION

(*a*) Panel: F = Force exerted by counterweight



$\xleftarrow{+}\ \Sigma F_x = ma$: $T - F = \dfrac{40}{g}a$ (1)

Counterweight *A*: Its acceleration has two components



$$\mathbf{a}_A = \mathbf{a}_P + \mathbf{a}_{A/P} = a \rightarrow + a \downarrow$$

$\xleftarrow{+}\ \Sigma F_x = ma_x$: $F = \dfrac{25}{g}a$ (2)

$+\!\downarrow \Sigma F_g = ma_g$: $25 - T = \dfrac{25}{g}a$ (3)

Adding (1), (2), and (3):

$$\cancel{T} - F + F + 25 - \cancel{T} = \frac{40+25+25}{g}a$$

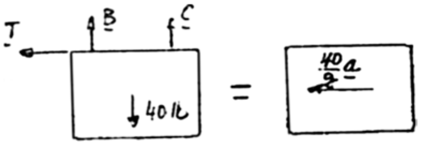
$$a = \frac{25}{90}g = \frac{25}{90}(32.2)$$ $\mathbf{a} = 8.94\ \text{ft/s}^2 \longleftarrow$ ◀

Substituting for *a* into (3):

$$25 - T = \frac{25}{g}\left(\frac{25}{90}g\right) \qquad T = 25 - \frac{625}{90}$$ $T = 18.06$ lb ◀

PROBLEM 12.29 (Continued)

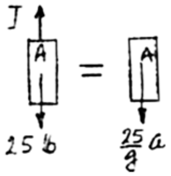
(*b*) Panel:



$\xleftarrow{+}\ \Sigma F_y = ma:$ $$T = \frac{40}{g}a \qquad (1)$$

Counterweight *A*:

$+\!\downarrow \Sigma F_y = ma:$ $$25 - T = \frac{25}{g}a \qquad (2)$$



Adding (1) and (2): $$\cancel{T} + 25 - \cancel{T} = \frac{40+25}{g}a$$

$$a = \frac{25}{65}g$$

$\mathbf{a} = 12.38\ \text{ft/s}^2 \longleftarrow$ ◀

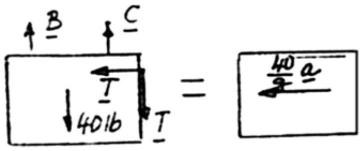
Substituting for *a* into (1):

$$T = \frac{40}{g}\left(\frac{25}{65}g\right) = \frac{1000}{65}$$

$T = 15.38$ lb ◀

(*c*) Since panel is accelerated to the left, there is no force exerted by panel on counterweight and vice versa.

Panel:



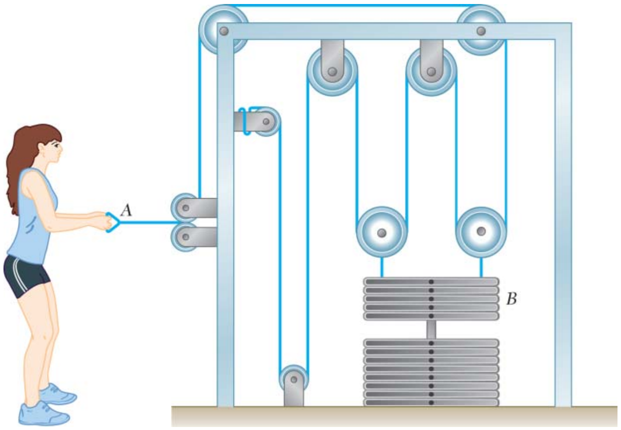
$\xleftarrow{+}\ \Sigma F_x = ma:$ $$T = \frac{40}{g}a \qquad (1)$$

Counterweight *A*: Same free body as in Part (*b*):

$+\!\downarrow \Sigma F_y = ma:$ $$25 - T = \frac{25}{g}a \qquad (2)$$

Since Eqs. (1) and (2) are the same as in (*b*), we get the same answers:

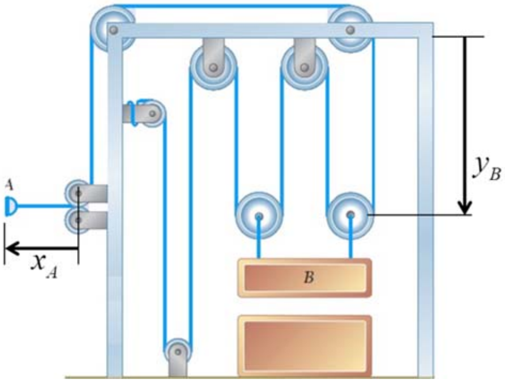
$\mathbf{a} = 12.38\ \text{ft/s}^2 \longleftarrow;\ T = 15.38$ lb ◀



PROBLEM 12.30

An athlete pulls handle *A* to the left with a constant force of *P* = 100 N. Knowing that after the handle *A* has been pulled 30 cm its velocity is 3 m/s, determine the mass of the weight stack *B*.

SOLUTION



Given: $P = 100\text{ N}$

$x_A = 0.30\text{ m}$

$\text{v}_A = 3\text{ m/s}$

Kinematics: $x_A + 4y_B = \text{constant}$

$v_A + 4v_B = 0$

$a_A + 4a_B = 0 \qquad (1)$

Uniform Acceleration of handle A:

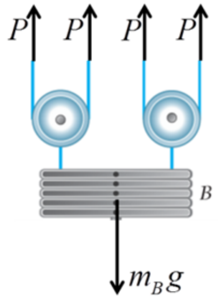
$$\text{v}_A{}^2 = (\text{v}_A)_o^2 + 2a_A\left(x_A - (x_A)_o\right)$$

$$3^2 = 0^2 + 2a_A(0.3 - 0)$$

$$a_A = 15\text{ m/s}^2$$

From (1): $a_B = 3.75\text{ m/s}^2 \uparrow$

Free Body Diagram:



From FBD:

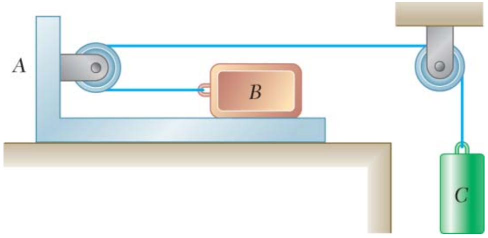
$$\sum F_y = m_B a_B$$

$$4P - m_B g = m_B a_B$$

$$m_B = \frac{4P}{g + a_B}$$

$$= \frac{4(100)}{9.81 + 3.75}\text{ kg}$$

$$m_B = 29.50\text{ kg} \blacktriangleleft$$

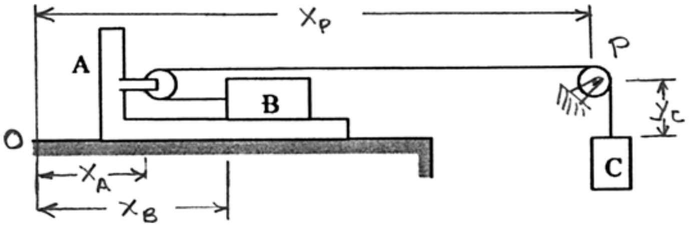


PROBLEM 12.31

A 10-lb block *B* rests as shown on a 20-lb bracket *A*. The coefficients of friction are $\mu_s = 0.30$ and $\mu_k = 0.25$ between block *B* and bracket *A*, and there is no friction in the pulley or between the bracket and the horizontal surface. (*a*) Determine the maximum weight of block *C* if block *B* is not to slide on bracket *A*. (*b*) If the weight of block *C* is 10% larger than the answer found in *a* determine the accelerations of *A*, *B* and *C*.

SOLUTION

Kinematics. Let x_A and x_B be horizontal coordinates of *A* and *B* measured from a fixed vertical line to the left of *A* and *B*. Let y_C be the distance that block *C* is below the pulley. Note that y_C increases when *C* moves downward. See figure.



The cable length *L* is fixed.

$$L = (x_B - x_A) + (x_P - x_A) + y_C + \text{constant}$$

Differentiating and noting that $\dot{x}_P = 0,$

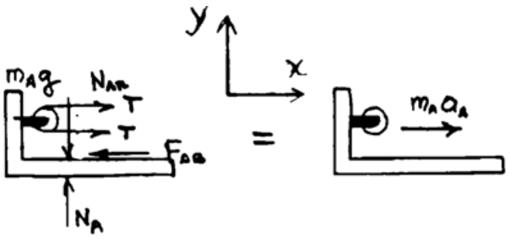
$$v_B - 2v_A + v_C = 0$$

$$-2a_A + a_B + a_C = 0 \qquad (1)$$

Here, a_A and a_B are positive to the right, and a_C is positive downward.

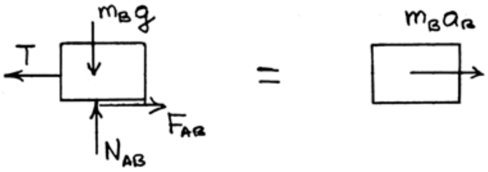
Kinetics. Let *T* be the tension in the cable and F_{AB} be the friction force between blocks *A* and *B*. The free body diagrams are:

Bracket *A*:

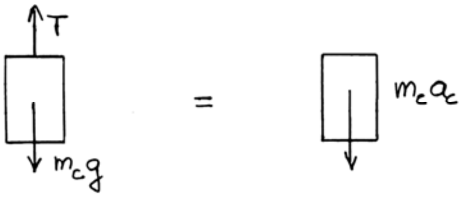


PROBLEM 12.31 (Continued)

Block *B*:



Block *C*:



Bracket *A*: $\xrightarrow{+} \Sigma F_x = ma_x: \quad 2T - F_{AB} = \dfrac{W_A}{g} a_A$ (2)

Block *B*: $\xrightarrow{+} \Sigma F_x = ma_x: \quad F_{AB} - T = \dfrac{W_B}{g} a_B$ (3)

$+\uparrow \Sigma F_y = ma_y: \quad N_{AB} - W_B = 0$

or $N_{AB} = W_B$

Block *C*: $+\downarrow \Sigma F_y = ma_y: \quad m_C - T = \dfrac{W_C}{g} a_C$ (4)

Adding Eqs. (2), (3), and (4), and transposing,

$$\frac{W_A}{g} a_A + \frac{W_B}{g} a_B + \frac{W_C}{g} a_C = W_C \tag{5}$$

Subtracting Eq. (4) from Eq. (3) and transposing,

$$\frac{W_B}{g} a_B - \frac{W_C}{g} a_C = F_{AB} - W_C \tag{6}$$

(*a*) No slip between *A* and *B*. $a_B = a_A$

From Eq. (1), $a_A = a_B = a_C = a$

From Eq. (5), $a = \dfrac{W_C g}{W_A + W_B + W_C}$

For impending slip, $F_{AB} = \mu_s N_{AB} = \mu_s W_B$

PROBLEM 12.31 (Continued)

Substituting into Eq. (6),

$$\frac{(W_B - W_C)(W_C g)}{W_A + W_B + W_C} = \mu_s W_B - W_C$$

Solving for W_C,

$$W_C = \frac{\mu_s W_B (W_A + W_B)}{W_A + 2W_B - \mu_s W_B}$$

$$= \frac{(0.30)(10)(20+10)}{20 + (2)(10) - (0.30)(10)}$$

$W_C = 2.43 \text{ lbs}$ ◀

(*b*) W_C increased by 10%. $W_C = 2.6757 \text{ lbs}$

Since slip is occurring, $F_{AB} = \mu_k N_{AB} = \mu_k W_B$

Eq. (6) becomes $\frac{W_B}{g} a_B - \frac{W_C}{g} a_C = \mu_k W_B - W_C$

or $10a_B - 2.6757a_C = [(0.25)(10) - 2.6757](32.2)$ (7)

With numerical data, Eq. (5) becomes

$$20a_A + 10a_B + 2.6757a_C = (2.6757)(32.2) \quad (8)$$

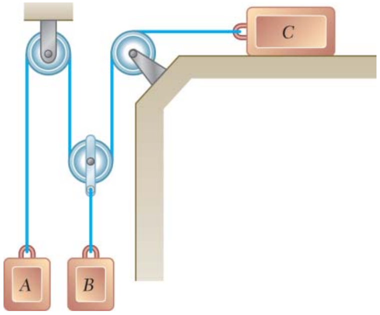
Solving Eqs. (1), (7), and (8) gives

$$a_A = 3.144 \text{ ft/s}^2, \quad a_B = 0.881 \text{ ft/s}^2, \quad a_C = 5.407 \text{ ft/s}^2$$

$\mathbf{a}_A = 3.14 \text{ ft/s}^2 \longrightarrow$ ◀

$\mathbf{a}_B = 0.881 \text{ ft/s}^2 \longrightarrow$ ◀

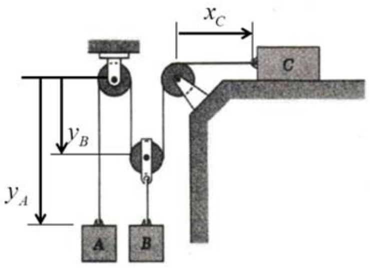
$\mathbf{a}_C = 5.41 \text{ ft/s}^2 \downarrow$ ◀



PROBLEM 12.32

Knowing that μ = 0.30, determine the acceleration of each block when $m_A = m_B = m_C$.

SOLUTION



Given: $\mu = 0.30$

$m_A = m_B = m_c = m$

Kinematics: $y_A + 2y_B + x_C = \text{constant}$

$v_A + 2v_B + v_C = 0$

$a_C + a_A + 2a_B = 0 \qquad (1)$

Free Body Diagram of Block A:

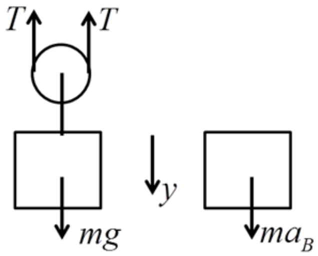
Equation of Motion:

$$\sum F_y = ma_A$$

$$mg - T = ma_A$$

$$a_A = g - \frac{T}{m} \qquad (2)$$

Free Body Diagram of Block B:



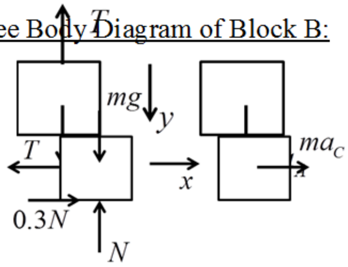
Equation of Motion:

$$\sum F_y = ma_B$$

$$mg - 2T = ma_B$$

$$a_B = g - \frac{2T}{m} \qquad (3)$$

Free Body Diagram of Block B:



Equations of Motion:

$$\sum F_y = 0$$

$$N = mg$$

$$\sum F_x = ma_C$$

$$0.3mg - T = ma_C$$

$$a_C = 0.3g - \frac{T}{m} \qquad (4)$$

Problem 12.32 (Continued)

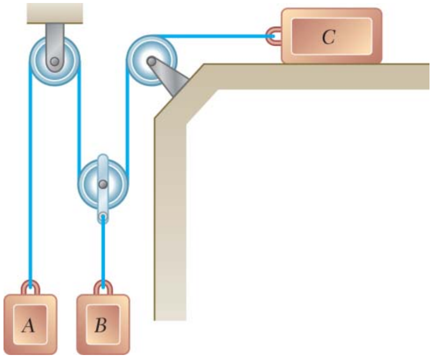
Substitute (2), (3) and (4) → (1)
$$3.3g - \frac{6T}{m} = 0$$

$$T = \frac{1.1}{2}mg \qquad (5)$$

Substitute (5) → (2): $a_A = g - \frac{1.1}{2}g$ $\qquad a_A = 0.45\text{g}\downarrow$ ◀

Substitute (5) → (3): $a_B = g - \frac{2.2}{2}g$ $\qquad a_B = 0.10\text{g}\uparrow$ ◀

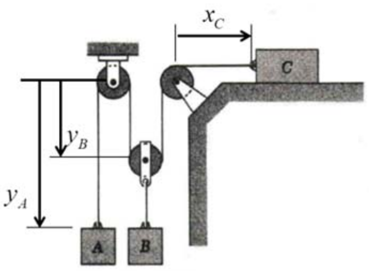
Substitute (5) → (4): $a_C = 0.3g - \frac{1.1}{2}g$ $\qquad a_C = 0.25\text{g}\leftarrow$ ◀



PROBLEM 12.33

Knowing that μ = 0.30, determine the acceleration of each block when $m_A = 5$ kg, $m_B = 30$ kg, and $m_C = 15$ kg.

SOLUTION



Given: $\mu = 0.30,\ g = 9.81\ \text{m/s}^2$

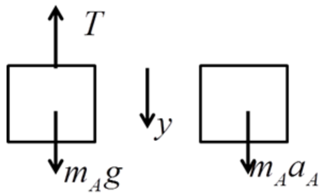
$m_A = 5\ \text{kg},\ m_B = 30\ \text{kg},\ m_C = 15\ \text{kg}$

Kinematics: $y_A + 2y_B + x_C = \text{constant}$

$$v_A + 2v_B + v_C = 0$$

$$a_A + 2a_B + a_C = 0 \qquad (1)$$

Free Body Diagram of Block A:



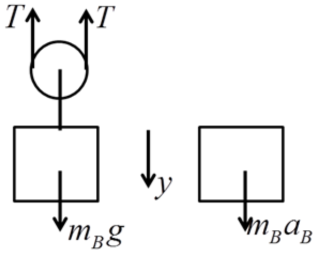
Equation of Motion:

$$\sum F_y = m_A a_A$$

$$m_A g - T = m_A a_A$$

$$a_A = g - \frac{T}{m_A} \qquad (2)$$

Free Body Diagram of Block B:



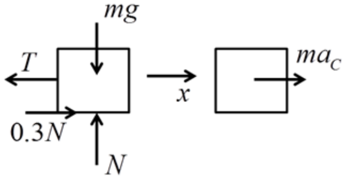
Equation of Motion:

$$\sum F_y = m_B a_B$$

$$m_B g - 2T = m_B a_B$$

$$a_B = g - \frac{2T}{m_B} \qquad (3)$$

Free Body Diagram of Block B:



Equations of Motion:

$$\sum F_y = 0 \qquad \sum F_x = m_C a_C$$

$$N = m_C g \qquad 0.3 m_C g - T = m_C a_C$$

Problem 12.33 (Continued)

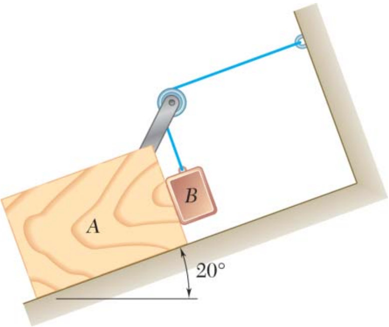
$$a_C = 0.3g - \frac{T}{m_C} \qquad (4)$$

Substitute (2), (3) and (4) → (1) $$3.3g - \frac{T}{m_A} - \frac{4T}{m_B} - \frac{T}{m_C} = 0$$

Substitute (5) → (2): $$a_A = g - \frac{8.25}{5}g \qquad a_A = 6.377 \text{ m/s}^2 \uparrow \blacktriangleleft$$

Substitute (5) → (3): $$a_B = g - \frac{16.5}{30}g \qquad a_B = 4.415 \text{ m/s}^2 \downarrow \blacktriangleleft$$

Substitute (5) → (4): $$a_C = 0.3g - \frac{8.25}{15}g \qquad a_C = -2.453 \text{ m/s}^2 \leftarrow \blacktriangleleft$$

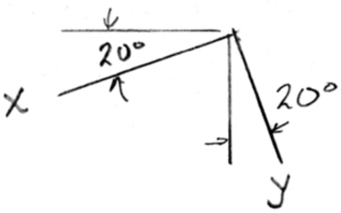


PROBLEM 12.34

A 25-kg block A rests on an inclined surface, and a 15-kg counterweight B is attached to a cable as shown. Neglecting friction, determine the acceleration of A and the tension in the cable immediately after the system is released from rest.

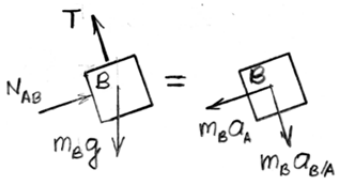
SOLUTION

Let the positive direction of x and y be those shown in the sketch, and let the origin lie at the cable anchor.



Constraint of cable: $x_A + y_{B/A} = \text{constant}$ or $a_A + a_{B/A} = 0$, where the positive directions of a_A and $a_{B/A}$ are respectively the x and the y directions. Then $a_{B/A} = -a_A$ (1)

First note that $\mathbf{a}_B = \mathbf{a}_A + \mathbf{a}_{B/A} = \left(a_A \nearrow 20°\right) + \left(a_{B/A} \searrow 20°\right)$



Block B: $\overset{+}{\swarrow}\ \Sigma F_x = m_B\left(a_B\right)_x: \quad m_Bg\sin 20° - N_{AB} = m_Ba_A$

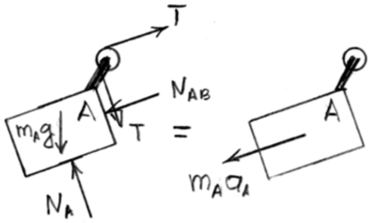
$$m_Ba_A + N_{AB} = m_Bg\sin 20°$$

$$15\,a_A + N_{AB} = 50.328 \tag{2}$$

$$\overset{+}{\searrow}\ \Sigma F_y = m_B\left(a_B\right)_y: \quad m_Bg\cos 20° - T = m_Ba_{B/A}$$

$$m_Ba_{B/A} + T = m_Bg\cos 20°$$

$$15\,a_{B/A} + T = 138.276 \tag{3}$$



Block A: $\overset{+}{\swarrow}\ \Sigma F_x = m_Aa_A: \quad m_Ag\sin 20° + N_{AB} + T = m_Aa_A$

$$m_Aa_A - N_{AB} + T = m_Ag\sin 20°$$

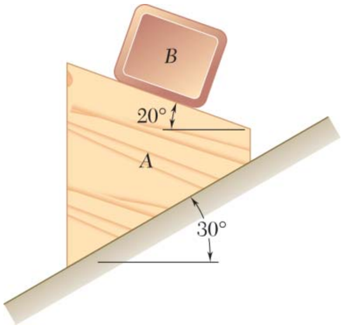
$$25\,a_{B/A} - N_{AB} + T = 83.880 \tag{4}$$

Eliminate $a_{B/A}$ using Eq. (1), then add Eq. (4) to Eq. (2) and subtract Eq. (3).

$55\,a_A = -4.068$ or $a_A = -0.0740\ \text{m/s}^2$, $\mathbf{a}_A = 0.0740\ \text{m/s}^2 \measuredangle 20°$ ◀

From Eq. (1), $a_{B/A} = 0.0740\ \text{m/s}^2$

From Eq. (3), $T = 137.2\ \text{N}$ $T = 137.2\ \text{N}$ ◀

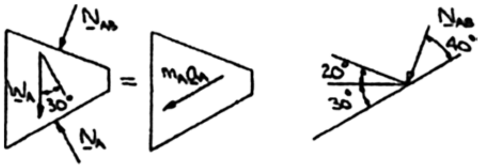


PROBLEM 12.35

Block B of mass 10-kg rests as shown on the upper surface of a 22-kg wedge A. Knowing that the system is released from rest and neglecting friction, determine (a) the acceleration of B, (b) the velocity of B relative to A at $t = 0.5$ s.

SOLUTION

A:



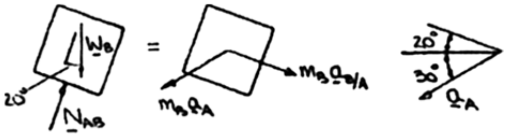
$\underline{N}_{AB}$
$\underline{W}_A$
30°
$\underline{N}_A$
=
$m_A\underline{a}_A$
20°
30°
$\underline{N}_{AB}$
40°

(a) $+\swarrow \Sigma F_x = m_A a_A$: $W_A \sin 30° + N_{AB} \cos 40° = m_A a_A$

or $$N_{AB} = \frac{22\left(a_A - \frac{1}{2} g\right)}{\cos 40°}$$

Now we note: $\mathbf{a}_B = \mathbf{a}_A + \mathbf{a}_{B/A}$, where $\mathbf{a}_{B/A}$ is directed along the top surface of A.

B:



$\underline{W}_B$
20°
$\underline{N}_{AB}$
=
$m_B\underline{a}_{B/A}$
$m_B\underline{a}_A$
20°
30°
$\underline{a}_A$

$+\nearrow \Sigma F_{y'} = m_B a_{y'}$: $N_{AB} - W_B \cos 20° = -m_B a_A \sin 50°$

or $$N_{AB} = 10\,(g \cos 20° - a_A \sin 50°)$$

Equating the two expressions for N_{AB}

$$\frac{22\left(a_A - \frac{1}{2} g\right)}{\cos 40°} = 10(g \cos 20° - a_A \sin 50°)$$

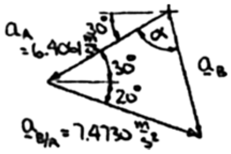
or $$a_A = \frac{(9.81)(1.1 + \cos 20° \cos 40°)}{2.2 + \cos 40° \sin 50°} = 6.4061 \text{ m/s}^2$$

$\overset{+}{\searrow} \Sigma F_{x'} = m_B a_{x'}$: $W_B \sin 20° = m_B a_{B/A} - m_B a_A \cos 50°$

or $$\begin{aligned} a_{B/A} &= g \sin 20° + a_A \cos 50° \\ &= (9.81 \sin 20° + 6.4061 \cos 50°) \text{ m/s}^2 \\ &= 7.4730 \text{ m/s}^2 \end{aligned}$$

PROBLEM 12.35 (Continued)

Finally $\mathbf{a}_B = \mathbf{a}_A + \mathbf{a}_{B/A}$



$a_A = 6.4061 \frac{m}{s^2}$
30°
α
30°
20°
a_B
$a_{B/A} = 7.4730 \frac{m}{s^2}$

We have $a_B^2 = 6.4061^2 + 7.4730^2 - 2(6.4061 \times 7.4730)\cos 50°$

or $a_B = 5.9447 \text{ m/s}^2$

and $$\frac{7.4730}{\sin\alpha} = \frac{5.9447}{\sin 50°}$$

or $\alpha = 74.4°$

$\mathbf{a}_B = 5.94 \text{ m/s}^2$ ↘ 75.6° ◀

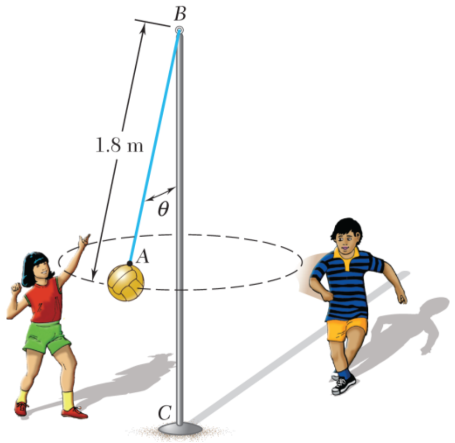
(*b*) *Note:* We have uniformly accelerated motion, so that

$$v = 0 + at$$

Now $\mathbf{v}_{B/A} = \mathbf{v}_B - \mathbf{v}_A = \mathbf{a}_B t - \mathbf{a}_A t = \mathbf{a}_{B/A} t$

At $t = 0.5$ s: $v_{B/A} = 7.4730 \text{ m/s}^2 \times 0.5 \text{ s}$

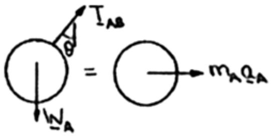
or $\mathbf{v}_{B/A} = 3.74 \text{ m/s}$ ↘ 20° ◀



PROBLEM 12.36

A 450-g tetherball A is moving along a horizontal circular path at a constant speed of 4 m/s. Determine (*a*) the angle θ that the cord forms with pole BC, (*b*) the tension in the cord.

SOLUTION



First we note $$a_A = a_n = \frac{v_A^2}{\rho}$$

where $$\rho = l_{AB}\sin\theta$$

(*a*) $+\!\uparrow \Sigma F_y = 0\text{:}\quad T_{AB}\cos\theta - W_A = 0$

or $$T_{AB} = \frac{m_A g}{\cos\theta}$$

$$\xrightarrow{+} \Sigma F_x = m_A a_A\text{:}\quad T_{AB}\sin\theta = m_A\frac{v_A^2}{\rho}$$

Substituting for T_{AB} and ρ

$$\frac{m_A g}{\cos\theta}\sin\theta = m_A\frac{v_A^2}{l_{AB}\sin\theta} \qquad \sin^2\theta = 1-\cos^2\theta$$

$$1-\cos^2\theta = \frac{(4\text{ m/s})^2}{1.8\text{ m}\times 9.81\text{ m/s}^2}\cos\theta$$

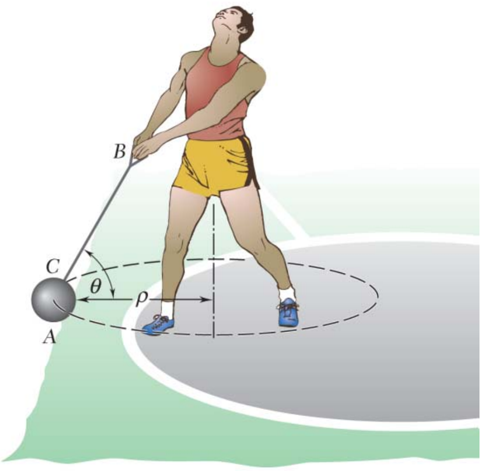
or $$\cos^2\theta + 0.906105\cos\theta - 1 = 0$$

Solving $$\cos\theta = 0.64479$$

or $$\theta = 49.9° \blacktriangleleft$$

(*b*) From above $$T_{AB} = \frac{m_A g}{\cos\theta} = \frac{0.450\text{ kg}\times 9.81\text{ m/s}^2}{0.64479}$$

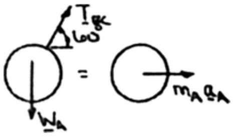
or $$T_{AB} = 6.85\text{ N} \blacktriangleleft$$



PROBLEM 12.37

During a hammer thrower's practice swings, the 7.1-kg head *A* of the hammer revolves at a constant speed *v* in a horizontal circle as shown. If $\rho = 0.93$ m and $\theta = 60°$, determine (*a*) the tension in wire *BC*, (*b*) the speed of the hammer's head.

SOLUTION



First we note $$a_A = a_n = \frac{v_A^2}{\rho}$$

(*a*) $+\uparrow \Sigma F_y = 0\text{:} \quad T_{BC} \sin 60° - W_A = 0$

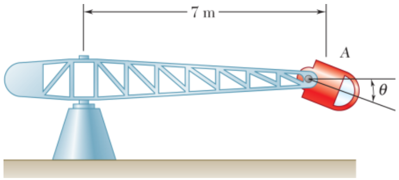
or $$T_{BC} = \frac{7.1 \text{ kg} \times 9.81 \text{ m/s}^2}{\sin 60°}$$
$$= 80.426 \text{ N}$$

$$T_{BC} = 80.4 \text{ N} \blacktriangleleft$$

(*b*) $\xrightarrow{+} \Sigma F_x = m_A a_A\text{:} \quad T_{BC} \cos 60° = m_A \frac{v_A^2}{\rho}$

or $$v_A^2 = \frac{(80.426 \text{ N}) \cos 60° \times 0.93 \text{ m}}{7.1 \text{ kg}}$$

or $$v_A = 2.30 \text{ m/s} \blacktriangleleft$$



PROBLEM 12.38

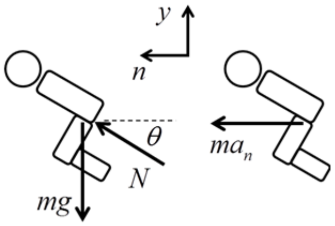
Human centrifuges are often used to simulate different acceleration levels for pilots. When aerospace physiologists say that a pilot is pulling 9*g's*, they mean that the resultant normal force on the pilot from the bottom of the seat is nine times their weight. Knowing that the centrifuge starts from rest and has a constant angular acceleration of 1.5 RPM per second until the pilot is pulling 9*g*'s and then continues with a constant angular velocity, determine (*a*) how long it will take for the pilot to reach 9*g's* (*b*) the angle θ of the normal force once the pilot reaches 9 g's. Assume that the force parallel to the seat is zero.

SOLUTION

Given:

$$\alpha = 1.5 \text{ RPM/s} = 0.157 \text{ rad/s}^2$$
$$\omega_0 = 0$$
$$\text{N} = 9\,\text{mg}$$
$$R = 7 \text{ m}$$

Free Body Diagram of Pilot:



Equations of Motion:

$$\sum F_y = ma_y$$
$$N\sin\theta - mg = m(0)$$
$$N\sin\theta = mg \qquad (1)$$

$$\sum F_n = ma_n$$
$$\text{N}\cos\theta = mR\omega^2$$
$$\omega = \sqrt{\frac{\text{N}\cos\theta}{mR}} \qquad (2)$$

Substitute N=9mg into (1): $9mg\sin\theta = mg$

$$\theta = \sin^{-1}\left(\frac{1}{9}\right)$$
$$\theta = 6.379°$$

Substitute N=9mg and θ into (2):

$$\omega = \sqrt{\frac{9*9.81\cos 6.379°}{7}}$$
$$\omega = 3.540 \text{ rad/s}$$

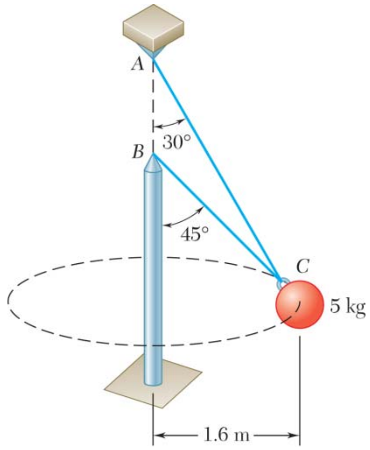
For constant angular acceleration:

$$\omega = \omega_0 + \alpha t$$
$$3.540 = 0 + 0.157 * t$$

(*a*) Solving for t: $t = 22.55 \text{ s}$ ◀

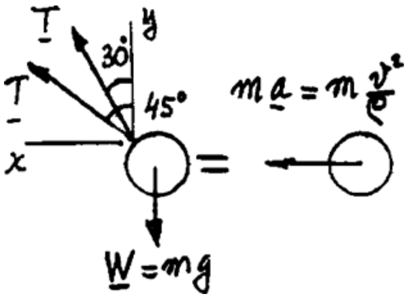
From earlier: $\theta = 6.379°$ ◀

PROBLEM 12.39



A single wire *ACB* passes through a ring at *C* attached to a sphere which revolves at a constant speed *v* in the horizontal circle shown. Knowing that the tension is the same in both portions of the wire, determine the speed *v*.

SOLUTION



$$\xleftarrow{+}\ \Sigma F_x = ma: \quad T(\sin 30° + \sin 45°) = \frac{mv^2}{\rho} \qquad (1)$$

$$+\uparrow\ \Sigma F_y = 0: \quad T\ (\cos 30° + \cos 45°) - mg = 0$$

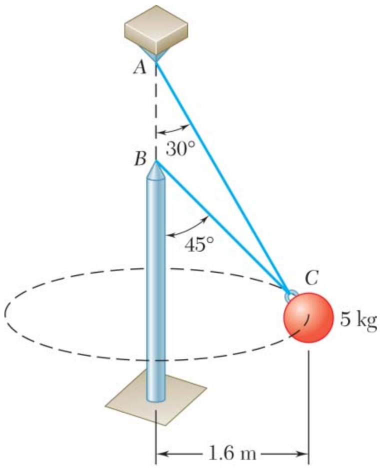
$$T\ (\cos 30° + \cos 45°) = mg \qquad (2)$$

Divide Eq. (1) by Eq. (2):

$$\frac{\sin 30° + \sin 45°}{\cos 30° + \cos 45°} = \frac{v^2}{\rho g}$$

$$v^2 = 0.76733\rho g = 0.76733\ (1.6\text{ m})(9.81\text{ m/s}^2) = 12.044\text{ m}^2/\text{s}^2$$

$v = 3.47$ m/s ◀



PROBLEM 12.40*

Two wires *AC* and *BC* are tied at *C* to a sphere which revolves at a constant speed *v* in the horizontal circle shown. Determine the range of the allowable values of *v* if both wires are to remain taut and if the tension in either of the wires is not to exceed 60 N.

SOLUTION

From the solution of Problem 12.39, we find that both wires remain taut for $3.01 \text{ m/s} \le v \le 3.96 \text{ m/s}$ ◁

To determine the values of *v* for which the tension in either wire will not exceed 60 N, we recall Eqs. (1) and (2) from Problem 12.39:

$$T_{AC}\sin 30° + T_{BC}\sin 45° = \frac{mv^2}{\rho} \qquad (1)$$

$$T_{AC}\cos 30° + T_{BC}\cos 45° = mg \qquad (2)$$

Subtract Eq. (1) from Eq. (2). Since sin 45° = cos 45°, we obtain

$$T_{AC}(\cos 30° - \sin 30°) = mg - \frac{mv^2}{\rho} \qquad (3)$$

Multiply Eq. (1) by cos 30°, Eq. (2) by sin 30°, and subtract:

$$T_{BC}(\sin 45°\cos 30° - \cos 45°\sin 30°) = \frac{mv^2}{\rho}\cos 30° - mg\sin 30°$$

$$T_{BC}\sin 15° = \frac{mv^2}{\rho}\cos 30° - mg\sin 30° \qquad (4)$$

Making $T_{AC} = 60$ N, $m = 5$ kg, $\rho = 1.6$ m, $g = 9.81 \text{ m/s}^2$ in Eq. (3), we find the value v_1 of v for which

$T_{AC} = 60$ N: $\quad 60(\cos 30° - \sin 30°) = 5(9.81) - \dfrac{5v_1^2}{1.6}$

$$21.962 = 49.05 - \frac{v_1^2}{0.32} \qquad v_1^2 = 8.668, \qquad v_1 = 2.94 \text{ m/s}$$

We have $T_{AC} \le 60$ N for $v \ge v_1$, that is, for $v \ge 2.94$ m/s ◁

PROBLEM 12.40* (Continued)

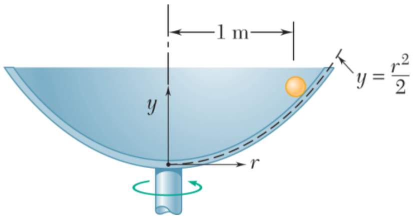
Making $T_{BC} = 60$ N, $m = 5$ kg, $\rho = 1.6$ m, $g = 9.81$ m/s^2 in Eq. (4), we find the value v_2 of v for which

$T_{BC} = 60$ N: $$60 \sin 15° = \frac{5v_2^2}{1.6} \cos 30° - 5(9.81) \sin 30°$$

$$15.529 = 2.7063v_2^2 - 24.523 \qquad v_2^2 = 14.80, \qquad v_2 = 3.85 \text{ m/s}$$

We have $T_{BC} \leq 60$ N for $v \leq v_2$, that is, for $v \leq 3.85$ m/s ◁

Combining the results obtained, we conclude that the range of allowable value is $3.01 \text{ m/s} \leq v \leq 3.85 \text{ m/s}$ ◀



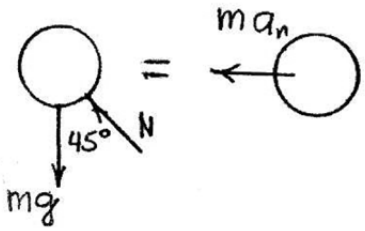
PROBLEM 12.41

A 1-kg sphere is at rest relative to a parabolic dish which rotates at a constant rate about a vertical axis. Neglecting friction and knowing that $r = 1$ m, determine (*a*) the speed v of the sphere, (*b*) the magnitude of the normal force exerted by the sphere on the inclined surface of the dish.

SOLUTION

Given: $$y = \frac{r^2}{2}, \quad \frac{dy}{dx} = r = 1 = \tan\theta \quad \text{or} \quad \theta = 45°$$

Free Body Diagram of Sphere:



Equations of Motion:

$$+\uparrow \Sigma F_y = 0: \quad N\cos\theta - mg = 0$$

$$N = \frac{mg}{\cos\theta}$$

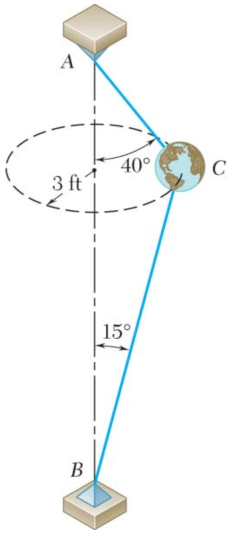
$$\overset{+}{\leftarrow} \Sigma F_n = ma_n: \quad N\sin\theta = ma_n$$

$$mg\tan\theta = m\frac{v^2}{r}$$

$$v^2 = gr\tan\theta$$

(*a*) $v^2 = (9.81)(1)(1.0000) = 9.81 \text{ m}^2/\text{s}^2$ $\quad v = 3.13$ m/s ◀

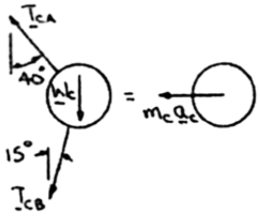
(*b*) $N = \dfrac{mg}{\cos 45°} = \dfrac{(1)(9.81)}{\cos 45°}$ $\quad N = 13.87$ N ◀



PROBLEM 12.42*

As part of an outdoor display, a 12-lb model *C* of the earth is attached to wires *AC* and *BC* and revolves at a constant speed *v* in the horizontal circle shown. Determine the range of the allowable values of *v* if both wires are to remain taut and if the tension in either of the wires is not to exceed 26 lb.

SOLUTION



First note $$a_C = a_n = \frac{v_C^2}{\rho}$$

where $$\rho = 3 \text{ ft}$$

$$\overset{+}{\leftarrow} \Sigma F_x = m_C a_C: \quad T_{CA}\sin 40° + T_{CB}\sin 15° = \frac{W_C}{g}\frac{v_C^2}{\rho} \qquad (1)$$

$$+\!\uparrow \Sigma F_y = 0: \quad T_{CA}\cos 40° - T_{CB}\cos 15° - W_C = 0 \qquad (2)$$

Note that Eq. (2) implies that

(*a*) when $T_{CB} = (T_{CB})_{\max}, \quad T_{CA} = (T_{CA})_{\max}$

(*b*) when $T_{CB} = (T_{CB})_{\min}, \quad T_{CA} = (T_{CA})_{\min}$

Case 1: T_{CA} is maximum.

Let $$T_{CA} = 26 \text{ lb}$$

Eq. (2) $$(26 \text{ lb})\cos 40° - T_{CB}\cos 15° - (12 \text{ lb}) = 0$$

or $$T_{CB} = 8.1964 \text{ lb}$$

$$(T_{CB})_{(T_{CA})_{\max}} < 26 \text{ lb} \qquad \text{OK}$$
$$[(T_{CB})_{\max} = 8.1964 \text{ lb}]$$

Eq. (1)

$$(v_C^2)_{(T_{CA})_{\max}} = \frac{(32.2\text{ ft/s}^2)(3\text{ ft})}{12\text{ lb}}(26\sin 40° + 8.1964\sin 15°)\text{ lb}$$

or $$(v_C)_{(T_{CA})_{\max}} = 12.31\text{ ft/s}$$

Now we form $$(\cos 15°)(\text{Eq. }1) + (\sin 15°)(\text{Eq. }2)$$

$$T_{CA}\sin 40°\cos 15° + T_{CA}\cos 40°\sin 15° = \frac{W_C}{g}\frac{v_C^2}{\rho}\cos 15° + W_C\sin 15°$$

or $$T_{CA}\sin 55° = \frac{W_C}{g}\frac{v_C^2}{\rho}\cos 15° + W_C\sin 15° \qquad (3)$$

$(v_c)_{\max}$ occurs when $T_{CA} = (T_{CA})_{\max}$

$(v_C)_{\max} = 12.31\text{ ft/s}$

Case 2: T_{CA} is minimum.

Because $(T_{CA})_{\min}$ occurs when $T_{CB} = (T_{CB})_{\min}$,

let $T_{CB} = 0$ (note that wire *BC* will not be taut).

Eq. (2) $$T_{CA}\cos 40° - (12\text{ lb}) = 0$$

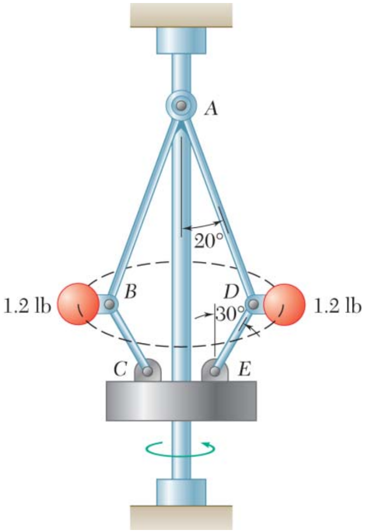
or $$T_{CA} = 15.6649\text{ lb}, \quad 26\text{ lb} \quad \text{OK}$$

Note: Eq. (3) implies that when $T_{CA} = (T_{CA})_{\min}$, $v_C = (v_C)_{\min}$. Then

Eq. (1) $$(v_C^2)_{\min} = \frac{(32.2\text{ ft/s}^2)(3\text{ ft})}{12\text{ lb}}(15.6649\text{ lb})\sin 40°$$

or $$(v_C)_{\min} = 9.00\text{ ft/s}$$

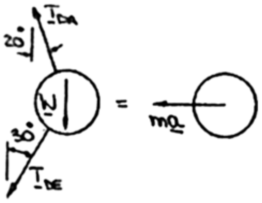
$0 < T_{CA} \le T_{CB} < 6\text{ lb}$ when $9.00\text{ ft/s} < v_C < 12.31\text{ ft/s}$ ◀



PROBLEM 12.43*

The 1.2-lb flyballs of a centrifugal governor revolve at a constant speed v in the horizontal circle of 6-in. radius shown. Neglecting the weights of links *AB*, *BC*, *AD*, and *DE* and requiring that the links support only tensile forces, determine the range of the allowable values of v so that the magnitudes of the forces in the links do not exceed 17 lb.

SOLUTION



First note $$a = a_n = \frac{v^2}{\rho}$$

where $$\rho = 0.5 \text{ ft}$$

$$\xleftarrow{+} \Sigma F_x = ma: \quad T_{DA} \sin 20° + T_{DE} \sin 30° = \frac{W}{g}\frac{v^2}{\rho} \qquad (1)$$

$$+\!\uparrow \Sigma F_y = 0: \quad T_{DA} \cos 20° - T_{DE} \cos 30° - W = 0 \qquad (2)$$

Note that Eq. (2) implies that

(*a*) when $T_{DE} = (T_{DE})_{\max}, \quad T_{DA} = (T_{DA})_{\max}$

(*b*) when $T_{DE} = (T_{DE})_{\min}, \quad T_{DA} = (T_{DA})_{\min}$

Case 1: T_{DA} is maximum.

Let $$T_{DA} = 17 \text{ lb}$$

Eq. (2) $$(17 \text{ lb}) \cos 20° - T_{DE} \cos 30° - (1.2 \text{ lb}) = 0$$

or $$T_{DE} = 17.06 \text{ lb} \quad \text{unacceptable } (> 17 \text{ lb})$$

Now let $$T_{DE} = 17 \text{ lb}$$

Eq. (2) $$T_{DA} \cos 20° - (17 \text{ lb}) \cos 30° - (1.2 \text{ lb}) = 0$$

or $$T_{DA} = 16.9443 \text{ lb} \quad \text{OK} \quad (\le 17 \text{ lb})$$

$$(T_{DA})_{\max} = 16.9443 \text{ lb}$$
$$(T_{DE})_{\max} = 17 \text{ lb}$$

Eq. (1) $$(v^2)_{(T_{DA})_{\max}} = \frac{(32.2 \text{ ft/s}^2)(0.5 \text{ ft})}{1.2 \text{ lb}}(16.9443 \sin 20° + 17 \sin 30°) \text{ lb}$$

or $$v_{(T_{DA})_{\max}} = 13.85 \text{ ft/s}$$

Now form $$(\cos 30°) \times [\text{Eq. (1)}] + (\sin 30°) \times [\text{Eq. (2)}]$$

$$T_{DA} \sin 20° \cos 30° + T_{DA} \cos 20° \sin 30° = \frac{W}{g}\frac{v^2}{\rho}\cos 30° + W \sin 30°$$

or $$T_{DA} \sin 50° = \frac{W}{g}\frac{v^2}{\rho}\cos 30° + W \sin 30° \qquad (3)$$

$v_{\max}$ occurs when $T_{DA} = (T_{DA})_{\max}$

$v_{\max} = 13.85$ ft/s

Case 2: T_{DA} is minimum.

Because $(T_{DA})_{\min}$ occurs when $T_{DE} = (T_{DE})_{\min}$,

let $T_{DE} = 0$.

Eq. (2) $$T_{DA} \cos 20° - (1.2 \text{ lb}) = 0$$

or $$T_{DA} = 1.27701 \text{ lb}, \ 17 \text{ lb} \qquad \text{OK}$$

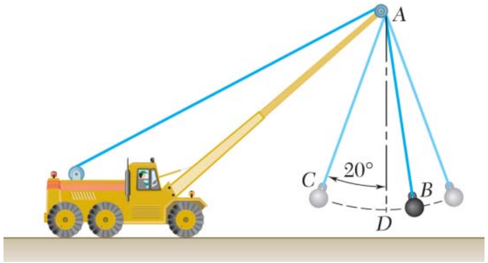
Note: Eq. (3) implies that when $T_{DA} = (T_{DA})_{\min}$, $v = v_{\min}$. Then

Eq. (1) $$(v^2)_{\min} = \frac{(32.2 \text{ ft/s}^2)(0.5 \text{ ft})}{1.2 \text{ lb}}(1.27701 \text{ lb}) \sin 20°$$

or $$v_{\min} = 2.42 \text{ ft/s}$$

$0 < T_{AB}, T_{BC}, T_{AD}, T_{DE} < 17$ lb

when $2.42 \text{ ft/s} < v < 13.85 \text{ ft/s}$ ◀

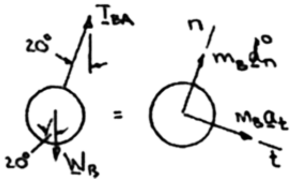


PROBLEM 12.44

A 130-lb wrecking ball B is attached to a 45-ft-long steel cable AB and swings in the vertical arc shown. Determine the tension in the cable (a) at the top C of the swing, (b) at the bottom D of the swing, where the speed of B is 13.2 ft/s.

SOLUTION

(a) At C, the top of the swing, $v_B = 0$; thus



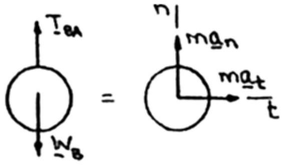
$$a_n = \frac{v_B^2}{L_{AB}} = 0$$

$$+\nearrow \ \Sigma F_n = 0: \quad T_{BA} - W_B \cos 20° = 0$$

or $$T_{BA} = (130 \text{ lb}) \times \cos 20°$$

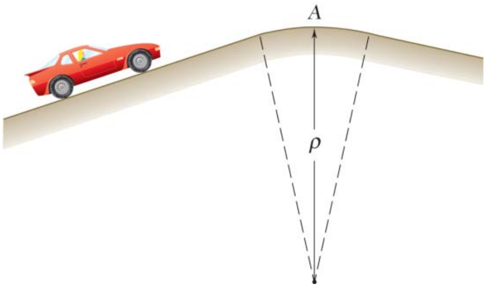
or $$T_{BA} = 122.2 \text{ lb} \blacktriangleleft$$

(b) $$+\uparrow \ \Sigma F_n = ma_n: \quad T_{BA} - W_B = m_B \frac{(v_B)_D^2}{L_{AB}}$$



or $$T_{BA} = (130 \text{ lb}) + \left[\left(\frac{130 \text{ lb}}{32.2 \text{ ft/s}^2}\right)\left(\frac{(13.2 \text{ ft/s})^2}{45 \text{ ft}}\right)\right]$$

or $$T_{BA} = 145.6 \text{ lb} \blacktriangleleft$$



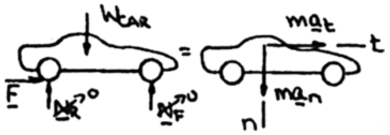
PROBLEM 12.45

During a high-speed chase, a 2400-lb sports car traveling at a speed of 100 mi/h just loses contact with the road as it reaches the crest *A* of a hill. (*a*) Determine the radius of curvature ρ of the vertical profile of the road at *A*. (*b*) Using the value of ρ found in part *a*, determine the force exerted on a 160-lb driver by the seat of his 3100-lb car as the car, traveling at a constant speed of 50 mi/h, passes through *A*.

SOLUTION

(*a*) *Note:* $100 \text{ mi/h} = 146.667 \text{ ft/s}$

$$+\!\downarrow \Sigma F_n = ma_n: \quad W_{\text{car}} = \frac{W_{\text{car}}}{g}\frac{v_A^2}{\rho}$$

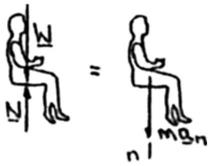


or $$\rho = \frac{(146.667 \text{ ft/s})^2}{32.2 \text{ ft/s}^2} = 668.05 \text{ ft}$$

or $$\rho = 668 \text{ ft} \blacktriangleleft$$

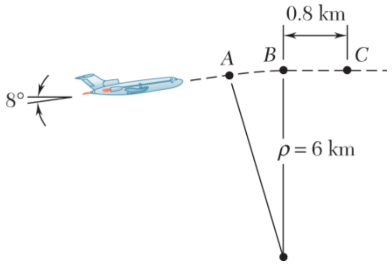
(*b*) *Note:* v is constant $\Rightarrow a_t = 0$; $50 \text{ mi/h} = 73.333 \text{ ft/s}$

$$+\!\downarrow \Sigma F_n = ma_n: \quad W - N = \frac{W}{g}\frac{v_A^2}{\rho}$$



or $$N = (160 \text{ lb})\left[1 - \frac{(73.333 \text{ ft/s})^2}{(32.2 \text{ ft/s}^2)(668.05 \text{ ft})}\right]$$

or $$\mathbf{N} = 120.0 \text{ lb}\uparrow \blacktriangleleft$$



PROBLEM 12.46

An airline pilot climbs to a new flight level along the path shown. Knowing that the speed of the airplane decreases at a constant rate from 180 m/s at point *A* to 160 m/s at point *C*, determine the magnitude of the abrupt change in the force exerted on a 90-kg passenger as the airplane passes point *B*.

SOLUTION

Angle change over arc *AB*. $\theta = \frac{8°}{180°}\pi = 0.13963 \text{ rad}$

Length of arc: $s_{AB} = \rho\theta = (6000)(0.13963) = 837.76 \text{ m}$

$$s_{BC} = 800 \text{ m}, \quad s_{AC} = 837.76 + 800 = 1637.76 \text{ m}$$

$$\int_{180}^{160} v\,dv = \int_0^{1637.76} a_t\,ds \qquad \text{or} \qquad \frac{160^2}{2} - \frac{180^2}{2} = a_t(1637.76)$$

$$a_t = -2.076 \text{ m/s}^2$$

$$\int_{180}^{v_B} v\,dv = \int_0^{837.76} a_t\,ds \qquad \text{or} \qquad \frac{v_B^2}{2} - \frac{180^2}{2} = (-2.076)(837.76)$$

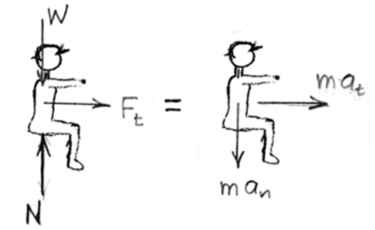
$$v_B^2 = 28922 \text{ m}^2/\text{s}^2 \qquad v_B = 170.06 \text{ m/s}$$

Weight of passenger: $mg = (90)(9.81) = 882.9 \text{ N}$

Just before point *B*. $v = 170.06 \text{ m/s}, \quad \rho = 6000 \text{ m}$

$$a_n = \frac{v^2}{\rho} = \frac{(170.06)^2}{6000} = 4.820 \text{ m/s}^2$$

Free Body Diagram of Pilot:



$$+\uparrow \Sigma F_n = N_1 - W = -m(a_n)_1: \quad N_1 = 882.9 - (90)(4.820) = 449.1 \text{ N}$$

$$\xrightarrow{+} \Sigma F_t = F_t = ma_t: \quad (F_t)_1 = (90)(-2.076) = -186.8 \text{ N}$$

Just after point *B*. $v = 170.06 \text{ m/s}, \quad \rho = \infty, \quad a_n = 0$

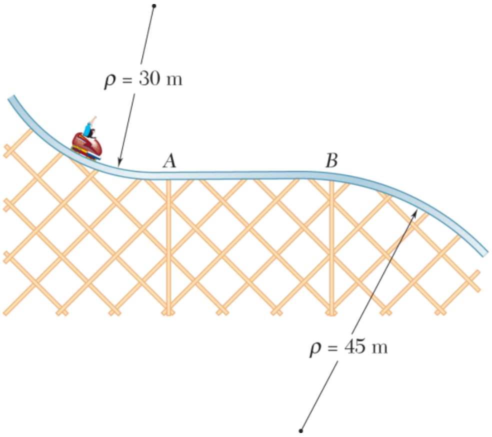
$$+\uparrow \Sigma F_y = 0: \quad N_2 - W = 0 \qquad N_2 = W = 882.9 \text{ N}$$

$$\xrightarrow{+} \Sigma F_x = ma_t: \quad F_t = ma_t = (90)(-2.076) = -186.8 \text{ N}$$

F_t does not change.

N increases by 433.8 N.

magnitude of change of force = 434 N ◀



$\rho = 30$ m

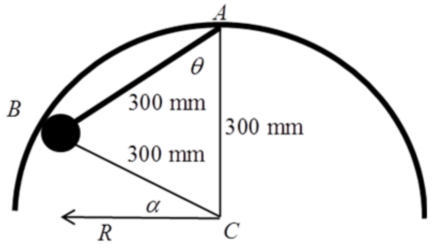
PROBLEM 12.48

A spherical-cap governor is fixed to a vertical shaft that rotates with angular velocity ω. When the string-supported clapper of mass m touches the cap, a cutoff switch is operated electrically to reduce the speed of the shaft. Knowing that the radius of the clapper is small relative to the cap, determine the minimum angular speed at which the cutoff switch operates.

SOLUTION

Given: $\omega_{\min}$ is the angular velocity when the clapper hits the cap

Geometry From Figure:



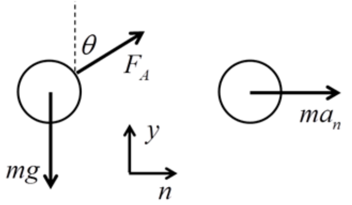
Distance AB is 300 mm, the length of the Clapper Arm

Distance BC and AC is 300 mm, the radius of the Spherical Cap.

Therefore $\triangle ABC$ is equilateral, so $\theta = 60°$ and $\alpha = 30°$

$$R = 0.3 * \cos\alpha$$

Free Body Diagram of Clapper:



Equations of Motion:

$$\sum F_y = ma_y \qquad \sum F_n = ma_n$$

$$\mathrm{F}_A \cos\theta - mg = m(0) \qquad F_A \sin\theta = mR\omega_{\min}^2$$

$$F_A = \frac{mg}{\cos\theta} \quad (1) \qquad \omega_{win} = \sqrt{\frac{F_A \sin\theta}{mR}} \quad (2)$$

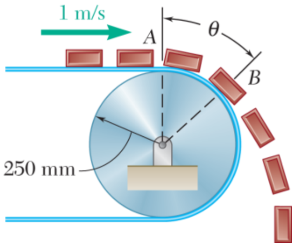
Substitute (1)into (2):

$$\omega_{win} = \sqrt{\frac{\cancel{m} g \tan\theta}{\cancel{m} R}}$$

$$= \sqrt{\frac{9.81 \tan 60°}{0.3 \cos 30°}}$$

$$= 8.087 \text{ rad/s}$$

ω_{win} =77.23 rpm ◀



PROBLEM 12.49

A series of small packages, each with a mass of 0.5 kg, are discharged from a conveyor belt as shown. Knowing that the coefficient of static friction between each package and the conveyor belt is 0.4, determine (*a*) the force exerted by the belt on a package just after it has passed Point *A*, (*b*) the angle θ defining the Point *B* where the packages first *slip* relative to the belt.

SOLUTION

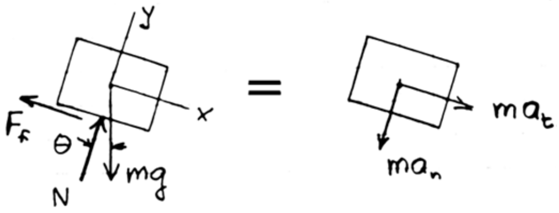
Assume package does not slip.

$$a_t = 0, \quad F_f \le \mu_s N$$

On the curved portion of the belt

$$a_n = \frac{v^2}{\rho} = \frac{(1\text{ m/s})^2}{0.250\text{ m}} = 4\text{ m/s}^2$$

For any angle θ



$$+\nearrow \Sigma F_y = ma_y: \quad N - mg\cos\theta = -ma_n = -\frac{mv^2}{\rho}$$

$$N = mg\cos\theta - \frac{mv^2}{\rho} \qquad (1)$$

$$+\searrow \Sigma F_x = ma_x: \quad -F_f + mg\sin\theta = ma_t = 0$$

$$F_f = mg\sin\theta \qquad (2)$$

(*a*) At Point *A*, $\theta = 0°$

$$N = (0.5)(9.81)(1.000) - (0.5)(4)$$

$N = 2.905\text{ N}$ ◀

(*b*) At Point *B*, $F_f = \mu_s N$

$$mg\sin\theta = \mu_s(mg\cos\theta - ma_n)$$

$$\sin\theta = \mu_s\left(\cos\theta - \frac{a_n}{g}\right) = 0.40\left[\cos\theta - \frac{4}{9.81}\right]$$

PROBLEM 12.49 (Continued)

Squaring and using trigonometic identities,

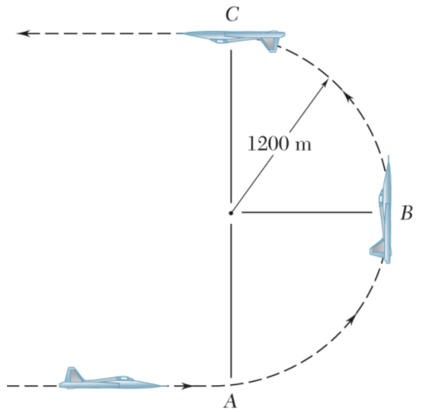
$$1-\cos^2\theta = 0.16\cos^2\theta - 0.130479\cos\theta + 0.026601$$

$$1.16\cos^2\theta - 0.130479\cos\theta - 0.97340 = 0$$

$$\cos\theta = 0.97402 \qquad \theta = 13.09° \blacktriangleleft$$

Check that package does not separate from the belt.

$$N = \frac{F_f}{\mu_s} = \frac{mg\sin\theta}{\mu_s} \qquad N > 0.$$



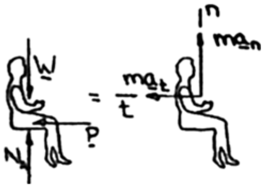
PROBLEM 12.50

A 54-kg pilot flies a jet trainer in a half vertical loop of 1200-m radius so that the speed of the trainer decreases at a constant rate. Knowing that the pilot's apparent weights at Points *A* and *C* are 1680 N and 350 N, respectively, determine the force exerted on her by the seat of the trainer when the trainer is at Point *B*.

SOLUTION

First we note that the pilot's apparent weight is equal to the vertical force that she exerts on the seat of the jet trainer.

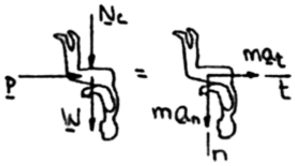
At *A*: $+\uparrow \Sigma F_n = ma_n\text{:}\quad N_A - W = m\dfrac{v_A^2}{\rho}$



or $$v_A^2 = (1200\text{ m})\left(\frac{1680\text{ N}}{54\text{ kg}} - 9.81\text{ m/s}^2\right)$$

$$= 25{,}561.3\text{ m}^2/\text{s}^2$$

At *C*: $+\downarrow \Sigma F_n = ma_n\text{:}\quad N_C + W = m\dfrac{v_C^2}{\rho}$



or $$v_C^2 = (1200\text{ m})\left(\frac{350\text{ N}}{54\text{ kg}} + 9.81\text{ m/s}^2\right)$$

$$= 19{,}549.8\text{ m}^2/\text{s}^2$$

Since $a_t = \text{constant,}$ we have from *A* to *C*

$$v_C^2 = v_A^2 + 2a_t\ \Delta s_{AC}$$

or $$19{,}549.8\text{ m}^2/\text{s}^2 = 25{,}561.3\text{ m}^2/\text{s}^2 + 2a_t(\pi \times 1200\text{ m})$$

or $$a_t = -0.79730\text{ m/s}^2$$

Then from *A* to *B*

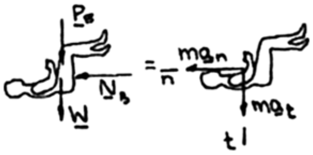
$$v_B^2 = v_A^2 + 2a_t\ \Delta s_{AB}$$

$$= 25{,}561.3\text{ m}^2/\text{s}^2 + 2(-0.79730\text{ m/s}^2)\left(\frac{\pi}{2} \times 1200\text{ m}\right)$$

$$= 22{,}555\text{ m}^2/\text{s}^2$$

PROBLEM 12.50 (Continued)

At B: $\overset{+}{\longleftarrow}\ \Sigma F_n = ma_n$: $N_B = m\dfrac{v_B^2}{\rho}$



or $$N_B = 54\ \text{kg}\,\frac{22{,}555\ \text{m}^2/\text{s}^2}{1200\ \text{m}}$$

or $$\mathbf{N}_B = 1014.98\ \text{N} \longleftarrow$$

$$+\big\downarrow \Sigma F_t = ma_t: \quad W + P_B = m\,|a_t|$$

or $$P_B = (54\ \text{kg})(0.79730 - 9.81)\ \text{m/s}^2$$

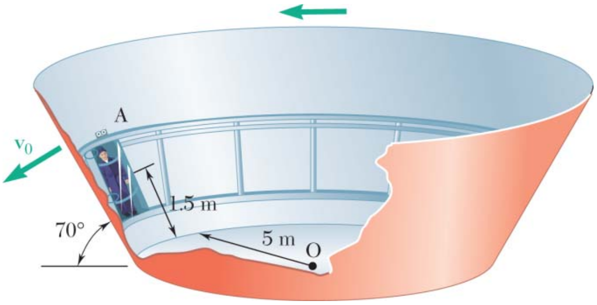
or $$\mathbf{P}_B = 486.69\ \text{N}\uparrow$$

Finally, $$(F_{\text{pilot}})_B = \sqrt{N_B^2 + P_B^2} = \sqrt{(1014.98)^2 + (486.69)^2}$$
$$= 1126\ \text{N}$$

or $$(\mathbf{F}_{\text{pilot}})_B = 1126\ \text{N} \searrow 25.6° \blacktriangleleft$$

PROBLEM 12.51

A carnival ride is designed to allow the general public to experience high acceleration motion. The ride rotates about Point O in a horizontal circle such that the rider has a speed v_0. The rider reclines on a platform A which rides on rollers such that friction is negligible. A mechanical stop prevents the platform from rolling down the incline. Determine (a) the speed v_0 at which the platform A begins to roll upwards, (b) the normal force experienced by an 80-kg rider at this speed.



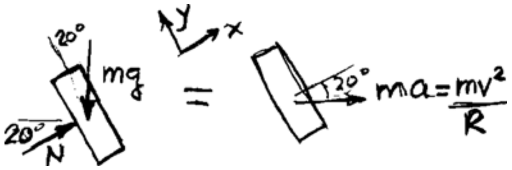
SOLUTION

Radius of circle: $R = 5 + 1.5\cos 70° = 5.513 \text{ m}$

$\Sigma\mathbf{F} = m\mathbf{a}$:

Components up the incline, ∡70°:

$$-m_A g\cos 20° = -\frac{mv_0^2}{R}\sin 20°$$

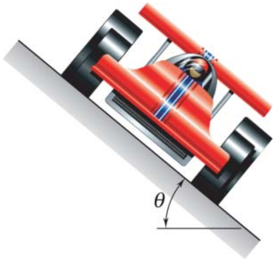


(a) Speed v_0: $v_0 = \left[\dfrac{gR}{\tan 20°}\right]^{\frac{1}{2}} = \left[\dfrac{(9.81 \text{ m/s})(5.513 \text{ m}}{\tan 20°}\right]^{\frac{1}{2}} = 12.1898 \text{ m/s}$ $v_0 = 12.19 \text{ m/s}$ ◀

Components normal to the incline, ∡ 20°.

$$N - mg\sin 20° = \frac{mv_0^2}{R}\cos 20°.$$

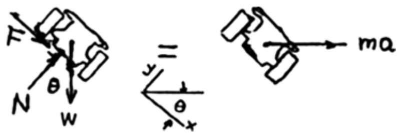
(b) Normal force: $N = (80)(9.81)\sin 20° + \dfrac{80(12.1898)^2}{5.513}\cos 20° = 2294 \text{ N}$ $N = 2290 \text{ N}$ ◀



PROBLEM 12.52

A curve in a speed track has a radius of 1000 ft and a rated speed of 120 mi/h. (See Sample Problem 12.7 for the definition of rated speed). Knowing that a racing car starts skidding on the curve when traveling at a speed of 180 mi/h, determine (*a*) the banking angle θ, (*b*) the coefficient of static friction between the tires and the track under the prevailing conditions, (*c*) the minimum speed at which the same car could negotiate that curve.

SOLUTION



Weight $W = mg$

Acceleration $a = \dfrac{v^2}{\rho}$

$$\Sigma F_x = ma_x: \quad F + W \sin\theta = ma \cos\theta$$

$$F = \frac{mv^2}{\rho}\cos\theta - mg\sin\theta \qquad (1)$$

$$\Sigma F_y = ma_y: \quad N - W\cos\theta = ma\sin\theta$$

$$N = \frac{mv^2}{\rho}\sin\theta + mg\cos\theta \qquad (2)$$

(*a*) Banking angle. Rated speed $v = 120$ mi/h $= 176$ ft/s. $F = 0$ at rated speed.

$$0 = \frac{mv^2}{\rho}\cos\theta - mg\sin\theta$$

$$\tan\theta = \frac{v^2}{\rho g} = \frac{(176)^2}{(1000)(32.2)} = 0.96199$$

$$\theta = 43.89^\circ$$

$\theta = 43.9^\circ$ ◀

(*b*) Slipping outward. $v = 180$ mi/h $= 264$ ft/s

$$F = \mu N \quad \mu = \frac{F}{N} = \frac{v^2\cos\theta - \rho g\sin\theta}{v^2\sin\theta + \rho g\cos\theta}$$

$$\mu = \frac{(264)^2\cos 43.89^\circ - (1000)(32.2)\sin 43.89^\circ}{(264)^2\sin 43.89^\circ + (1000)(32.2)\cos 43.89^\circ}$$

$$= 0.39009$$

$\mu = 0.390$ ◀

PROBLEM 12.52 (Continued)

(*c*) Minimum speed.

$$F = -\mu N$$

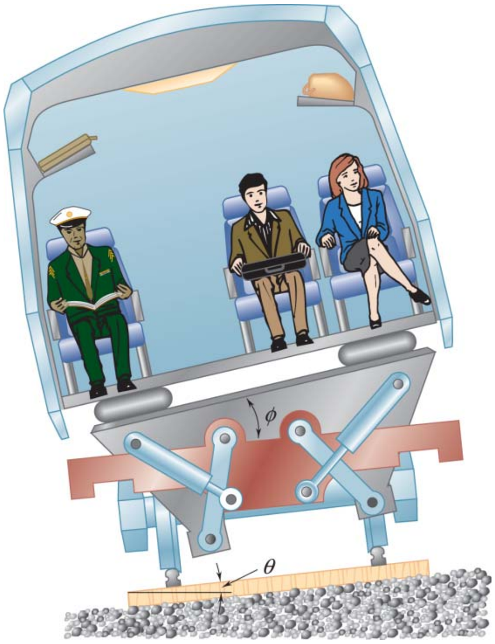
$$-\mu = \frac{v^2 \cos\theta - \rho g \sin\theta}{v^2 \sin\theta + \rho g \cos\theta}$$

$$v^2 = \frac{\rho g(\sin\theta - \mu\cos\theta)}{\cos\theta + \mu\sin\theta}$$

$$= \frac{(1000)(32.2)(\sin 43.89° - 0.39009 \cos 43.89°)}{\cos 43.89° + 0.39009 \sin 43.89°}$$

$$= 13.369 \text{ ft}^2/\text{s}^2$$

$$v = 115.62 \text{ ft/s} \qquad v = 78.8 \text{ mi/h} \blacktriangleleft$$



PROBLEM 12.53

Tilting trains, such as the *American Flyer* which will run from Washington to New York and Boston, are designed to travel safely at high speeds on curved sections of track which were built for slower, conventional trains. As it enters a curve, each car is tilted by hydraulic actuators mounted on its trucks. The tilting feature of the cars also increases passenger comfort by eliminating or greatly reducing the side force $\mathbf{F}_s$ (parallel to the floor of the car) to which passengers feel subjected. For a train traveling at 100 mi/h on a curved section of track banked through an angle $\theta = 6°$ and with a rated speed of 60 mi/h, determine (*a*) the magnitude of the side force felt by a passenger of weight W in a standard car with no tilt ($\phi = 0$), (*b*) the required angle of tilt ϕ if the passenger is to feel no side force. (See Sample Problem 12.7 for the definition of rated speed.)

SOLUTION

Rated speed: $v_R = 60 \text{ mi/h} = 88 \text{ ft/s}, \;\; 100 \text{ mi/h} = 146.67 \text{ ft/s}$

From Sample Problem 12.6,

$$v_R^2 = g\rho \tan\theta$$

or

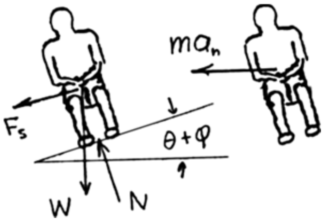
$$\rho = \frac{v_R^2}{g\tan\theta} = \frac{(88)^2}{32.2\tan 6°} = 2288 \text{ ft}$$

Let the *x*-axis be parallel to the floor of the car.

$$+\swarrow \Sigma F_x = ma_x: \quad F_s + W\sin(\theta+\phi) = ma_n\cos(\theta+\phi)$$

$$= \frac{mv^2}{\rho}\cos(\theta+\phi)$$

(*a*) $\phi = 0.$



$$F_s = W\left[\frac{v^2}{g\rho}\cos(\theta+\phi) - \sin(\theta+\phi)\right]$$

$$= W\left[\frac{(146.67)^2}{(32.2)(2288)}\cos 6° - \sin 6°\right]$$

$$= 0.1858W$$

$F_s = 0.1858W$ ◀

PROBLEM 12.53 (Continued)

(*b*) For $F_s = 0$,

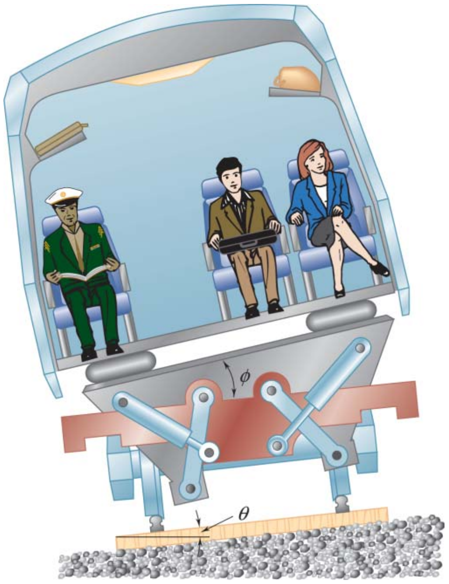
$$\frac{v^2}{g\rho}\cos(\theta+\phi) - \sin(\theta+\phi) = 0$$

$$\tan(\theta+\phi) = \frac{v^2}{g\rho} = \frac{(146.67)^2}{(32.2)(2288)} = 0.29199$$

$$\theta+\phi = 16.28°$$

$$\phi = 16.28° - 6°$$

$\phi = 10.28°$ ◀



PROBLEM 12.54

Tests carried out with the tilting trains described in Problem 12.53 revealed that passengers feel queasy when they see through the car windows that the train is rounding a curve at high speed, yet do not feel any side force. Designers, therefore, prefer to reduce, but not eliminate, that force. For the train of Problem 12.53, determine the required angle of tilt ϕ if passengers are to feel side forces equal to 10% of their weights.

SOLUTION

Rated speed: $v_R = 60 \text{ mi/h} = 88 \text{ ft/s}, \;\; 100 \text{ mi/h} = 146.67 \text{ ft/s}$

From Sample Problem 12.6,

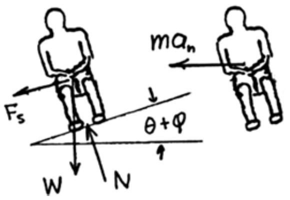
$$v_R^2 = g\rho \tan\theta$$

or $$\rho = \frac{v_R^2}{g\tan\theta} = \frac{(88)^2}{32.2\tan 6°} = 2288 \text{ ft}$$

Let the *x*-axis be parallel to the floor of the car.

$$+\swarrow \Sigma F_x = ma_x: \quad F_s + W\sin(\theta+\phi) = ma_n\cos(\theta+\phi)$$

$$= \frac{mv^2}{\rho}\cos(\theta+\phi)$$



Solving for F_s, $$F_s = W\left[\frac{v^2}{g\rho}\cos(\theta+\phi) - \sin(\theta+\phi)\right]$$

Now $$\frac{v^2}{g\rho} = \frac{(146.67)^2}{(32.2)(2288)} = 0.29199 \quad \text{and} \quad F_s = 0.10W$$

So that $$0.10W = W[0.29199\cos(\theta+\phi) - \sin(\theta+\phi)]$$

Let $$u = \sin(\theta+\phi)$$

Then $$\cos(\theta+\phi) = \sqrt{1-u^2}$$

$$0.10 = 0.29199\sqrt{1-u^2} - u \quad \text{or} \quad 0.29199\sqrt{1-u^2} = 0.10 + u$$

PROBLEM 12.54 (Continued)

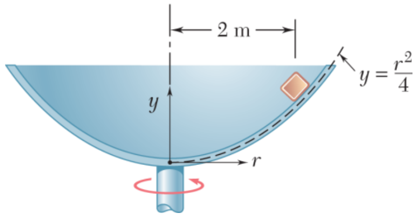
Squaring both sides, $0.08526(1-u^2) = 0.01 + 0.2u + u^2$

or $1.08526u^2 + 0.2u - 0.07526 = 0$

The positive root of the quadratic equation is $u = 0.18685$

Then, $\theta + \phi = \sin^{-1} u = 10.77°$

$\phi = 10.77° - 6°$ $\phi = 4.77°$ ◀



PROBLEM 12.55

A 3-kg block is at rest relative to a parabolic dish which rotates at a constant rate about a vertical axis. Knowing that the coefficient of static friction is 0.5 and that $r = 2$ m, determine the maximum allowable velocity v of the block.

SOLUTION

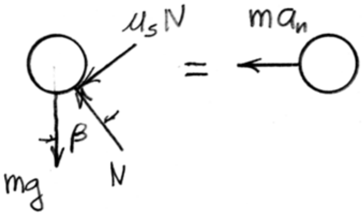
Let β be the slope angle of the dish. $\tan\beta = \frac{dy}{dr} = \frac{1}{2}r$

At $r = 2$ m, $\tan\beta = 1$ or $\beta = 45°$

Draw free body sketches of the sphere.

$$\Sigma F_y = 0: \quad N\cos\beta - \mu_S N\sin\beta - mg = 0$$

$$N = \frac{mg}{\cos\beta - \mu_S\sin\beta}$$

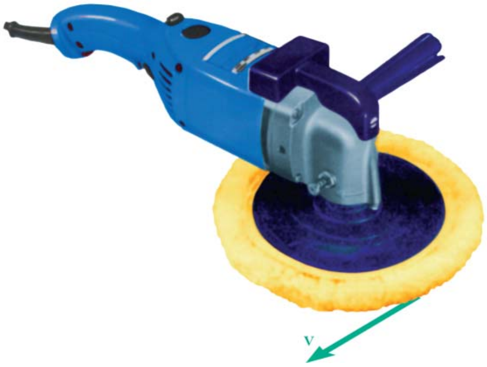


$$\overset{+}{\longleftarrow} \Sigma F_n = ma_n: \quad N\sin\beta + \mu_S N\cos\beta = \frac{mv^2}{\rho}$$

$$\frac{mg(\sin\beta + \mu_S N\cos\beta)}{\cos\beta - \mu_S\sin\beta} = \frac{mv^2}{\rho}$$

$$v^2 = \rho g\frac{\sin\beta + \mu_S\cos\beta}{\cos\beta - \mu_S\sin\beta} = (2)(9.81)\frac{\sin 45° + 0.5\cos 45°}{\cos 45° - 0.5\sin 45°} = 58.86 \text{ m}^2/\text{s}^2$$

$v = 7.67$ m/s ◀



PROBLEM 12.56

A polisher is started so that the fleece along the circumference undergoes a constant tangential acceleration of 4 m/s^2. Three seconds after a polisher is started from rest, small tufts of fleece from along the circumference of the 225-mm-diameter polishing pad are observed to fly free of the pad. At this instant, determine (*a*) the speed *v* of a tuft as it leaves the pad, (*b*) the magnitude of the force required to free a tuft if the average mass of a tuft is 1.6 mg.

SOLUTION

(*a*) $a_t = \text{constant} \Rightarrow$ uniformly acceleration motion

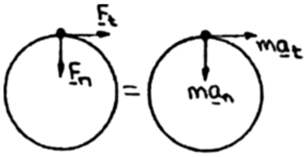
Then $\quad v = 0 + a_t t$

At $t = 3$ s: $\quad v = (4\text{ m/s}^2)(3\text{ s})$

or $\quad v = 12.00\text{ m/s}$ ◀

(*b*) $\Sigma F_t = ma_t: \quad F_t = ma_t$

or
$$F_t = (1.6\times10^{-6}\text{kg})(4\text{ m/s}^2) = 6.4\times10^{-6}\text{N}$$

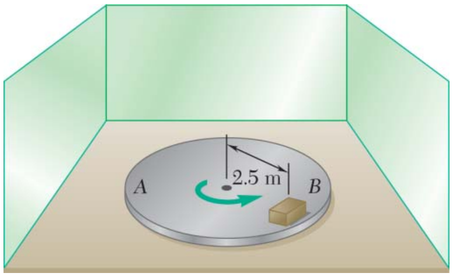


$$\Sigma F_n = ma_n: \quad F_n = m\frac{v^2}{\rho}$$

At $t = 3$ s:
$$F_n = (1.6\times10^{-6}\text{kg})\frac{(12\text{ m/s})^2}{\left(\frac{0.225}{2}\text{m}\right)} = 2.048\times10^{-3}\text{N}$$

Finally,
$$F_{\text{tuft}} = \sqrt{F_t^2 + F_n^2} = \sqrt{(6.4\times10^{-6}\text{N})^2 + (2.048\times10^{-3}\text{N})^2}$$

or $\quad F_{\text{tuft}} = 2.05\times10^{-3}\text{N}$ ◀



PROBLEM 12.57

A turntable A is built into a stage for use in a theatrical production. It is observed during a rehearsal that a trunk B starts to slide on the turntable 10 s after the turntable begins to rotate. Knowing that the trunk undergoes a constant tangential acceleration of 0.24 m/s^2, determine the coefficient of static friction between the trunk and the turntable.

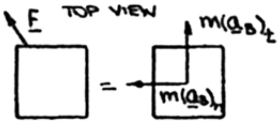
SOLUTION

First we note that $(a_B)_t =$ constant implies uniformly accelerated motion.

$$v_B = 0 + (a_B)_t t$$

At $t = 10$ s: $$v_B = (0.24\ \text{m/s}^2)(10\ \text{s}) = 2.4\ \text{m/s}$$

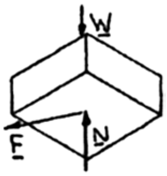
In the plane of the turntable



$$\Sigma\mathbf{F} = m_B\mathbf{a}_B: \quad \mathbf{F} = m_B(\mathbf{a}_B)_t + m_B(\mathbf{a}_B)_n$$

Then $$F = m_B\sqrt{(a_B)_t^2 + (a_B)_n^2}$$

$$= m_B\sqrt{(a_B)_t^2 + \left(\frac{v_B^2}{\rho}\right)^2}$$



$$+\uparrow \Sigma F_y = 0: \quad N - W = 0$$

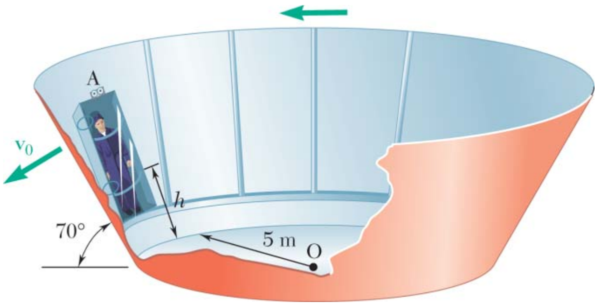
or $$N = m_B g$$

At $t = 10$ s: $$F = \mu_s N = \mu_s m_B g$$

Then $$\mu_s m_B g = m_B\sqrt{(a_B)_t^2 + \left(\frac{v_B^2}{\rho} -\right)^2}$$

or $$\mu_s = \frac{1}{9.81\ \text{m/s}^2}\left\{(0.24\ \text{m/s}^2)^2 + \left[\frac{(2.4\ \text{m/s})^2}{2.5\ \text{m}}\right]^2\right\}^{1/2}$$

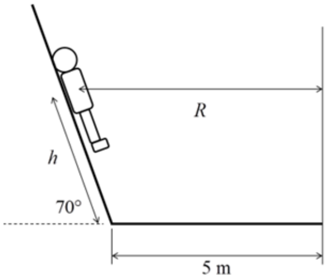
or $$\mu_s = 0.236 \blacktriangleleft$$



PROBLEM 12.58

The carnival ride from Prob 12.51 is modified so that the 80 kg riders can move up and down the inclined wall as the speed of the ride increases. Assuming that the friction between the wall and the carriage is negligible, determine the position h of the rider if the speed v_0 = 13 m/s.

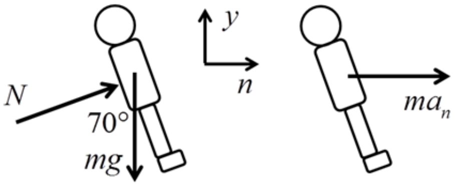
SOLUTION



Given: $m = 80\text{ kg},\ v_0 = 13\text{ m/s}$

Geometry from figure: $R = 5 + h\cos 70°$

Free Body Diagram of Rider:



Equations of Motion:

$$\sum F_y = ma_y$$

$$N\cos 70° - mg = m(0)$$

$$N = \frac{mg}{\cos 70°} \qquad (1)$$

$$\sum F_n = ma_n$$

$$N\sin 70° = \frac{mv^2}{R}$$

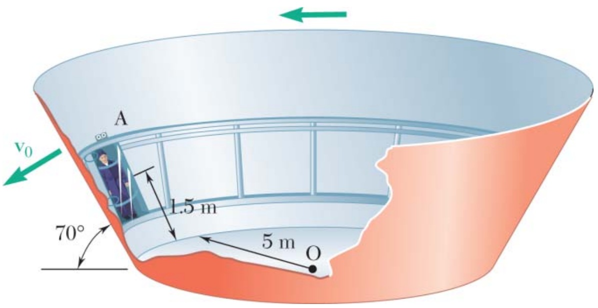
$$v = \sqrt{\frac{N\sin 70° R}{m}} \qquad (2)$$

Substitute (1)into (2):

$$v = \sqrt{\frac{\cancel{m}g\tan 70° R}{\cancel{m}}}$$

$$13 = \sqrt{9.81\tan 70°(5 + h\cos 70°)}$$

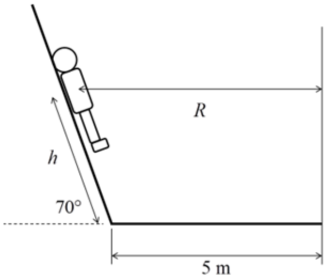
$$h = 3.714\text{ m} ◀$$



PROBLEM 12.59

The carnival ride from Prob 12.51 is modified so that the 80 kg riders can move up and down the inclined wall as the speed of the ride increases. Knowing that the coefficient of static friction between the wall and the platform is 0.2, determine the range of values of the constant speed v_0 for which the platform will remain in the position shown.

SOLUTION



Given: $m = 80 \text{ kg},\ \mu_s = 0.2,\ h = 1.5 \text{ m}$

Geometry from figure:

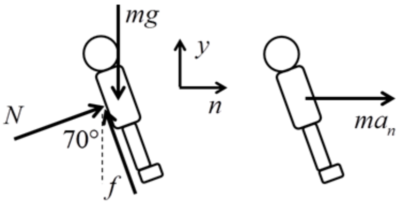
$$R = 5 + 1.5\cos 70^\circ$$
$$= 5.513 \text{ m}$$

Minimum and Maximum speeds occur if slipping is impending:

$$f = \mu_s N$$

Finding the minimum speed so that rider does not slide down the wall:

Free Body Diagram of Rider:



Equations of Motion:

$$\sum F_y = ma_y$$
$$N\cos 70^\circ + f\sin 70^\circ - mg = m(0)$$
$$N\cos 70^\circ + \mu_s \text{N}\sin 70^\circ - mg = 0$$
$$N = \frac{mg}{\cos 70^\circ + \mu_s \sin 70^\circ}$$
$$N = 1480.9 \text{ N}$$

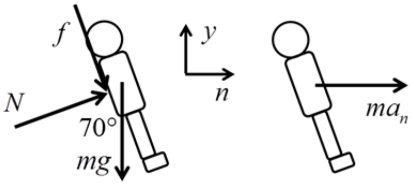
$$\sum F_n = ma_n$$
$$N\sin 70^\circ - f\cos 70^\circ = \frac{mv_{\min}^2}{R}$$
$$N\sin 70^\circ - \mu_s \text{N}\cos 70^\circ = \frac{mv_{\min}^2}{R}$$
$$v_{\min} = \sqrt{\frac{N(\sin 70^\circ - \mu_s\cos 70^\circ)R}{m}}$$

$$v_{\min} = 9.430 \text{ m/s} \blacktriangleleft$$

PROBLEM 12.59 (Continued)

Finding the maximum speed so that rider does not slide up the wall:

Free Body Diagram of Rider:



Equations of Motion:

$$\sum F_y = ma_y$$

$$N\cos 70° - f\sin 70° - mg = m(0)$$

$$N\cos 70° - \mu_s \mathrm{N}\sin 70° - mg = 0$$

$$N = \frac{mg}{\cos 70° - \mu_s \sin 70°}$$

$$N = 5093.4 \text{ N}$$

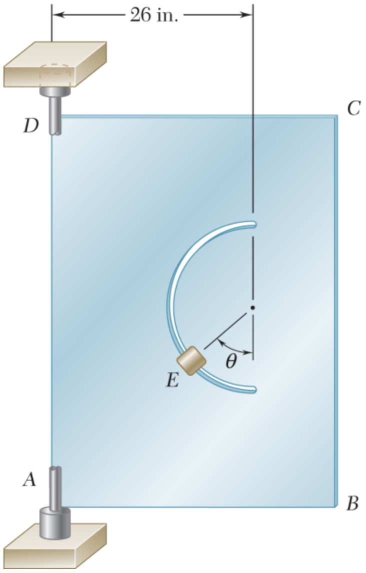
$$\sum F_n = ma_n$$

$$N\sin 70° + f\cos 70° = \frac{mv_{\min}^2}{R}$$

$$N\sin 70° + \mu_s \mathrm{N}\cos 70° = \frac{mv_{\min}^2}{R}$$

$$v_{\min} = \sqrt{\frac{N(\sin 70° + \mu_s \cos 70°)R}{m}}$$

$$v_{\min} = 18.81 \text{ m/s} ◀$$



PROBLEM 12.60

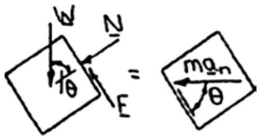
A semicircular slot of 10-in. radius is cut in a flat plate which rotates about the vertical *AD* at a constant rate of 14 rad/s. A small, 0.8-lb block *E* is designed to slide in the slot as the plate rotates. Knowing that the coefficients of friction are $\mu_s = 0.35$ and $\mu_k = 0.25$, determine whether the block will slide in the slot if it is released in the position corresponding to (*a*) $\theta = 80°$, (*b*) $\theta = 40°$. Also determine the magnitude and the direction of the friction force exerted on the block immediately after it is released.

SOLUTION

First note
$$\rho = \frac{1}{12}(26 - 10\sin\theta)\ \text{ft}$$
$$v_E = \rho\dot{\phi}_{ABCD}$$

Then
$$a_n = \frac{v_E^2}{\rho} = \rho(\dot{\phi}_{ABCD})^2$$
$$= \left[\frac{1}{12}(26 - 10\sin\theta)\ \text{ft}\right](14\ \text{rad/s})^2$$
$$= \frac{98}{3}(13 - 5\sin\theta)\ \text{ft/s}^2$$

Assume that the block is at rest with respect to the plate.



$$+\swarrow\ \Sigma F_x = ma_x\text{:}\quad N + W\cos\theta = m\frac{v_E^2}{\rho}\sin\theta$$

or
$$N = W\left(-\cos\theta + \frac{v_E^2}{g\rho}\sin\theta\right)$$

$$+\searrow\ \Sigma F_y = ma_y\text{:}\quad -F + W\sin\theta = -m\frac{v_E^2}{\rho}\cos\theta$$

or
$$F = W\left(\sin\theta + \frac{v_E^2}{g\rho}\cos\theta\right)$$

PROBLEM 12.60 (Continued)

(*a*) We have $\theta = 80°$

Then

$$N = (0.8\text{ lb})\left[-\cos 80° + \frac{1}{32.2\text{ ft/s}^2} \times \frac{98}{3}(13 - 5\sin 80°)\text{ ft/s}^2 \times \sin 80°\right]$$
$$= 6.3159\text{ lb}$$

$$F = (0.8\text{ lb})\left[\sin 80° + \frac{1}{32.2\text{ ft/s}^2} \times \frac{98}{3}(13 - 5\sin 80°)\text{ ft/s}^2 \times \cos 80°\right]$$
$$= 1.92601\text{ lb}$$

Now $F_{\max} = \mu_s N = 0.35(6.3159\text{ lb}) = 2.2106\text{ lb}$

The block does not slide in the slot, and

$\mathbf{F} = 1.926\text{ lb} \searrow 80°$ ◀

(*b*) We have $\theta = 40°$

Then

$$N = (0.8\text{ lb})\left[-\cos 40° + \frac{1}{32.2\text{ ft/s}^2} \times \frac{98}{3}(13 - 5\sin 40°)\text{ ft/s}^2 \times \sin 40°\right]$$
$$= 4.4924\text{ lb}$$

$$F = (0.8\text{ lb})\left[\sin 40° + \frac{1}{32.2\text{ ft/s}^2} \times \frac{98}{3}(13 - 5\sin 40°)\text{ ft/s}^2 \times \cos 40°\right]$$
$$= 6.5984\text{ lb}$$

Now $F_{\max} = \mu_s N,$ from which it follows that

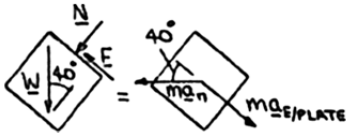
$$F > F_{\max}$$

Block *E* will slide in the slot

and
$$\mathbf{a}_E = \mathbf{a}_n + \mathbf{a}_{E/\text{plate}}$$
$$= \mathbf{a}_n + (\mathbf{a}_{E/\text{plate}})_t + (\mathbf{a}_{E/\text{plate}})_n$$

At $t = 0,$ the block is at rest relative to the plate, thus $(\mathbf{a}_{E/\text{plate}})_n = 0$ at $t = 0,$ so that $\mathbf{a}_{E/\text{plate}}$ must be directed tangentially to the slot.

$$+\nearrow \Sigma F_x = ma_x: \quad N + W\cos 40° = m\frac{v_E^2}{\rho}\sin 40°$$



or
$$N = W\left(-\cos 40° + \frac{v_E^2}{g\rho}\sin 40°\right) \quad \text{(as above)}$$
$$= 4.4924\text{ lb}$$

Sliding:

$$F = \mu_k N$$
$$= 0.25(4.4924 \text{ lb})$$
$$= 1.123 \text{ lb}$$

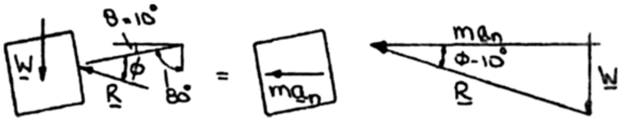
Noting that **F** and $\mathbf{a}_{E/\text{plane}}$ must be directed as shown (if their directions are reversed, then $\Sigma\mathbf{F}_x$ is $\searrow$ while $m\mathbf{a}_x$ is $\nwarrow$), we have the block slides downward in the slot and

$\mathbf{F} = 1.123 \text{ lb} \searrow 40°$ ◀

Alternative solutions.

(*a*) Assume that the block is at rest with respect to the plate.

$$\Sigma\mathbf{F} = m\mathbf{a}: \quad \mathbf{W} + \mathbf{R} = m\mathbf{a}_n$$



Then

$$\tan(\phi - 10°) = \frac{W}{ma_n} = \frac{W}{\frac{W}{g}\frac{v_E^2}{\rho}} = \frac{g}{\rho(\dot{\phi}_{ABCD})^2}$$

$$= \frac{32.2 \text{ ft/s}^2}{\frac{98}{3}(13 - 5\sin 80°) \text{ ft/s}^2} \qquad \text{(from above)}$$

or

$$\phi - 10° = 6.9588°$$

and

$$\phi = 16.9588°$$

Now

$$\tan\phi_s = \mu_s \quad \mu_s = 0.35$$

so that

$$\phi_s = 19.29°$$

$0 < \phi < \phi_s \Rightarrow$ Block does not slide and **R** is directed as shown.

Now

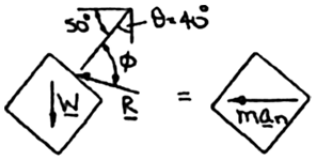
$$F = R\sin\phi \quad \text{and} \quad R = \frac{W}{\sin(\phi - 10°)}$$

Then

$$F = (0.8 \text{ lb})\frac{\sin 16.9588°}{\sin 6.9588°}$$
$$= 1.926 \text{ lb}$$

The block does not slide in the slot and

$\mathbf{F} = 1.926 \text{ lb} \searrow 80°$ ◀



(*b*) Assume that the block is at rest with respect to the plate.

$$\Sigma\mathbf{F} = m\mathbf{a}: \quad \mathbf{W} + \mathbf{R} = m\mathbf{a}_n$$

From Part *a* (above), it then follows that

$$\tan(\phi - 50°) = \frac{g}{\rho(\dot{\phi}_{ABCD})^2} = \frac{32.2 \text{ ft/s}^2}{\frac{98}{3}(13 - 5\sin 40°) \text{ ft/s}^2}$$

or $\phi - 50° = 5.752°$

and $\phi = 55.752°$

Now $\phi_s = 19.29°$

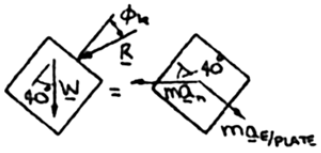
so that $\phi > \phi_s$

The block will slide in the slot and then

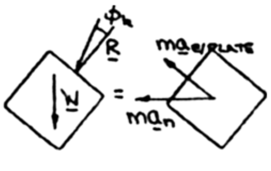
$$\phi = \phi_k, \quad \text{where} \quad \tan\phi_k = \mu_k \quad \mu_k = 0.25$$

or $\phi_k = 14.0362°$

To determine in which direction the block will slide, consider the free-body diagrams for the two possible cases.



SLIDING DOWNWARD



SLIDING UPWARD

Now $\Sigma\mathbf{F} = m\mathbf{a}: \quad \mathbf{W} + \mathbf{R} = m\mathbf{a}_n + m\mathbf{a}_{E/\text{plate}}$

From the diagrams it can be concluded that this equation can be satisfied only if the block is sliding downward. Then

$$+\swarrow \Sigma F_x = ma_x: \quad W\cos 40° + R\cos\phi_k = m\frac{v_E^2}{\rho}\sin 40°$$

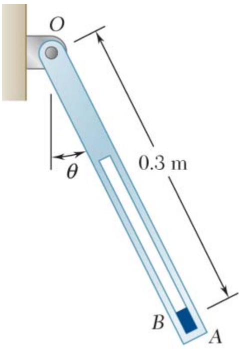
Now $F = R\sin\phi_k$

Then $$W\cos 40° + \frac{F}{\tan\phi_k} = \frac{W}{g}\frac{v_E^2}{\rho}\sin 40°$$

or $$F = \mu_k W\left(-\cos 40° + \frac{v_E^2}{g\rho}\sin 40°\right)$$

$$= 1.123 \text{ lb} \qquad \text{(see the first solution)}$$

The block slides downward in the slot and $\mathbf{F} = 1.123 \text{ lb} \measuredangle 40°$ ◀



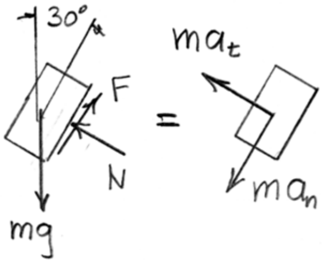
PROBLEM 12.61

A small block *B* fits inside a lot cut in arm *OA* which rotates in a vertical plane at a constant rate. The block remains in contact with the end of the slot closest to *A* and its speed is 1.4 m/s for $0 \le \theta \le 150°$. Knowing that the block begins to slide when $\theta = 150°$, determine the coefficient of static friction between the block and the slot.

SOLUTION

Draw the free body diagrams of the block *B* when the arm is at $\theta = 150°$.

$$\dot{v} = a_t = 0, \quad g = 9.81 \text{ m/s}^2$$



$$+\nwarrow \Sigma F_t = ma_t: \quad -mg\sin 30° + N = 0$$

$$N = mg\sin 30°$$

$$+\swarrow \Sigma F_n = ma_n: \quad mg\cos 30° - F = m\frac{v^2}{\rho}$$

$$F = mg\cos 30° - \frac{mv^2}{\rho}$$

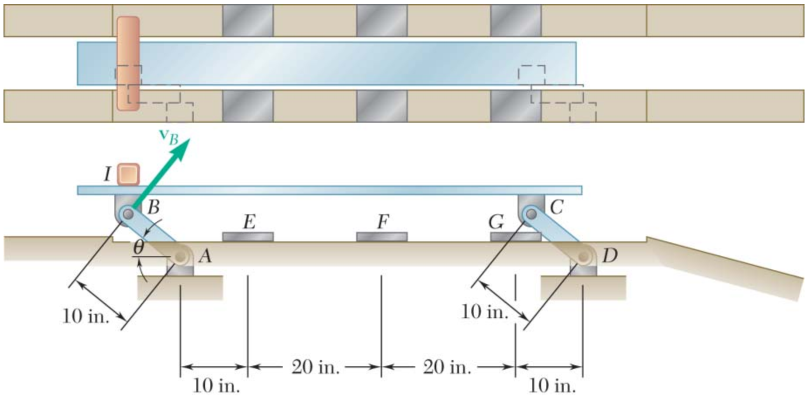
Form the ratio $\frac{F}{N}$, and set it equal to μ_s for impending slip.

$$\mu_s = \frac{F}{N} = \frac{g\cos 30° - v^2/\rho}{g\sin 30°} = \frac{9.81\cos 30° - (1.4)^2/0.3}{9.81\sin 30°}$$

$$\mu_s = 0.400 \blacktriangleleft$$

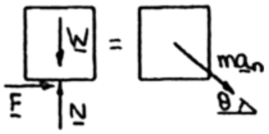
PROBLEM 12.62

The parallel-link mechanism *ABCD* is used to transport a component *I* between manufacturing processes at stations *E*, *F*, and *G* by picking it up at a station when $\theta = 0$ and depositing it at the next station when $\theta = 180°$. Knowing that member *BC* remains horizontal throughout its motion and that links *AB* and *CD* rotate at a constant rate in a vertical plane in such a way that $v_B = 2.2$ ft/s, determine (*a*) the minimum value of the coefficient of static friction between the component and *BC* if the component is not to slide on *BC* while being transferred, (*b*) the values of θ for which sliding is impending.



SOLUTION

$$\xrightarrow{+} \Sigma F_x = ma_x: \quad F = \frac{W}{g}\frac{v_B^2}{\rho}\cos\theta$$



$$+\!\uparrow \Sigma F_y = ma_y: \quad N - W = -\frac{W}{g}\frac{v_B^2}{\rho}\sin\theta$$

or

$$N = W\left(1 - \frac{v_B^2}{g\rho}\sin\theta\right)$$

Now

$$F_{\max} = \mu_s N = \mu_s W\left(1 - \frac{v_B^2}{g\rho}\sin\theta\right)$$

and for the component not to slide

$$F < F_{\max}$$

or

$$\frac{W}{g}\frac{v_B^2}{\rho}\cos\theta < \mu_s W\left(1 - \frac{v_B^2}{g\rho}\sin\theta\right)$$

or

$$\mu_s > \frac{\cos\theta}{\frac{g\rho}{v_B^2} - \sin\theta}$$

We must determine the values of θ which maximize the above expression. Thus

$$\frac{d}{d\theta}\left(\frac{\cos\theta}{\frac{g\rho}{v_B^2}-\sin\theta}\right)=\frac{-\sin\theta\left(\frac{g\rho}{v_B^2}-\sin\theta\right)-(\cos\theta)(-\cos\theta)}{\left(\frac{g\rho}{v_B^2}-\sin\theta\right)^2}=0$$

or $$\sin\theta=\frac{v_B^2}{g\rho}\qquad\text{for}\qquad \mu_s=(\mu_s)_{\min}$$

Now $$\sin\theta=\frac{(2.2\text{ ft/s})^2}{(32.2\text{ ft/s}^2)\left(\frac{10}{12}\text{ ft}\right)}=0.180373$$

or $$\theta=10.3915^\circ\quad\text{and}\quad\theta=169.609^\circ$$

(*a*) From above,

$$(\mu_s)_{\min}=\frac{\cos\theta}{\frac{g\rho}{v_B^2}-\sin\theta}\quad\text{where}\quad\sin\theta=\frac{v_B^2}{g\rho}$$

$$(\mu_s)_{\min}=\frac{\cos\theta}{\frac{1}{\sin\theta}-\sin\theta}=\frac{\cos\theta\sin\theta}{1-\sin^2\theta}=\tan\theta$$

$$=\tan 10.3915^\circ$$

or $$(\mu_s)_{\min}=0.1834 \blacktriangleleft$$

(*b*) We have impending motion

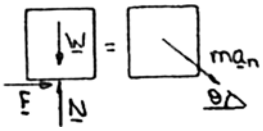
to the left for $\theta=10.39^\circ$ ◀

to the right for $\theta=169.6^\circ$ ◀

PROBLEM 12.63

Knowing that the coefficients of friction between the component *I* and member *BC* of the mechanism of Problem 12.62 are $\mu_s = 0.35$ and $\mu_k = 0.25$, determine (*a*) the maximum allowable constant speed v_B if the component is not to slide on *BC* while being transferred, (*b*) the values of θ for which sliding is impending.

SOLUTION



$$\xrightarrow{+} \Sigma F_x = ma_x: \quad F = \frac{W}{g}\frac{v_B^2}{\rho}\cos\theta$$

$$+\uparrow \Sigma F_y = ma_y: \quad N - W = -\frac{W}{g}\frac{v_B^2}{\rho}\sin\theta$$

or

$$N = W\left(1 - \frac{v_B^2}{g\rho}\sin\theta\right)$$

Now

$$F_{\max} = \mu_s N$$

$$= \mu_s W\left(1 - \frac{v_B^2}{g\rho}\sin\theta\right)$$

and for the component not to slide

$$F < F_{\max}$$

or

$$\frac{W}{g}\frac{v_B^2}{\rho}\cos\theta < \mu_s W\left(1 - \frac{v_B^2}{g\rho}\sin\theta\right)$$

or

$$v_B^2 < \mu_s \frac{g\rho}{\cos\theta + \mu_s \sin\theta} \qquad (1)$$

To ensure that this inequality is satisfied, $\left(v_B^2\right)_{\max}$ must be less than or equal to the minimum value of $\mu_s g\rho/(\cos\theta + \mu_s\sin\theta)$, which occurs when $(\cos\theta + \mu_s\sin\theta)$ is maximum. Thus

$$\frac{d}{d\theta}(\cos\theta + \mu_s\sin\theta) = -\sin\theta + \mu_s\cos\theta = 0$$

or

$$\tan\theta = \mu_s$$

$$\mu_s = 0.35$$

or

$$\theta = 19.2900^\circ$$

PROBLEM 12.63 (Continued)

(*a*) The maximum allowed value of v_B is then

$$\left(v_B^2\right)_{\max} = \mu_s \frac{g\rho}{\cos\theta + \mu_s \sin\theta} \quad \text{where} \quad \tan\theta = \mu_s$$

$$= g\rho \frac{\tan\theta}{\cos\theta + (\tan\theta)\sin\theta} = g\rho\sin\theta$$

$$= (32.2 \text{ ft/s}^2)\left(\frac{10}{12}\text{ ft}\right)\sin 19.2900°$$

or $(v_B)_{\max} = 2.98 \text{ ft/s}$ ◀

(*b*) First note that for $90° < \theta < 180°$, Eq. (1) becomes

$$v_B^2 < \mu_s \frac{g\rho}{\cos\alpha + \mu_s \sin\alpha}$$

where $\alpha = 180° - \theta$. It then follows that the second value of θ for which motion is impending is

$$\theta = 180° - 19.2900°$$
$$= 160.7100°$$

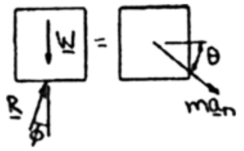
we have impending motion

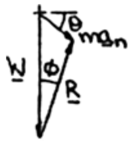
to the left for $\theta = 19.29°$ ◀

to the right for $\theta = 160.7°$ ◀

Alternative solution.

$$\Sigma\mathbf{F} = m\mathbf{a}: \quad \mathbf{W} + \mathbf{R} = m\mathbf{a}_n$$

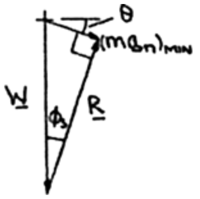




For impending motion, $\phi = \phi_s$. Also, as shown above, the values of θ for which motion is impending minimize the value of v_B, and thus the value of a_n is $\left(a_n = \frac{v_B^2}{\rho}\right)$. From the above diagram, it can be concluded that a_n is minimum when $m\mathbf{a}_n$ and $\mathbf{R}$ are perpendicular.

PROBLEM 12.63 (Continued)

Therefore, from the diagram



θ
$(m\underline{a}_n)_{MIN}$
$\underline{W}$
$\underline{R}$
ϕ_s

$$\theta = \phi_s = \tan^{-1}\mu_s \qquad \text{(as above)}$$

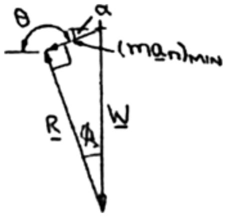
and $$ma_n = W\sin\phi_s$$

or $$m\frac{v_B^2}{\rho} = mg\sin\theta$$

or $$v_B^2 = g\rho\sin\theta \qquad \text{(as above)}$$

For $90° \le \theta \le 180°$, we have

from the diagram



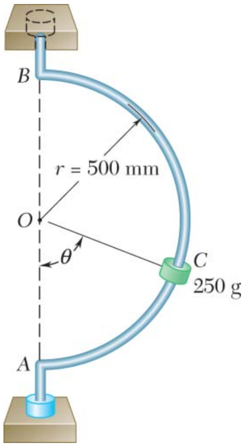
θ
α
$(m\underline{a}_n)_{MIN}$
$\underline{R}$
$\underline{W}$
ϕ_s

$$\alpha = 180° - \theta \qquad \text{(as above)}$$

$$\alpha = \phi_s$$

and $$ma_n = W\sin\phi_s$$

or $$v_B^2 = g\rho\sin\theta \qquad \text{(as above)}$$



PROBLEM 12.64

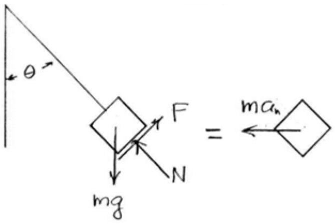
A small 250-g collar C can slide on a semicircular rod which is made to rotate about the vertical AB at a constant rate of 7.5 rad/s. Determine the three values of θ for which the collar will not slide on the rod, assuming no friction between the collar and the rod.

SOLUTION

If the collar is not sliding, it moves at constant speed on a circle of radius $\rho = r\sin\theta$. $v = \rho\omega$

Normal acceleration. $a_n = \dfrac{v^2}{\rho} = \dfrac{\rho^2\omega^2}{\rho} = (r\sin\theta)\omega^2$

$$+\uparrow \Sigma F_y = ma_y:$$



$$N\cos\theta - mg = 0$$

$$N = \frac{mg}{\cos\theta}$$

$$\overset{+}{\leftarrow} \Sigma F_x = ma_x:$$

$$N\sin\theta = ma$$

$$\frac{mg\sin\theta}{\cos\theta} = (m\,r\sin\theta)\omega^2 \quad (1)$$

To satisfy (1), either:

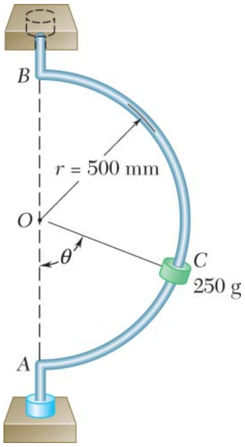
$$\sin\theta = 0$$

or $$\cos\theta = \frac{g}{r\omega^2}$$

$$\theta = 0° \text{ or } 180°$$

or $$\cos\theta = \frac{9.81}{(0.5)(7.5)^2} = 0.3488$$

$\theta = 0°, 180°, \text{ and } 69.6°$ ◀



PROBLEM 12.65

A small 250-g collar C can slide on a semicircular rod which is made to rotate about the vertical AB at a constant rate of 7.5 rad/s. Knowing that the coefficients of friction are $\mu_s = 0.25$ and $\mu_k = 0.20$, indicate whether the collar will slide on the rod if it is released in the position corresponding to (*a*) $\theta = 75°$, (*b*) $\theta = 40°$. Also, determine the magnitude and direction of the friction force exerted on the collar immediately after release.

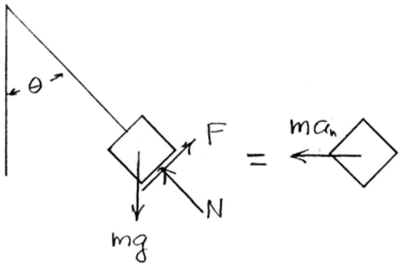
SOLUTION

If the collar is not sliding, it moves at constant speed on a circle of radius $\rho = r\sin\theta$. $v = \rho\omega$

Given: $r = 500\,\text{mm} = 0.500\,\text{m},\ \omega = 7.5\,\text{rad/s},$

$m = 250\,\text{g} = 0.250$ kg.

Normal acceleration: $a_n = \dfrac{v^2}{\rho} = \dfrac{\rho^2\omega^2}{\rho} = (r\sin\theta)\omega^2$



$+\nearrow\ \Sigma F = \nearrow\ ma$:

$$F - mg\sin\theta = -m(r\sin\theta)\,\omega^2\cos\theta$$

$$F = m(g - r\omega^2\cos\theta)\sin\theta$$

$+\nwarrow\ \Sigma F = \nwarrow\ ma$:

$$N - mg\cos\theta = m(r\sin\theta)\omega^2\sin\theta$$

$$N = m(g\cos\theta + r\,\omega^2\sin^2\theta)$$

(*a*) $\theta = 75°$.

$$F = (0.25)\left[9.81 - (0.500\cos 75°)(7.5)^2\right]\sin 75°$$

$$= 0.61112 \text{ N}$$

$$N = (0.25)\left[9.81\cos 75° + (0.500\sin^2 75°)(7.5)^2\right]$$

$$= 7.1950 \text{ N}$$

$$\mu_s N = (0.25)(7.1950) = 1.7987 \text{ N}$$

Since $|F| < \mu_s N$, the collar does not slide.

$F = 0.611\text{ N} \measuredangle 75°$ ◀

PROBLEM 12.65 (Continued)

(*b*) $\theta = 40°$.

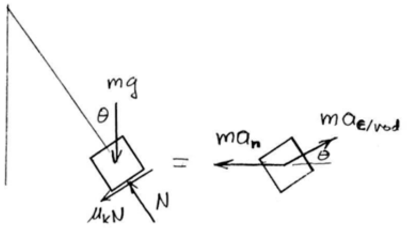
$$F = (0.25)\left[9.81 - (0.500\cos 40°)(7.5)^2\right]\sin 40°$$
$$= -1.8858 \text{ N}$$

$$N = (0.25)\left[9.81\cos 40° + (0.500\sin^2 40°)(7.5)^2\right]$$
$$= 4.7839 \text{ N}$$

$$\mu_s N = (0.25)(4.7839) = 1.1960 \text{ N}$$

Since $|F| > \mu_s N$, the collar slides.

Since the collar is sliding, $|F| = \mu_k N$.



$$+\nwarrow \sum F_n = +\nwarrow ma:$$

$$N - mg\cos\theta = ma_n \sin\theta$$

$$N = mg\cos\theta + m(r\sin\theta)\omega^2\sin\theta$$

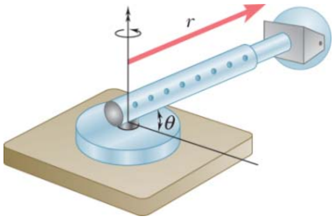
$$= m\left[g\cos\theta + (r\sin^2\theta)\omega^2\right]$$

$$= (0.25)\left[9.81\cos 40° + (0.500\sin^2 40°)(7.5)^2\right]$$

$$= 4.7839 \text{ N}$$

$$|F| = \mu_k N = (0.20)(4.7839) = 0.957 \text{ N}$$

$$F = 0.957 \text{ N} \swarrow 40° \blacktriangleleft$$



PROBLEM 12.66

An advanced spatial disorientation trainer allows the cab to rotate around multiple axes as well as extend inwards and outwards. It can be used to simulate driving, fixed wing aircraft flying, and helicopter maneuvering. In one training scenario, the trainer rotates and translates in the horizontal plane where the location of the pilot is defined by the relationships $r = 10 + 2\cos\left(\frac{\pi}{3}t\right)$ and $\theta = 0.1\left(2t^2 - t\right)$, where r, θ, and t are expressed in feet, radians, and seconds, respectively. Knowing that the pilot has a mass of 175 lbs, (a) find the magnitude of the resulting force acting on the pilot at t= 5 s (b) plot the magnitudes of the radial and transverse components of the force exerted on the pilot from 0 to 10 seconds.

SOLUTION

Given:

$$r = 10 + 2\cos\left(\frac{\pi}{3}t\right) \text{ ft}$$

$$\theta = 0.1\left(2t^2 - t\right) \text{ rad}$$

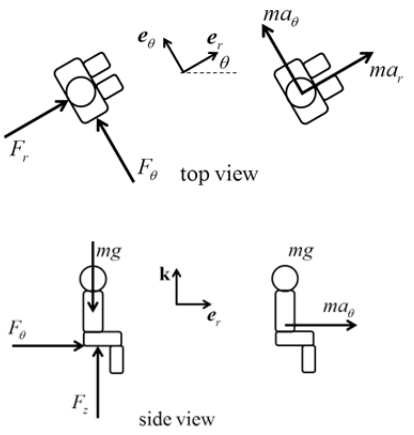
$$m = \frac{175 \text{ lbs}}{32.2 \text{ ft/s}^2} = 5.435 \text{ slugs}$$

Using Radial and Transverse Coordinates:

$$\dot{r} = -\frac{2\pi}{3}\sin\left(\frac{\pi}{3}t\right) \text{ ft/s} \qquad \dot{\theta} = 0.1\left(4t - 1\right) \text{ rad/s}$$

$$\ddot{r} = -\frac{2\pi^2}{9}\cos\left(\frac{\pi}{3}t\right) \text{ ft/s}^2 \qquad \ddot{\theta} = 0.4 \text{ rad/s}^2$$

Free Body Diagram of pilot (top and side view) showing net forces in the radial and transverse directions:



Equations of Motion:

$$\sum F_r = ma_r = m\left(\ddot{r} - r\dot{\theta}^2\right)$$

$$F_r = m\left[-\frac{2\pi^2}{9}\cos\left(\frac{\pi}{3}t\right) - \left(10 + 2\cos\left(\frac{\pi}{3}t\right)\right)0.1^2\left(4t-1\right)^2\right]$$

$$\sum F_\theta = ma_\theta = m\left(r\ddot{\theta} + 2\dot{r}\dot{\theta}\right)$$

$$F_\theta = m\left[\left(10 + 2\cos\left(\frac{\pi}{3}t\right)\right)(0.4) - \frac{0.4\pi}{3}\sin\left(\frac{\pi}{3}t\right)\left(4t-1\right)\right]$$

$$\sum F_z = 0 \Rightarrow F_z = mg$$

PROBLEM 12.66 (Continued)

(a) Evaluate forces at t=5 s:

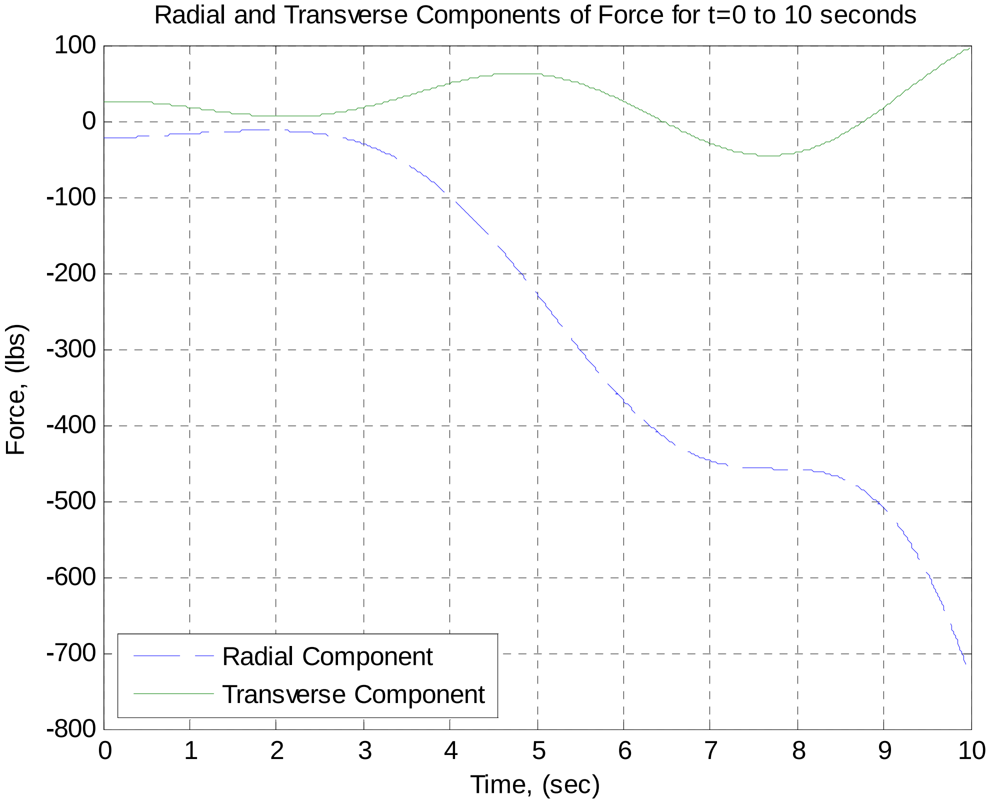
$$F_r = -221.78 \text{ lbs}$$

$$F_\theta = 61.37 \text{ lbs}$$

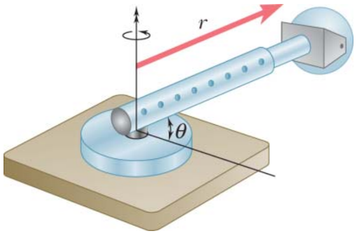
$$F_z = 175 \text{ lbs}$$

$$|\boldsymbol{F}| = \sqrt{F_r^2 + F_\theta^2 + F_z^2} \qquad |\boldsymbol{F}| = 289.1 \text{ lb} \blacktriangleleft$$

(b) Plot of F_r and F_θ from t=0 to t=10 s:



◀



PROBLEM 12.67

An advanced spatial disorientation trainer is programmed to only rotate and translate in the horizontal plane. The pilot's location is defined by the relationships $r = 8\left(1-e^{-t}\right)$ and $\theta = 2/\pi\left(\sin\frac{\pi}{2}t\right)$, where r, θ, and t are expressed in feet, radians, and seconds, respectively. Determine the radial and transverse components of the force exerted on the 175 lb pilot at $t = 3$ s.

SOLUTION

Given:

$$r = 8\left(1-e^{-t}\right)\ \text{ft}$$

$$\theta = 2/\pi\left(\sin\frac{\pi}{2}t\right)\ \text{rad}$$

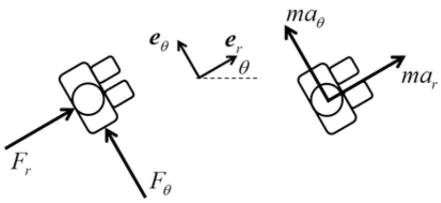
$$m = \frac{175\ \text{lbs}}{32.2\ \text{ft/s}^2} = 5.435\ \text{slugs}$$

Using Radial and Transverse Coordinates:

$$\dot{r} = 8e^{-t}\ \text{ft/s} \qquad \dot{\theta} = \cos\frac{\pi}{2}t\ \text{rad/s}$$

$$\ddot{r} = -8e^{-t}\ \text{ft/s}^2 \qquad \ddot{\theta} = -\frac{\pi}{2}\sin\frac{\pi}{2}\text{t rad/s}^2$$

Free Body Diagram of pilot (top view) showing net forces in the radial and transverse directions:



Equations of Motion:

$$\sum F_r = ma_r$$

$$F_r = m\left(\ddot{r} - r\dot{\theta}^2\right)$$

$$F_r = m\left[-8e^{-t} - 8\left(1-e^{-t}\right)\cos^2\frac{\pi}{2}t\right]$$

$$\sum F_\theta = ma_\theta$$

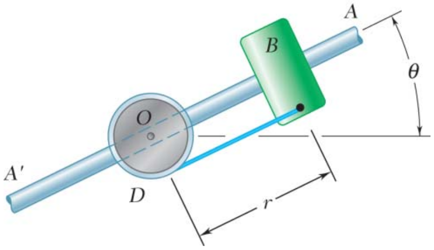
$$F_\theta = m\left(r\ddot{\theta} + 2\dot{r}\dot{\theta}\right)$$

$$F_\theta = m\left[8\left(1-e^{-t}\right)\left(-\frac{\pi}{2}\right)\sin\frac{\pi}{2}\text{t} - 16e^{-t}\cos\frac{\pi}{2}t\right]$$

Evaluate F_r and F_θ at t=3 s:

$$F_r = -2.165\ \text{lb} ◀$$

$$F_\theta = 64.90\ \text{lb} ◀$$



PROBLEM 12.68

The 3-kg collar B slides on the frictionless arm AA'. The arm is attached to drum D and rotates about O in a horizontal plane at the rate $\dot{\theta} = 0.75t$, where $\dot{\theta}$ and t are expressed in rad/s and seconds, respectively. As the arm-drum assembly rotates, a mechanism within the drum releases cord so that the collar moves outward from O with a constant speed of 0.5 m/s. Knowing that at $t = 0$, $r = 0$, determine the time at which the tension in the cord is equal to the magnitude of the horizontal force exerted on B by arm AA'.

SOLUTION

Kinematics

We have $$\frac{dr}{dt} = \dot{r} = 0.5 \text{ m/s}$$

At $t = 0, r = 0$: $$\int_0^r dr = \int_0^t 0.5\, dt$$

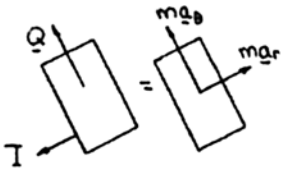
or $$r = (0.5t) \text{ m}$$

Also, $$\ddot{r} = 0 \qquad \dot{\theta} = (0.75t) \text{ rad/s}$$
$$\ddot{\theta} = 0.75 \text{ rad/s}^2$$

Now $$a_r = \ddot{r} - r\dot{\theta}^2 = 0 - [(0.5t) \text{ m}][(0.75t) \text{ rad/s}]^2 = -(0.28125t^3) \text{ m/s}^2$$

and $$a_\theta = r\ddot{\theta} + 2\dot{r}\dot{\theta}$$
$$= [(0.5t) \text{ m}][0.75 \text{ rad/s}^2] + 2(0.5 \text{ m/s})[(0.75t) \text{ rad/s}]$$
$$= (1.125t) \text{ m/s}^2$$

Kinetics



$$+\nearrow \Sigma F_r = ma_r: \quad -T = (3 \text{ kg})(-0.28125t^3) \text{ m/s}^2$$

or $$T = (0.84375t^3) \text{ N}$$

$$+\nwarrow \Sigma F_\theta = m_B a_\theta: \quad Q = (3 \text{ kg})(1.125t) \text{ m/s}^2$$

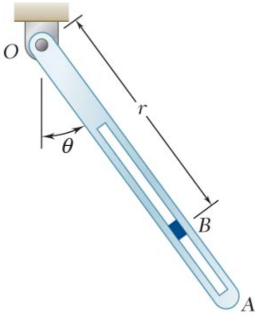
or $$Q = (3.375t) \text{ N}$$

Now require that $$T = Q$$

or $$(0.84375t^3) \text{ N} = (3.375t) \text{ N}$$

or $$t^2 = 4.000$$

or $$t = 2.00 \text{ s} \blacktriangleleft$$



PROBLEM 12.69

A 0.5-kg block B slides without friction inside a slot cut in arm OA which rotates in a vertical plane. The rod has a constant angular acceleration $\ddot{\theta} = 10\text{ rad/s}^2$. Knowing that when $\theta = 45°$ and $r = 0.8$ m the velocity of the block is zero, determine at this instant, (*a*) the force exerted on the block by the arm, (*b*) the relative acceleration of the block with respect to the arm.

SOLUTION

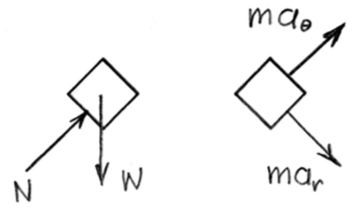
Given: $\theta = 45°, \quad r = 0.8\text{ m}, \quad \ddot{\theta} = 10\text{ rad/s}^2$
$m = 0.5\text{ kg}, \quad W = mg$

Using Radial and Transverse Components:

$$v_r = \dot{r} = 0, \quad v_\theta = r\dot{\theta} = 0$$

$$\dot{\theta} = 0$$

FBD of Block B



(*a*) $$\Sigma F_\theta = ma_\theta: \quad N - W\cos 45° = m\left(r\ddot{\theta} + 2\dot{r}\dot{\theta}\right)$$

$$N = mg\cos 45° + m\left(r\ddot{\theta} + 2\dot{r}\dot{\theta}\right)$$

$$= (0.5)(9.81)\cos 45° + 0.5\left[(0.8)(10) + 0\right]$$

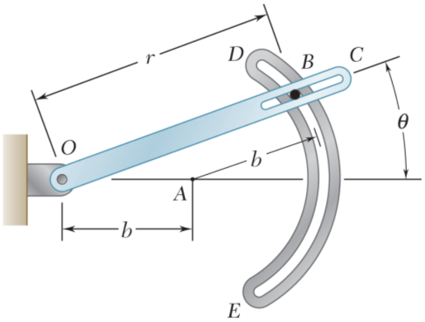
$$= 7.468$$

$N = 7.47\text{ N} \measuredangle 45°$ ◀

(*b*) $$\Sigma F_r = ma_r: \quad mg\sin 45° = m\left(\ddot{r} - r\dot{\theta}^2\right)$$

$$\ddot{r} = \frac{mg}{m}\sin 45° + r\dot{\theta}^2$$
$$= g\sin 45° + r\dot{\theta}^2$$
$$= (9.81)\sin 45° + 0$$
$$= 6.937\text{ m/s}^2$$

$\mathbf{a}_{B/\text{rod}} = 6.94\text{ m/s}^2 \searrow 45°$ ◀



PROBLEM 12.70

Pin B weighs 4 oz and is free to slide in a horizontal plane along the rotating arm OC and along the circular slot DE of radius $b = 20$ in. Neglecting friction and assuming that $\dot{\theta} = 15$ rad/s and $\ddot{\theta} = 250$ rad/s^2 for the position $\theta = 20°$, determine for that position (*a*) the radial and transverse components of the resultant force exerted on pin B, (*b*) the forces **P** and **Q** exerted on pin B, respectively, by rod OC and the wall of slot DE.

SOLUTION

Kinematics.

From the geometry of the system, we have

Then $\quad r = 2b\cos\theta \qquad \dot{r} = -(2b\sin\theta)\dot{\theta} \qquad \ddot{r} = -2b(\ddot{\theta}\sin\theta + \dot{\theta}^2\cos\theta)$

and $\quad a_r = \ddot{r} - r\dot{\theta}^2 = -2b(\ddot{\theta}\sin\theta + \dot{\theta}^2\cos\theta) - (2b\cos\theta)\dot{\theta}^2 = -2b(\ddot{\theta}\sin\theta + 2\dot{\theta}^2\cos\theta)$

Now $\quad = -2\left(\dfrac{20}{12}\text{ ft}\right)[(250\text{ rad/s}^2)\sin 20° + 2(15\text{ rad/s})^2\cos 20°] = -1694.56\text{ ft/s}^2$

and $\quad a_\theta = r\ddot{\theta} + 2\dot{r}\dot{\theta} = (2b\cos\theta)\ddot{\theta} + 2(-2b\dot{\theta}\sin\theta)\dot{\theta} = 2b(\ddot{\theta}\cos\theta - 2\dot{\theta}^2\sin\theta)$

$$= 2\left(\frac{20}{12}\text{ ft}\right)[(250\text{ rad/s}^2)\cos 20° - 2(15\text{ rad/s})^2\sin 20°] = 270.05\text{ ft/s}^2$$

Kinetics.

(*a*) We have $\quad F_r = ma_r = \dfrac{\frac{1}{4}\text{ lb}}{32.2\text{ ft/s}^2} \times (-1694.56\text{ ft/s}^2) = -13.1565\text{ lb} \qquad F_r = -13.16\text{ lb}$ ◀

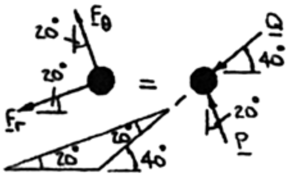
and $\quad F_\theta = ma_\theta = \dfrac{\frac{1}{4}\text{ lb}}{32.2\text{ ft/s}^2} \times (270.05\text{ ft/s}^2) = 2.0967\text{ lb} \qquad F_\theta = 2.10\text{ lb}$ ◀

(*b*) $\quad +\nearrow\ \Sigma F_r\text{:} \quad -F_r = -Q\cos 20°$

or $\quad Q = \dfrac{1}{\cos 20°}(13.1565\text{ lb}) = 14.0009\text{ lb}$

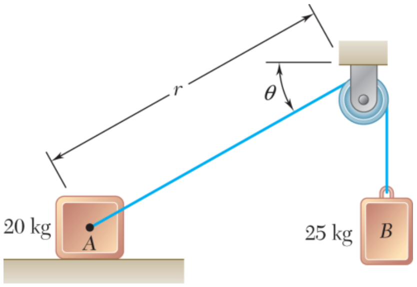
$+\nwarrow\ \Sigma F_\theta\text{:} \quad F_\theta = P - Q\sin 20°$

or $\quad P = (2.0967 + 14.0009\sin 20°)\text{ lb} = 6.89\text{ lb}$



$\mathbf{P} = 6.89\text{ lb}$ $\nwarrow$ 70° ◀

$\mathbf{Q} = 14.00\text{ lb}$ $\swarrow$ 40° ◀



PROBLEM 12.71

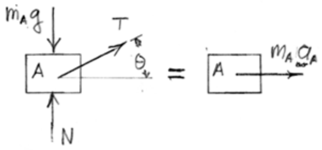
The two blocks are released from rest when $r = 0.8$ m and $\theta = 30°$. Neglecting the mass of the pulley and the effect of friction in the pulley and between block A and the horizontal surface, determine (*a*) the initial tension in the cable, (*b*) the initial acceleration of block A, (*c*) the initial acceleration of block B.

SOLUTION

Let r and θ be polar coordinates of block A as shown, and let y_B be the position coordinate (positive downward, origin at the pulley) for the rectilinear motion of block B.

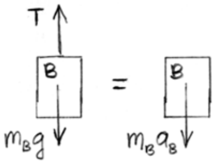
Constraint of cable: $r + y_B = \text{constant}$,

$$\dot{r} + v_B = 0, \quad \ddot{r} + a_B = 0 \quad \text{or} \quad \ddot{r} = -a_B \qquad (1)$$



For block A, $\xrightarrow{+} \Sigma F_x = m_A a_A$: $\quad T\cos\theta = m_A a_A$ or $T = m_A a_A \sec\theta \qquad (2)$

For block B, $+\!\downarrow \Sigma F_y = m_B a_B$: $\quad m_B g - T = m_B a_B \qquad (3)$

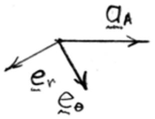


Adding Eq. (1) to Eq. (2) to eliminate T, $\quad m_B g = m_A a_A \sec\theta + m_B a_B \qquad (4)$

Radial and transverse components of $\mathbf{a}_A$.

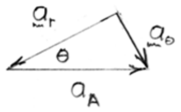
Use either the scalar product of vectors or the triangle construction shown, being careful to note the positive directions of the components.

$$\ddot{r} - r\dot{\theta}^2 = a_r = \mathbf{a}_A \cdot \mathbf{e}_r = -a_A \cos\theta \qquad (5)$$



Noting that initially $\dot{\theta} = 0$, using Eq. (1) to eliminate $\ddot{r}$, and changing signs gives

$$a_B = a_A \cos\theta \qquad (6)$$



Substituting Eq. (6) into Eq. (4) and solving for a_A,

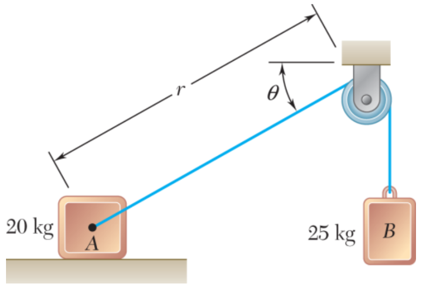
$$a_A = \frac{m_B g}{m_A \sec\theta + m_B \cos\theta} = \frac{(25)(9.81)}{20\sec 30° + 25\cos 30°} = 5.48 \text{ m/s}^2$$

From Eq. (6), $\quad a_B = 5.48\cos 30° = 4.75 \text{ m/s}^2$

(*a*) From Eq. (2), $T = (20)(5.48)\sec 30° = 126.6 \qquad T = 126.6 \text{ N}$ ◀

(*b*) Acceleration of block A. $\qquad \mathbf{a}_A = 5.48 \text{ m/s}^2 \longrightarrow$ ◀

(*c*) Acceleration of block B. $\qquad \mathbf{a}_B = 4.75 \text{ m/s}^2 \downarrow$ ◀



PROBLEM 12.72

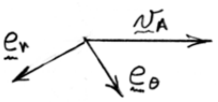
The velocity of block A is 2 m/s to the right at the instant when $r = 0.8$ m and $\theta = 30°$. Neglecting the mass of the pulley and the effect of friction in the pulley and between block A and the horizontal surface, determine, at this instant, (a) the tension in the cable, (b) the acceleration of block A, (c) the acceleration of block B.

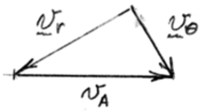
SOLUTION

Let r and θ be polar coordinates of block A as shown, and let y_B be the position coordinate (positive downward, origin at the pulley) for the rectilinear motion of block B.

Radial and transverse components of $\mathbf{v}_A$.

Use either the scalar product of vectors or the triangle construction shown, being careful to note the positive directions of the components.

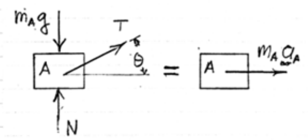


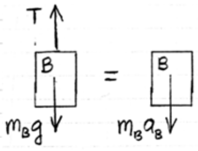


$$\dot{r} = v_r = \mathbf{v}_A \cdot \mathbf{e}_r = -v_A \cos 30°$$
$$= -2\cos 30° = -1.73205 \text{ m/s}$$

$$r\dot{\theta} = v_\theta = \mathbf{v}_A \cdot \mathbf{e}_\theta = -v_A \sin 30°$$
$$= 2\sin 30° = 1.000 \text{ m/s}^2$$

$$\dot{\theta} = \frac{v_\theta}{r} = \frac{1.000}{0.8} = 1.25 \text{ rad/s}$$





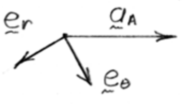
Constraint of cable: $r + y_B = \text{constant}$,

$$\dot{r} + v_B = 0, \quad \ddot{r} + a_B = 0 \quad \text{or} \quad \ddot{r} = -a_B \tag{1}$$

For block A, $\xrightarrow{+} \Sigma F_x = m_A a_A : T\cos\theta = m_A a_A$ or $T = m_A a_A \sec\theta$ (2)

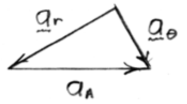
For block B, $+\!\downarrow \Sigma F_y = m_B a_B$: $m_B g - T = m_B a_B$ (3)

Adding Eq. (1) to Eq. (2) to eliminate T, $m_B g = m_A a_A \sec\theta + m_B a_B$ (4)



Radial and transverse components of $\mathbf{a}_A$.

Use a method similar to that used for the components of velocity.



$$\ddot{r} - r\dot{\theta}^2 = a_r = \mathbf{a}_A \cdot \mathbf{e}_r = -a_A \cos\theta \tag{5}$$

Using Eq. (1) to eliminate $\ddot{r}$ and changing signs gives

$$a_B = a_A \cos\theta - r\dot{\theta}^2 \tag{6}$$

Substituting Eq. (6) into Eq. (4) and solving for a_A,

$$a_A = \frac{m_B\left(g + r\dot{\theta}^2\right)}{m_A \sec\theta + m_B \cos\theta} = \frac{(25)[9.81 + (0.8)(1.25)^2]}{20\sec 30^\circ + 25\cos 30^\circ} = 6.18 \text{ m/s}^2$$

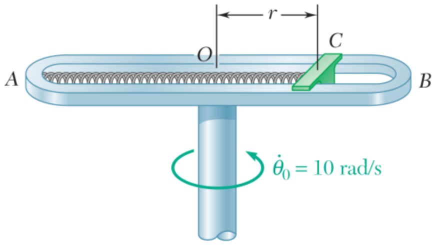
From Eq. (6), $a_B = 6.18\cos 30^\circ - (0.8)(1.25)^2 = 4.10 \text{ m/s}^2$

(*a*) From Eq. (2), $T = (20)(6.18)\sec 30^\circ = 142.7$ $T = 142.7 \text{ N}$ ◀

(*b*) Acceleration of block *A*. $\mathbf{a}_A = 6.18 \text{ m/s}^2 \longrightarrow$ ◀

(*c*) Acceleration of block *B*. $\mathbf{a}_B = 4.10 \text{ m/s}^2 \downarrow$ ◀

PROBLEM 12.73*



Slider *C* has a weight of 0.5 lb and may move in a slot cut in arm *AB*, which rotates at the constant rate $\dot{\theta}_0 = 10\text{ rad/s}$ in a horizontal plane. The slider is attached to a spring of constant *k* = 2.5 lb/ft, which is unstretched when *r* = 0. Knowing that the slider is released from rest with no radial velocity in the position *r* = 18 in. and neglecting friction, determine for the position *r* = 12 in. (*a*) the radial and transverse components of the velocity of the slider, (*b*) the radial and transverse components of its acceleration, (*c*) the horizontal force exerted on the slider by arm *AB*.

SOLUTION

Let l_0 be the radial coordinate when the spring is unstretched. Force exerted by the spring.

$$F_r = -k(r - l_0)$$

$$\Sigma F_r = ma_r: \quad -k(r - l_0) = m(\ddot{r} - r\dot{\theta}^2)$$

$$\ddot{r} = \left(\dot{\theta}^2 - \frac{k}{m}\right)r + \frac{kl_0}{m} \qquad (1)$$

But

$$\ddot{r} = \frac{d}{dt}(\dot{r}) = \frac{d\dot{r}}{dr}\frac{dr}{dt} = \dot{r}\frac{d\dot{r}}{dr}$$

$$\dot{r}d\dot{r} = \ddot{r}dr = \left[\left(\dot{\theta}^2 - \frac{k}{m}\right)r + \frac{kl_0}{m}\right]dr$$

Integrate using the condition $\dot{r} = \dot{r}_0$ when $r = r_0$.

$$\frac{1}{2}\dot{r}^2\Big|_{\dot{r}_0}^{\dot{r}} = \left[\frac{1}{2}\left(\dot{\theta}^2 - \frac{k}{m}\right)r^2 + \frac{kl_0}{m}r\right]\Bigg|_{r_0}^{r}$$

$$\frac{1}{2}\dot{r}^2 - \frac{1}{2}\dot{r}_0^2 = \frac{1}{2}\left(\dot{\theta}^2 - \frac{k}{m}\right)\left(r^2 - r_0^2\right) + \frac{kl_0}{m}(r - r_0)$$

$$\dot{r}^2 = \dot{r}_0^2 + \left(\dot{\theta}^2 - \frac{k}{m}\right)\left(r^2 - r_0^2\right) + \frac{2kl_0}{m}(r - r_0)$$

Data:

$$m = \frac{W}{g} = \frac{0.5\text{ lb}}{32.2\text{ ft/s}^2} = 0.01553\text{ lb}\cdot\text{s}^2/\text{ft}$$

$$\dot{\theta} = 10\text{ rad/s}, \quad k = 2.5\text{ lb/ft}, \quad l_0 = 0$$

$$\dot{r}_0 = (v_r)_0 = 0, \quad r_0 = 18\text{ in.} = 1.5\text{ ft}, \quad r = 12\text{ in.} = 1.0\text{ ft}$$

PROBLEM 12.73* (Continued)

(*a*) Components of velocity when $r = 12$ in.

$$\dot{r}^2 = 0 + \left(10^2 - \frac{2.5}{0.01553}\right)(1.0^2 - 1.5^2) + 0$$

$$= 76.223\ \text{ft}^2/\text{s}^2$$

$$v_r = \dot{r} = \pm 8.7306\ \text{ft/s}$$

Since r is decreasing, v_r is negative

$$\dot{r} = -8.7306\ \text{ft/s} \qquad v_r = -8.73\ \text{ft/s} \blacktriangleleft$$

$$v_\theta = r\dot{\theta} = (1.0)(10) \qquad v_\theta = 10.00\ \text{ft/s} \blacktriangleleft$$

(*b*) Components of acceleration.

$$F_r = -kr + kl_0 = -(2.5)(1.0) + 0 = -2.5\ \text{lb}$$

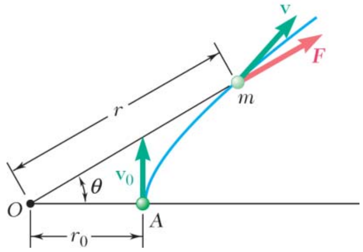
$$a_\theta = r\ddot{\theta} + 2\dot{r}\dot{\theta} = 0 + (2)(-8.7306)(10)$$

$$a_\theta = -174.6\ \text{ft/s}^2 \blacktriangleleft$$

(*c*) Transverse component of force.

$$F_\theta = ma_\theta = (0.01553)(-174.6) \qquad F_\theta = -2.71\ \text{lb} \blacktriangleleft$$



PROBLEM 12.74

A particle of mass *m* is projected from Point *A* with an initial velocity $\mathbf{v}_0$ perpendicular to line *OA* and moves under a central force **F** directed away from the center of force *O*. Knowing that the particle follows a path defined by the equation $r = r_0/\sqrt{\cos 2\theta}$ and using Eq. (12.25), express the radial and transverse components of the velocity **v** of the particle as functions of θ.

SOLUTION

Since the particle moves under a central force, $h = \text{constant}$.

Using Eq. (12.27), $h = r^2\dot{\theta} = h_0 = r_0 v_0$

or
$$\dot{\theta} = \frac{r_0 v_0}{r^2} = \frac{r_0 v_0 \cos 2\theta}{r_0^{\,2}} = \frac{v_0}{r_0}\cos 2\theta$$

Radial component of velocity.

$$v_r = \dot{r} = \frac{dr}{d\theta}\dot{\theta} = \frac{d}{d\theta}\left(\frac{r_0}{\sqrt{\cos 2\theta}}\right)\dot{\theta} = r_0 \frac{\sin 2\theta}{(\cos 2\theta)^{3/2}}\dot{\theta}$$

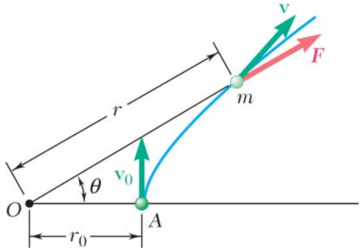
$$= r_0 \frac{\sin 2\theta}{(\cos 2\theta)^{3/2}} \frac{v_0}{r}\cos 2\theta$$

$$v_r = v_0 \frac{\sin 2\theta}{\sqrt{\cos 2\theta}} \blacktriangleleft$$

Transverse component of velocity.

$$v_\theta = \frac{h}{r} = \frac{r_0 v_0}{r_0}\sqrt{\cos 2\theta}$$

$$v_\theta = v_0\sqrt{\cos 2\theta} \blacktriangleleft$$



PROBLEM 12.75

For the particle of Problem 12.74, show (*a*) that the velocity of the particle and the central force **F** are proportional to the distance *r* from the particle to the center of force *O*, (*b*) that the radius of curvature of the path is proportional to r^3.

PROBLEM 12.74 A particle of mass *m* is projected from Point *A* with an initial velocity $\mathbf{v}_0$ perpendicular to line *OA* and moves under a central force **F** directed away from the center of force *O*. Knowing that the particle follows a path defined by the equation $r = r_0/\sqrt{\cos 2\theta}$ and using Eq. (12.25), express the radial and transverse components of the velocity **v** of the particle as functions of *θ*.

SOLUTION

Since the particle moves under a central force, $h =$ constant.

Using Eq. (12.27),

$$h = r^2\dot{\theta} = h_0 = r_0 v_0 \quad \text{or} \quad \dot{\theta} = \frac{r_0 v_0}{r^2} = \frac{r_0 v_0 \cos 2\theta}{r_0^{\,2}} = \frac{v_0}{r_0}\cos 2\theta$$

Differentiating the expression for *r* with respect to time,

$$\dot{r} = \frac{dr}{d\theta}\dot{\theta} = \frac{d}{d\theta}\left(\frac{r_0}{\sqrt{\cos 2\theta}}\right)\dot{\theta} = r_0\frac{\sin 2\theta}{(\cos 2\theta)^{3/2}}\dot{\theta} = r_0\frac{\sin 2\theta}{(\cos 2\theta)^{3/2}}\frac{v_0}{r_0}\cos 2\theta = v_0\frac{\sin 2\theta}{\sqrt{\cos 2\theta}}$$

Differentiating again,

$$\ddot{r} = \frac{d\dot{r}}{d\theta}\dot{\theta} = \frac{d}{d\theta}\left(v_0\frac{\sin 2\theta}{\sqrt{\cos 2\theta}}\right)\dot{\theta} = v_0\frac{2\cos^2 2\theta + \sin^2 2\theta}{(\cos 2\theta)^{3/2}}\dot{\theta} = \frac{v_0^{\,2}}{r_0}\frac{2\cos^2 2\theta + \sin^2 2\theta}{\sqrt{\cos 2\theta}}$$

(*a*) $\quad v_r = \dot{r} = v_0\dfrac{\sin 2\theta}{\sqrt{\cos 2\theta}} = \dfrac{v_0 r}{r_0}\sin 2\theta \qquad v_\theta = r\dot{\theta} = \dfrac{v_0 r}{r_0}\cos 2\theta$

$$v = \sqrt{(v_r)^2 + (v_\theta)^2} = \frac{v_0 r}{r_0}\sqrt{\sin^2 2\theta + \cos^2 2\theta}$$

$v = \dfrac{v_0 r}{r_0}$ ◀

$$a_r = \ddot{r} - r\dot{\theta}^2 = \frac{v_0^{\,2}}{r_0}\frac{2\cos^2 2\theta + \sin^2 2\theta}{\sqrt{\cos 2\theta}} - \frac{r_0}{\sqrt{\cos 2\theta}}\frac{v_0^{\,2}}{r_0^2}\cos^2 2\theta$$

$$= \frac{v_0^{\,2}}{r_0}\frac{\cos^2 2\theta + \sin^2 2\theta}{\sqrt{\cos 2\theta}} = \frac{v_0}{r_0\sqrt{\cos 2\theta}} = \frac{v_0^{\,2} r}{r_0^{\,2}}$$

$$F_r = ma_r = \frac{mv_0^2 r}{r_0^2}:$$

$F_r = \dfrac{mv_0^2 r}{r_0^2}$ ◀

PROBLEM 12.75 (Continued)

Since the particle moves under a central force, $a_\theta = 0.$

Magnitude of acceleration.

$$a = \sqrt{a_r{}^2 + a_\theta{}^2} = \frac{v_0{}^2 r}{r_0{}^2}$$

Tangential component of acceleration.

$$a_t = \frac{dv}{dt} = \frac{d}{dt}\left(\frac{v_0 r}{r_0}\right) = \frac{v_0}{r_0}\dot{r} = \frac{v_0{}^2 r}{r_0{}^2}\sin 2\theta$$

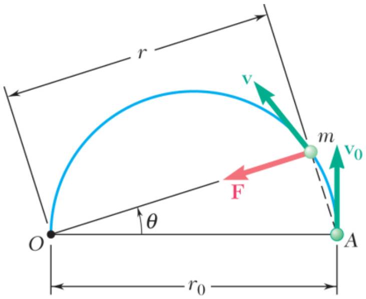
Normal component of acceleration.

$$a_t = \sqrt{a^2 - a_t{}^2} = \frac{v_0{}^2 r}{r_0{}^2}\sqrt{1-\sin^2 2\theta} = \frac{v_0{}^2 r \cos 2\theta}{r_0{}^2}$$

But $\qquad \cos 2\theta = \left(\frac{r_0}{r}\right)^2$

Hence, $\qquad a_n = \frac{v_0{}^2}{r}$

(*b*) But $a_n = \dfrac{v^2}{\rho}$ or $\rho = \dfrac{v^2}{a_n} = \dfrac{v_0{}^2 r^2}{r_0{}^2}\cdot\dfrac{r}{v_0{}^2}$ $\qquad \rho = \dfrac{r^3}{r_0^2}$ ◀



PROBLEM 12.76

A particle of mass *m* is projected from Point *A* with an initial velocity $\mathbf{v}_0$ perpendicular to line *OA* and moves under a central force **F** along a semicircular path of diameter *OA*. Observing that $r = r_0 \cos\theta$ and using Eq. (12.25), show that the speed of the particle is $v = v_0/\cos^2\theta$.

SOLUTION

Since the particle moves under a central force, $h =$ constant.

Using Eq. (12.27), $$h = r^2\dot{\theta} = h_0 = r_0 v_0$$

or $$\dot{\theta} = \frac{r_0 v_0}{r^2} = \frac{r_0 v_0}{r_0^2 \cos^2\theta} = \frac{v_0}{r_0 \cos^2\theta}$$

Radial component of velocity.

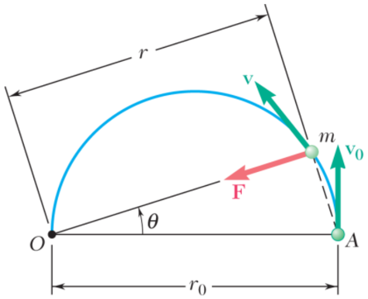
$$v_r = \dot{r} = \frac{d}{dt}(r_0 \cos\theta) = -(r_0 \sin\theta)\dot{\theta}$$

Transverse component of velocity.

$$v_\theta = r\dot{\theta} = (r_0 \cos\theta)\dot{\theta}$$

Speed. $$v = \sqrt{v_r^2 + v_\theta^2} = r_0\dot{\theta} = \frac{r_0 v_0}{r_0 \cos^2\theta}$$

$$v = \frac{v_0}{\cos^2\theta} \blacktriangleleft$$



PROBLEM 12.77

For the particle of Problem 12.76, determine the tangential component F_t of the central force **F** along the tangent to the path of the particle for (*a*) $\theta = 0$, (*b*) $\theta = 45°$.

PROBLEM 12.76 A particle of mass *m* is projected from Point *A* with an initial velocity $\mathbf{v}_0$ perpendicular to line *OA* and moves under a central force **F** along a semicircular path of diameter *OA*. Observing that $r = r_0 \cos\theta$ and using Eq. (12.25), show that the speed of the particle is $v = v_0/\cos^2\theta$.

SOLUTION

Since the particle moves under a central force, $h = \text{constant}$

Using Eq. (12.27),

$$h = r^2\dot{\theta} = h_0 = r_0 v_0$$

$$\dot{\theta} = \frac{r_0 v_0}{r^2} = \frac{r_0 v_0}{r_0^2 \cos^2\theta} = \frac{v_0}{r_0 \cos^2\theta}$$

Radial component of velocity.

$$v_r = \dot{r} = \frac{d}{dt}(r_0\cos\theta) = -(r_0\sin\theta)\dot{\theta}$$

Transverse component of velocity.

$$v_\theta = r\dot{\theta} = (r_0\cos\theta)\dot{\theta}$$

Speed.

$$v = \sqrt{v_r^2 + v_\theta^2} = r_0\dot{\theta} = \frac{r_0 v_0}{r_0\cos^2\theta} = \frac{v_0}{\cos^2\theta}$$

Tangential component of acceleration.

$$a_t = \frac{dv}{dt} = v_0\frac{(-2)(-\sin\theta)\dot{\theta}}{\cos^3\theta} = \frac{2v_0\sin\theta}{\cos^3\theta}\cdot\frac{v_0}{r_0\cos^2\theta}$$

$$= \frac{2v_0^2\sin\theta}{r_0\cos^5\theta}$$

Tangential component of force.

$$F_t = ma_t: \quad F_t = \frac{2mv_0^2\sin\theta}{r_0\cos^5\theta}$$

(*a*) $\theta = 0, \quad F_t = 0$ $\qquad F_t = 0$ ◀

(*b*) $\theta = 45°, \quad F_t = \frac{2mv_0\sin 45°}{\cos^5 45°}$ $\qquad F_t = \frac{8mv_0^2}{r_0}$ ◀

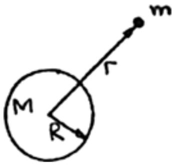
PROBLEM 12.78

Determine the mass of the earth knowing that the mean radius of the moon's orbit about the earth is 238,910 mi and that the moon requires 27.32 days to complete one full revolution about the earth.

SOLUTION

We have $F = G\dfrac{Mm}{r^2}$ [Eq. (12.28)]

and $F = F_n = ma_n = m\dfrac{v^2}{r}$



Then $G\dfrac{Mm}{r^2} = m\dfrac{v^2}{r}$

or $M = \dfrac{r}{G}v^2$

Now $v = \dfrac{2\pi r}{\tau}$

so that $M = \dfrac{r}{G}\left(\dfrac{2\pi r}{\tau}\right)^2 = \dfrac{1}{G}\left(\dfrac{2\pi}{\tau}\right)^2 r^3$

Noting that $\tau = 27.32\,\text{days} = 2.3604 \times 10^6\,\text{s}$

and $r = 238{,}910\text{ mi} = 1.26144 \times 10^9\,\text{ft}$

we have $M = \dfrac{1}{34.4\times 10^{-9}\,\text{ft}^4/\text{lb}\cdot\text{s}^4}\left(\dfrac{2\pi}{2.3604\times 10^6\,\text{s}}\right)^2 (1.26144 \times 10^9\,\text{ft})^3$

or $M = 413 \times 10^{21}\,\text{lb}\cdot\text{s}^2/\text{ft}$ ◀

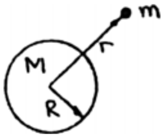
PROBLEM 12.79

Show that the radius r of the moon's orbit can be determined from the radius R of the earth, the acceleration of gravity g at the surface of the earth, and the time τ required for the moon to complete one full revolution about the earth. Compute r knowing that $\tau = 27.3$ days, giving the answer in both SI and U.S. customary units.

SOLUTION

We have $$F = G\frac{Mm}{r^2} \qquad \text{[Eq. (12.28)]}$$

and $$F = F_n = ma_n = m\frac{v^2}{r}$$



Then $$G\frac{Mm}{r^2} = m\frac{v^2}{r}$$

or $$v^2 = \frac{GM}{r}$$

Now $$GM = gR^2 \qquad \text{[Eq. (12.30)]}$$

so that $$v^2 = \frac{gR^2}{r} \quad \text{or} \quad v = R\sqrt{\frac{g}{r}}$$

For one orbit, $$\tau = \frac{2\pi r}{v} = \frac{2\pi r}{R\sqrt{\frac{g}{r}}}$$

or $$r = \left(\frac{g\tau^2R^2}{4\pi^2}\right)^{1/3} \qquad \text{Q.E.D.} \quad ◀$$

Now $$\tau = 27.3 \text{ days} = 2.35872\times10^6 \text{ s}$$
$$R = 3960 \text{ mi} = 20.9088\times10^6 \text{ ft}$$

SI: $$r = \left[\frac{9.81 \text{ m/s}^2\times(2.35872\times10^6 \text{ s})^2\times(6.37\times10^6 \text{ m})^2}{4\pi^2}\right]^{1/3} = 382.81\times10^6 \text{ m}$$

or $$r = 383\times10^3 \text{ km} \quad ◀$$

U.S. customary units:

$$r = \left[\frac{32.2 \text{ ft/s}^2\times(2.35872\times10^6 \text{ s})^2\times(20.9088\times10^6 \text{ ft})^2}{4\pi^2}\right]^{1/3} = 1256.52\times10^6 \text{ ft}$$

or $$r = 238\times10^3 \text{ mi} \quad ◀$$

PROBLEM 12.80

Communication satellites are placed in a geosynchronous orbit, i.e., in a circular orbit such that they complete one full revolution about the earth in one sidereal day (23.934 h), and thus appear stationary with respect to the ground. Determine (*a*) the altitude of these satellites above the surface of the earth, (*b*) the velocity with which they describe their orbit. Give the answers in both SI and U.S. customary units.

SOLUTION

For gravitational force and a circular orbit,

$$|F_r| = \frac{GMm}{r^2} = \frac{mv^2}{r} \qquad \text{or} \qquad v = \sqrt{\frac{GM}{r}}$$

Let τ be the period time to complete one orbit.

But $$v\tau = 2\pi r \qquad \text{or} \qquad v^2\tau^2 = \frac{GM\tau^2}{r} = 4\pi^2 r^2$$

Then $$r^3 = \frac{GM\tau^2}{4\pi^2} \qquad \text{or} \qquad r = \left(\frac{GM\tau^2}{4\pi^2}\right)^{1/3}$$

Data: $$\tau = 23.934\text{ h} = 86.1624\times 10^3\text{ s}$$

(*a*) In SI units: $$g = 9.81\text{ m/s}^2,\ R = 6.37\times 10^6\text{ m}$$

$$GM = gR^2 = (9.81)(6.37\times 10^6)^2 = 398.06\times 10^{12}\text{ m}^3/\text{s}^2$$

$$r = \left[\frac{(398.06\times 10^{12})(86.1624\times 10^3)^2}{4\pi^2}\right]^{1/3} = 42.145\times 10^6\text{ m}$$

altitude $h = r - R = 35.775\times 10^6$ m $\qquad h = 35{,}800$ km ◀

In U.S. units: $$g = 32.2\text{ ft/s}^2,\ R = 3960\text{ mi} = 20.909\times 10^6\text{ ft}$$

$$GM = gR^2 = (32.2)(20.909\times 10^6)^2 = 14.077\times 10^{15}\text{ ft}^3/\text{s}^2$$

$$r = \left[\frac{(14.077\times 10^{15})(86.1624\times 10^3)^2}{4\pi^2}\right]^{1/3} = 138.334\times 10^6\text{ ft}$$

altitude $h = r - R = 117.425\times 10^6$ ft $\qquad h = 22{,}200$ mi ◀

PROBLEM 12.80 (Continued)

(*b*) In SI units:

$$v = \sqrt{\frac{GM}{r}} = \sqrt{\frac{398.06 \times 10^{12}}{42.145 \times 10^{6}}} = 3.07 \times 10^{3} \text{ m/s} \qquad v = 3.07 \text{ km/s} \blacktriangleleft$$

In U.S. units:

$$v = \sqrt{\frac{GM}{r}} = \sqrt{\frac{14.077 \times 10^{15}}{138.334 \times 10^{6}}} = 10.09 \times 10^{3} \text{ ft/s} \qquad v = 10.09 \times 10^{3} \text{ ft/s} \blacktriangleleft$$

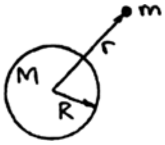
PROBLEM 12.81

Show that the radius r of the orbit of a moon of a given planet can be determined from the radius R of the planet, the acceleration of gravity at the surface of the planet, and the time τ required by the moon to complete one full revolution about the planet. Determine the acceleration of gravity at the surface of the planet Jupiter knowing that $R = 71{,}492$ km and that $\tau = 3.551$ days and $r = 670.9 \times 10^3$ km for its moon Europa.

SOLUTION

We have $$F = G\frac{Mm}{r^2} \qquad \text{[Eq. (12.28)]}$$

and $$F = F_n = ma_n = m\frac{v^2}{r}$$



Then $$G\frac{Mm}{r^2} = m\frac{v^2}{r}$$

or $$v^2 = \frac{GM}{r}$$

Now $$GM = gR^2 \qquad \text{[Eq. (12.30)]}$$

so that $$v^2 = \frac{gR^2}{r} \qquad \text{or} \qquad v = R\sqrt{\frac{g}{r}}$$

For one orbit, $$\tau = \frac{2\pi r}{v} = \frac{2\pi r}{R\sqrt{\frac{g}{r}}}$$

or $$r = \left(\frac{g\tau^2R^2}{4\pi^2}\right)^{1/3} \qquad \text{Q.E.D.} \quad ◀$$

Solving for g, $$g = 4\pi^2\frac{r^3}{\tau^2R^2}$$

and noting that $\tau = 3.551\,\text{days} = 306{,}806$ s, then

$$g_{\text{Jupiter}} = 4\pi^2\frac{r_{\text{Eur}}^3}{\tau_{\text{Eur}}^2 R_{\text{Jup}}} = 4\pi^2\frac{(670.9\times10^6\,\text{m})^3}{(306{,}806\,\text{s})^2(71.492\times10^6\,\text{m})^2}$$

or $$g_{\text{Jupiter}} = 24.8\ \text{m/s}^2 \quad ◀$$

Note: $g_{\text{Jupiter}} \approx 2.53 g_{\text{Earth}}$

PROBLEM 12.82

The orbit of the planet Venus is nearly circular with an orbital velocity of 126.5×10^3 km/h. Knowing that the mean distance from the center of the sun to the center of Venus is 108×10^6 km and that the radius of the sun is 695×10^3 km, determine (*a*) the mass of the sun, (*b*) the acceleration of gravity at the surface of the sun.

SOLUTION

Let M be the mass of the sun and m the mass of Venus.

For the circular orbit of Venus,

$$\frac{GMm}{r^2} = ma_n = \frac{mv^2}{r} \qquad GM = rv^2$$

where r is radius of the orbit.

Data: $$r = 108 \times 10^6 \text{ km} = 108 \times 10^9 \text{ m}$$

$$v = 126.5 \times 10^3 \text{ km/hr} = 35.139 \times 10^3 \text{ m/s}$$

$$GM = (108 \times 10^9)(35.139 \times 10^3)^2 = 1.3335 \times 10^{20} \text{ m}^3/\text{s}^2$$

(*a*) Mass of sun. $$M = \frac{GM}{G} = \frac{1.3335 \times 10^{20} \text{ m}^3/\text{s}^2}{66.73 \times 10^{-12}} \qquad M = 1.998 \times 10^{30} \text{ kg} \blacktriangleleft$$

(*b*) At the surface of the sun, $$R = 695.5 \times 10^3 \text{ km} = 695.5 \times 10^6 \text{ m}$$

$$\frac{GMm}{R^2} = mg$$

$$g = \frac{GM}{R^2} = \frac{1.3335 \times 10^{20}}{(695.5 \times 10^6)^2} \qquad g = 276 \text{ m/s}^2 \blacktriangleleft$$

PROBLEM 12.83

A satellite is placed into a circular orbit about the planet Saturn at an altitude of 2100 mi. The satellite describes its orbit with a velocity of 54.7×10^3 mi/h. Knowing that the radius of the orbit about Saturn and the periodic time of Atlas, one of Saturn's moons, are 85.54×10^3 mi and 0.6017 days, respectively, determine (*a*) the radius of Saturn, (*b*) the mass of Saturn. (The *periodic time* of a satellite is the time it requires to complete one full revolution about the planet.)

SOLUTION

Velocity of Atlas.

$$v_A = \frac{2\pi r_A}{\tau_A}$$

where

$$v_A = 85.54\times10^3 \text{ mi} = 451.651\times10^6 \text{ ft}$$

and

$$\tau_A = 0.6017 \text{ days} = 51{,}987 \text{ s}$$

$$v_A = \frac{(2\pi)(451.651\times10^6)}{51{,}987} = 54.587\times10^3 \text{ ft/s}$$

Gravitational force.

$$F = \frac{GMm}{r^2} = \frac{mv^2}{r}$$

from which

$$GM = rv^2 = \text{constant}$$

For the satellite,

$$r_s v_s^2 = r_A v_A^2$$

$$r_s = \frac{r_A v_A^2}{v_s{}^2}$$

where

$$v_s = 54.7\times10^3 \text{mi/h} = 80.227\times10^3 \text{ ft/s}$$

$$r_s = \frac{(451.651\times10^6)(54.587\times10^3)^2}{(80.227\times10^3)^2} = 209.09\times10^6 \text{ ft}$$

$$r_s = 39{,}600 \text{ mi}$$

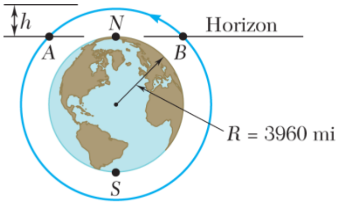
(*a*) Radius of Saturn.

$$R = r_s - (\text{altitude}) = 39{,}600 - 2100 \qquad R = 37{,}500 \text{ mi} \blacktriangleleft$$

(*b*) Mass of Saturn.

$$M = \frac{r_A v_A^2}{G} = \frac{(451.651\times10^6)(54.587\times10^3)^2}{34.4\times10^{-9}}$$

$$M = 39.1\times10^{24} \text{ lb}\cdot\text{s}^2/\text{ft} \blacktriangleleft$$



PROBLEM 12.84

The periodic time (see Prob. *12.83*) of an earth satellite in a circular polar orbit is 120 minutes. Determine (*a*) the altitude *h* of the satellite, (*b*) the time during which the satellite is above the horizon for an observer located at the north pole.

SOLUTION

For gravitational force and a circular orbit,

$$|F_r| = \frac{GMm}{r^2} = \frac{mv^2}{r} \qquad \text{or} \qquad v = \sqrt{\frac{GM}{r}}$$

Let τ be the periodic time to complete one orbit.

$$v\tau = 2\pi r \qquad \text{or} \qquad \tau\sqrt{\frac{GM}{r}} = 2\pi r$$

Solving for r, $\quad r = \left(\dfrac{GM\tau^2}{4\pi^2}\right)^{1/3}$

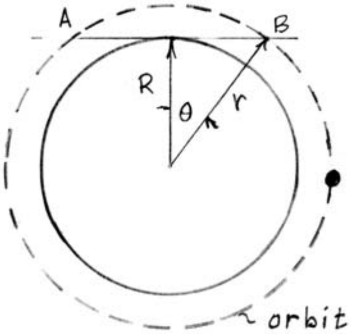
For earth, $R = 3960 \text{ mi} = 20.909 \times 10^6 \text{ ft}, \; g = 32.2 \text{ ft/s}^2$

$$GM = gR^2 = (32.2)\left(20.909 \times 10^6\right)^2 = 14.077 \times 10^{15} \text{ ft}^3/\text{s}^2$$

Data: $\tau = 120 \text{ min} = 7200 \text{ s}$

$$r = \left[\frac{\left(14.077 \times 10^{15}\right)(7200)^2}{4\pi^2}\right]^{1/3} = 26.441 \times 10^6 \text{ ft}$$

(*a*) altitude $h = r - R = 5.532 \times 10^6$ ft $\qquad h = 1048$ mi ◀



(*b*) $\cos\theta = \dfrac{R}{r} = \dfrac{20.909 \times 10^6}{26.441 \times 10^6} = 0.79078$

$$\theta = 37.74°$$

$$t_{AB} = \frac{2\theta}{360°}\tau = \frac{(75.48)(7200)}{360} = 1509.6 \text{ s}$$

$t_{AB} = 25.2$ min ◀

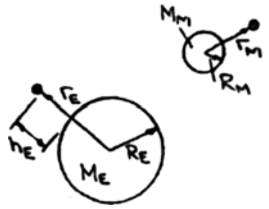
PROBLEM 12.85

A 500 kg spacecraft first is placed into a circular orbit about the earth at an altitude of 4500 km and then is transferred to a circular orbit about the moon. Knowing that the mass of the moon is 0.01230 times the mass of the earth and that the radius of the moon is 1737 km, determine (*a*) the gravitational force exerted on the spacecraft as it was orbiting the earth, (*b*) the required radius of the orbit of the spacecraft about the moon if the periodic times (see Problem 12.83) of the two orbits are to be equal, (*c*) the acceleration of gravity at the surface of the moon.

SOLUTION

First note that $R_E = 6.37\times 10^6 \text{ m}$

Then
$$r_E = R_E + h_E = (6.37\times 10^6 + 4.5\times 10^6)\text{ m}$$
$$= 10.87\times 10^6 \text{ m}$$



(*a*) We have $F = \dfrac{GMm}{r^2}$ [Eq. (12.28)]

and $GM = gR^2$ [Eq. (12.29)]

Then
$$F = gR^2\frac{m}{r^2} = W\left(\frac{R}{r}\right)^2$$

For the earth orbit,
$$F = (500\text{ kg})(9.81\text{ m/s}^2)\left(\frac{6.37\times 10^6\text{ m}}{10.87\times 10^6\text{ m}}\right)^2$$

or $F = 1684\text{ N}$ ◀

(*b*) From the solution to Problem 12.78, we have
$$M = \frac{1}{G}\left(\frac{2\pi}{\tau}\right)^2 r^3$$

Then
$$\tau = \frac{2\pi r^{3/2}}{\sqrt{GM}}$$

Now
$$\tau_E = \tau_M \Rightarrow \frac{2\pi r_E^{3/2}}{\sqrt{GM_E}} = \frac{2\pi r_M^{3/2}}{\sqrt{GM_M}} \qquad (1)$$

or
$$r_M = \left(\frac{M_M}{M_E}\right)^{1/3} r_E = (0.01230)^{1/3}(10.87\times 10^6\text{ m})$$

or $r_M = 2.509\times 10^6\text{ m}$ $r_M = 2510\text{ km}$ ◀

PROBLEM 12.85 (Continued)

(*c*) We have $GM = gR^2$ [Eq.(12.29)]

Substituting into Eq. (1)

$$\frac{2\pi r_E^{3/2}}{R_E\sqrt{g_E}} = \frac{2\pi r_M^{3/2}}{R_M\sqrt{g_M}}$$

or

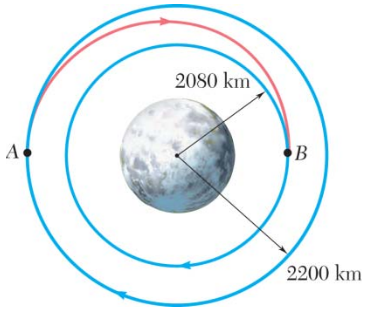
$$g_M = \left(\frac{R_E}{R_M}\right)^2 \left(\frac{r_M}{r_E}\right)^3 g_E = \left(\frac{R_E}{R_M}\right)^2 \left(\frac{M_M}{M_E}\right) g_E$$

using the results of Part (b). Then

$$g_M = \left(\frac{6370 \text{ km}}{1737 \text{ km}}\right)^2 (0.01230)(9.81 \text{ m/s}^2)$$

or $g_{\text{moon}} = 1.62 \text{ m/s}^2$ ◀

Note: $g_{\text{moon}} \approx \frac{1}{6} g_{\text{earth}}$



PROBLEM 12.86

A space vehicle is in a circular orbit of 2200-km radius around the moon. To transfer it to a smaller circular orbit of 2080-km radius, the vehicle is first placed on an elliptic path *AB* by reducing its speed by 26.3 m/s as it passes through *A*. Knowing that the mass of the moon is 73.49×10^{21} kg, determine (*a*) the speed of the vehicle as it approaches *B* on the elliptic path, (*b*) the amount by which its speed should be reduced as it approaches *B* to insert it into the smaller circular orbit.

SOLUTION

For a circular orbit, $\Sigma F_n = ma_n: \quad F = m\dfrac{v^2}{r}$

Eq. (12.28): $$F = G\frac{Mm}{r^2}$$

Then $$G\frac{Mm}{r^2} = m\frac{v^2}{r}$$

or $$v^2 = \frac{GM}{r}$$

Then $$(v_A)^2_{\text{circ}} = \frac{66.73\times 10^{-12}\ \text{m}^3/\text{kg}\cdot\text{s}^2 \times 73.49\times 10^{21}\ \text{kg}}{2200\times 10^3\ \text{m}}$$

or $$(v_A)_{\text{circ}} = 1493.0\ \text{m/s}$$

and $$(v_B)^2_{\text{circ}} = \frac{66.73\times 10^{-12}\ \text{m}^3/\text{kg}\cdot\text{s}^2 \times 73.49\times 10^{21}\ \text{kg}}{2080\times 10^3\ \text{m}}$$

or $$(v_B)_{\text{circ}} = 1535.5\ \text{m/s}$$

(*a*) We have $$(v_A)_{TR} = (v_A)_{\text{circ}} + \Delta v_A$$
$$= (1493.0 - 26.3)\ \text{m/s}$$
$$= 1466.7\ \text{m/s}$$

Conservation of angular momentum requires that

$$r_A m(v_A)_{TR} = r_B m(v_B)_{TR}$$

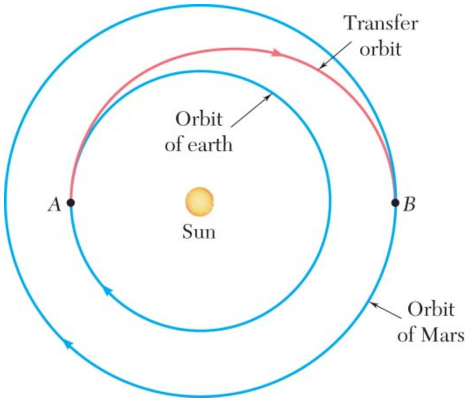
or $$(v_B)_{TR} = \frac{2200\ \text{km}}{2080\ \text{km}} \times 1466.7\ \text{m/s}$$
$$= 1551.3\ \text{m/s}$$

or $$(v_B)_{TR} = 1551\ \text{m/s} \blacktriangleleft$$

(*b*) Now $$(v_B)_{\text{circ}} = (v_B)_{TR} + \Delta v_B$$

or $$\Delta v_B = (1535.5 - 1551.3)\ \text{m/s}$$

or $$\Delta v_B = -15.8\ \text{m/s} \blacktriangleleft$$



PROBLEM 12.87

As a first approximation to the analysis of a space flight from the earth to Mars, assume the orbits of the earth and Mars are circular and coplanar. The mean distances from the sun to the earth and to Mars are 149.6×10^6 km and 227.8×10^6 km, respectively. To place the spacecraft into an elliptical transfer orbit at point *A*, its speed is increased over a short interval of time to v_A which is 2.94 km/s faster than the earth's orbital speed. When the spacecraft reaches point *B* on the elliptical transfer orbit, its speed v_B is increased to the orbital speed of Mars. Knowing that the mass of the sun is 332.8×10^3 times the mass of the earth, determine the increase in speed required at *B*.

SOLUTION

For earth, $(GM)_{\text{earth}} = gR^2 = (9.81)(6.37 \times 10^6)^2 = 398.06 \times 10^{12}\ \text{m}^3/\text{s}^2$

For sun, $(GM)_{\text{sun}} = (332.8 \times 10^3)(GM)_{\text{earth}} = 132.474 \times 10^{18}\text{m}^3/\text{s}^2$

For circular orbit of earth, $r_E = 149.6 \times 10^6\ \text{km} = 149.6 \times 10^9\ \text{m/s}$

$$v_E = \sqrt{\frac{(GM)_{\text{sun}}}{r_E}} = \sqrt{\frac{132.474 \times 10^{18}}{149.6 \times 10^9}} = 29.758 \times 10^3\ \text{m/s}$$

For transfer orbit *AB*, $r_A = r_E, \quad r_B = r_M = 227.8 \times 10^9\ \text{m}$

$$v_A = v_E + (\Delta v)_A = 29.758 \times 10^3 + 2.94 \times 10^3 = 32.698 \times 10^3\ \text{m/s}$$

$$mr_A v_A = mr_B v_B$$

$$v_B = \frac{r_A v_A}{r_B} = \frac{(149.6 \times 10^9)(32.698 \times 10^3)}{227.8 \times 10^9} = 21.473 \times 10^3\ \text{m/s}$$

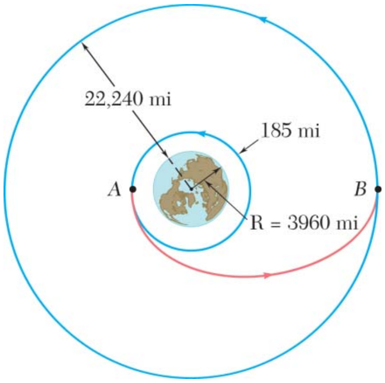
For circular orbit of Mars,

$$v_M = \sqrt{\frac{(GM)_{\text{sun}}}{r_M}} = \sqrt{\frac{132.474 \times 10^{18}}{227.8 \times 10^9}} = 24.115 \times 10^3\ \text{m/s}$$

Speed increase at *B*.

$$(\Delta v)_B = v_M - v_B = 24.115 \times 10^3 - 21.473 \times 10^3 = 2.643 \times 10^3\ \text{m/s}$$

$(\Delta v)_B = 2.64\ \text{km/s}$ ◀



PROBLEM 12.88

To place a communications satellite into a geosynchronous orbit (see Problem 12.80) at an altitude of 22,240 mi above the surface of the earth, the satellite first is released from a space shuttle, which is in a circular orbit at an altitude of 185 mi, and then is propelled by an upper-stage booster to its final altitude. As the satellite passes through *A*, the booster's motor is fired to insert the satellite into an elliptic transfer orbit. The booster is again fired at *B* to insert the satellite into a geosynchronous orbit. Knowing that the second firing increases the speed of the satellite by 4810 ft/s, determine (*a*) the speed of the satellite as it approaches *B* on the elliptic transfer orbit, (*b*) the increase in speed resulting from the first firing at *A*.

SOLUTION

For earth, $R = 3960 \text{ mi} = 20.909 \times 10^6 \text{ ft}$

$$GM = gR^2 = (32.2)(20.909 \times 10^6)^2 = 14.077 \times 10^{15} \text{ ft}^3/\text{s}^2$$

$$r_A = 3960 + 185 = 4145 \text{ mi} = 21.8856 \times 10^6 \text{ ft}$$

$$r_B = 3960 + 22,240 = 26,200 \text{ mi} = 138.336 \times 10^6 \text{ ft}$$

Speed on circular orbit through *A*.

$$(v_A)_{\text{circ}} = \sqrt{\frac{GM}{r_A}} = \sqrt{\frac{14.077 \times 10^{15}}{21.8856 \times 10^6}} = 25.362 \times 10^3 \text{ ft/s}$$

Speed on circular orbit through *B*.

$$(v_B)_{\text{circ}} = \sqrt{\frac{GM}{r_B}} = \sqrt{\frac{14.077 \times 10^{15}}{138.336 \times 10^6}} = 10.088 \times 10^3 \text{ ft/s}$$

PROBLEM 12.88 (Continued)

(*a*) Speed on transfer trajectory at *B*.

$$(v_B)_{\text{tr}} = 10.088 \times 10^3 - 4810$$

$$= 5.278 \times 10^3$$

5280 ft/s ◀

Conservation of angular momentum for transfer trajectory.

$$r_A (v_A)_{\text{tr}} = r_B (v_B)_{\text{tr}}$$

$$(v_A)_{\text{tr}} = \frac{r_B (v_B)_{\text{tr}}}{r_A}$$

$$= \frac{(138.336 \times 10^6)(5278)}{21.8856 \times 10^6}$$

$$= 33.362 \times 10^3 \text{ ft/s}$$

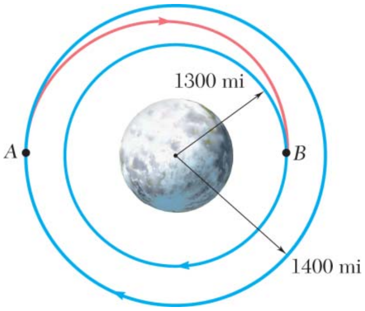
(*b*) Change in speed at *A*.

$$\Delta v_A = (v_A)_{\text{tr}} - (v_A)_{\text{circ}}$$

$$= 33.362 \times 10^3 - 25.362 \times 10^3$$

$$= 8.000 \times 10^3$$

$\Delta v_A = 8000$ ft/s ◀



PROBLEM 12.89

A space vehicle is in a circular orbit of 1400-mi radius around the moon. To transfer to a smaller orbit of 1300-mi radius, the vehicle is first placed in an elliptic path *AB* by reducing its speed by 86 ft/s as it passes through *A*. Knowing that the mass of the moon is 5.03×10^{21} lb·s^2/ft, determine (*a*) the speed of the vehicle as it approaches *B* on the elliptic path, (*b*) the amount by which its speed should be reduced as it approaches *B* to insert it into the smaller circular orbit.

SOLUTION

Circular orbits: $v = \sqrt{\dfrac{GM}{r}}$

$$r_A = 1400 \text{ mi} = 7.392 \times 10^6 \text{ ft}$$

$$(v_A)_1 = \sqrt{\frac{(34.4 \times 10^{-9})(5.03 \times 10^{21})}{7.392 \times 10^6}} = 4.8382 \times 10^3 \text{ ft/s}$$

$$r_B = 1300 \text{ mi} = 6.864 \times 10^6 \text{ ft}$$

$$(v_B)_2 = \sqrt{\frac{(34.4 \times 10^{-9})(5.03 \times 10^{21})}{6.864 \times 10^6}} = 5.0208 \times 10^3 \text{ ft/s}$$

(*a*) Transfer orbit *AB*.

$$(v_A)_2 = (v_A)_1 + (\Delta v)_A = 4.8382 \times 10^3 - 86 = 4.7522 \times 10^3 \text{ ft/s}$$

$$mr_A(v_A)_2 = mr_B(v_B)_1$$

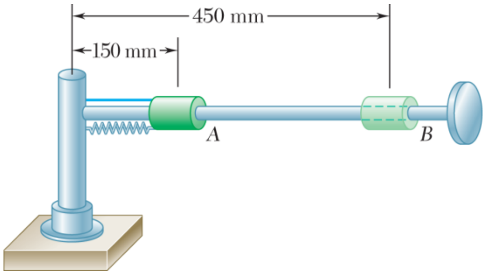
$$(v_B)_1 = \frac{r_A(v_A)_2}{r_B} = \frac{(7.392 \times 10^6)(4.7522 \times 10^3)}{6.864 \times 10^3} = 5.1178 \times 10^3 \text{ ft/s}$$

$$(v_B)_1 = 5.12 \times 10^3 \text{ ft/s} \blacktriangleleft$$

(*b*) Speed change at *B*.

$$(\Delta v_B) = (v_B)_2 - (v_B)_1 = 5.0208 \times 10^3 \text{ ft/s} - 5.1178 \times 10^3 \text{ ft/s} = -97.0 \text{ ft/s}$$

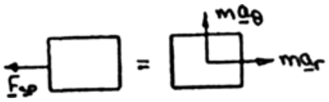
Speed reduction at *B*. $|\Delta v_B| = 97.0$ ft/s ◀



PROBLEM 12.90

A 1 kg collar can slide on a horizontal rod, which is free to rotate about a vertical shaft. The collar is initially held at *A* by a cord attached to the shaft. A spring of constant 30 N/m is attached to the collar and to the shaft and is undeformed when the collar is at *A*. As the rod rotates at the rate $\dot{\theta} = 16$ rad/s, the cord is cut and the collar moves out along the rod. Neglecting friction and the mass of the rod, determine (*a*) the radial and transverse components of the acceleration of the collar at *A*, (*b*) the acceleration of the collar relative to the rod at *A*, (*c*) the transverse component of the velocity of the collar at *B*.

SOLUTION



First note $\qquad F_{sp} = k(r - r_A)$

(*a*) $\quad F_\theta = 0$ and at *A*, $\qquad F_r = -F_{sp} = 0$

$$(a_A)_r = 0 \blacktriangleleft$$

$$(a_A)_\theta = 0 \blacktriangleleft$$

(*b*) $\quad \xrightarrow{+} \Sigma F_r = ma_r$: $\qquad -F_{sp} = m(\ddot{r} - r\dot{\theta}^2)$

Noting that $\qquad a_{\text{collar/rod}} = \ddot{r}$, we have at *A*

$$0 = m[a_{\text{collar/rod}} - (150 \text{ mm})(16 \text{ rad/s})^2]$$

$$a_{\text{collar/rod}} = 38400 \text{ mm/s}^2$$

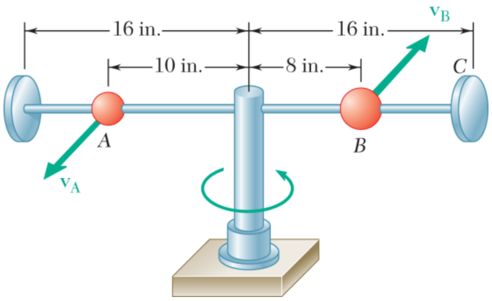
or $\qquad (a_{\text{collar/rod}})_A = 38.4 \text{ m/s}^2 \blacktriangleleft$

(*c*) After the cord is cut, the only horizontal force acting on the collar is due to the spring. Thus, angular momentum about the shaft is conserved.

$$r_A m(v_A)_\theta = r_B m(v_B)_\theta \quad \text{where} \quad (v_A)_\theta = r_A\dot{\theta}_0$$

Then $\qquad (v_B)_\theta = \dfrac{150 \text{ mm}}{450 \text{ mm}}[(150 \text{ mm})(16 \text{ rad/s})] = 800 \text{ mm/s}$

or $\qquad (v_B)_\theta = 0.800 \text{ m/s} \blacktriangleleft$



PROBLEM 12.91

A 1-lb ball A and a 2-lb ball B are mounted on a horizontal rod which rotates freely about a vertical shaft. The balls are held in the positions shown by pins. The pin holding B is suddenly removed and the ball moves to position C as the rod rotates. Neglecting friction and the mass of the rod and knowing that the initial speed of A is $v_A = 8$ ft/s, determine (*a*) the radial and transverse components of the acceleration of ball B immediately after the pin is removed, (*b*) the acceleration of ball B relative to the rod at that instant, (*c*) the speed of ball A after ball B has reached the stop at C.

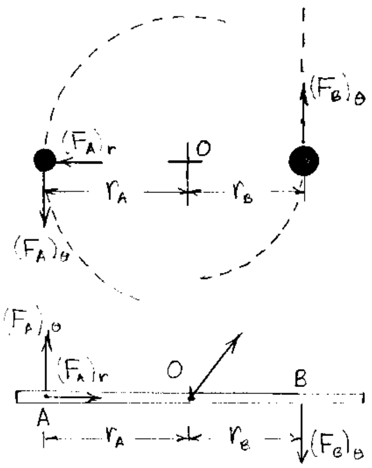
SOLUTION

Let r and θ be polar coordinates with the origin lying at the shaft.

Constraint of rod: $\theta_B = \theta_A + \pi$ radians; $\dot{\theta}_B = \dot{\theta}_A = \dot{\theta}$; $\ddot{\theta}_B = \ddot{\theta}_A = \ddot{\theta}$.

(*a*) Components of acceleration

Sketch the free body diagrams of the balls showing the radial and transverse components of the forces acting on them. Owing to frictionless sliding of B along the rod, $(F_B)_r = 0$.



Radial component of acceleration of B.

$$F_r = m_B(a_B)_r: \qquad (a_B)_r = 0 \blacktriangleleft$$

Transverse components of acceleration.

$$(a_A)_\theta = r_A\ddot{\theta} + 2\dot{r}_A\dot{\theta} = ra\ddot{\theta}$$

$$(a_B)_\theta = r_B\ddot{\theta} + 2\dot{r}_B\dot{\theta} \qquad (1)$$

Since the rod is massless, it must be in equilibrium. Draw its free body diagram, applying Newton's 3rd Law.

$$+\circlearrowleft \Sigma M_0 = 0: \quad r_A(F_A)_\theta + r_B(F_B)_\theta = r_A m_A(a_A)_\theta + r_B m_B(a_B)_\theta = 0$$

$$r_A m_A r_A\ddot{\theta} + r_B m_B(r_B\ddot{\theta} + 2\dot{r}_B\dot{\theta}) = 0$$

$$\ddot{\theta} = \frac{-2m_B\dot{r}_B\dot{\theta}}{m_A r_A^2 + m_B r_B^2}$$

At $t = 0$, $\dot{r}_B = 0$ so that $\ddot{\theta} = 0$.

From Eq. (1), $(a_B)_\theta = 0 \blacktriangleleft$

PROBLEM 12.91 (Continued)

(*b*) Acceleration of *B* relative to the rod.

At $t = 0,\ (v_A)_\theta = 8\text{ ft/s} = 96\text{ in./s},\ \dot{\theta} = \dfrac{(v_A)_\theta}{r_A} = \dfrac{96}{10} = 9.6\text{ rad/s}$

$$\ddot{r}_B - r_B\dot{\theta}^2 = (a_B)_r = 0$$

$$\ddot{r}_B = r_B\dot{\theta}^2 = (8)(9.6)^2 = 737.28\text{ in./s}^2$$

$$\ddot{r}_B = 61.4\text{ ft/s}^2 \blacktriangleleft$$

(*c*) Speed of *A*.

Substituting $\dfrac{d}{dt}(mr^2\dot{\theta})$ for rF_θ in each term of the moment equation gives

$$\frac{d}{dt}\left(m_A r_A{}^2\dot{\theta}\right) + \frac{d}{dt}\left(m_B r_B{}^2\dot{\theta}\right) = 0$$

Integrating with respect to time,

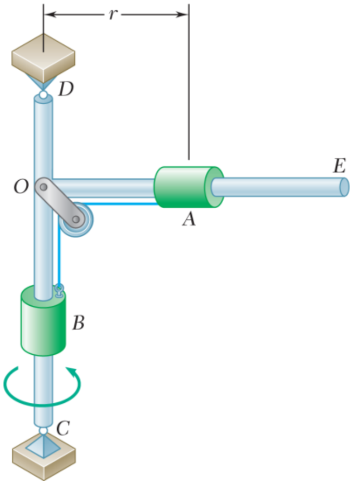
$$m_A r_A{}^2\dot{\theta} + m_B r_B{}^2\dot{\theta} = \left(m_A r_A{}^2\dot{\theta}\right)_0 + \left(m_B r_B{}^2\dot{\theta}\right)_0$$

Applying to the final state with ball *B* moved to the stop at *C*,

$$\left(\frac{W_A}{g}r_A^2 + \frac{W_B}{g}r_C^2\right)\dot{\theta}_f = \left[\frac{W_A}{g}r_A^2 + \frac{W_B}{g}(r_B)_0^2\right]\dot{\theta}_0$$

$$\dot{\theta}_f = \frac{W_A r_A{}^2 + W_B(r_B)_0^2}{W_A r_A{}^2 + W_B r_C{}^2}\dot{\theta}_0 = \frac{(1)(10)^2 + (2)(8)^2}{(1)(10)^2 + (2)(16)^2}(9.6) = 3.5765\text{ rad/s}$$

$$(v_A)_f = r_A\dot{\theta}_f = (10)(3.5765) = 35.765\text{ in./s} \qquad (v_A)_f = 2.98\text{ ft/s} \blacktriangleleft$$



PROBLEM 12.92

Two 2.6-lb collars *A* and *B* can slide without friction on a frame, consisting of the horizontal rod *OE* and the vertical rod *CD*, which is free to rotate about *CD*. The two collars are connected by a cord running over a pulley that is attached to the frame at *O* and a stop prevents collar *B* from moving. The frame is rotating at the rate $\dot{\theta} = 12$ rad/s and $r = 0.6$ ft when the stop is removed allowing collar *A* to move out along rod *OE*. Neglecting friction and the mass of the frame, determine, for the position $r = 1.2$ ft, (*a*) the transverse component of the velocity of collar *A*, (*b*) the tension in the cord and the acceleration of collar *A* relative to the rod *OE*.

SOLUTION

Masses: $m_A = m_B = \dfrac{2.6}{32.2} = 0.08075 \text{ lb}\cdot\text{s}^2/\text{ft}$

(*a*) Conservation of angular momentum of collar *A*: $(H_0)_2 = (H_0)_1$

$$m_A r_1 (v_\theta)_1 = m_A r_2 (v_\theta)_2$$

$$(v_\theta)_2 = \frac{r_1 (v_\theta)_1}{r_2} = \frac{r_1^2 \dot{\theta}_1}{r_2} = \frac{(0.6)^2(12)}{1.2} = 3.6$$

$(v_\theta)_2 = 3.60$ ft/s ◀

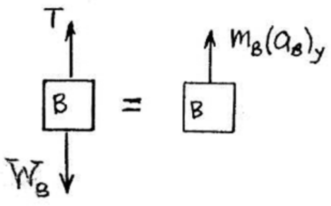
$$\dot{\theta}_2 = \frac{(v_\theta)_2}{r_A} = \frac{3.6}{1.2} = 3.00 \text{ rad/s}$$

(*b*) Let *y* be the position coordinate of *B*, positive upward with origin at *O*.

Constraint of the cord: $r - y = \text{constant}$ or $\ddot{y} = \ddot{r}$

Kinematics:

$$(a_B)_y = \ddot{y} = \ddot{r} \qquad \text{and} \qquad (a_A)_r = \ddot{r} - r\dot{\theta}^2$$

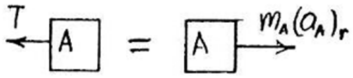


Collar *B*: $\Sigma F_y = m_B a_B: \quad T - W_B = m_B \ddot{y} = m_B \ddot{r}$ (1)

Collar *A*: $\xrightarrow{+} \Sigma F_r = m_A (a_A)_r: \quad -T = m_A(\ddot{r} - r\dot{\theta}^2)$ (2)

Adding (1) and (2) to eliminate *T*,

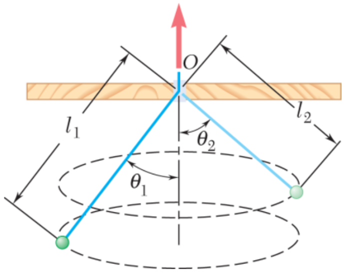
$$-W_B = (m_A + m_B)\ddot{r} + m_A r \dot{\theta}^2$$



$$a_{A/\text{rod}} = \ddot{r} = \frac{m_A r \dot{\theta}^2 - W_B}{m_A + m_B} = \frac{(0.08075)(1.2)(3.00)^2 - (2.6)}{0.08075 + 0.08075} = -10.70 \text{ ft/s}^2$$

$T = m_B(\ddot{r} + g) = (0.08075)(-10.70 + 32.2)$ $\qquad T = 1.736$ lb ◀

$a_{A/\text{rod}} = 10.70 \text{ ft/s}^2$ radially inward. ◀



PROBLEM 12.93

A small ball swings in a horizontal circle at the end of a cord of length l_1, which forms an angle θ_1 with the vertical. The cord is then slowly drawn through the support at O until the length of the free end is l_2. (*a*) Derive a relation among l_1, l_2, θ_1, and θ_2. (*b*) If the ball is set in motion so that initially $l_1 = 0.8$ m and $\theta_1 = 35°$, determine the angle θ_2 when $l_2 = 0.6$ m.

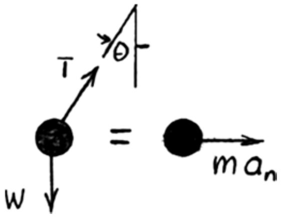
SOLUTION

(*a*) For state 1 or 2, neglecting the vertical component of acceleration,

$$+\!\uparrow \Sigma F_y = 0: \quad T\cos\theta - W = 0$$

$$T = W\cos\theta$$

$$\xrightarrow{+} \Sigma F_x = ma_n: \quad T\sin\theta = W\sin\theta\cos\theta = \frac{mv^2}{\rho}$$



But $\rho = \ell\sin\theta$ so that

$$v^2 = \frac{\rho W}{m}\sin^2\theta\cos\theta = \ell\, g\sin\theta\tan\theta$$

$$v_1 = \sqrt{\ell_1 g\sin\theta_1\tan\theta_1}$$

and $$v_2 = \sqrt{\ell_2\, g\sin\theta_2\tan\theta_2}$$

$$\Sigma M_y = 0: \quad H_y = \text{constant}$$

$$r_1 m v_1 = r_2 m v_2 \qquad \text{or} \qquad v_1\ell_1\sin\theta_1 = v_2\ell_2\sin\theta_2$$

$$\ell_1^{3/2} g\sin\theta_1\sqrt{\sin\theta_1\tan\theta_1} = \ell_2^{3/2}\sin\theta_2\sqrt{\sin\theta_2\tan\theta_2}$$

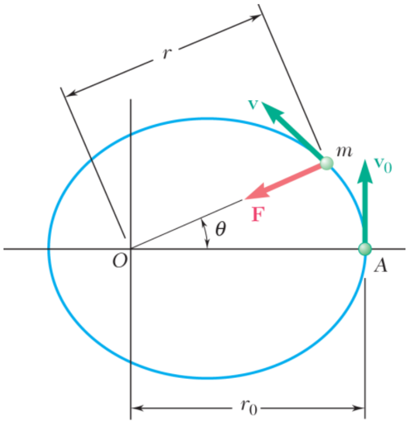
$$\ell_1^3\sin^3\theta_1\tan\theta_1 = \ell_2^3\sin^3\theta_2\tan\theta_2 \ ◀$$

(*b*) With $\theta_1 = 35°$, $\ell_1 = 0.8$ m, and $\ell_2 = 0.6$ m

$$(0.8)^3\sin^3 35°\tan 35° = (0.6)^3\sin^3\theta_2\tan\theta_2$$

$$\sin^3\theta_2\tan\theta_2 - 0.31320 = 0$$

$$\theta_2 = 43.6° \ ◀$$



PROBLEM 12.94

A particle of mass m is projected from Point A with an initial velocity $\mathbf{v}_0$ perpendicular to OA and moves under a central force $\mathbf{F}$ along an elliptic path defined by the equation $r = r_0/(2-\cos\theta)$. Using Eq. (12.35), show that $\mathbf{F}$ is inversely proportional to the square of the distance r from the particle to the center of force O.

SOLUTION

$$u = \frac{1}{r} = \frac{2-\cos\theta}{r_0}, \quad \frac{du}{d\theta} = \frac{\sin\theta}{r_0}, \quad \frac{d^2u}{d\theta^2} = \frac{\cos\theta}{r_0}$$

$$\frac{d^2u}{d\theta^2} + u = \frac{2}{r_0} = \frac{F}{mh^2u^2} \quad \text{by Eq. (12.37).}$$

Solving for F,

$$F = \frac{2mh^2u^2}{r_0} = \frac{2mh^2}{r_0r^2}$$

Since m, h, and r_0 are constants, F is proportional to $\frac{1}{r^2}$, or inversely proportional to r^2.

PROBLEM 12.95

A particle of mass m describes the logarithmic spiral $r = r_0 e^{b\theta}$ under a central force **F** directed toward the center of force O. Using Eq. (12.35) show that **F** is inversely proportional to the cube of the distance r from the particle to O.

SOLUTION

$$u = \frac{1}{r} = \frac{1}{r_0} e^{-b\theta}$$

$$\frac{du}{d\theta} = -\frac{b}{r_0} e^{-b\theta}$$

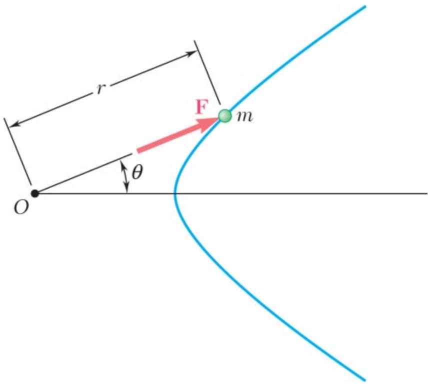
$$\frac{d^2u}{d\theta^2} = \frac{b^2}{r_0} e^{-b\theta}$$

$$\frac{d^2u}{d\theta^2} + u = \frac{b^2 + 1}{r_0} e^{-b\theta} = \frac{F}{mh^2u^2}$$

$$F = \frac{(b^2 + 1)mh^2u^2}{r_0} e^{-b\theta}$$

$$= \frac{(b^2 + 1)mh^2u^2}{r} = \frac{(b^2 + 1)mh^2}{r^3}$$

Since b, m, and h are constants, **F** is proportional to $\frac{1}{r^3}$, or inversely proportional to r^3.



PROBLEM 12.96

A particle of mass m describes the path defined by the equation $r = r_0/(6\cos\theta - 5)$ under a central force **F** directed away from the center of force O. Using Eq. (12.35), show that **F** is inversely proportional to the square of the distance r from the particle to O.

SOLUTION

$$u = \frac{1}{r} = \frac{6\cos\theta - 5}{r_0}$$

$$\frac{du}{d\theta} = -\frac{6\sin\theta}{r_0}$$

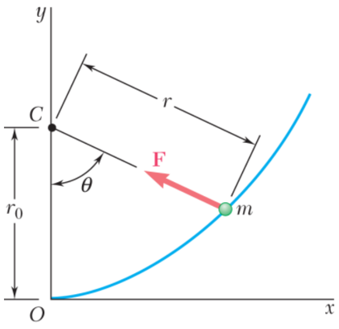
$$\frac{d^2u}{d\theta} = -\frac{6\cos\theta}{r_0}$$

$$\frac{d^2u}{d\theta^2} + u = -\frac{5}{r_0} = \frac{F}{mh^2u^2} \quad \text{by Eq. (12.35).}$$

Solving for F, $$F = -\frac{5mh^2u^2}{r_0}$$

Substitute $u = \frac{1}{r}$ $$F = -\frac{5mh^2}{r_0 r^2} \blacktriangleleft$$

Since m, h, and r_0 are constants, F is proportional to $\frac{1}{r^2}$, or inversely proportional to r^2. The minus sign indicates that the force is repulsive, as shown in Fig. P12.96.



PROBLEM 12.97

A particle of mass m describes the parabola $y = x^2/4r_0$ under a central force $\mathbf{F}$ directed toward the center of force C. Using Eq. (12.35) and Eq. $(12.37')$ with $\varepsilon = 1$, show that $\mathbf{F}$ is inversely proportional to the square of the distance r from the particle to the center of force and that the angular momentum per unit mass $h = \sqrt{2GMr_0}$.

SOLUTION

From Fig. P12.97, $\quad x = r\sin\theta, \quad y = r_0 - r\cos\theta$

But $\quad y = \dfrac{x^2}{4r_0} \quad$ or $\quad r_0 - r\cos\theta = \dfrac{r^2\sin^2\theta}{4r_0} = \dfrac{r^2\left(1-\cos^2\theta\right)}{4r_0}$

$$\left(\frac{1-\cos^2\theta}{4r_0}\right)r^2 + (\cos\theta)r - r_0 = 0$$

Solving the quadratic equation for r,

$$r = \frac{2r_0}{1-\cos^2\theta}\left[-\cos\theta \pm \sqrt{\cos^2\theta - 4\left(\frac{1-\cos^2\theta}{4r_0}\right)(-r_0)}\right]$$

$$= \frac{2r_0}{1-\cos^2\theta}(-\cos\theta \pm 1) = \frac{2r_0(1-\cos\theta)}{1-\cos^2\theta}$$

since $r > 0$. Simplifying gives

$$r = \frac{2r_0}{1+\cos\theta} \quad \text{or} \quad \frac{1}{r} = \frac{1+\cos\theta}{2r_0} = u \qquad (1)$$

$$\frac{du}{d\theta} = -\frac{\sin\theta}{2r_0} \quad \text{and} \quad \frac{d^2u}{d\theta^2} = -\frac{\cos\theta}{2r_0}$$

$$\frac{d^2u}{d\theta^2} + u = \frac{1}{2r_0} = \frac{F}{mh^2u^2}$$

Solving for F, $\qquad F = \dfrac{mh^2u^2}{2r_0} \qquad\qquad F = \dfrac{mh^2}{2r_0r^2}$ ◀

Since m, h, and r_0 are constants, F is proportional to $\dfrac{1}{r^2}$, or inversely proportional to r^2.

By Eq. $(12.37')$, $\quad \dfrac{1}{r} = \dfrac{GM}{h^2}(1+\varepsilon\cos\theta) = u$

Comparing with (1) shows that $\varepsilon = 1$ and $\dfrac{GM}{h^2} = \dfrac{1}{2r_0} \qquad\qquad h = \sqrt{2GMr_0}$ ◀

PROBLEM 12.98

It was observed that during its second flyby of the earth, the Galileo spacecraft had a velocity of 14.1 km/s as it reached its minimum altitude of 303 km above the surface of the earth. Determine the eccentricity of the trajectory of the spacecraft during this portion of its flight.

SOLUTION

For earth, $R = 6.37 \times 10^6\ \text{m}$

$$r_0 = 6.37 \times 10^6 + 303. \times 10^3 = 6.673 \times 10^6\ \text{m}$$

$$h = r_0 v_0 = (6.673 \times 10^6)(14.1 \times 10^3) = 94.09 \times 10^9\ \text{m}^2/\text{s}$$

$$GM = gR^2 = (9.81)(6.37 \times 10^6)^2 = 398.06 \times 10^{12}\ \text{m}^3/\text{s}^2$$

$$\frac{1}{r_0} = \frac{GM}{h^2}(1 + \varepsilon)$$

$$1 + \varepsilon = \frac{h^2}{r_0 GM} = \frac{(94.09 \times 10^9)^2}{(6.673 \times 10^6)(398.06 \times 10^{12})} = 3.33$$

$$\varepsilon = 3.33 - 1 \qquad \varepsilon = 2.33 \blacktriangleleft$$

PROBLEM 12.99

It was observed that during the Galileo spacecraft's first flyby of the earth, its maximum altitude was 600 mi above the surface of the earth. Assuming that the trajectory of the spacecraft was parabolic, determine the maximum velocity of Galileo during its first flyby of the earth.

SOLUTION

For the earth: $R = 3960 \text{ mi} = 20.909 \times 10^6 \text{ ft}$

$$GM = gR^2 = (32.2)(20.909 \times 10^6)^2 = 14.077 \times 10^{15} \text{ ft}^3/\text{s}^2$$

For a parabolic trajectory, $\varepsilon = 1.$

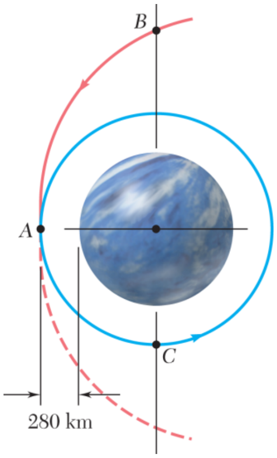
Eq. (12.39′): $\dfrac{1}{r} = \dfrac{GM}{h^2}(1 + \cos\theta)$

At $\theta = 0,$ $\dfrac{1}{r_0} = \dfrac{2GM}{h^2} = \dfrac{2GM}{r_0{}^2 v_0{}^2}$ or $v_0 = \sqrt{\dfrac{2GM}{r_0}}$

At $r_0 = 3960 + 600 = 4560 \text{ mi} = 24.077 \times 10^6 \text{ ft},$

$$v_0 = \sqrt{\frac{(2)(14.077 \times 10^{15})}{24.077 \times 10^6}} = 34.196 \times 10^3 \text{ ft/s}$$

$v_0 = 6.48 \text{ mi/s}$ ◀



PROBLEM 12.100

As a space probe approaching the planet Venus on a parabolic trajectory reaches Point A closest to the planet, its velocity is decreased to insert it into a circular orbit. Knowing that the mass and the radius of Venus are 4.87×10^{24} kg and 6052 km, respectively, determine (*a*) the velocity of the probe as it approaches A, (*b*) the decrease in velocity required to insert it into the circular orbit.

SOLUTION

First note $\quad r_A=(6052+280)\text{ km}=6332\text{ km}$

(*a*) From the textbook, the velocity at the point of closest approach on a parabolic trajectory is given by

$$v_0=\sqrt{\frac{2GM}{r_0}}$$

Thus, $$(v_A)_{\text{par}}=\left[\frac{2\times66.73\times10^{-12}\text{ m}^3/\text{kg}\cdot\text{s}^2\times4.87\times10^{24}\text{ kg}}{6332\times10^3\text{ m}}\right]^{1/2}$$

$$=10{,}131.4\text{ m/s}$$

or $\quad (v_A)_{\text{par}}=10.13\text{ km/s}$ ◀

(*b*) We have $\quad (v_A)_{\text{circ}}=(v_A)_{\text{par}}+\Delta v_A$

Now $$(v_A)_{\text{circ}}=\sqrt{\frac{GM}{r_0}}\qquad\text{Eq. (12.44)}$$

$$=\frac{1}{\sqrt{2}}(v_A)_{\text{par}}$$

Then $$\Delta v_A=\frac{1}{\sqrt{2}}(v_A)_{\text{par}}-(v_A)_{\text{par}}$$

$$=\left(\frac{1}{\sqrt{2}}-1\right)(10.1314\text{ km/s})$$

$$=-2.97\text{ km/s}$$

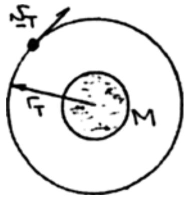
$|\Delta v_A|=2.97\text{ km/s}$ ◀

PROBLEM 12.101

It was observed that as the Voyager I spacecraft reached the point of its trajectory closest to the planet Saturn, it was at a distance of 185×10^3 km from the center of the planet and had a velocity of 21.0 km/s. Knowing that Tethys, one of Saturn's moons, describes a circular orbit of radius 295×10^3 km at a speed of 11.35 km/s, determine the eccentricity of the trajectory of Voyager I on its approach to Saturn.

SOLUTION

For a circular orbit,



Eq. (12.44) $$v = \sqrt{\frac{GM}{r}}$$

For the orbit of Tethys,

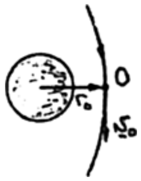
$$GM = r_T v_T^2$$

For Voyager's trajectory, we have

$$\frac{1}{r} = \frac{GM}{h^2}(1 + \varepsilon \cos\theta)$$

where $h = r_0 v_0$

At O, $$r = r_0, \ \theta = 0$$

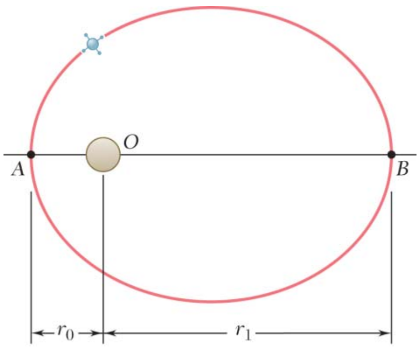


Then $$\frac{1}{r_0} = \frac{GM}{(r_0 v_0)^2}(1 + \varepsilon)$$

or $$\varepsilon = \frac{r_0 v_0^2}{GM} - 1 = \frac{r_0 v_0^2}{r_T v_T^2} - 1$$

$$= \frac{185 \times 10^3 \text{ km}}{295 \times 10^3 \text{ km}} \times \left(\frac{21.0 \text{ km/s}}{11.35 \text{ km/s}}\right)^2 - 1$$

or $$\varepsilon = 1.147 \blacktriangleleft$$



PROBLEM 12.102

A satellite describes an elliptic orbit about a planet of mass M. Denoting by r_0 and r_1, respectively, the minimum and maximum values of the distance r from the satellite to the center of the planet, derive the relation

$$\frac{1}{r_0}+\frac{1}{r_1}=\frac{2GM}{h^2}$$

where h is the angular momentum per unit mass of the satellite.

SOLUTION

Using Eq. (12.39),
$$\frac{1}{r_A}=\frac{GM}{h^2}+C\cos\theta_A$$

and
$$\frac{1}{r_B}=\frac{GM}{h^2}+C\cos\theta_B.$$

But
$$\theta_B=\theta_A+180°,$$

so that
$$\cos\theta_A=-\cos\theta_B.$$

Adding,
$$\frac{1}{r_A}+\frac{1}{r_B}=\frac{1}{r_0}+\frac{1}{r_1}=\frac{2GM}{h^2}$$

PROBLEM 12.103

A space probe is describing a circular orbit about a planet of radius R. The altitude of the probe above the surface of the planet is αR and its speed is v_0. To place the probe in an elliptic orbit which will bring it closer to the planet, its speed is reduced from v_0 to βv_0, where $\beta < 1$, by firing its engine for a short interval of time. Determine the smallest permissible value of β if the probe is not to crash on the surface of the planet.

SOLUTION

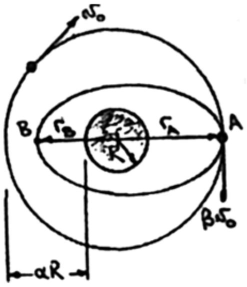
For the circular orbit, $v_0 = \sqrt{\dfrac{GM}{r_A}}$ Eq. (12.44),

where $r_A = R + \alpha R = R(1+\alpha)$

Then $GM = v_0^2 R(1+\alpha)$

From the solution to Problem 12.102, we have for the elliptic orbit,

$$\frac{1}{r_A} + \frac{1}{r_B} = \frac{2GM}{h^2}$$



Now
$$h = h_A = r_A (v_A)_{AB} = [R(1+\alpha)](\beta v_0)$$

Then
$$\frac{1}{R(1+\alpha)} + \frac{1}{r_B} = \frac{2v_0^2 R(1+\alpha)}{[R(1+\alpha)\beta v_0]^2} = \frac{2}{\beta^2 R(1+\alpha)}$$

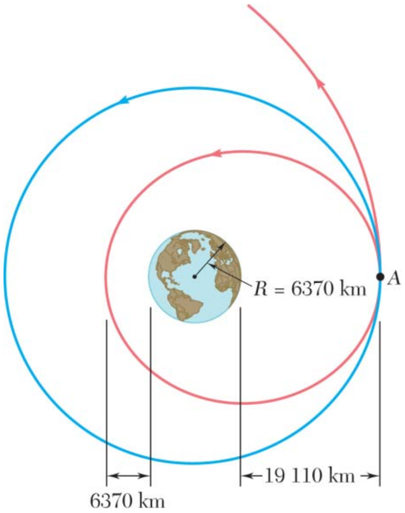
Now $\beta_{\min}$ corresponds to $r_B \to R.$

Then
$$\frac{1}{R(1+\alpha)} + \frac{1}{R} = \frac{2}{\beta_{\min}^2 R(1+\alpha)}$$

or
$$\beta_{\min} = \sqrt{\frac{2}{2+\alpha}} \blacktriangleleft$$

PROBLEM 12.104

A satellite describes a circular orbit at an altitude of 19 110 km above the surface of the earth. Determine (*a*) the increase in speed required at point *A* for the satellite to achieve the escape velocity and enter a parabolic orbit, (*b*) the decrease in speed required at point *A* for the satellite to enter an elliptic orbit of minimum altitude 6370 km, (*c*) the eccentricity ε of the elliptic orbit.



SOLUTION

For earth, $GM = gR^2 = (9.81)\left(6.37\times10^6\right) = 398.06\times10^{12}\ \text{m}^3/\text{s}^2$

$$r_A = 6370 + 19110 = 25480\ \text{km} = 25.48\times10^6\ \text{m}$$

$$v_{\text{circ}} = \sqrt{\frac{GM}{r_A}} = \sqrt{\frac{398.06\times10^{12}}{25.48\times10^6}} = 3.9525\times10^3\ \text{m/s}$$

$$v_{\text{esc}} = \sqrt{\frac{2GM}{r_A}} = \sqrt{2}\,v_{\text{circ}} = 5.5897\times10^3\ \text{m/s}$$

(*a*) Increase in speed at *A*.

$$\Delta v = v_{\text{esc}} - v_{\text{circ}} = 1.637\times10^3\ \text{m/s} \qquad \Delta v = 1.637\times10^3\ \text{m/s} \blacktriangleleft$$

Elliptical orbit with $r_B = 6370 + 6370 = 12740\ \text{km} = 12.74\times10^6\ \text{m}.$

Using Eq. (12.39), $\dfrac{1}{r_A} = \dfrac{GM}{h^2} + C\cos\theta_A$ and $\dfrac{1}{r_B} = \dfrac{GM}{h^2} + C\cos\theta_B.$

But $\theta_B = \theta_A + 180°$, so that $\cos\theta_A = -\cos\theta_B$

Adding, $\dfrac{1}{r_A} + \dfrac{1}{r_B} = \dfrac{r_A + r_B}{r_A r_B} = \dfrac{2GM}{h^2}$

$$h = \sqrt{\frac{2GMr_Ar_B}{r_A + r_B}} = \sqrt{\frac{(2)\left(398.06\times10^{12}\right)\left(25.48\times10^6\right)\left(12.74\times10^6\right)}{38.22\times10^6}}$$

$$= 82.230\times10^9\ \text{m}^2/\text{s}$$

PROBLEM 12.104 (Continued)

$$v_A = \frac{h}{r_A} = \frac{82.230 \times 10^9}{25.48 \times 10^6} = 3.2272 \times 10^3 \text{ m/s}$$

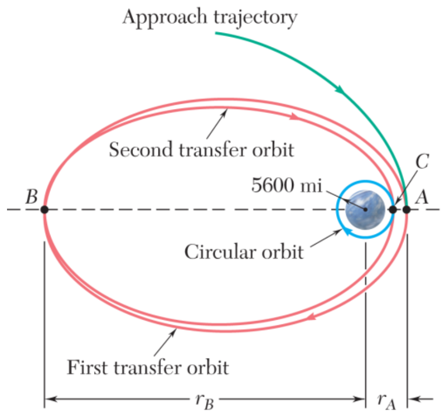
(*b*) Decrease in speed. $\Delta v = v_{\text{circ}} - v_A = 725 \text{ m/s}$ $\Delta v = 725 \text{ m/s}$ ◀

(*c*) $\dfrac{1}{r_B} - \dfrac{1}{r_A} = \dfrac{r_A - r_B}{r_A r_B} = C\cos\theta_B - C\cos_A = 2C$

$$C = \frac{r_A - r_B}{2r_A r_B} = \frac{12.74 \times 10^6}{(2)\left(25.48 \times 10^6\right)\left(12.74 \times 10^6\right)} = 19.623 \times 10^{-9} \text{ m}^{-1}$$

By Eq. (12.40), $\varepsilon = \dfrac{Ch^2}{GM} = \dfrac{\left(19.623 \times 10^{-9}\right)\left(82.230 \times 10^9\right)^2}{398.06 \times 10^{12}}$

$\varepsilon = 0.333$ ◀



PROBLEM 12.105

A space probe is to be placed in a circular orbit of 5600 mi radius about the planet Venus in a specified plane. As the probe reaches *A*, the point of its original trajectory closest to Venus, it is inserted in a first elliptic transfer orbit by reducing its speed by Δv_A. This orbit brings it to Point *B* with a much reduced velocity. There the probe is inserted in a second transfer orbit located in the specified plane by changing the direction of its velocity and further reducing its speed by Δv_B. Finally, as the probe reaches Point *C*, it is inserted in the desired circular orbit by reducing its speed by Δv_C. Knowing that the mass of Venus is 0.82 times the mass of the earth, that $r_A = 9.3 \times 10^3$ mi and $r_B = 190 \times 10^3$ mi, and that the probe approaches *A* on a parabolic trajectory, determine by how much the velocity of the probe should be reduced (*a*) at *A*, (*b*) at *B*, (*c*) at *C*.

SOLUTION

For Earth,

$$R = 3690 \text{ mi} = 20.9088 \times 10^6 \text{ ft}, \quad g = 32.2 \text{ ft/s}^2$$

$$GM_{\text{earth}} = gR^2 = (32.2)(20.9088 \times 10^6)^2 = 14.077 \times 10^{15} \text{ ft}^3/\text{s}^2$$

For Venus,

$$GM = 0.82 GM_{\text{earth}} = 11.543 \times 10^{15} \text{ ft}^3/\text{s}^2$$

For a parabolic trajectory with

$$r_A = 9.3 \times 10^3 \text{ mi} = 49.104 \times 10^6 \text{ ft}$$

$$(v_A)_1 = v_{\text{esc}} = \sqrt{\frac{2GM}{r_A}} = \sqrt{\frac{(2)(11.543 \times 10^{15})}{49.104 \times 10^6}} = 21.683 \times 10^3 \text{ ft/s}$$

First transfer orbit *AB*.

$$r_B = 190 \times 10^3 \text{ mi} = 1003.2 \times 10^6 \text{ ft}$$

At Point *A*, where $\theta = 180°$

$$\frac{1}{r_A} = \frac{GM}{h_{AB}^2} + C \cos 180° = \frac{GM}{h_{AB}^2} - C \qquad (1)$$

At Point *B*, where $\theta = 0°$

$$\frac{1}{r_B} = \frac{GM}{h_{AB}^2} + C \cos 0 = \frac{GM}{h_{AB}^2} + C \qquad (2)$$

Adding,

$$\frac{1}{r_A} + \frac{1}{r_B} = \frac{r_B + r_A}{r_A r_B} = \frac{2GM}{h_{AB}^2}$$

PROBLEM 12.105 (Continued)

Solving for h_{AB},

$$h_{AB} = \sqrt{\frac{2GMr_A r_B}{r_B + r_A}} = \sqrt{\frac{(2)(11.543\times10^{15})(49.104\times10^6)(1003.2\times10^6)}{1052.3\times10^6}} = 1.039575\times10^{12}\ \text{ft}^2/\text{s}$$

$$(v_A)_2 = \frac{h_{AB}}{r_A} = \frac{1.039575\times10^{12}}{49.104\times10^6} = 21.174\times10^3\ \text{ft/s}$$

$$(v_B)_1 = \frac{h_{AB}}{r_B} = \frac{1.039575\times10^{12}}{1003.2\times10^6} = 1.03626\times10^3\ \text{ft/s}$$

Second transfer orbit *BC*. $r_C = 5600\ \text{mi} = 29.568\times10^6\ \text{ft}$

At Point *B*, where $\theta = 0$

$$\frac{1}{r_B} = \frac{GM}{h_{BC}^2} + C\cos 0 = \frac{GM}{h_{BC}^2} + C$$

At Point *C*, where $\theta = 180°$

$$\frac{1}{r_C} = \frac{GM}{h_{BC}^2} + C\cos 180° = \frac{GM}{h_{BC}^2} - C$$

Adding, $$\frac{1}{r_B} + \frac{1}{r_C} = \frac{r_B + r_C}{r_B r_C} = \frac{2GM}{h_{BC}^2}$$

$$h_{BC} = \sqrt{\frac{2GMr_B r_C}{r_B + r_C}} = \sqrt{\frac{(2)(11.543\times10^{15})(1003.2\times10^6)(29.568\times10^6)}{1032.768\times10^6}} = 814.278\times10^9\ \text{ft}^2/\text{s}$$

$$(v_B)_2 = \frac{h_{BC}}{r_B} = \frac{814.278\times10^9}{1003.2\times10^6} = 811.69\ \text{ft/s}$$

$$(v_C)_1 = \frac{h_{BC}}{r_C} = \frac{814.278\times10^9}{29.568\times10^6} = 27.539\times10^3\ \text{ft/s}$$

Final circular orbit. $r_C = 29.568\times10^6\ \text{ft}$

$$(v_C)_2 = \sqrt{\frac{GM}{r_C}} = \sqrt{\frac{11.543\times10^{15}}{29.568\times10^6}} = 19.758\times10^3\ \text{ft/s}$$

Speed reductions.

(*a*) At *A*: $(v_A)_1 - (v_A)_2 = 21.683\times10^3 - 21.174\times10^3$ $\Delta v_A = 509\ \text{ft/s}$ ◀

(*b*) At *B*: $(v_B)_1 - (v_B)_2 = 1.036\times10^3 - 811.69$ $\Delta v_B = 224\ \text{ft/s}$ ◀

(*c*) At *C*: $(v_C)_1 - (v_C)_2 = 27.539\times10^3 - 19.758\times10^3$ $\Delta v_C = 7.78\times10^3\ \text{ft/s}$ ◀

PROBLEM 12.106

For the space probe of Problem 12.105, it is known that $r_A = 9.3 \times 10^3$ mi and that the velocity of the probe is reduced to $20{,}000$ ft/s as it passes through *A*. Determine (*a*) the distance from the center of Venus to Point *B*, (*b*) the amounts by which the velocity of the probe should be reduced at *B* and *C*, respectively.

SOLUTION

Data from Problem 12.105: $r_C = 29.568 \times 10^6$ ft, $M = 0.82\, M_{\text{earth}}$

For Earth, $R = 3960 \text{ mi} = 20.9088 \times 10^6 \text{ ft}, \quad g = 32.2 \text{ ft/s}^2$

$$GM_{\text{earth}} = gR^2 = (32.2)(20.9088 \times 10^6)^2 = 14.077 \times 10^{15} \text{ m}^3/\text{s}^2$$

For Venus, $GM = 0.82 GM_{\text{earth}} = 11.543 \times 10^{15} \text{ ft}^3/\text{s}^2$

Transfer orbit *AB*: $v_A = 20{,}000 \text{ ft/s}, \quad r_A = 9.3 \times 10^3 \text{ mi} = 49.104 \times 10^6 \text{ ft}$

$$h_{AB} = r_A v_A = (49.104 \times 10^6)(20{,}000) = 982.08 \times 10^9 \text{ ft}^2/\text{s}$$

At Point *A*, where $\theta = 180°$

$$\frac{1}{r_A} = \frac{GM}{h_{AB}^2} + C \cos 180° = \frac{GM}{h_{AB}^2} - C$$

At Point *B*, where $\theta = 0°$

$$\frac{1}{r_B} = \frac{GM}{h_{AB}^2} + C \cos 0 = \frac{GM}{h_{AB}^2} + C$$

Adding, $$\frac{1}{r_A} + \frac{1}{r_B} = \frac{2GM}{h_{AB}^2}$$

$$\frac{1}{r_B} = \frac{2GM}{h_{AB}^2} - \frac{1}{r_A}$$

$$= \frac{(2)(11.543 \times 10^{15})}{(982.08 \times 10^9)^2} - \frac{1}{49.104 \times 10^6}$$

$$= 3.57125 \times 10^{-9} \text{ ft}^{-1}$$

(*a*) Radial coordinate r_B. $r_B = 280.01 \times 10^6$ ft $\qquad r_B = 53.0 \times 10^3$ mi ◀

$$(v_B)_1 = \frac{h_{AB}}{r_B} = \frac{982.08 \times 10^9}{280.01 \times 10^6} = 3.5073 \times 10^3 \text{ ft/s}$$

PROBLEM 12.106 (Continued)

At Point *B*, where $\theta = 0$

$$\frac{1}{r_B} = \frac{GM}{h_{BC}^2} + C\cos 0 = \frac{GM}{h_{BC}^2} + C$$

At Point *C*, where $\theta = 180°$

$$\frac{1}{r_C} = \frac{GM}{h_{BC}^2} + C\cos 180° = \frac{GM}{h_{BC}^2} - C$$

Adding, $$\frac{1}{r_B} + \frac{1}{r_C} = \frac{r_B + r_C}{r_B r_C} = \frac{2GM}{h_{BC}^2}$$

$$h_{BC} = \sqrt{\frac{2GMr_Br_C}{r_B + r_C}} = \sqrt{\frac{(2)(11.543\times10^{15})(280.01\times10^6)(29.568\times10^6)}{309.578\times10^6}}$$

$$= 785.755\times10^9 \text{ ft}^2/\text{s}$$

$$(v_B)_2 = \frac{h_{BC}}{r_B} = \frac{785.755\times10^9}{280.01\times10^6} = 2.8062\times10^3 \text{ ft/s}$$

$$(v_C)_1 = \frac{h_{BC}}{r_C} = \frac{785.755\times10^9}{29.568\times10^6} = 26.575\times10^3 \text{ ft/s}$$

Circular orbit with $r_C = 29.568\times10^6 \text{ ft}$

$$(v_C)_2 = \sqrt{\frac{GM}{r_C}} = \sqrt{\frac{11.543\times10^{15}}{29.568\times10^6}} = 19.758\times10^3 \text{ ft/s}$$

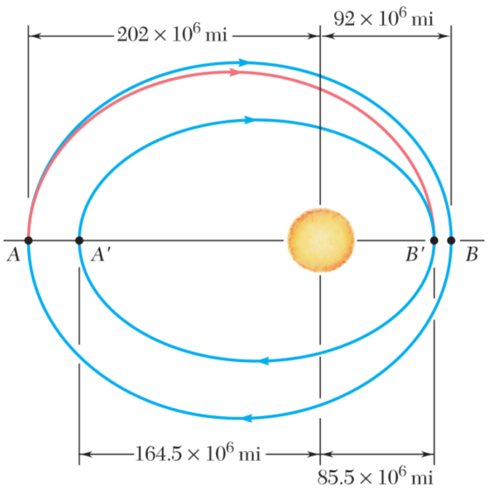
(*b*) Speed reductions at *B* and *C*.

At *B*: $(v_B)_1 - (v_B)_2 = 3.5073\times10^3 - 2.8062\times10^3$

$\Delta v_B = 701 \text{ ft/s}$ ◀

At *C*: $(v_C)_1 - (v_C)_2 = 26.575\times10^3 - 19.758\times10^3$

$\Delta v_C = 6.82\times10^3 \text{ ft/s}$ ◀



PROBLEM 12.107

As it describes an elliptic orbit about the sun, a spacecraft reaches a maximum distance of 202×10^6 mi from the center of the sun at Point *A* (called the aphelion) and a minimum distance of 92×10^6 mi at Point *B* (called the perihelion). To place the spacecraft in a smaller elliptic orbit with aphelion at A' and perihelion at B', where A' and B' are located 164.5×10^6 mi and 85.5×10^6 mi, respectively, from the center of the sun, the speed of the spacecraft is first reduced as it passes through *A* and then is further reduced as it passes through B'. Knowing that the mass of the sun is 332.8×10^3 times the mass of the earth, determine (*a*) the speed of the spacecraft at *A*, (*b*) the amounts by which the speed of the spacecraft should be reduced at *A* and B' to insert it into the desired elliptic orbit.

SOLUTION

First note

$$R_{\text{earth}} = 3960 \text{ mi} = 20.9088 \times 10^6 \text{ ft}$$

$$r_A = 202 \times 10^6 \text{ mi} = 1066.56 \times 10^9 \text{ ft}$$

$$r_B = 92 \times 10^6 \text{ mi} = 485.76 \times 10^9 \text{ ft}$$

From the solution to Problem 12.102, we have for any elliptic orbit about the sun

$$\frac{1}{r_1} + \frac{1}{r_2} = \frac{2GM_{\text{sun}}}{h^2}$$

(*a*) For the elliptic orbit *AB*, we have

$$r_1 = r_A, \quad r_2 = r_B, \quad h = h_A = r_A v_A$$

Also,

$$GM_{\text{sun}} = G[(332.8 \times 10^3)M_{\text{earth}}]$$

$$= gR_{\text{earth}}^2(332.8 \times 10^3) \qquad \text{using Eq. (12.30).}$$

Then

$$\frac{1}{r_A} + \frac{1}{r_B} = \frac{2gR_{\text{earth}}^2(332.8 \times 10^3)}{(r_A v_A)^2}$$

or

$$v_A = \frac{R_{\text{earth}}}{r_A}\left(\frac{665.6g \times 10^3}{\frac{1}{r_A} + \frac{1}{r_B}}\right)^{1/2}$$

$$= \frac{3960 \text{ mi}}{202 \times 10^6 \text{ mi}}\left(\frac{665.6 \times 10^3 \times 32.2 \text{ ft/s}^2}{\frac{1}{1066.56 \times 10^9 \text{ ft}} + \frac{1}{485.76 \times 10^9 \text{ ft}}}\right)^{1/2}$$

$$= 52,431 \text{ ft/s}$$

or $v_A = 52.4 \times 10^3$ ft/s ◀

PROBLEM 12.107 (Continued)

(*b*) From Part (*a*), we have

$$2GM_{\text{sun}} = (r_A v_A)^2\left(\frac{1}{r_A}+\frac{1}{r_B}\right)$$

Then, for any other elliptic orbit about the sun, we have

$$\frac{1}{r_1}+\frac{1}{r_2} = \frac{(r_A v_A)^2\left(\frac{1}{r_A}+\frac{1}{r_B}\right)}{h^2}$$

For the elliptic transfer orbit AB', we have

$$r_1 = r_A, \quad r_2 = r_{B'}, \quad h = h_{\text{tr}} = r_A (v_A)_{\text{tr}}$$

Then $$\frac{1}{r_A}+\frac{1}{r_{B'}} = \frac{(r_A v_A)^2\left(\frac{1}{r_A}+\frac{1}{r_B}\right)}{[r_A (v_A)_{\text{tr}}]^2}$$

or $$(v_A)_{\text{tr}} = v_A\left(\frac{\frac{1}{r_A}+\frac{1}{r_B}}{\frac{1}{r_A}+\frac{1}{r_{B'}}}\right)^{1/2} = v_A\left(\frac{1+\frac{r_A}{r_B}}{1+\frac{r_A}{r_{B'}}}\right)^{1/2}$$

$$= (52{,}431 \text{ ft/s})\left(\frac{1+\frac{202}{92}}{1+\frac{202}{85.5}}\right)^{1/2}$$

$$= 51{,}113 \text{ ft/s}$$

Now $$h_{\text{tr}} = (h_A)_{\text{tr}} = (h_{B'})_{\text{tr}}: \quad r_A (v_A)_{\text{tr}} = r_{B'} (v_{B'})_{\text{tr}}$$

Then $$(v_{B'})_{\text{tr}} = \frac{202\times 10^6 \text{ mi}}{85.5\times 10^6 \text{ mi}} \times 51{,}113 \text{ ft/s} = 120{,}758 \text{ ft/s}$$

For the elliptic orbit $A'B'$, we have

$$r_1 = r_{A'}, \quad r_2 = r_{B'}, \quad h = r_{B'} v_{B'}$$

Then $$\frac{1}{r_{A'}}+\frac{1}{r_{B'}} = \frac{(r_A v_A)^2\left(\frac{1}{r_A}+\frac{1}{r_B}\right)}{(r_{B'} v_{B'})^2}$$

or $$v_{B'} = v_A \frac{r_A}{r_{B'}}\left(\frac{\frac{1}{r_A}+\frac{1}{r_B}}{\frac{1}{r_{A'}}+\frac{1}{r_{B'}}}\right)^{1/2}$$

$$= (52{,}431 \text{ ft/s})\frac{202\times 10^6 \text{ mi}}{85.5\times 10^6 \text{ mi}}\left(\frac{\frac{1}{202\times 10^6}+\frac{1}{92\times 10^6}}{\frac{1}{164.5\times 10^6}+\frac{1}{85.5\times 10^6}}\right)^{1/2}$$

$$= 116{,}862 \text{ ft/s}$$

Finally, $(v_A)_{\text{tr}} = v_A + \Delta v_A$

or $\Delta v_A = (51{,}113 - 52{,}431) \text{ ft/s}$

or $|\Delta v_A| = 1318 \text{ ft/s}$ ◀

and $v_{B'} = (v_{B'})_{\text{tr}} + \Delta v_B$

or
$$\begin{aligned}\Delta v_{B'} &= (116{,}862 - 120{,}758) \text{ ft/s}\\ &= -3896 \text{ ft/s}\end{aligned}$$

or $|\Delta v_B| = 3900 \text{ ft/s}$ ◀

PROBLEM 12.108

Halley's comet travels in an elongated elliptic orbit for which the minimum distance from the sun is approximately $\frac{1}{2}r_E$, where $r_E = 150 \times 10^6$ km is the mean distance from the sun to the earth. Knowing that the periodic time of Halley's comet is about 76 years, determine the maximum distance from the sun reached by the comet.

SOLUTION

We apply Kepler's Third Law to the orbits and periodic times of earth and Halley's comet:

$$\left(\frac{\tau_H}{\tau_E}\right)^2 = \left(\frac{a_H}{a_E}\right)^3$$

Thus

$$\begin{aligned} a_H &= a_E\left(\frac{\tau_H}{\tau_E}\right)^{2/3} \\ &= r_E\left(\frac{76 \text{ years}}{1 \text{ year}}\right)^{2/3} \\ &= 17.94 r_E \end{aligned}$$

But

$$\begin{aligned} a_H &= \frac{1}{2}(r_{\min} + r_{\max}) \\ 17.94 r_E &= \frac{1}{2}\left(\frac{1}{2}r_E + r_{\max}\right) \\ r_{\max} &= 2(17.94 r_E) - \frac{1}{2}r_E \\ &= (35.88 - 0.5)r_E \\ &= 35.38\, r_E \\ r_{\max} &= (35.38)(150 \times 10^6 \text{ km}) \end{aligned}$$

$r_{\max} = 5.31 \times 10^9$ km ◀

PROBLEM 12.109

Based on observations made during the 1996 sighting of comet Hyakutake, it was concluded that the trajectory of the comet is a highly elongated ellipse for which the eccentricity is approximately $\varepsilon = 0.999887$. Knowing that for the 1996 sighting the minimum distance between the comet and the sun was $0.230R_E$, where R_E is the mean distance from the sun to the earth, determine the periodic time of the comet.

SOLUTION

For Earth's orbit about the sun,

$$v_0 = \sqrt{\frac{GM}{R_E}}, \quad \tau_0 = \frac{2\pi R_E}{v_0} = \frac{2\pi R_E^{3/2}}{\sqrt{GM}} \quad \text{or} \quad \sqrt{GM} = \frac{2\pi R_E^{3/2}}{\tau_0} \qquad (1)$$

For the comet Hyakutake,

$$\frac{1}{r_0} = \frac{GM}{h^2} = (1+\varepsilon), \quad \frac{1}{r_1} = \frac{GM}{h^2}(1+\varepsilon), \quad r_1 = \frac{1+\varepsilon}{1-\varepsilon} r_0$$

$$a = \frac{1}{2}(r_0 + r_1) = \frac{r_0}{1-\varepsilon}, \quad b = \sqrt{r_0 r_1} = \sqrt{\frac{1+\varepsilon}{1-\varepsilon}}\, r_0$$

$$h = \sqrt{GMr_0(1+\varepsilon)}$$

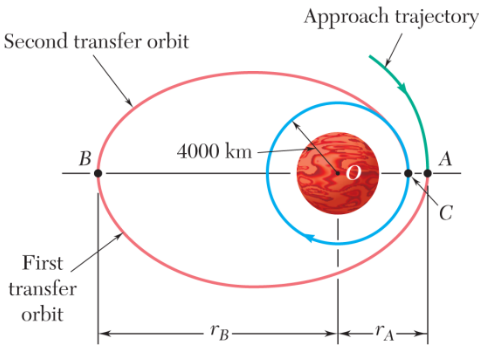
$$\tau = \frac{2\pi ab}{h} = \frac{2\pi r_0^2 (1+\varepsilon)^{1/2}}{(1-\varepsilon)^{3/2}\sqrt{GMr_0(1+\varepsilon)}}$$

$$= \frac{2\pi r_0^{3/2}}{\sqrt{GM}\,(1-\varepsilon)^{3/2}} = \frac{2\pi r_0^{3/2}\tau_0}{2\pi R_E^3 (1-\varepsilon)^{3/2}}$$

$$= \left(\frac{r_0}{R_E}\right)^{3/2} \frac{1}{(1-\varepsilon)^{3/2}}\,\tau_0$$

$$= (0.230)^{3/2} \frac{1}{(1-0.999887)^{3/2}}\,\tau_0 = 91.8 \times 10^3 \tau_0$$

Since $\tau_0 = 1$ yr, $\tau = (91.8 \times 10^3)(1.000)$ $\qquad \tau = 91.8 \times 10^3$ yr ◀



PROBLEM 12.110

A space probe is to be placed in a circular orbit of radius 4000 km about the planet Mars. As the probe reaches *A*, the point of its original trajectory closest to Mars, it is inserted into a first elliptic transfer orbit by reducing its speed. This orbit brings it to Point *B* with a much reduced velocity. There the probe is inserted into a second transfer orbit by further reducing its speed. Knowing that the mass of Mars is 0.1074 times the mass of the earth, that $r_A = 9000$ km and $r_B = 180{,}000$ km, and that the probe approaches *A* on a parabolic trajectory, determine the time needed for the space probe to travel from *A* to *B* on its first transfer orbit.

SOLUTION

For earth, $R = 6373 \text{ km} = 6.373 \times 10^6 \text{ m}$

$$GM = gR^2 = (9.81)(6.373 \times 10^6)^2 = 398.43 \times 10^{12} \text{ m}^3/\text{s}^2$$

For Mars, $GM = (0.1074)(398.43 \times 10^{12}) = 42.792 \times 10^{12} \text{ m}^3/\text{s}^2$

$$r_A = 9000 \text{ km} = 9.0 \times 10^6 \text{ m} \qquad r_B = 180000 \text{ km} = 180 \times 10^6 \text{ m}$$

For the parabolic approach trajectory at *A*,

$$(v_A)_1 = \sqrt{\frac{2GM}{r_A}} = \sqrt{\frac{(2)(42.792 \times 10^{12})}{9.0 \times 10^6}} = 3.0837 \times 10^3 \text{ m/s}$$

First elliptic transfer orbit *AB*.

Using Eq. (12.39), $\frac{1}{r_A} = \frac{GM}{h_{AB}^2} + C\cos\theta_A$ and $\frac{1}{r_B} = \frac{GM}{h_{AB}^2} + C\cos\theta_B$.

But $\theta_B = \theta_A + 180°$, so that $\cos\theta_A = -\cos\theta_B$.

Adding, $\frac{1}{r_A} + \frac{1}{r_B} = \frac{r_A + r_B}{r_A r_B} = \frac{2GM}{h_{AB}^2}$

$$h_{AB} = \sqrt{\frac{2GMr_A r_B}{r_A + r_B}} = \sqrt{\frac{(2)(42.792 \times 10^{12})(9.0 \times 10^6)(180 \times 10^6)}{189.0 \times 10^6}}$$

$$h_{AB} = 27.085 \times 10^9 \text{ m}^2/\text{s}$$

$$a = \frac{1}{2}(r_A + r_B) = \frac{1}{2}(9.0 \times 10^6 + 180 \times 10^6) = 94.5 \times 10^6 \text{ m}$$

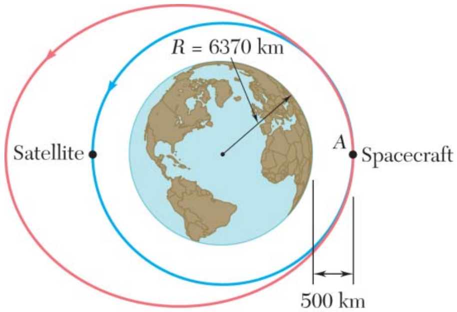
$$b = \sqrt{r_A r_B} = \sqrt{(9.0 \times 10^6)(180 \times 10^6)} = 40.249 \times 10^6 \text{ m}$$

PROBLEM 12.110 (Continued)

Periodic time for full ellipse: $\tau = \dfrac{2\pi ab}{h}$

For half ellipse *AB*, $\tau_{AB} = \dfrac{1}{2}\tau = \dfrac{\pi ab}{h}$

$$\tau_{AB} = \frac{\pi(94.5 \times 10^6)(40.249 \times 10^6)}{27.085 \times 10^9} = 444.81 \times 10^3 \text{ s} \qquad \tau_{AB} = 122.6 \text{ h} \blacktriangleleft$$



PROBLEM 12.111

A spacecraft and a satellite are at diametrically opposite positions in the same circular orbit of altitude 500 km above the earth. As it passes through point A, the spacecraft fires its engine for a short interval of time to increase its speed and enter an elliptic orbit. Knowing that the spacecraft returns to A at the same time the satellite reaches A after completing one and a half orbits, determine (a) the increase in speed required, (b) the periodic time for the elliptic orbit.

SOLUTION

For earth, $R = 6.37 \times 10^6$ m, $g = 9.81$ m/s^2

$$GM = gR^2 = (9.81)\left(6.37 \times 10^6\right)^2 = 398.06 \times 10^{12} \text{ m}^3/\text{s}^2$$

For circular orbit of satellite,

$$r_0 = 6370 + 500 = 6870 \text{ km} = 6.87 \times 10^6 \text{ m/s}$$

$$v_0 = \sqrt{\frac{GM}{r_0}} = \sqrt{\frac{398.06 \times 10^{12}}{6.87 \times 10^6}} = 7.6119 \times 10^3 \text{ m/s}$$

$$\tau_0 = \frac{2\pi r_0}{v_0} = \frac{(2\pi)\left(6.87 \times 10^6\right)}{7.6119 \times 10^3} = 5.6708 \times 10^3 \text{ s}$$

For elliptic orbit of spacecraft it is given that

$$\tau = \frac{3}{2}\tau_0 = 8.5062 \times 10^3 \text{ s}$$

$$a = \frac{1}{2}(r_A + r_B), \qquad b = \sqrt{r_A r_B}$$

Using Eq. (12.39), $\frac{1}{r_A} = \frac{GM}{h^2} + C\cos\theta_A$ and $\frac{1}{r_B} = \frac{GM}{h^2} + C\cos\theta_B$.

But $\theta_B = \theta_A + 180°$, so that $\cos\theta_A = -\cos\theta_B$.

Adding, $\frac{1}{r_A} + \frac{1}{r_B} = \frac{r_A + r_B}{r_A r_B} = \frac{2a}{b^2} = \frac{2GM}{h^2}$ or $h = \sqrt{\frac{GMb^2}{a}}$

Periodic time: $\tau = \frac{2\pi ab}{h} = \frac{2\pi ab\sqrt{a}}{\sqrt{GMb^2}} = \frac{2\pi a^{3/2}}{\sqrt{GM}}$

$$a^3 = \frac{GM\tau^2}{4\pi^2} = \frac{\left(398.06 \times 10^{12}\right)\left(8.5062 \times 10^3\right)^2}{4\pi^2} = 729.558 \times 10^{18} \text{ m}^3$$

$$a = 9.0023 \times 10^6 \text{ m}, \qquad r_A = r_0 = 6.87 \times 10^6 \text{ m}$$

$$r_B = 2a - r_A = 11.1346 \times 10^6 \text{ m}, \qquad b = \sqrt{r_A r_B} = 8.7461 \times 10^6 \text{ m}$$

$$h = \frac{2\pi ab}{\tau} = \frac{2\pi\left(9.0023 \times 10^6\right)\left(8.7461 \times 10^6\right)}{8.5062 \times 10^3} = 58.159 \times 10^9 \text{ m}^2\text{/s}$$

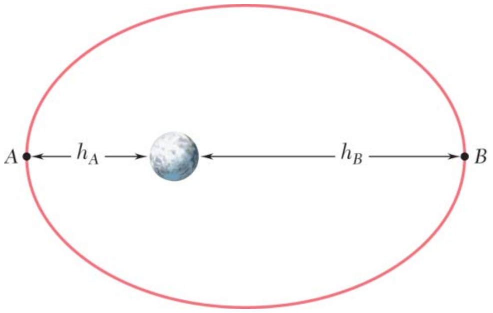
$$v_A = \frac{h}{r_A} = \frac{58.159 \times 10^9}{6.87 \times 10^6} = 8.4656 \times 10^3 \text{ m/s}$$

(*a*) Increase in speed at *A*.

$$\Delta v_A = v_A - v_0 = 8.4656 \times 10^3 - 7.6119 \times 10^3 \qquad \Delta v_A = 854 \text{ m/s} \blacktriangleleft$$

(*b*) Periodic time for elliptic orbit.

As calculated above $\tau = 8.5062$ s $\qquad \tau = 141.8$ min ◀



PROBLEM 12.112

The Clementine spacecraft described an elliptic orbit of minimum altitude $h_A = 400$ km and a maximum altitude of $h_B = 2940$ km above the surface of the moon. Knowing that the radius of the moon is 1737 km and that the mass of the moon is 0.01230 times the mass of the earth, determine the periodic time of the spacecraft.

SOLUTION

For earth, $R = 6370 \text{ km} = 6.370 \times 10^6 \text{ m}$

$$GM = gR^2 = (9.81)(6.370 \times 10^6)^2 = 398.06 \times 10^{12} \text{ m}^3/\text{s}^2$$

For moon, $GM = (0.01230)(398.06 \times 10^{12}) = 4.896 \times 10^{12} \text{ m}^3/\text{s}^2$

$$r_A = 1737 + 400 = 2137 \text{ km} = 2.137 \times 10^6 \text{ m}$$

$$r_B = 1737 + 2940 = 4677 \text{ km} = 4.677 \times 10^6 \text{ m}$$

Using Eq. (12.39), $\dfrac{1}{r_A} = \dfrac{GM}{h^2} + C\cos\theta_A \quad \text{and} \quad \dfrac{1}{r_B} = \dfrac{GM}{h^2} + C\cos\theta_B.$

But $\theta_B = \theta_A + 180°, \quad \text{so that} \quad \cos\theta_A = -\cos\theta_B.$

Adding, $\dfrac{1}{r_A} + \dfrac{1}{r_B} = \dfrac{r_A + r_B}{r_A r_B} = \dfrac{2GM}{h_{AB}^2}$

$$h_{AB} = \sqrt{\frac{2GMr_Ar_B}{r_A + r_B}} = \sqrt{\frac{(2)(4.896 \times 10^{12})(2.137 \times 10^6)(4.677 \times 10^6)}{6.814 \times 10^6}}$$

$$= 3.78983 \times 10^9 \text{ m}^2/\text{s}$$

$$a = \frac{1}{2}(r_A + r_B) = 3.402 \times 10^6 \text{ m}$$

$$b = \sqrt{r_A r_B} = 3.16145 \times 10^6 \text{ m}$$

Periodic time.

$$\tau = \frac{2\pi ab}{h_{AB}} = \frac{2\pi(3.402 \times 10^6)(3.16145 \times 10^6)}{3.78983 \times 10^9} = 17.831 \times 10^3 \text{ s}$$

$\tau = 4.95$ h ◀

PROBLEM 12.113

Determine the time needed for the space probe of Problem 12.100 to travel from *B* to *C*.

SOLUTION

From the solution to Problem 12.100, we have

$$(v_A)_{\text{par}} = 10{,}131.4 \text{ m/s}$$

and
$$(v_A)_{\text{circ}} = \frac{1}{\sqrt{2}}(v_A)_{\text{par}} = 7164.0 \text{ m/s}$$

Also,
$$r_A = (6052 + 280) \text{ km} = 6332 \text{ km}$$

For the parabolic trajectory *BA*, we have

$$\frac{1}{r} = \frac{GM_v}{h_{BA}^2}(1 + \varepsilon\cos\theta) \qquad \text{[Eq. (12.39′)]}$$

where $\varepsilon = 1$. Now

at A, $\theta = 0$:
$$\frac{1}{r_A} = \frac{GM_v}{h_{BA}^2}(1+1)$$

or
$$r_A = \frac{h_{BA}^2}{2GM_v}$$

at B, $\theta = -90°$:
$$\frac{1}{r_B} = \frac{GM_v}{h_{BA}^2}(1+0)$$

or
$$r_B = \frac{h_{BA}^2}{GM_v}$$

$$r_B = 2r_A$$

As the probe travels from *B* to *A*, the area swept out is the semiparabolic area defined by Vertex *A* and Point *B*. Thus,

$$(\text{Area swept out})_{BA} = A_{BA} = \frac{2}{3}r_A r_B = \frac{4}{3}r_A^2$$

Now
$$\frac{dA}{dt} = \frac{1}{2}h$$

where $h = \text{constant}$

Then $$A = \frac{1}{2}ht \quad \text{or} \quad t_{BA} = \frac{2A_{BA}}{h_{BA}} \qquad h_{BA} = r_A v_A$$

$$t_{BA} = \frac{2 \times \frac{4}{3} r_A^2}{r_A v_A} = \frac{8}{3}\frac{r_A}{v_A}$$

$$= \frac{8}{3}\frac{6332 \times 10^3 \text{ m}}{10{,}131.4 \text{ m/s}}$$

$$= 1666.63 \text{ s}$$

For the circular trajectory *AC*,

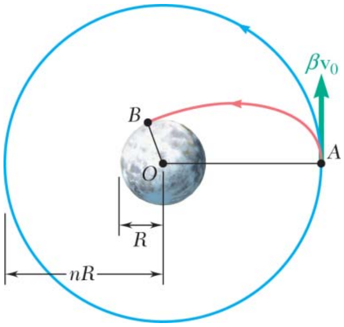
$$t_{AC} = \frac{\frac{\pi}{2} r_A}{(v_A)_{\text{circ}}} = \frac{\pi}{2}\frac{6332 \times 10^3 \text{ m}}{7164.0 \text{ m/s}} = 1388.37 \text{ s}$$

Finally, $$t_{BC} = t_{BA} + t_{AC}$$

$$= (1666.63 + 1388.37) \text{ s}$$

$$= 3055.0 \text{ s}$$

or $$t_{BC} = 50 \text{ min } 55 \text{ s} \blacktriangleleft$$



PROBLEM 12.114

A space probe is describing a circular orbit of radius nR with a velocity v_0 about a planet of radius R and center O. As the probe passes through Point A, its velocity is reduced from v_0 to βv_0, where $\beta < 1$, to place the probe on a crash trajectory. Express in terms of n and β the angle AOB, where B denotes the point of impact of the probe on the planet.

SOLUTION

For the circular orbit,

$$r_0 = r_A = nR$$

$$v_0 = \sqrt{\frac{GM}{r_0}} = \sqrt{\frac{GM}{nR}}$$

The crash trajectory is elliptic.

$$v_A = \beta v_0 = \sqrt{\frac{\beta^2 GM}{nR}}$$

$$h = r_A v_A = nRv_A = \sqrt{\beta^2 nGMR}$$

$$\frac{GM}{h^2} = \frac{1}{\beta^2 nR}$$

$$\frac{1}{r} = \frac{GM}{h^2}(1+\varepsilon\cos\theta) = \frac{1+\varepsilon\cos\theta}{\beta^2 nR}$$

At Point A, $\theta = 180°$

$$\frac{1}{r_A} = \frac{1}{nR} = \frac{1-\varepsilon}{\beta^2 nR} \quad \text{or} \quad \beta^2 = 1-\varepsilon \quad \text{or} \quad \varepsilon = 1-\beta^2$$

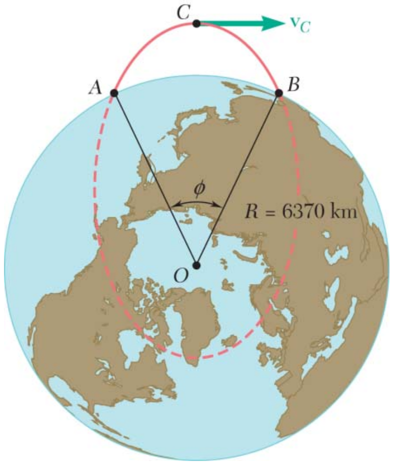
At impact Point B, $\theta = \pi - \phi$

$$\frac{1}{r_B} = \frac{1}{R}$$

$$\frac{1}{R} = \frac{1+\varepsilon\cos(\pi-\phi)}{\beta^2 nR} = \frac{1-\varepsilon\cos\phi}{\beta^2 nR}$$

$$\varepsilon\cos\phi = 1-n\beta^2 \quad \text{or} \quad \cos\phi = \frac{1-n\beta^2}{\varepsilon} = \frac{1-n\beta^2}{1-\beta^2}$$

$$\phi = \cos^{-1}[(1-n\beta^2)/(1-\beta^2)] \blacktriangleleft$$



PROBLEM 12.115

A long-range ballistic trajectory between Points *A* and *B* on the earth's surface consists of a portion of an ellipse with the apogee at Point *C*. Knowing that Point *C* is 1500 km above the surface of the earth and the range $R\phi$ of the trajectory is 6000 km, determine (*a*) the velocity of the projectile at *C*, (*b*) the eccentricity ε of the trajectory.

SOLUTION

For earth, $R = 6370 \text{ km} = 6.37 \times 10^6 \text{ m}$

$$GM = gR^2 = (9.81)(6.37 \times 10^6)^2 = 398.06 \times 10^{12} \text{ m}^3/\text{s}^2$$

For the trajectory, $r_C = 6370 + 1500 = 7870 \text{ km} = 7.87 \times 10^6 \text{ m}$

$$r_A = r_B = R = 6.37 \times 10^6 \text{ m}, \qquad \frac{r_C}{r_A} = \frac{7870}{6370} = 1.23548$$

Range *A* to *B*: $s_{AB} = 6000 \text{ km} = 6.00 \times 10^6 \text{ m}$

$$\varphi = \frac{s_{AB}}{R} = \frac{6.00 \times 10^6}{6.37 \times 10^6} = 0.94192 \text{ rad} = 53.968°$$

For an elliptic trajectory, $\dfrac{1}{r} = \dfrac{GM}{h^2}(1 + \varepsilon\cos\theta)$

At *A*, $\theta = 180° - \dfrac{\varphi}{2} = 153.016°, \qquad \dfrac{1}{r_A} = \dfrac{GM}{h^2}(1 + \varepsilon\cos 153.016°)$ (1)

At *C*, $\theta = 180°, \qquad \dfrac{1}{r_C} = \dfrac{GM}{h^2}(1 - \varepsilon)$ (2)

Dividing Eq. (1) by Eq. (2),

$$\frac{r_C}{r_A} = \frac{1 + \varepsilon\cos 153.016°}{1 - \varepsilon} = 1.23548$$

$$\varepsilon = \frac{1.23548 - 1}{1.23548 + \cos 153.016°} = 0.68384$$

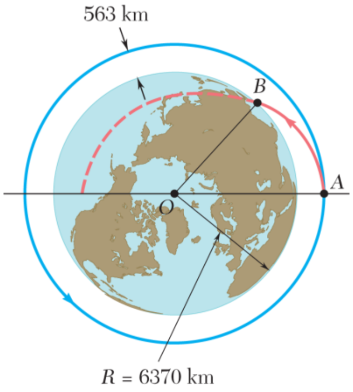
PROBLEM 12.115 (Continued)

From Eq. (2), $h = \sqrt{GM(1-\varepsilon)r_C}$

$$h = \sqrt{(398.06\times 10^{12})(0.31616)(7.87\times 10^{6})} = 31.471\times 10^{9}\ \text{m}^2/\text{s}$$

(*a*) Velocity at *C*. $v_C = \dfrac{h}{r_C} = \dfrac{31.471\times 10^{9}}{7.87\times 10^{6}} = 4.00\times 10^{3}\ \text{m/s}$ $v_C = 4\ \text{km/s}$ ◀

(*b*) Eccentricity of trajectory. $\varepsilon = 0.684$ ◀



PROBLEM 12.116

A space shuttle is describing a circular orbit at an altitude of 563 km above the surface of the earth. As it passes through Point *A*, it fires its engine for a short interval of time to reduce its speed by 152 m/s and begin its descent toward the earth. Determine the angle *AOB* so that the altitude of the shuttle at Point *B* is 121 km. (*Hint:* Point *A* is the apogee of the elliptic descent trajectory.)

SOLUTION

$$GM = gR^2 = (9.81)(6.37\times 10^6)^2 = 398.06\times 10^{12}\ \text{m}^3/\text{s}^2$$

$$r_A = 6370 + 563 = 6933\ \text{km} = 6.933\times 10^6\ \text{m}$$

$$r_B = 6370 + 121 = 6491\ \text{km} = 6.491\times 10^6\ \text{m}$$

For the circular orbit through Point *A*,

$$v_{\text{circ}} = \sqrt{\frac{GM}{r_A}} = \sqrt{\frac{398.06\times 10^{12}}{6.933\times 10^6}} = 7.5773\times 10^3\ \text{m/s}$$

For the descent trajectory,

$$v_A = v_{\text{circ}} + \Delta v = 7.5773\times 10^3 - 152 = 7.4253\times 10^3\ \text{m/s}$$

$$h = r_A v_A = (6.933\times 10^6)(7.4253\times 10^3) = 51.4795\times 10^9\ \text{m}^2/\text{s}$$

$$\frac{1}{r} = \frac{GM}{h^2}(1+\varepsilon\cos\theta)$$

At Point *A*, $\theta = 180°$, $r = r_A$

$$\frac{1}{r_A} = \frac{GM}{h^2}(1-\varepsilon)$$

$$1-\varepsilon = \frac{h^2}{GM\ r_A} = \frac{(51.4795\times 10^9)^2}{(398.06\times 10^{12})(6.933\times 10^6)} = 0.96028$$

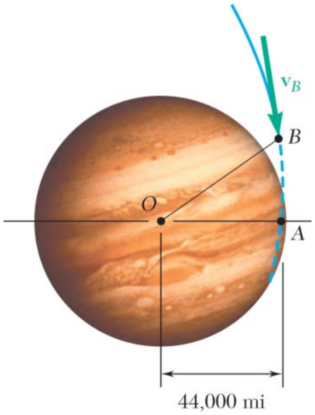
$$\varepsilon = 0.03972$$

$$\frac{1}{r_B} = \frac{GM}{h^2}(1+\varepsilon\cos\theta_B)$$

$$1+\varepsilon\cos\theta_B = \frac{h^2}{GM\ r_B} = \frac{(51.4795\times 10^9)^2}{(398.06\times 10^{12})(6.491\times 10^6)} = 1.02567$$

$$\cos\theta_B = \frac{1.02567-1}{\varepsilon} = 0.6463$$

$\theta_B = 49.7°$ $\qquad$ $\measuredangle AOB = 180° - \theta_B = 130.3°$ $\qquad$ $\measuredangle AOB = 130.3°$ ◀



PROBLEM 12.117

As a spacecraft approaches the planet Jupiter, it releases a probe which is to enter the planet's atmosphere at Point B at an altitude of 280 mi above the surface of the planet. The trajectory of the probe is a hyperbola of eccentricity $\varepsilon = 1.031$. Knowing that the radius and the mass of Jupiter are 44423 mi and 1.30×10^{26} slug, respectively, and that the velocity $\mathbf{v}_B$ of the probe at B forms an angle of 82.9° with the direction of OA, determine (a) the angle AOB, (b) the speed v_B of the probe at B.

SOLUTION

First we note $$r_B = (44.423 \times 10^3 + 280)\text{ mi} = 44.703 \times 10^3\text{ mi}$$

(a) We have $$\frac{1}{r} = \frac{GM_j}{h^2}(1 + \varepsilon\cos\theta) \qquad \text{[Eq. (12.39′)]}$$

At A, $\theta = 0$: $$\frac{1}{r_A} = \frac{GM_j}{h^2}(1 + \varepsilon)$$

or $$\frac{h^2}{GM_j} = r_A(1 + \varepsilon)$$

At B, $\theta = \theta_B = \measuredangle AOB$: $$\frac{1}{r_B} = \frac{GM_j}{h^2}(1 + \varepsilon\cos\theta_B)$$

or $$\frac{h^2}{GM_j} = r_B(1 + \varepsilon\cos\theta_B)$$

Then $$r_A(1 + \varepsilon) = r_B(1 + \varepsilon\cos\theta_B)$$

or $$\cos\theta_B = \frac{1}{\varepsilon}\left[\frac{r_A}{r_B}(1 + \varepsilon) - 1\right]$$
$$= \frac{1}{1.031}\left[\frac{44.0 \times 10^3\text{ mi}}{44.703 \times 10^3\text{ mi}}(1 + 1.031) - 1\right]$$
$$= 0.96902$$

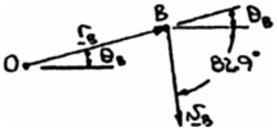
or $$\theta_B = 14.2988°$$ $$\measuredangle AOB = 14.30° \blacktriangleleft$$

PROBLEM 12.117 (Continued)

(*b*) From above $$h^2 = GM_j r_B(1+\varepsilon\cos\theta_B)$$

where $$h = \frac{1}{m}|\mathbf{r}_B \times m\mathbf{v}_B| = r_B v_B \sin\phi$$

$$\phi = (\theta_B + 82.9°) = 97.1988°$$



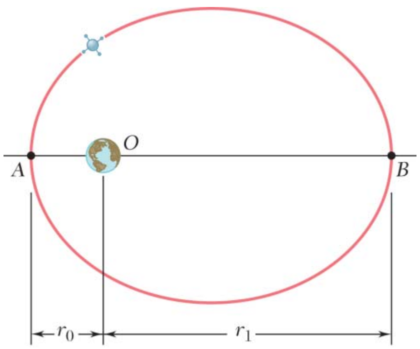
Then $$(r_B v_B \sin\phi)^2 = GM_j r_B(1+\varepsilon\cos\theta_B)$$

or

$$v_B = \frac{1}{\sin\phi}\left[\frac{GM_j}{r_B}(1+\varepsilon\cos\theta_B)\right]^{1/2}$$

$$= \frac{1}{\sin 97.1988°}\left\{\frac{34.4\times10^{-9}\ \text{ft}^4/\text{lb}\cdot\text{s}^4 \times (1.30\times10^{26}\ \text{slug})}{236.03\times10^6\ \text{ft}}\times[1+(1.031)(0.96902)]\right\}^{1/2}$$

or $$v_B = 196.2\ \text{ft/s} \blacktriangleleft$$



PROBLEM 12.118

A satellite describes an elliptic orbit about a planet. Denoting by r_0 and r_1 the distances corresponding, respectively, to the perigee and apogee of the orbit, show that the curvature of the orbit at each of these two points can be expressed as

$$\frac{1}{\rho}=\frac{1}{2}\left(\frac{1}{r_0}+\frac{1}{r_1}\right)$$

SOLUTION

Using Eq. (12.39),
$$\frac{1}{r_A}=\frac{GM}{h^2}+C\cos\theta_A$$

and
$$\frac{1}{r_B}=\frac{GM}{h^2}+C\cos\theta_B.$$

But
$$\theta_B=\theta_A+180°,$$

so that
$$\cos\theta_A=-\cos\theta_B$$

Adding,
$$\frac{1}{r_A}+\frac{1}{r_B}=\frac{2GM}{h^2}$$

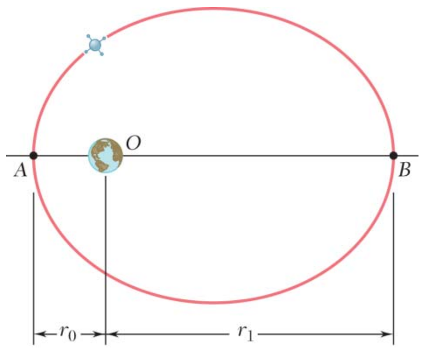
At Points *A* and *B*, the radial direction is normal to the path.

$$a_n=\frac{v^2}{\rho}=\frac{h^2}{r^2\rho}$$

But
$$F_n=\frac{GMm}{r^2}=ma_n=\frac{mh^2}{r^2\rho}$$

$$\frac{1}{\rho}=\frac{GM}{h^2}=\frac{1}{2}\left(\frac{1}{r_A}+\frac{1}{r_B}\right)$$

$$\frac{1}{\rho}=\frac{1}{2}\left(\frac{1}{r_0}+\frac{1}{r_1}\right) \blacktriangleleft$$



PROBLEM 12.119

(*a*) Express the eccentricity ε of the elliptic orbit described by a satellite about a planet in terms of the distances r_0 and r_1 corresponding, respectively, to the perigee and apogee of the orbit. (*b*) Use the result obtained in Part *a* and the data given in Problem 12.109, where $R_E = 149.6 \times 10^6$ km, to determine the approximate maximum distance from the sun reached by comet Hyakutake.

SOLUTION

(*a*) We have $$\frac{1}{r} = \frac{GM}{h^2}(1 + \varepsilon \cos \theta) \qquad \text{Eq. (12.39}'\text{)}$$

At A, $\theta = 0$: $$\frac{1}{r_0} = \frac{GM}{h^2}(1 + \varepsilon)$$

or $$\frac{h^2}{GM} = r_0(1 + \varepsilon)$$

At B, $\theta = 180°$: $$\frac{1}{r_1} = \frac{GM}{h^2}(1 - \varepsilon)$$

or $$\frac{h^2}{GM} = r_1(1 - \varepsilon)$$

Then $$r_0(1 + \varepsilon) = r_1(1 - \varepsilon)$$

or $$\varepsilon = \frac{r_1 - r_0}{r_1 + r_0} \blacktriangleleft$$

(*b*) From above, $$r_1 = \frac{1 + \varepsilon}{1 - \varepsilon} r_0$$

where $$r_0 = 0.230 R_E$$

Then $$r_1 = \frac{1 + 0.999887}{1 - 0.999887} \times 0.230(149.6 \times 10^9 \text{ m})$$

or $$r_1 = 609 \times 10^{12} \text{ m} \blacktriangleleft$$

Note: $r_1 = 4070 R_E$ or $r_1 = 0.064$ lightyears.

PROBLEM 12.120

Derive Kepler's third law of planetary motion from Eqs. (12.37) and (12.43).

SOLUTION

For an ellipse, $2a = r_A + r_B \quad \text{and} \quad b = \sqrt{r_A r_B}$

Using Eq. (12.37), $$\frac{1}{r_A} = \frac{GM}{h^2} + C\cos\theta_A$$

and $$\frac{1}{r_B} = \frac{GM}{h^2} + C\cos\theta_B.$$

But $\theta_B = \theta_A + 180°,$

so that $\cos\theta_A = -\cos\theta_B.$

Adding, $$\frac{1}{r_A} + \frac{1}{r_B} = \frac{r_A + r_B}{r_A r_B} = \frac{2a}{b^2} = \frac{2GM}{h^2}$$

$$h = b\sqrt{\frac{GM}{a}}$$

By Eq. (12.43),

$$\tau = \frac{2\pi ab}{h} = \frac{2\pi ab\sqrt{a}}{b\sqrt{GM}} = \frac{2\pi a^{3/2}}{\sqrt{GM}}$$

$$\tau^2 = \frac{4\pi^2 a^3}{GM}$$

For Orbits 1 and 2 about the same large mass,

$$\tau_1^2 = \frac{4\pi^2 a_1^3}{GM}$$

and $$\tau_2^2 = \frac{4\pi^2 a_2^3}{GM}$$

Forming the ratio, $$\left(\frac{\tau_1}{\tau_2}\right)^2 = \left(\frac{a_1}{a_2}\right)^3 \blacktriangleleft$$

PROBLEM 12.121

Show that the angular momentum per unit mass h of a satellite describing an elliptic orbit of semimajor axis a and eccentricity ε about a planet of mass M can be expressed as

$$h = \sqrt{GMa(1-\varepsilon^2)}$$

SOLUTION

By Eq. (12.39′),

$$\frac{1}{r} = \frac{GM}{h^2}(1+\varepsilon\cos\theta)$$

At A, $\theta = 0°$:

$$\frac{1}{r_A} = \frac{GM}{h^2} = (1+\varepsilon) \qquad \text{or} \qquad r_A = \frac{h^2}{GM(1+\varepsilon)}$$

At B, $\theta = 180°$:

$$\frac{1}{r_B} = \frac{GM}{h^2} = (1-\varepsilon) \qquad \text{or} \qquad r_B = \frac{h^2}{GM(1-\varepsilon)}$$

Adding,

$$r_A + r_B = \frac{h^2}{GM} = \left(\frac{1}{1+\varepsilon} + \frac{1}{1-\varepsilon}\right) = \frac{2h^2}{GM(1-\varepsilon^2)}$$

But for an ellipse,

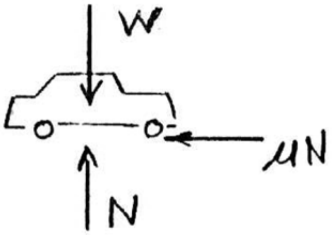
$$r_A + r_B = 2a$$

$$2a = \frac{2h^2}{GM(1-\varepsilon^2)} \qquad h = \sqrt{GMa(1-\varepsilon^2)} \blacktriangleleft$$

PROBLEM 12.122

In the braking test of a sports car its velocity is reduced from 70 mi/h to zero in a distance of 170 ft with slipping impending. Knowing that the coefficient of kinetic friction is 80 percent of the coefficient of static friction, determine (*a*) the coefficient of static friction, (*b*) the stopping distance for the same initial velocity if the car skids. Ignore air resistance and rolling resistance.

SOLUTION



(*a*) Coefficient of static friction.

$$\Sigma F_y = 0: \quad N - W = 0 \qquad N = W$$

$$v_0 = 70 \text{ mi/h} = 102.667 \text{ ft/s}$$

$$\frac{v^2}{2} - \frac{v_0^2}{2} = a_t(s - s_0)$$

$$a_t = \frac{v^2 - v_0^2}{2(s - s_0)} = \frac{0 - (102.667)^2}{(2)(170)} = -31.001 \text{ ft/s}^2$$

For braking without skidding $\mu = \mu_s$, so that $\mu_s N = m|a_t|$

$$\xrightarrow{+} \Sigma F_t = ma_t: \quad -\mu_s N = ma_t$$

$$\mu_s = -\frac{ma_t}{W} = -\frac{a_t}{g} = \frac{31.001}{32.2}$$

$\mu_s = 0.963$ ◀

(*b*) Stopping distance with skidding.

Use $\mu = \mu_k = (0.80)(0.963) = 0.770$

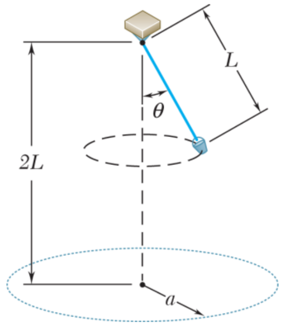
$$\xleftarrow{+} \Sigma F = ma_t: \quad \mu_k N = -ma_t$$

$$a_t = -\frac{\mu_k N}{m} = -\mu_k g = -24.801 \text{ ft/s}^2$$

Since acceleration is constant,

$$(s - s_0) = \frac{v^2 - v_0^2}{2a_t} = \frac{0 - (102.667)^2}{(2)(-24.801)}$$

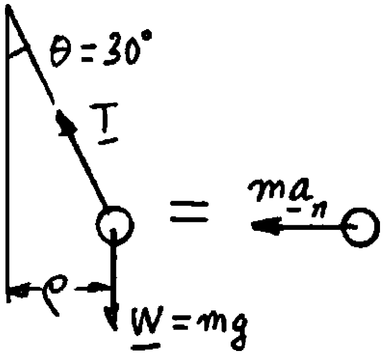
$s - s_0 = 212 \text{ ft}$ ◀

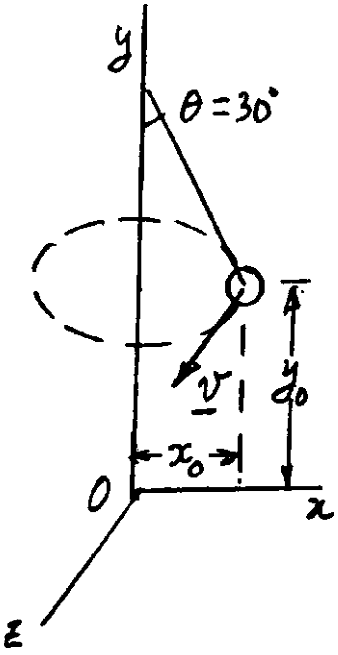


PROBLEM 12.123

A bucket is attached to a rope of length $L = 1.2$ m and is made to revolve in a horizontal circle. Drops of water leaking from the bucket fall and strike the floor along the perimeter of a circle of radius a. Determine the radius a when $\theta = 30°$.

SOLUTION





Initial velocity of drop = velocity of bucket

$$\Sigma F_y = 0: \qquad T\cos 30° = mg \qquad (1)$$

$$\xleftarrow{+} \Sigma F_x = ma_x: \qquad T\sin 30° = ma_n \qquad (2)$$

Divide (2) by (1): $\tan 30° = \dfrac{a_n}{g} = \dfrac{v^2}{\rho g}$

Thus $\quad v^2 = \rho g \tan 30°$

But $\quad \rho = L\sin 30° = (1.2 \text{ m}) \sin 30° = 0.6 \text{ m}$

Thus $\quad v^2 = 0.6(9.81)\tan 30° = 3.398 \text{ m}^2/\text{s}^2 \qquad v = 1.843 \text{ m/s}$

Assuming the bucket to rotate clockwise (when viewed from above), and using the axes shown, we find that the components of the initial velocity of the drop are

$$(v_0)_x = 0,\ (v_0)_y = 0,\ (v_0)_2 = 1.843 \text{ m/s}$$

Free fall of drop

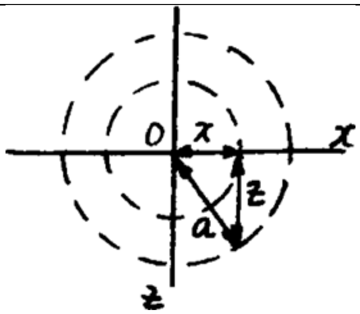
$$y = y_0 + (v_0)_y t - \frac{1}{2}gt^2 \qquad y = y_0 - \frac{1}{2}gt^2$$

When drop strikes floor:

$$y = 0 \qquad y_0 - \frac{1}{2}gt^2 = 0$$

But $\quad y_0 = 2L - L\cos 30° = 2(1.2) - 1.2\cos 30° = 1.361 \text{ m}$

Thus $\quad 1.361 - \dfrac{1}{2}(9.81)t^2 = 0 \qquad t = 0.5275$



PROBLEM 12.123 (Continued)

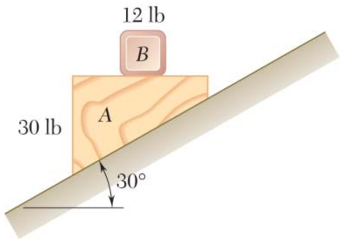
Projection on horizontal floor (uniform motion)

$$x = x_0 + (v_0)_z t = L \sin 30° + 0, \qquad x = 0.6 \text{ m}$$
$$z = z_0 + (v_0)_z t = 0 + 1.843(0.527) = 0.971 \text{ m}$$

Radius of circle: $a = \sqrt{x^2 + z^2}$

$$a = \sqrt{(0.6)^2 + (0.971)^2} \qquad a = 1.141 \text{ m} \blacktriangleleft$$

Note: The drop travels in a vertical plane parallel to the *yz* plane.



PROBLEM 12.124

A 12-lb block *B* rests as shown on the upper surface of a 30-lb wedge *A*. Neglecting friction, determine immediately after the system is released from rest (*a*) the acceleration of *A*, (*b*) the acceleration of *B* relative to *A*.

SOLUTION

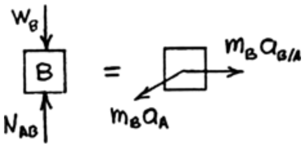
Acceleration vectors:

$$\mathbf{a}_A = a_A \swarrow 30^\circ, \quad \mathbf{a}_{B/A} = a_{B/A} \longrightarrow$$

$$\mathbf{a}_B = \mathbf{a}_A + \mathbf{a}_{B/A}$$

Block *B*:

$$\xrightarrow{+} \Sigma F_x = ma_x: \quad m_B a_{B/A} - m_B a_A \cos 30^\circ = 0$$



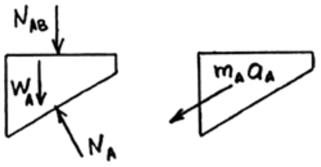
$$a_{B/A} = a_A \cos 30^\circ \tag{1}$$

$$+\!\downarrow \Sigma F_y = ma_y: \quad N_{AB} - W_B = -m_B a_A \sin 30^\circ$$

$$N_{AB} = W_B - (W_B \sin 30^\circ)\frac{a_A}{g} \tag{2}$$

Block *A*:

$$+\!\swarrow \Sigma F = ma: \quad W_A \sin 30^\circ + N_{AB} \sin 30^\circ = W_A \frac{a_A}{g}$$



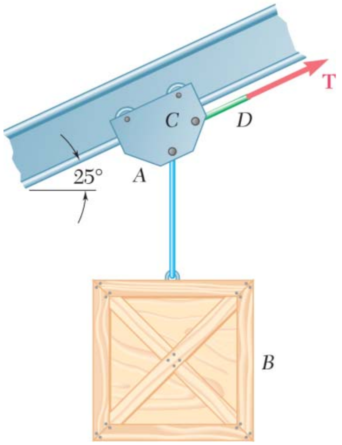
$$W_A \sin 30^\circ + W_B \sin 30^\circ - (W_B \sin^2 30^\circ)\frac{a_A}{g} = W_A \frac{a_A}{g}$$

$$a_A = \frac{(W_A + W_B)\sin 30^\circ}{W_A + W_B \sin^2 30^\circ} g = \frac{(30+12)\sin 30^\circ}{30 + 12\sin^2 30^\circ}(32.2) = 20.49 \text{ ft/s}^2$$

(*a*) $\mathbf{a}_A = 20.49 \text{ ft/s}^2 \swarrow 30^\circ$ ◀

$$a_{B/A} = (20.49)\cos 30^\circ = 17.75 \text{ ft/s}^2$$

(*b*) $\mathbf{a}_{B/A} = 17.75 \text{ ft/s}^2 \longrightarrow$ ◀



PROBLEM 12.125

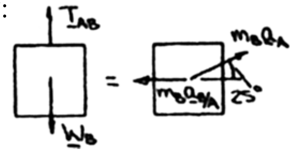
A 500-lb crate B is suspended from a cable attached to a 40-lb trolley A which rides on an inclined I-beam as shown. Knowing that at the instant shown the trolley has an acceleration of 1.2 ft/s^2 up and to the right, determine (a) the acceleration of B relative to A, (b) the tension in cable CD.

SOLUTION

(a) First we note: $\mathbf{a}_B = \mathbf{a}_A + \mathbf{a}_{B/A}$, where $\mathbf{a}_{B/A}$ is directed perpendicular to cable AB.

$$\xrightarrow{+} \Sigma F_x = m_B a_x: \quad 0 = -m_B a_x + m_B a_A \cos 25°$$

B:



or
$$a_{B/A} = (1.2 \text{ ft/s}^2)\cos 25°$$

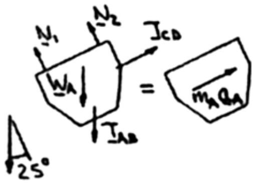
or
$$\mathbf{a}_{B/A} = 1.088 \text{ ft/s}^2 \longleftarrow \blacktriangleleft$$

(b) For crate B

$$+\!\uparrow \Sigma F_y = m_B a_y: \quad T_{AB} - W_B = \frac{W_B}{g} a_A \sin 25°$$

or
$$T_{AB} = (500 \text{ lb})\left[1 + \frac{(1.2 \text{ ft/s}^2)\sin 25°}{32.2 \text{ ft/s}^2}\right]$$
$$= 507.87 \text{ lb}$$

A:

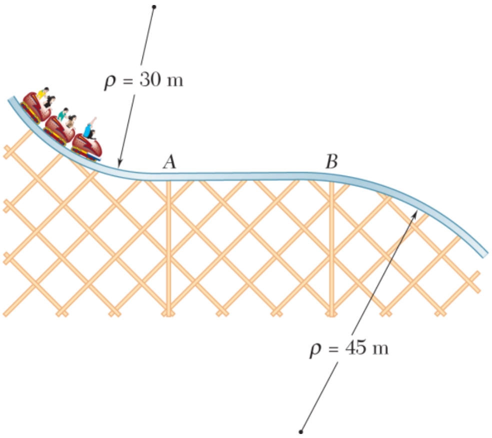


For trolley A

$$+\!\nearrow \Sigma F_x = m_A a_A: \quad T_{CD} - T_{AB}\sin 25° - W_A \sin 25° = \frac{W_A}{g} a_A$$

or
$$T_{CD} = (507.87 \text{ lb})\sin 25° + (40 \text{ lb})\left(\sin 25° + \frac{1.2 \text{ ft/s}^2}{32.2 \text{ ft/s}^2}\right)$$

or
$$T_{CD} = 233 \text{ lb} \blacktriangleleft$$

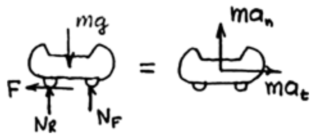


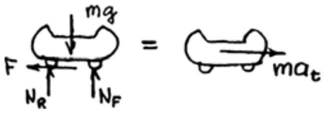
PROBLEM 12.126

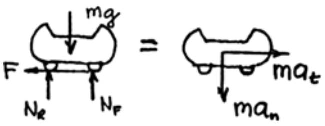
The roller-coaster track shown is contained in a vertical plane. The portion of track between *A* and *B* is straight and horizontal, while the portions to the left of *A* and to the right of *B* have radii of curvature as indicated. A car is traveling at a speed of 72 km/h when the brakes are suddenly applied, causing the wheels of the car to slide on the track ($\mu_k = 0.25$). Determine the initial deceleration of the car if the brakes are applied as the car (*a*) has almost reached *A*, (*b*) is traveling between *A* and *B*, (*c*) has just passed *B*.

SOLUTION

$$v = 72 \text{ km/h} = 20 \text{ m/s}$$







(*a*) Almost reached Point *A*. $\rho = 30 \text{ m}$

$$a_n = \frac{v^2}{\rho} = \frac{(20)^2}{30} = 13.333 \text{ m/s}^2 \uparrow$$

$$\Sigma F_y = ma_y: \quad N_R + N_F - mg = ma_n$$

$$N_R + N_F = m(g + a_n)$$

$$F = \mu_k(N_R + N_F) = \mu_k m(g + a_n)$$

$$\xrightarrow{+} \Sigma F_x = ma_x: \quad -F = ma_t$$

$$a_t = -\frac{F}{m} = -\mu_k(g + a_n)$$

$$|a_t| = \mu_k(g + a_n) = 0.25(9.81 + 13.33)$$

$|a_t| = 5.79 \text{ m/s}^2$ ◀

(*b*) Between *A* and *B*. $\rho = \infty$

$$a_n = 0$$

$$|a_t| = \mu_k g = (0.25)(9.81)$$

$|a_t| = 2.45 \text{ m/s}^2$ ◀

(*c*) Just passed Point *B*. $\rho = 45 \text{ m}$

$$a_n = \frac{v^2}{\rho} = \frac{(20)^2}{45} = 8.8889 \text{ m/s}^2 \downarrow$$

$$\Sigma F_y = ma_y: \quad N_R + N_F - mg = -ma_n$$

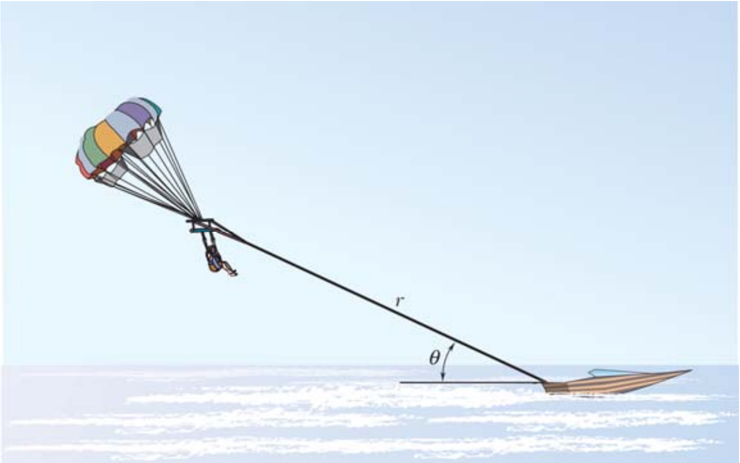
or
$$N_R + N_F = m(g - a_n)$$
$$F = \mu_k(N_R + N_F) = \mu_k m(g - a_n)$$

$$\xrightarrow{+} \Sigma F_x = ma_x: \quad -F = ma_t$$

$$a_t = -\frac{F}{m} = -\mu_k(g - a_n)$$

$$|a_t| = \mu_k(g - a_n) = (0.25)(9.81 - 8.8889)$$

$$|a_t| = 0.230 \text{ m/s}^2 \blacktriangleleft$$



PROBLEM 12.127

The parasailing system shown uses a winch to pull the rider in towards the boat, which is travelling with a constant velocity. During the interval when θ is between 20° and 40°, (where t = 0 at θ = 20°) the angle increases at the constant rate of 2 °/s. During this time, the length of the rope is defined by the relationship $r = 125 - \frac{1}{3}t^{3/2}$, where r and t are expressed in meters and seconds, respectively. At the instant when the rope makes a 30 degree angle with the water, the tension in the rope is 18 kN. At this instant, what is the magnitude and direction of the force of the parasail on the 75 kg parasailor?

SOLUTION

Given:

$$r = 125 - \frac{1}{3}t^{3/2} \text{ m}$$

$$\theta_0 = 20°,\ \theta = 30°,\ \dot{\theta} = 2°/s = 0.0349 \text{ rad/s},\ \ddot{\theta}=0$$

$$T = 18 \text{ kN},\ m = 75 \text{ kg}$$

Kinematics:

$$\theta = \theta_0 + \dot{\theta}t$$

$$30 = 20 + 2t \Rightarrow t = 5 \text{ s}$$

$$\mathbf{a}_P = \mathbf{a}_B + \mathbf{a}_{P/B}$$

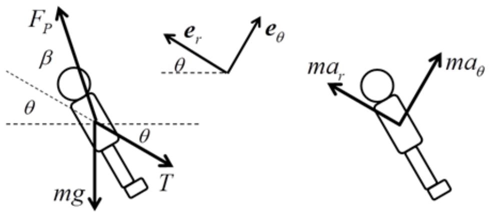
$$\mathbf{a}_P = 0 + a_r\mathbf{e}_r + a_\theta\mathbf{e}_\theta$$

Using Radial and Transverse Coordinates:

$$\dot{r} = -\frac{1}{2}t^{\frac{1}{2}} \text{ m/s}$$

$$\ddot{r} = -\frac{1}{4}t^{-\frac{1}{2}} \text{ m/s}^2$$

Free Body Diagram of parasailor (side view):



Equations of Motion:

$$\sum F_r = ma_r$$

$$F_P\cos\beta - T - mg\sin\theta = m\left(\ddot{r} - r\dot{\theta}^2\right)$$

$$F_P\cos\beta = T + m\left[g\sin\theta + \ddot{r} - r\dot{\theta}^2\right] \qquad (1)$$

$$\sum F_\theta = ma_\theta$$

$$F_P\sin\beta - mg\cos\theta = m\left(r\ddot{\theta} + 2\dot{r}\dot{\theta}\right)$$

$$F_P\sin\beta = m\left[g\cos\theta + r\ddot{\theta} + 2\dot{r}\dot{\theta}\right] \qquad (2)$$

PROBLEM 12.127 (Continued)

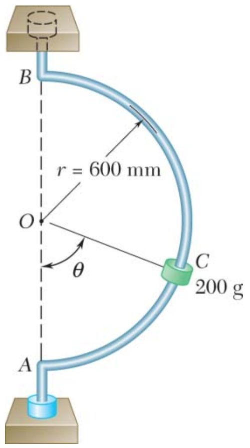
Evaluate at t=5 s: $r = 121.27\text{ m},\ \dot{r} = -1.118\text{ m/s},\ \ddot{r} = -0.1118\text{ m/s}^2$

(1) $F_P \cos\beta = 18000 + 75\left[9.81\sin 30° - 0.1118 - 121.27(0.0349)^2\right] \Rightarrow F_P \cos\beta = 18348.4\text{ N}$

(2) $F_P \sin\beta = 75\left[9.81\cos 30° + 0 + 2(-1.118)(0.0349)\right] \Rightarrow F_P \sin\beta = 631.33\text{ N}$

$$\frac{\cancel{F_P}\sin\beta}{\cancel{F_P}\cos\beta} = \frac{631.33}{18348.4} \Rightarrow \tan\beta = 0.03441 \Rightarrow \beta = 1.97°$$

$F_P \cos 1.97° = 18348.4\text{ N}$ $\qquad$ $F_P = 18.4\text{ kN} \measuredangle 31.97°$ ◀



PROBLEM 12.128

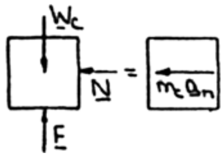
A small 200-g collar C can slide on a semicircular rod which is made to rotate about the vertical AB at the constant rate of 6 rad/s. Determine the minimum required value of the coefficient of static friction between the collar and the rod if the collar is not to slide when (a) $\theta = 90°$, (b) $\theta = 75°$, (c) $\theta = 45°$. Indicate in each case the direction of the impending motion.

SOLUTION

First note

$$\begin{aligned} v_C &= (r\sin\theta)\dot{\phi}_{AB} \\ &= (0.6\text{ m})(6\text{ rad/s})\sin\theta \\ &= (3.6\text{ m/s})\sin\theta \end{aligned}$$

(a) With $\theta = 90°$, $v_C = 3.6\text{ m/s}$



$$+\!\uparrow \Sigma F_y = 0: \quad F - W_C = 0$$

or $F = m_C g$

Now $F = \mu_s N$

or $N = \dfrac{1}{\mu_s} m_C g$

$$\xleftarrow{+} \Sigma F_n = m_C a_n: \quad N = m_C \frac{v_C^2}{r}$$

or $$\frac{1}{\mu_s} m_C g = m_C \frac{v_C^2}{r}$$

or $$\mu_s = \frac{gr}{v_C^2} = \frac{(9.81\text{ m/s}^2)(0.6\text{ m})}{(3.6\text{ m/s})^2}$$

or $(\mu_s)_{\min} = 0.454$ ◀

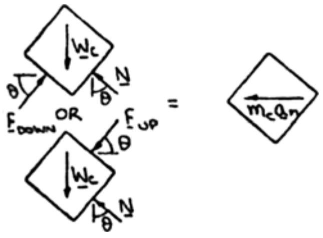
The direction of the impending motion is downward. ◀

Copyright © McGraw-Hill Education. Permission required for reproduction or display.

(*b*) and (*c*)

First observe that for an arbitrary value of θ, it is not known whether the impending motion will be upward or downward. To consider both possibilities for each value of θ, let F_{down} correspond to impending motion downward, F_{up} correspond to impending motion upward, then with the "top sign" corresponding to F_{down}, we have

$$+\uparrow \Sigma F_y = 0: \quad N\cos\theta \pm F\sin\theta - W_C = 0$$



Now $$F = \mu_s N$$

Then $$N\cos\theta \pm \mu_s N\sin\theta - m_C g = 0$$

or $$N = \frac{m_C g}{\cos\theta \pm \mu_s \sin\theta}$$

and $$F = \frac{\mu_s m_C g}{\cos\theta \pm \mu_s \sin\theta}$$

$$\xleftarrow{+} \Sigma F_n = m_C a_n: \quad N\sin\theta \mp F\cos\theta = m_C \frac{v_C^2}{\rho} \qquad \rho = r\sin\theta$$

Substituting for *N* and *F*

$$\frac{m_C g}{\cos\theta \pm \mu_s \sin\theta}\sin\theta \mp \frac{\mu_s m_C g}{\cos\theta \pm \mu_s \sin\theta}\cos\theta = m_C \frac{v_C^2}{r\sin\theta}$$

or $$\frac{\tan\theta}{1 \pm \mu_s \tan\theta} \mp \frac{\mu_s}{1 \pm \mu_s \tan\theta} = \frac{v_C^2}{gr\sin\theta}$$

or $$\mu_s = \pm \frac{\tan\theta - \frac{v_C^2}{gr\sin\theta}}{1 + \frac{v_C^2}{gr\sin\theta}\tan\theta}$$

Now $$\frac{v_C^2}{gr\sin\theta} = \frac{[(3.6\text{ m/s})\sin\theta]^2}{(9.81\text{ m/s}^2)(0.6\text{ m})\sin\theta} = 2.2018\sin\theta$$

Then $$\mu_s = \pm \frac{\tan\theta - 2.2018\sin\theta}{1 + 2.2018\sin\theta\tan\theta}$$

(*b*) $\theta = 75°$

$$\mu_s = \pm \frac{\tan 75° - 2.2018\sin 75°}{1 + 2.2018\sin 75°\tan 75°} = \pm 0.1796$$

Then

downward: $\mu_s = +0.1796$

upward: $\mu_s < 0$ not possible

$(\mu_s)_{\min} = 0.1796$ ◀

The direction of the impending motion is downward. ◀

(*c*) $\theta = 45°$

$$\mu_s = \pm \frac{\tan 45° - 2.2018 \sin 45°}{1 + 2.2018 \sin 45° \tan 45°} = \pm(-0.218)$$

Then

downward: $\mu_s < 0$ not possible

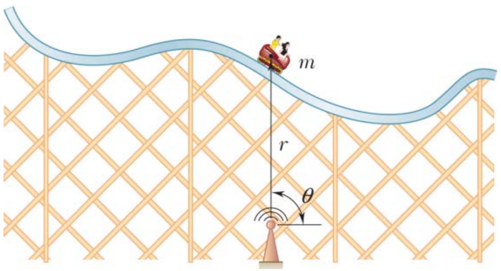
upward: $\mu_s = 0.218$ $(\mu_s)_{\min} = 0.218$ ◀

The direction of the impending motion is upward. ◀

Note: When $\tan\theta - 2.2018 \sin\theta = 0$

or $\theta = 62.988°$,

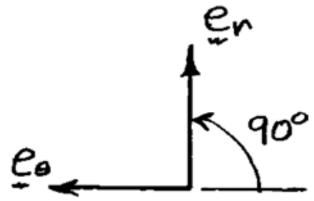
$\mu_s = 0$. Thus, for this value of θ, friction is not necessary to prevent the collar from sliding on the rod.



PROBLEM 12.129

Telemetry technology is used to quantify kinematic values of a 200-kg roller coaster cart as it passes overhead. According to the system, $r = 25$ m, $\dot{r} = -10$ m/s, $\ddot{r} = -2$ m/s^2, $\theta = 90°$, $\dot{\theta} = -0.4$ rad/s, $\ddot{\theta} = -0.32$ rad/s^2. At this instant, determine (*a*) the normal force between the cart and the track, (*b*) the radius of curvature of the track.

SOLUTION



$\underset{\sim}{e}_r$

x
mg
=
N
F_t
45°
ma

Find the acceleration and velocity using polar coordinates.

$$v_r = \dot{r} = -10 \text{ m/s}$$

$$v_\theta = r\dot{\theta} = (25 \text{ m})(-0.4 \text{ rad/s}) = -10 \text{ m/s}$$

So the tangential direction is ↘ 45° and $v = 10\sqrt{2}$ m/s.

$$a_r = \ddot{r} - r\dot{\theta}^2 = -2 \text{ m/s} - (25 \text{ m})(-0.4 \text{ rad/s})^2$$
$$= -6 \text{ m/s}^2$$

$$a_\theta = r\ddot{\theta} + 2\dot{r}\dot{\theta}$$
$$= (25 \text{ m})(-0.32) \text{ rad/s}^2| + 2(-10 \text{ m/s})(-0.4 \text{ rad/s})$$
$$= 0$$

So the acceleration is vertical and downward.

(*a*) To find the normal force use Newton's second law.

y-direction

$$N - mg\sin 45° = -ma\cos 45°$$
$$N = m(g\sin 45° - a\cos 45°)$$
$$= (200 \text{ kg})(9.81) \text{ m/s}^2 - 6 \text{ m/s}^2)(0.70711)$$
$$= 538.815 \text{ N}$$

$N = 539$ N ◀

(*b*) Radius l curvature of the track.

$$a_n = \frac{v^2}{\rho}$$

$$\rho = \frac{v^2}{a_n} = \frac{(10\sqrt{2})^2}{6\cos 45°}$$

$\rho = 47.1$ m ◀

PROBLEM 12.130

The radius of the orbit of a moon of a given planet is equal to twice the radius of that planet. Denoting by ρ the mean density of the planet, show that the time required by the moon to complete one full revolution about the planet is $(24\ \pi/G\rho)^{1/2}$, where G is the constant of gravitation.

SOLUTION

For gravitational force and a circular orbit,

$$|F_r| = \frac{GMm}{r^2} = \frac{mv^2}{r} \qquad \text{or} \qquad v = \sqrt{\frac{GM}{r}}$$

Let τ be the periodic time to complete one orbit.

$$v\tau = 2\pi r \qquad \text{or} \qquad \tau\sqrt{\frac{GM}{r}} = 2\pi r$$

Solving for τ,

$$\tau = \frac{2\pi r^{3/2}}{\sqrt{GM}}$$

But

$$M = \frac{4}{3}\pi R^3 \rho, \quad \text{hence,} \quad \sqrt{GM} = 2\sqrt{\frac{\pi}{3}G\rho}\ R^{3/2}$$

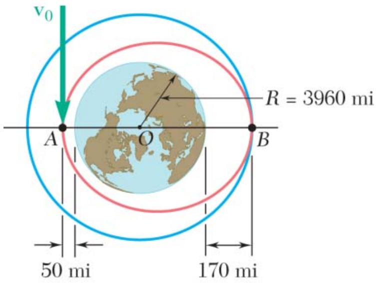
Then

$$\tau = \sqrt{\frac{3\pi}{G\rho}}\left(\frac{r}{R}\right)^{3/2}$$

Using $r = 2R$ as a given leads to

$$\tau = 2^{3/2}\sqrt{\frac{3\pi}{G\rho}} = \sqrt{\frac{24\pi}{G\rho}}$$

$\tau = (24\pi/G\rho)^{1/2}$ ◀



PROBLEM 12.131

At engine burnout on a mission, a shuttle had reached Point *A* at an altitude of 40 mi above the surface of the earth and had a horizontal velocity $\mathbf{v}_0$. Knowing that its first orbit was elliptic and that the shuttle was transferred to a circular orbit as it passed through Point *B* at an altitude of 170 mi, determine (*a*) the time needed for the shuttle to travel from *A* to *B* on its original elliptic orbit, (*b*) the periodic time of the shuttle on its final circular orbit.

SOLUTION

For Earth,
$$R = 3960 \text{ mi} = 20.909\times10^6 \text{ ft}, \quad g = 32.2 \text{ ft/s}^2$$

$$GM = gR^2 = (32.2)(20.909\times10^6)^2 = 14.077\times10^{15} \text{ ft}^3/\text{s}^2$$

(*a*) For the elliptic orbit,
$$r_A = 3960 + 40 = 4000 \text{ mi} = 21.12\times10^6 \text{ ft}$$
$$r_B = 3960 + 170 = 4130 \text{ mi} = 21.8064\times10^6 \text{ ft}$$

$$a = \frac{1}{2}(r_A + r_B) = 21.5032\times10^6 \text{ ft}$$
$$b = \sqrt{r_A r_B} = 21.4605\times10^6 \text{ ft}$$

Using Eq. 12.39,
$$\frac{1}{r_A} = \frac{GM}{h^2} + C\cos\theta_A$$

and
$$\frac{1}{r_B} = \frac{GM}{r_B^2} + C\cos\theta_B$$

But $\theta_B = \theta_A + 180°$, so that $\cos\theta_A = -\cos\theta_B$

Adding,
$$\frac{1}{r_A} + \frac{1}{r_B} = \frac{r_A + r_B}{r_A r_B} = \frac{2a}{b^2} = \frac{2GM}{h^2}$$

or
$$h = \sqrt{\frac{GMb^2}{a}}$$

Periodic time.
$$\tau = \frac{2\pi ab}{h} = \frac{2\pi ab\sqrt{a}}{\sqrt{GMb^2}} = \frac{2\pi a^{3/2}}{\sqrt{GM}}$$

$$\tau = \frac{2\pi(21.5032\times10^6)^{3/2}}{\sqrt{14.077\times10^{15}}} = 5280.6 \text{ s} = 1.4668 \text{ h}$$

The time to travel from *A* to *B* is one half the periodic time

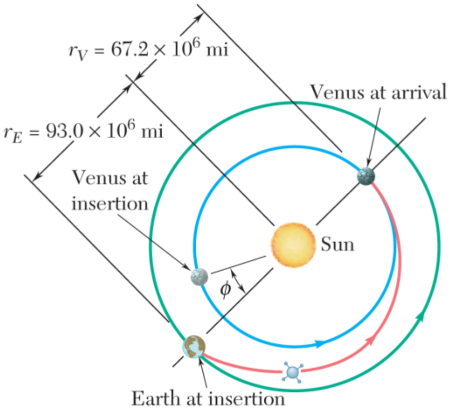
$$\tau_{AB} = 0.7334 \text{ h} \qquad \tau_{AB} = 44.0 \text{ min} \blacktriangleleft$$

PROBLEM 12.131 (Continued)

(*b*) For the circular orbit, $a = b = r_B = 21.8064 \times 10^6 \text{ ft}$

$$\tau_{\text{circ}} = \frac{2\pi a^{3/2}}{\sqrt{GM}} = \frac{2\pi(21.8064 \times 10^6)^{3/2}}{\sqrt{14.077 \times 10^{15}}} = 5393 \text{ s}$$

$\tau_{\text{circ}} = 1.498 \text{ h}$ $\tau_{\text{circ}} = 89.9 \text{ min}$ ◀



PROBLEM 12.132

A space probe in a low earth orbit is inserted into an elliptic transfer orbit to the planet Venus. Knowing that the mass of the sun is 332.8×10^3 times the mass of the earth and assuming that the probe is subjected only to the gravitational attraction of the sun, determine the value of ϕ, which defines the relative position of Venus with respect to the earth at the time the probe is inserted into the transfer orbit.

SOLUTION

First determine the time t_{probe} for the probe to travel from the earth to Venus:

$$t_{\text{probe}} = \frac{1}{2}\tau_{\text{tr}}$$

where τ_{tr} is the periodic time of the elliptic transfer orbit. Applying Kepler's Third Law to the orbits about the sun of the earth and the probe, we obtain

$$\frac{\tau_{\text{tr}}^2}{\tau_{\text{earth}}^2} = \frac{a_{\text{tr}}^3}{a_{\text{earth}}^3}$$

where
$$\begin{aligned} a_{\text{tr}} &= \frac{1}{2}(r_E + r_v) \\ &= \frac{1}{2}(93 \times 10^6 + 67.2 \times 10^6)\,\text{mi} \\ &= 80.1 \times 10^6\ \text{mi} \end{aligned}$$

and
$$a_{\text{earth}} \approx r_E \quad (\textit{Note:}\quad \varepsilon_{\text{earth}} = 0.0167)$$

Then
$$\begin{aligned} t_{\text{probe}} &= \frac{1}{2}\left(\frac{a_{\text{tr}}}{r_E}\right)^{3/2} \tau_{\text{earth}} \\ &= \frac{1}{2}\left(\frac{80.1 \times 10^6\ \text{mi}}{93.0 \times 10^6\ \text{mi}}\right)^{3/2} (365.25\ \text{days}) \\ &= 145.977\ \text{days} \\ &= 12.6124 \times 10^6\,\text{s} \end{aligned}$$

In time t_{probe}, Venus travels through the angle θ_v given by

$$\theta_v = \dot{\theta}_v t_{\text{probe}} = \frac{v_v}{r_v} t_{\text{probe}}$$

PROBLEM 12.132 (Continued)

Assuming that the orbit of Venus is circular (*note:* $\varepsilon_{\text{venus}} = 0.0068$), then, for a circular orbit

$$v_v = \sqrt{\frac{GM_{\text{sun}}}{r_v}} \qquad \text{[Eq. (12.44)]}$$

Now $$GM_{\text{sun}} = G(332.8\times 10^3 M_{\text{earth}})$$

$$= 332.8\times 10^3 \left(gR_{\text{earth}}^2\right) \qquad \text{using Eq. (12.30)}$$

Then $$\theta_v = \frac{t_{\text{probe}}}{r_v}\left[\frac{332.8\times 10^3\left(gR_{\text{earth}}^2\right)}{r_v}\right]^{1/2}$$

$$= t_{\text{probe}}\ R_{\text{earth}}\ \frac{(332.8g\times 10^3)^{1/2}}{r_v^{3/2}}$$

where $$R_{\text{earth}} = 3960 \text{ mi} = 20.9088\times 10^6 \text{ ft}$$

and $$r_v = 67.2\times 10^6 \text{ mi} = 354.816\times 10^9 \text{ ft}$$

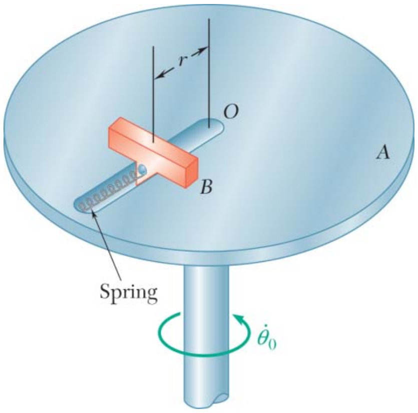
Then $$\theta_v = (12.6124\times 10^6 \text{ s})(20.9088\times 10^6 \text{ ft})\frac{(332.8\times 10^3\times 32.2 \text{ ft/s}^2)^{1/2}}{(354.816\times 10^9 \text{ ft})^{1/2}}$$

$$= 4.0845 \text{ rad}$$

$$= 234.02°$$

Finally, $$\phi = \theta_v - 180° = 234.02° - 180°$$

$$\varphi = 54.0° \blacktriangleleft$$



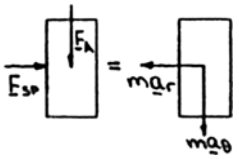
PROBLEM 12.133*

Disk *A* rotates in a horizontal plane about a vertical axis at the constant rate $\dot{\theta}_0 = 10$ rad/s. Slider *B* has mass 1 kg and moves in a frictionless slot cut in the disk. The slider is attached to a spring of constant *k*, which is undeformed when $r = 0$. Knowing that the slider is released with no radial velocity in the position $r = 500$ mm, determine the position of the slider and the horizontal force exerted on it by the disk at $t = 0.1$ s for (*a*) $k = 100$ N/m, (*b*) $k = 200$ N/m.

SOLUTION

First we note when $r = 0, \quad x_{sp} = 0 \Rightarrow F_{sp} = kr$

$$r_0 = 500 \text{ mm} = 0.5 \text{ m}$$



and $\dot{\theta} = \dot{\theta}_0 = 12$ rad/s

then $\ddot{\theta} = 0$

$$\overset{+}{\leftarrow} \Sigma F_r = m_B a_r: \quad -F_{sp} = m_B(\ddot{r} - r\dot{\theta}_0^2)$$

$$\ddot{r} + \left(\frac{k}{m_B} - \dot{\theta}_0^2\right) r = 0 \qquad (1)$$

$$+\!\downarrow \Sigma F_\theta = m_B a_\theta: \quad F_A = m_B(0 + 2\dot{r}\dot{\theta}_0) \qquad (2)$$

(*a*) $k = 100$ N/m

Substituting the given values into Eq. (1)

$$\ddot{r} + \left[\frac{100 \text{ N/m}}{1 \text{ kg}} - (10 \text{ rad/s})^2\right] r = 0$$

$$\ddot{r} = 0$$

Then $\dfrac{d\dot{r}}{dt} = \ddot{r} = 0$ and at $t = 0, \dot{r} = 0$:

$$\int_0^{\dot{r}} d\dot{r} = \int_0^{0.1} (0)\, dt$$

$$\dot{r} = 0$$

and $$\frac{dr}{dt} = \dot{r} = 0 \text{ and at } t = 0,\ r_0 = 0.5 \text{ m}$$

$$\int_{r_0}^{r} dr = \int_0^{0.1} (0)\, dt$$

$$r = r_0$$

$r = 0.5$ m ◀

Note: $\dot{r} = 0$ implies that the slider remains at its initial radial position.

With $\dot{r} = 0$, Eq. (2) implies

$F_H = 0$ ◀

(*b*) $k = 200$ N/m

Substituting the given values into Eq. (1)

$$\ddot{r} + \left[\frac{200}{1 \text{ kg}} - (10 \text{ rad/s})^2\right] r = 0$$

$$\ddot{r} + 100\, r = 0$$

Now $$\ddot{r} = \frac{d}{dt}(\dot{r}) \qquad \dot{r} = v_r \qquad \frac{d}{dt} = \frac{dr}{dt}\frac{d}{dr} = v_r \frac{d}{dr}$$

Then $$\ddot{r} = v_r \frac{dv_r}{dr}$$

so that $$v_r \frac{dv_r}{dr} + 100r = 0$$

At $t = 0,\ v_r = 0,\ r = r_0$: $$\int_0^{v_r} v_r\, d\, v_r = -100 \int_{r_0}^{r} r\, dr$$

$$v_r^2 = -100(r^2 - r_0^2)$$

$$v_r = 10\sqrt{r_0^2 - r^2}$$

Now $$v_r = \frac{dr}{dt} = 10\sqrt{r_0^2 - r^2}$$

At $t = 0,\ r = r_0$: $$\int_{r_0}^{r} \frac{dr}{\sqrt{r_0^2 - r^2}} = \int_0^t 10\, dt = 10t$$

PROBLEM 12.133* (Continued)

Let $$r = r_0 \sin\phi, \qquad dr = r_0 \cos\phi d\phi$$

Then $$\int_{\pi/2}^{\sin^{-1}(r/r_0)} \frac{r_0 \cos\phi d\phi}{\sqrt{r_0^2 - r_0^2 \sin^2\phi}} = 10t$$

$$\int_{\pi/2}^{\sin^{-1}(r/r_0)} d\phi = 10t$$

$$\sin^{-1}\left(\frac{r}{r_0}\right) - \frac{\pi}{2} = 10t$$

$$r = r_0 \sin\left(10t + \frac{\pi}{2}\right) = r_0 \cos 10t = (0.5\text{ ft})\cos 10t$$

Then $$\dot{r} = -(5\text{ m/s})\sin 10t$$

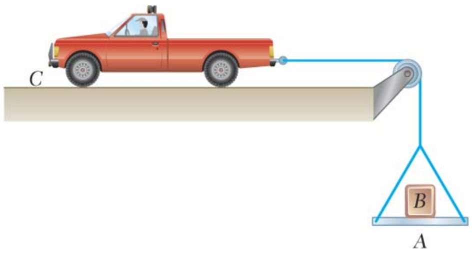
Finally, at $t = 0.1$ s:

$$r = (0.5\text{ ft})\cos(10 \times 0.1)$$

$$r = 0.270\text{ m} \blacktriangleleft$$

Eq. (2) $$F_H = 1\text{ kg} \times 2 \times [-(5\text{ ft/s})\sin(10 \times 0.1)]\ (10\text{ rad/s})$$

$$F_H = -84.1\text{ N} \blacktriangleleft$$



PROBLEM 12.CQ1

A 1000 lb boulder *B* is resting on a 200 lb platform *A* when truck *C* accelerates to the left with a constant acceleration. Which of the following statements are true (more than one may be true)?

(*a*) The tension in the cord connected to the truck is 200 lb

(*b*) The tension in the cord connected to the truck is 1200 lb

(*c*) The tension in the cord connected to the truck is greater than 1200 lb

(*d*) The normal force between *A* and *B* is 1000 lb

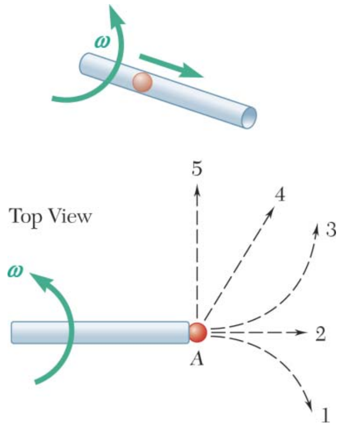
(*e*) The normal force between *A* and *B* is 1200 lb

(*f*) None of the above

SOLUTION

The boulder and platform are accelerating upwards; therefore it will require a force larger than their weight to achieve this acceleration:

Answers: (*c*) The tension will be greater than 1200 lb and (d) the normal force will be greater than 1000 lb.



PROBLEM 12.CQ2

Marble *A* is placed in a hollow tube, and the tube is swung in a horizontal plane causing the marble to be thrown out. As viewed from the top, which of the following choices best describes the path of the marble after leaving the tube?

(*a*) 1

(*b*) 2

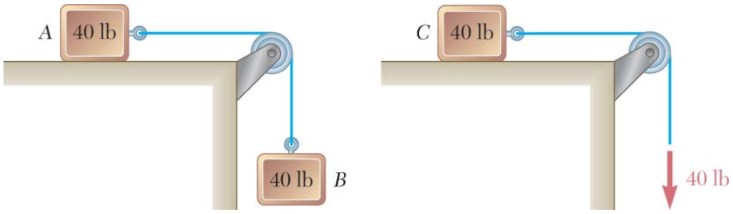
(*c*) 3

(*d*) 4

(*e*) 5

SOLUTION

Answer: (*d*) The particle will have velocity components along the tube and perpendicular to the tube when it leaves. After it leaves, it will not accelerate in the horizontal plane since there are no forces in that plane; therefore, it will travel in a straight line.



PROBLEM 12.CQ3

The two systems shown start from rest. On the left, two 40 lb weights are connected by an inextensible cord, and on the right, a constant 40 lb force pulls on the cord. Neglecting all frictional forces, which of the following statements is true?

(*a*) Blocks *A* and *C* will have the same acceleration

(*b*) Block *C* will have a larger acceleration than block *A*

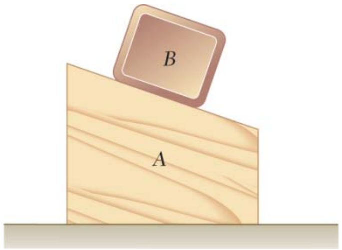
(*c*) Block *A* will have a larger acceleration than block *C*

(*d*) Block *A* will not move

(*e*) None of the above

SOLUTION

Answer: (*b*) If you draw a FBD of *B*, you will see that since it is accelerating downward, the tension in the cable will be less than 40 lb, so the acceleration of *A* will be less than the acceleration of *C*. Also, the system on the left has more inertia, so it will require more force to have the same acceleration as the system on the right.



PROBLEM 12.CQ4

The system shown is released from rest in the position shown. Neglecting friction, the normal force between block *A* and the ground is

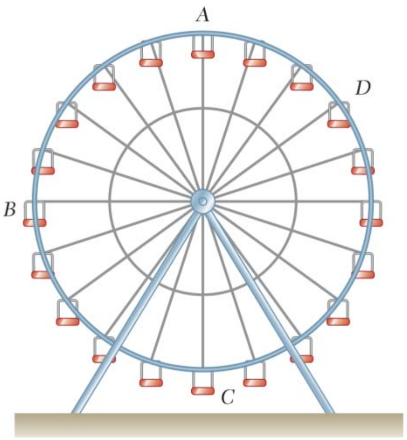
(*a*) less than the weight of *A* plus the weight of *B*

(*b*) equal to the weight of *A* plus the weight of *B*

(*c*) greater than the weight of *A* plus the weight of *B*

SOLUTION

Answer: (*a*) Since *B* has an acceleration component downward the normal force between *A* and the ground will be less than the sum of the weights. To see this, you can draw an FBD of both block A and B. From block A you will find that the normal force on the ground is the sum of the weight of block A plus the vertical component of the normal force of block B on A since block A does not accelerate in the vertical direction. From the FBD of block B and using F=ma, you will see that the vertical component of the normal force of B on A is less than the weight of block B since it is accelerating downwards.



PROBLEM 12.CQ5

People sit on a Ferris wheel at Points *A*, *B*, *C* and *D*. The Ferris wheel travels at a constant angular velocity. At the instant shown, which person experiences the largest force from his or her chair (back and seat)? Assume you can neglect the size of the chairs, that is, the people are located the same distance from the axis of rotation.

(*a*) *A*

(*b*) *B*

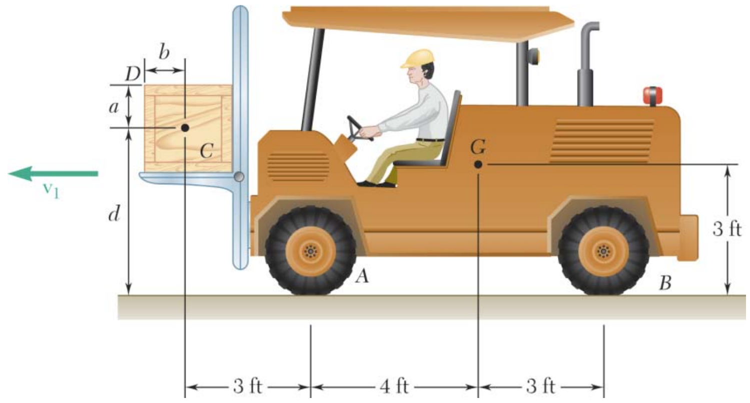
(*c*) *C*

(*d*) *D*

(*e*) The force is the same for all the passengers.

SOLUTION

Answer: (*c*) Draw a FBD and KD at each location and it will be clear that the maximum force will be experienced by the person at Point *C.* At this point the normal force isdirectly opposite the force of gravity and the acceleration is in the same direction as the normal force making the normal force the sum of *mg* and *ma*.



PROBLEM 12.CQ6

A uniform crate *C* with mass m_C is being transported to the left by a forklift with a constant speed v_1. What is the magnitude of the angular momentum of the crate about Point *D*, that is, the upper left corner of the crate?

(*a*) 0

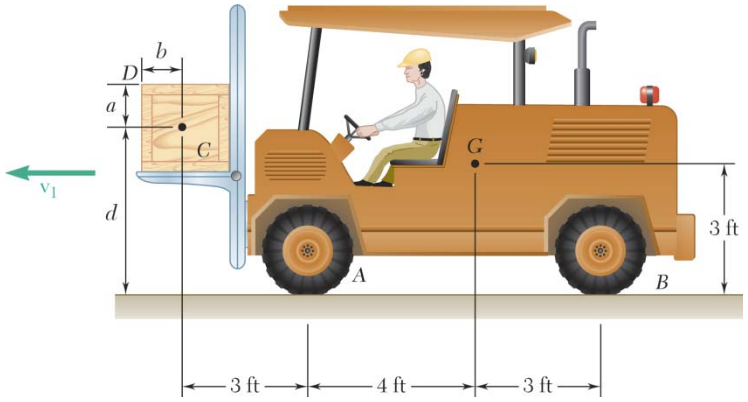
(*b*) mv_1a

(*c*) mv_1b

(*d*) $mv_1\sqrt{a^2+b^2}$

SOLUTION

Answers: (*b*) The angular momentum is the moment of the momentum, so simply take the linear momentum, mv_1, and multiply it by the perpendicular distance from the line of action of mv_1 and Point *D*.



PROBLEM 12.CQ7

A uniform crate C with mass m_C is being transported to the left by a forklift with a constant speed v_1. What is the magnitude of the angular momentum of the crate about Point A, that is, the point of contact between the front tire of the forklift and the ground?

(*a*) 0

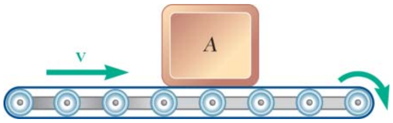
(*b*) mv_1d

(*c*) $3mv_1$

(*d*) $mv_1\sqrt{3^2 + d^2}$

SOLUTION

Answer: (*b*) The angular momentum is the moment of the momentum, so simply take the linear momentum, mv_1, and multiply it by the perpendicular distance from the line of action of mv_1 and Point A.

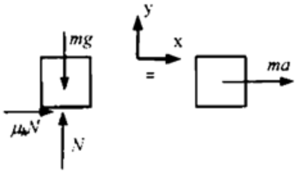


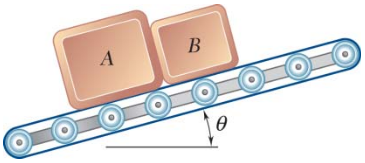
PROBLEM 12.F1

Crate *A* is gently placed with zero initial velocity onto a moving conveyor belt. The coefficient of kinetic friction between the crate and the belt is μ_k. Draw the FBD and KD for *A* immediately after it contacts the belt.

SOLUTION

Answer:





PROBLEM 12.F2

Two blocks weighing W_A and W_B are at rest on a conveyor that is initially at rest. The belt is suddenly started in an upward direction so that slipping occurs between the belt and the boxes. Assuming the coefficient of friction between the boxes and the belt is μ_k, draw the FBDs and KDs for blocks *A* and *B*. How would you determine if *A* and *B* remain in contact?

SOLUTION

Answer:

Block *A*

CHAPTER 13

PROBLEM 13.1

A 400-kg satellite is placed in a circular orbit 6394 km above the surface of the earth. At this elevation the acceleration of gravity is $4.09\ \text{m/s}^2$. Knowing that its orbital speed is 20 000 km/h, determine the kinetic energy of the satellite.

SOLUTION

Given: Mass of satellite, $m = 400\ \text{kg}$

Speed of satellite, $v = 20.0 \times 10^3\ \text{km/h}$

Find: Kinetic energy, T

$$v = \left(20.0 \times 10^3\ \text{km/h}\right)\left(\frac{1\ \text{h}}{3600\ \text{s}}\right)\left(1000\ \text{m/km}\right)$$

$$= 5555\ \text{m/s}$$

$$T = \frac{1}{2}mv^2 = \frac{1}{2}\left(400\ \text{kg}\right)\left(5.555 \times 10^3 \text{m/s}\right)^2$$

$$T = 6.17 \times 10^9\ \text{N}\cdot\text{m}$$

Note: Acceleration of gravity has no effect on the mass of the satellite.

$T = 6.17\ \text{GJ}$ ◀

PROBLEM 13.2

A 1-lb stone is dropped down the "bottomless pit" at Carlsbad Caverns and strikes the ground with a speed of 95 ft/s. Neglecting air resistance, determine (*a*) the kinetic energy of the stone as it strikes the ground and the height *h* from which it was dropped, (*b*) Solve Part *a* assuming that the same stone is dropped down a hole on the moon. (Acceleration of gravity on the moon = 5.31 ft/s^2.)

SOLUTION

Mass of stone: $m = \dfrac{W\text{ lb}}{g} = \dfrac{1\text{ lb}}{32.2\text{ ft/s}^2} = 0.031056\text{ lb}\cdot\text{s}^2/\text{ft}$

Initial kinetic energy: $T_1 = 0$ (rest)

(*a*) Kinetic energy at ground strike:

$$T_2 = \frac{1}{2}mv_2^2 = \frac{1}{2}(0.031056)(95)^2 = 140.14\text{ ft}\cdot\text{lb}$$

$T_2 = 140.1\text{ ft}\cdot\text{lb}$ ◀

Use work and energy: $T_1 + U_{1\to 2} = T_2$

where $U_{1\to 2} = wh = mgh$

$$0 + mgh = \frac{1}{2}mv_2^2$$

$$h = \frac{v_2^2}{2g} = \frac{(95)^2}{(2)(32.2)}$$

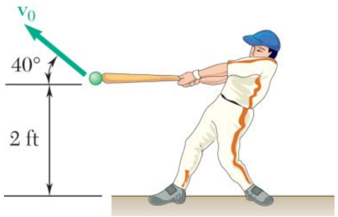
$h = 140.1\text{ ft}$ ◀

(*b*) On the moon: $g = 5.31\text{ ft/s}^2$

T_1 and T_2 will be the same, hence $T_2 = 140.1\text{ ft}\cdot\text{lb}$ ◀

$$h = \frac{v_2^2}{2g} = \frac{(95)^2}{(2)(5.31)}$$

$h = 850\text{ ft}$ ◀



PROBLEM 13.3

A baseball player hits a 5.1-oz baseball with an initial velocity of 140 ft/s at an angle of 40° with the horizontal as shown. Determine (*a*) the kinetic energy of the ball immediately after it is hit, (*b*) the kinetic energy of the ball when it reaches its maximum height, (*c*) the maximum height above the ground reached by the ball.

SOLUTION

Mass of baseball: $W = (5.1\text{ oz})\left(\dfrac{1\text{ lb}}{16\text{ oz}}\right) = 0.31875\text{ lb}$

$$m = \frac{W}{g} = \frac{0.31875\text{ lb}}{32.2\text{ ft/s}^2} = 0.009899\text{ lb}\cdot\text{s}^2/\text{ft}$$

(*a*) Kinetic energy immediately after hit.

$$v = v_0 = 140\text{ ft/s}$$

$$T_1 = \frac{1}{2}mv^2 = \frac{1}{2}(0.009899)(140)^2 \qquad T_1 = 97.0\text{ ft}\cdot\text{lb} \blacktriangleleft$$

(*b*) Kinetic energy at maximum height:

$$v = v_0\cos 40° = 140\cos 40° = 107.246\text{ ft/s}$$

$$T_2 = \frac{1}{2}mv^2 = \frac{1}{2}(0.009899)(107.246)^2 \qquad T_2 = 56.9\text{ ft}\cdot\text{lb} \blacktriangleleft$$

Principle of work and energy: $T_1 + U_{1\to 2} = T_2$

$$U_{1\to 2} = T_2 - T_1 = -40.082\text{ ft}\cdot\text{lb}$$

Work of weight: $U_{1\to 2} = -Wd$

Maximum height above impact point.

$$d = \frac{T_2 - T_1}{-W} = \frac{-40.082\text{ ft}\cdot\text{lb}}{-0.31875\text{ lb}} = 125.7\text{ ft} \qquad 125.7\text{ ft} \blacktriangleleft$$

(*c*) Maximum height above ground:

$$h = 125.7\text{ ft} + 2\text{ ft} \qquad h = 127.7\text{ ft} \blacktriangleleft$$

PROBLEM 13.4

A 500-kg communications satellite is in a circular geosynchronous orbit and completes one revolution about the earth in 23 h and 56 min at an altitude of 35800 km above the surface of the earth. Knowing that the radius of the earth is 6370 km, determine the kinetic energy of the satellite.

SOLUTION

Radius of earth: $R = 6370\text{ km}$

Radius of orbit: $r = R + h = 6370 + 35800 = 42170\text{ km} = 42.170 \times 10^6\text{ m}$

Time one revolution: $t = 23\text{ h} + 56\text{ min}$

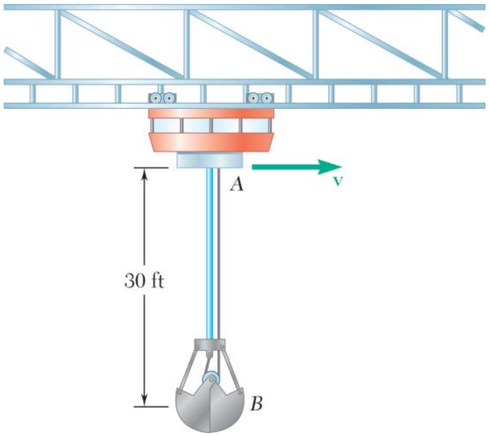
$$t = (23\text{ h})(3600\text{ s/h}) + (56\text{ min})(60\text{ s/min}) = 86.160 \times 10^3\text{ s}$$

Speed: $$v = \frac{2\pi r}{t} = \frac{2\pi(42.170 \times 10^6)}{86.160 \times 10^3} = 3075.2\text{ m/s}$$

Kinetic energy: $$T = \frac{1}{2}mv^2$$

$$T = \frac{1}{2}(500\text{ kg})(3075.2\text{ m/s})^2 = 2.3643 \times 10^9\text{ J}$$

$T = 2.36\text{ GJ}$ ◀



PROBLEM 13.5

In an ore-mixing operation, a bucket full of ore is suspended from a traveling crane which moves along a stationary bridge. The bucket is to swing no more than 10 ft horizontally when the crane is brought to a sudden stop. Determine the maximum allowable speed *v* of the crane.

SOLUTION

Let position ① be the position with bucket *B* directly below *A*, and position ② be that of maximum swing where $d = 10$ ft. Let *L* be the length *AB*.

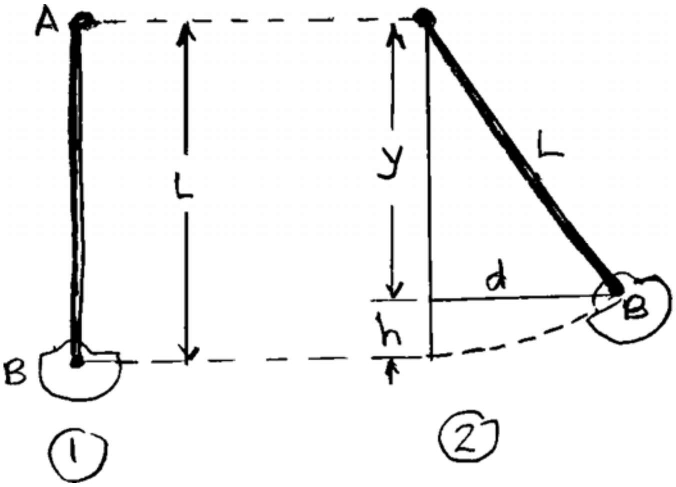
Kinetic energies: $T_1 = \frac{1}{2}mv^2,\ T_2 = 0$

Work of the weight: $U_{1\to 2} = -Wh = -mgh$

where *h* is the vertical projection of position ② above position ①

From geometry (see figure),

$$\begin{aligned} y &= \sqrt{L^2 - d^2} \\ h &= L - y \\ &= L - \sqrt{L^2 - d^2} \\ &= 30 - \sqrt{(30)^2 - (10)^2} \\ &= 1.7157 \text{ ft} \end{aligned}$$

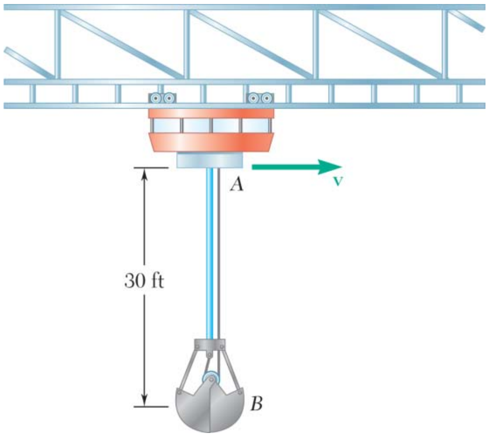


Principle of work and energy: $T_1 + U_{1\to 2} = T_2$

$$\frac{1}{2}mv^2 - mgh = 0$$

$$v^2 = 2gh = (2)(32.2 \text{ ft/s}^2)(1.7157 \text{ ft}) = 110.49 \text{ ft}^2/\text{s}^2$$

$v = 10.51$ ft/s ◀



PROBLEM 13.6

In an ore-mixing operation, a bucket full of ore is suspended from a traveling crane which moves along a stationary bridge. The crane is traveling at a speed of 10 ft/s when it is brought to a sudden stop. Determine the maximum horizontal distance through which the bucket will swing.

SOLUTION

Let position ① be the position with bucket *B* directly below *A*, and position ② be that of maximum swing where the horizontal distance is *d*. Let *L* be the length *AB*.

Kinetic energies: $$T_1 = \frac{1}{2}mv^2, \; T_2 = 0$$

Work of the weight: $$U_{1\to 2} = -Wh = -mgh$$

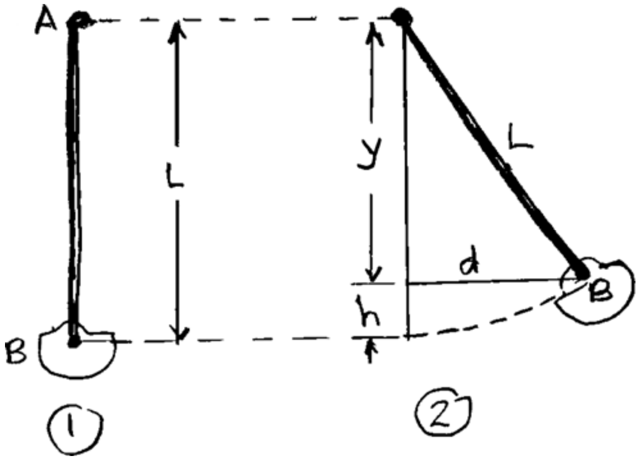
where *h* is the vertical projection of position ② above position ①.

Principle of work and energy: $$T_1 + U_{1\to 2} = T_2$$

$$\frac{1}{2}mv^2 - mgh = 0$$

$$h = \frac{v^2}{2g} = \frac{(10\text{ ft/s})^2}{(2)(32.2\text{ ft/s}^2)} = 1.5528\text{ ft}$$

From geometry (see figure),



$$\begin{aligned} d &= \sqrt{L^2 - y^2} \\ &= \sqrt{L^2 - (L-h)^2} \\ &= \sqrt{(30)^2 - (30-1.5528)^2} \\ &= 9.53\text{ ft} \end{aligned}$$

$d = 9.53$ ft ◀

PROBLEM 13.7

Determine the maximum theoretical speed that may be achieved over a distance of 110 m by a car starting from rest assuming there is no slipping. The coefficient of static friction between the tires and pavement is 0.75, and 60 percent of the weight of the car is distributed over its front wheels and 40 percent over its rear wheels. Assume (*a*) front-wheel drive, (*b*) rear-wheel drive.

SOLUTION

Let W be the weight and m the mass. $W = mg$

(*a*) *Front wheel drive*: $N = 0.60W = 0.60mg$

$\mu_s = 0.75$

Maximum friction force without slipping:

$$F = \mu_s N = (0.75)(0.60W) = 0.45mg$$

$$U_{1\to 2} = Fd = 0.45mgd$$

$$T_1 = 0, \qquad T_2 = \frac{1}{2}mv_2^2$$

Principle of work and energy: $T_1 + U_{1\to 2} = T_2$

$$0 + 0.45mgd = \frac{1}{2}mv_2^2$$

$$v_2^2 = (2)(0.45gd) = (2)(0.45)(9.81\text{ m/s}^2)(110\text{ m}) = 971.19\text{ m}^2/\text{s}^2$$

$v_2 = 31.164$ m/s $\qquad v_2 = 112.2$ km/h ◀

(*b*) *Rear wheel drive*: $N = 0.40W = 0.40mg$

$\mu_s = 0.75$

Maximum friction force without slipping:

$$F = \mu_s N = (0.75)(0.40W) = 0.30mg$$

$$U_{1\to 2} = Fd = 0.30mgd$$

$$T_1 = 0, \qquad T_2 = \frac{1}{2}mv_2^2$$

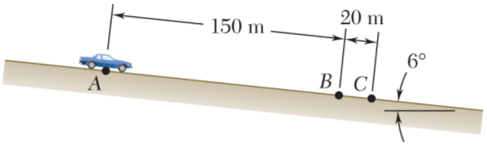
Principle of work and energy: $T_1 + U_{1\to 2} = T_2$

$$0 + 0.30mgd = \frac{1}{2}mv_2^2$$

$$v_2^2 = (2)(0.30)gd = (2)(0.30)(9.81\text{ m/s}^2)(110\text{ m}) = 647.46\text{ m}^2/\text{s}^2$$

$v_2 = 25.445$ m/s $\qquad v_2 = 91.6$ km/h ◀

Note: The car is treated as a particle in this problem. The weight distribution is assumed to be the same for static and dynamic conditions. Compare with sample Problem 16.1 where the vehicle is treated as a rigid body.



PROBLEM 13.8

A 2000-kg automobile starts from rest at point *A* on a 6° incline and coasts through a distance of 150 m to point *B*. The brakes are then applied, causing the automobile to come to a stop at point *C*, 20 m from *B*. Knowing that slipping is impending during the braking period and neglecting air resistance and rolling resistance, determine (*a*) the speed of the automobile at point *B*, (*b*) the coefficient of static friction between the tires and the road.

SOLUTION

Given: Automobile Weight $W = mg = (2000\text{ kg})\,(9.81)$

$$W = 19{,}620\text{ N}$$

Initial Velocity *A*, $v_A = 0\,\text{m/s}$

Incline Angle, $\alpha = 6°$

Vehicle brakes at impending slip for 20 m from *B* to *C*

$v_C = 0$

Find; speed of automobile at point *B*, v_B

Coefficient of static friction, μ

(*a*)

$$U_{A\to B} = Wh_{A\to B} - (19620\text{ N})\,(150\text{ m})\sin 6°$$

$$= 307.63\times 10^3\ \text{N}\cdot\text{m}$$

$$U_{A\to B} = T_B - T_A = \frac{1}{2}mv^2 - 0$$

$$307.63\times 10^3\ \text{N}\cdot\text{m} = \frac{1}{2}\,(2000\,\text{kg})\,v_B^2 - 0$$

$v_B = 17.54$ m/s ◀

(*b*)

$$U_{A\to C} = Wh_{A\to C} - Fd_{B\to C} = T_C - T_A = 0$$

$$d_{B\to C} = 20\text{ m} \qquad F = \mu\,\text{N}$$

Where μ = coefficient of static friction

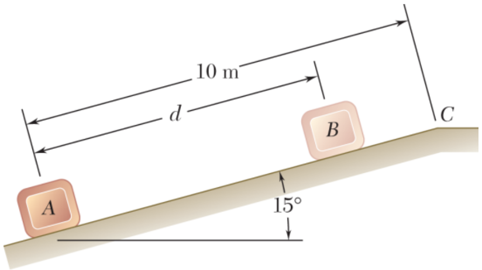
$$U_{A\to C} = (19620\,\text{N})(\sin 6°)(170\,\text{m}) - F(20\,\text{m})$$

$$F = \mu(19620\,\text{N})\,\cos 6°$$

$$(19620\,\text{N})(\sin 6°)(170\,\text{m}) - \mu(19620\,\text{N})(\cos 6°)\,(20\,\text{m}) = 0$$

$$\mu = \frac{170}{20}\tan 6° = 0.893$$

$\mu = 0.893$ ◀



PROBLEM 13.9

A package is projected up a 15° incline at *A* with an initial velocity of 8 m/s. Knowing that the coefficient of kinetic friction between the package and the incline is 0.12, determine (*a*) the maximum distance *d* that the package will move up the incline, (*b*) the velocity of the package as it returns to its original position.

SOLUTION

(*a*) Up the plane from *A* to *B*:

$$T_A = \frac{1}{2}mv_A^2 = \frac{1}{2}\frac{W}{g}(8\text{ m/s})^2 = 32\frac{W}{g} \qquad T_B = 0$$

$$U_{A-B} = (-W\ \sin 15° - F)d \qquad F = \mu_k N = 0.12\,\text{N}$$

$$\nwarrow \Sigma F = 0 \quad N - W\cos 15° = 0 \quad N = W\cos 15°$$

$$U_{A-B} = -W(\sin 15° + 0.12\cos 15°)d = -Wd(0.3747)$$

$$T_A + U_{A-B} = T_B\text{:} \quad 32\frac{W}{g} - Wd(0.3743) = 0$$

$$d = \frac{32}{(9.81)(0.3747)}$$

$d = 8.70$ m ◀

(*b*) Down the plane from *B* to *A*: (*F* reverses direction)

$$T_A = \frac{1}{2}\frac{W}{g}v_A^2 \qquad T_B = 0 \qquad d = 8.71\text{ m/s}$$

$$U_{B-A} = (W\ \sin 15° - F)d$$

$$= W(\sin 15° - 0.12\cos 15°)(8.70\text{ m/s})$$

$$U_{B-A} = 1.245W$$

$$T_B + U_{B-A} = T_A \quad 0 + 1.245W = \frac{1}{2}\frac{W}{g}v_A^2$$

$$v_A^2 = (2)(9.81)(1.245)$$

$$= 24.43$$

$$v_A = 4.94\text{ m/s}$$

$\mathbf{v}_A = 4.94$ m/s $\swarrow$ 15° ◀

PROBLEM 13.10

A 1.4 kg model rocket is launched vertically from rest with a constant thrust of 25 N until the rocket reaches an altitude of 15 m and the thrust ends. Neglecting air resistance, determine (*a*) the speed of the rocket when the thrust ends, (*b*) the maximum height reached by the rocket, (*c*) the speed of the rocket when it returns to the ground.

SOLUTION

Weight: $W = mg = (1.4)(9.81) = 13.734 \text{ N}$

(*a*) First stage: $T_1 = 0$

$$U_{1\to 2} = (25 - 13.734)(15) = 169.0 \text{ N}\cdot\text{m}$$

$$T_1 + U_{1\to 2} = T_2$$

$$T_2 = \frac{1}{2}mv^2 = U_{1\to 2} = 169.0 \text{ N}\cdot\text{m}$$

$$v_2 = \sqrt{\frac{2U_{1\to 2}}{m}} = \sqrt{\frac{(2)(169.0)}{1.4}}$$

$v_2 = 15.54 \text{ m/s}$ ◀

(*b*) Unpowered flight to maximum height h:

$$T_2 = 169.0 \text{ N}\cdot\text{m} \qquad T_3 = 0$$

$$U_{2\to 3} = -W(h - 15)$$

$$T_2 + U_{2\to 3} = T_3$$

$$W(h-15) = T_2$$

$$h - 15 = \frac{T_2}{W} = \frac{169.0}{13.734}$$

$h = 27.3 \text{ m}$ ◀

(*c*) Falling from maximum height:

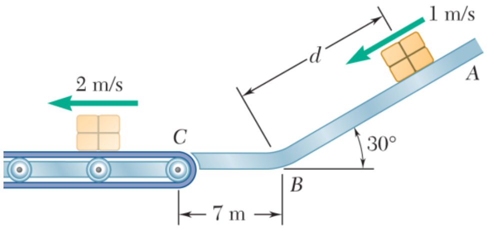
$$T_3 = 0 \qquad T_4 = \frac{1}{2}mv_4^2$$

$$U_{3\to 4} = Wh = mgh$$

$$T_3 = U_{3\to 4} = T_4: \qquad 0 + mgh = \frac{1}{2}mv_4^2$$

$$v_4^2 = 2\,gh = (2)(9.81 \text{ m/s}^2)(27.3 \text{ m}) = 535.6 \text{ m}^2/\text{s}^2$$

$v_4 = 23.1 \text{ m/s}$ ◀



PROBLEM 13.11

Packages are thrown down an incline at *A* with a velocity of 1 m/s. The packages slide along the surface *ABC* to a conveyor belt which moves with a velocity of 2 m/s. Knowing that $\mu_k = 0.25$ between the packages and the surface *ABC*, determine the distance *d* if the packages are to arrive at *C* with a velocity of 2 m/s.

SOLUTION

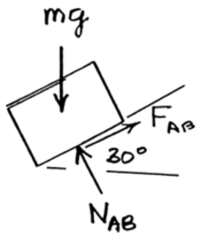
On incline *AB*:

$$N_{AB} = mg\cos 30°$$

$$F_{AB} = \mu_k N_{AB} = 0.25\,mg\,\cos 30°$$

$$U_{A\to B} = mgd\sin 30° - F_{AB}\,d$$

$$= mgd(\sin 30° - \mu_k\cos 30°)$$

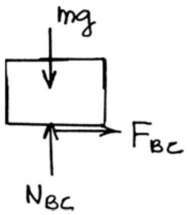


On level surface *BC*:

$$N_{BC} = mg \qquad x_{BC} = 7\text{ m}$$

$$F_{BC} = \mu_k mg$$

$$U_{B\to C} = -\mu_k mg\,x_{BC}$$



At *A*,

$$T_A = \frac{1}{2}mv_A^2 \quad\text{and}\quad v_A = 1\text{ m/s}$$

At *C*,

$$T_C = \frac{1}{2}mv_C^2 \quad\text{and}\quad v_C = 2\text{ m/s}$$

Assume that no energy is lost at the corner *B*.

Work and energy.

$$T_A + U_{A\to B} + U_{B\to C} = T_C$$

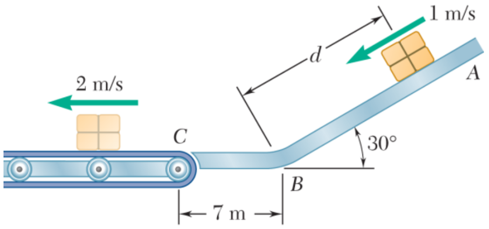
$$\frac{1}{2}mv_A^2 + mgd(\sin 30° - \mu_k\cos 30°) - \mu_k mg\,x_{BC} = \frac{1}{2}mv_0^2$$

Dividing by *m* and solving for *d*,

$$d = \frac{\left[v_C^2/2g + \mu_k x_{BC} - v_A^2/2g\right]}{(\sin 30° - \mu_k\cos 30°)}$$

$$= \frac{(2)^2/(2)(9.81) + (0.25)(7) - (1)^2/(2)(9.81)}{\sin 30° - 0.25\cos 30°}$$

$d = 6.71$ m ◀



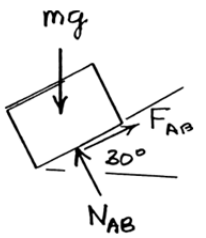
PROBLEM 13.12

Packages are thrown down an incline at *A* with a velocity of 1 m/s. The packages slide along the surface *ABC* to a conveyor belt which moves with a velocity of 2 m/s. Knowing that $d = 7.5 \text{ m}$ and $\mu_k = 0.25$ between the packages and all surfaces, determine (*a*) the speed of the package at *C*, (*b*) the distance a package will slide on the conveyor belt before it comes to rest relative to the belt.

SOLUTION

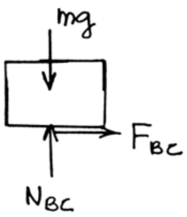
(*a*) On incline *AB*:

$$\begin{aligned} N_{AB} &= mg\cos 30^\circ \\ F_{AB} &= \mu_k N_{AB} = 0.25\,mg\cos 30^\circ \\ U_{A\to B} &= mgd\sin 30^\circ - F_{AB}\,d \\ &= mgd(\sin 30^\circ - \mu_k \cos 30^\circ) \end{aligned}$$



On level surface *BC*:

$$\begin{aligned} N_{BC} &= mg \qquad x_{BC} = 7 \text{ m} \\ F_{BC} &= \mu_k mg \\ U_{B\to C} &= -\mu_k mg\,x_{BC} \end{aligned}$$



At *A*, $T_A = \frac{1}{2}mv_A^2$ and $v_A = 1 \text{ m/s}$

At *C*, $T_C = \frac{1}{2}mv_C^2$ and $v_C = 2 \text{ m/s}$

Assume that no energy is lost at the corner *B*.

Work and energy. $T_A + U_{A\to B} + U_{B\to C} = T_C$

$$\frac{1}{2}mv_A^2 + mgd(\sin 30^\circ - \mu_k\cos 30^\circ) - \mu_k mg\,x_{BC} = \frac{1}{2}mv_0^2$$

Solving for v_C^2,

$$\begin{aligned} v_C^2 &= v_A^2 + 2gd(\sin 30^\circ - \mu_k\cos 30^\circ) - 2\mu_k g\,x_{BC} \\ &= (1)^2 + (2)(9.81)(7.5)(\sin 30^\circ - 0.25\cos 30^\circ) - (2)(0.25)(9.81)(7) \\ &= 8.3811 \text{ m}^2/\text{s}^2 \end{aligned}$$

$v_C = 2.90 \text{ m/s}$ ◀

(*b*) Box on belt: Let x_{belt} be the distance moves by a package as it slides on the belt.

$$+\uparrow \Sigma F_y = ma_y \qquad N - mg = 0 \qquad N = mg$$

$$F_x = \mu_k N = \mu_k mg$$

At the end of sliding, $v = v_{\text{belt}} = 2 \text{ m/s}$

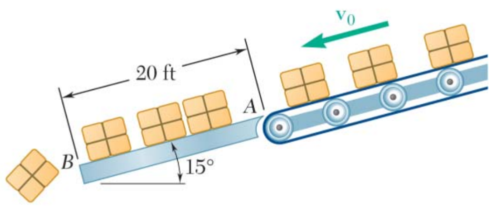
PROBLEM 13.12 (Continued)

Principle of work and energy:

$$\frac{1}{2}mv_C^2 - \mu_k mg\,x_{\text{belt}} = \frac{1}{2}mv_{\text{belt}}^2$$

$$x_{\text{belt}} = \frac{v_C^2 - v_{\text{belt}}^2}{2\,\mu_k g}$$

$$= \frac{8.3811 - (2)^2}{(2)(0.25)(9.81)} \qquad x_{\text{belt}} = 0.893\text{ m} ◀$$

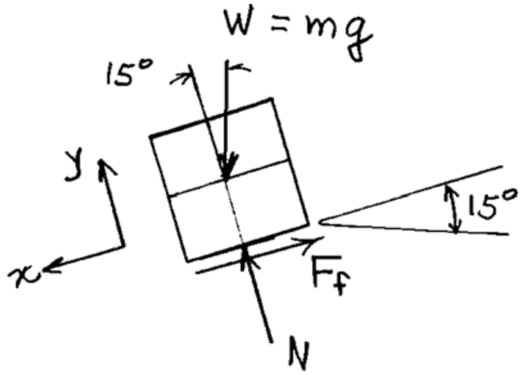


PROBLEM 13.13

Boxes are transported by a conveyor belt with a velocity $\mathbf{v}_0$ to a fixed incline at A where they slide and eventually fall off at B. Knowing that $\mu_k = 0.40$, determine the velocity of the conveyor belt if the boxes leave the incline at B with a velocity of 8 ft/s.

SOLUTION

Forces when box is on AB.



$$\Sigma F_y = 0: \quad N - W\cos 15° = 0$$

$$N = W\cos 15°$$

Box is sliding on AB.

$$F_f = \mu_k N = \mu_k W\cos 15°$$

Distance $\quad AB = d = 20$ ft

Work of gravity force: $\quad (U_{A-B})_g = Wd\sin 15°$

Work of friction force: $\quad -F_f d = -\mu_k Wd\cos 15°$

Total work $\quad U_{A\to B} = Wd(\sin 15° - \mu_k \sin 15°)$

Kinetic energy:

$$T_A = \frac{1}{2}\frac{W}{g}v_0^2$$

$$T_B = \frac{1}{2}\frac{W}{g}v_B^2$$

Principle of work and energy: $\quad T_A + U_{A\to B} = T_B$

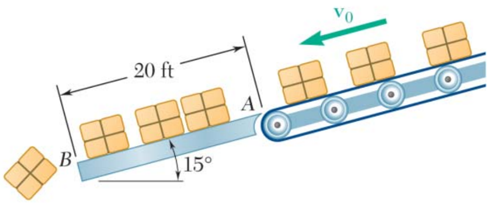
$$\frac{1}{2}\frac{W}{g}v_0^2 + Wd(\sin 15° - \mu_k \cos 15°) = \frac{1}{2}\frac{W}{g}v_B^2$$

$$v_0^2 = v_B^2 - 2gd(\sin 15° - \mu_k \cos 15°)$$

$$= (8)^2 - (2)(32.2)(20)[\sin 15° - (0.40)(\cos 15°)]$$

$$= 228.29 \text{ ft}^2/\text{s}^2$$

$\mathbf{v}_0 = 15.11$ ft/s ↙ 15° ◀

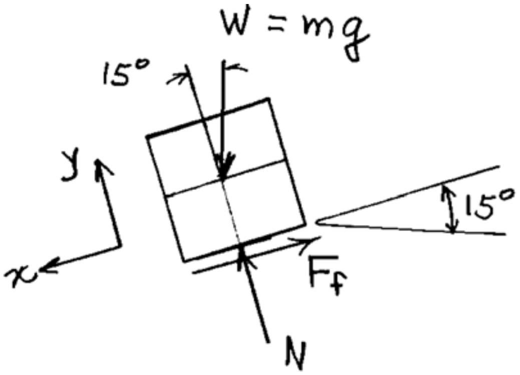


PROBLEM 13.14

Boxes are transported by a conveyor belt with a velocity $\mathbf{v}_0$ to a fixed incline at *A* where they slide and eventually fall off at *B*. Knowing that $\mu_k = 0.40$, determine the velocity of the conveyor belt if the boxes are to have zero velocity at *B*.

SOLUTION

Forces when box is on *AB*.



$$\Sigma F_y = 0: \quad N - W\cos 15° = 0$$

$$N = W\cos 15°$$

Box is sliding on AB.

$$F_f = \mu_k N = \mu_k W\cos 15°$$

Distance $\quad AB = d = 20 \text{ ft}$

Work of gravity force: $\quad (U_{A-B})_g = Wd\sin 15°$

Work of friction force: $\quad -F_f d = -\mu_k Wd\cos 15°$

Total work $\quad U_{A-B} = Wd(\sin 15° - \mu_k\cos 15°)$

Kinetic energy: $\quad T_A = \frac{1}{2}\frac{W}{g}v_0^2$

$$T_B = \frac{1}{2}\frac{W}{g}v_B^2$$

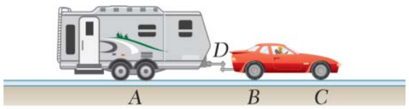
Principle of work and energy: $\quad T_A + U_{A-B} = T_B$

$$\frac{1}{2}\frac{W}{g}v_0^2 + Wd(\sin 15° - \mu_k\cos 15°) = \frac{1}{2}\frac{W}{g}v_B^2$$

$$\begin{aligned} v_0^2 &= v_B^2 - 2gd(\sin 15° - \mu_k\cos 15°) \\ &= 0 - (2)(32.2)(20)[\sin 15° - (0.40)(\cos 15°)] \\ &= 164.29 \text{ ft}^2/\text{s}^2 \end{aligned}$$

$\mathbf{v}_0 = 12.81 \text{ ft/s} \nearrow 15°$ ◀

PROBLEM 13.15



A 1200-kg trailer is hitched to a 1400-kg car. The car and trailer are traveling at 72 km/h when the driver applies the brakes on both the car and the trailer. Knowing that the braking forces exerted on the car and the trailer are 5000 N and 4000 N, respectively, determine (*a*) the distance traveled by the car and trailer before they come to a stop, (*b*) the horizontal component of the force exerted by the trailer hitch on the car.

SOLUTION

Let position 1 be the initial state at velocity $v_1 = 72\text{ km/h} = 20\text{ m/s}$ and position 2 be at the end of braking $(v_2 = 0)$. The braking forces and $F_C = 5000\text{ N}$ for the car and 4000 N for the trailer.

(*a*) Car and trailer system. (d = braking distance)

$$T_1 = \frac{1}{2}(m_C + m_T)v_1^2 \qquad T_2 = 0$$

$$U_{1\to 2} = -(F_C + F_T)d$$

$$T_1 + U_{1\to 2} = T_2$$

$$\frac{1}{2}(m_C + m_T)v_1^2 - (F_C + F_T)d = 0$$

$$d = \frac{(m_C + m_T)v_1^2}{2(F_C + F_T)} = \frac{(2600)(20)^2}{(2)(9000)} = 57.778 \qquad d = 57.8\text{ m} ◀$$

(*b*) Car considered separately.

Let H be the horizontal pushing force that the trailer exerts on the car through the hitch.

$$T_1 = \frac{1}{2}m_C v_1^2 \qquad T_2 = 0$$

$$U_{1\to 2} = (H - F_C)d$$

$$T_1 + U_{1\to 2} = T_2$$

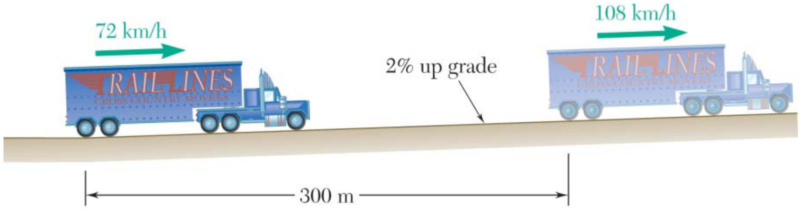
$$\frac{1}{2}m_C v_1^2 + (H - F_C)d = 0$$

$$H = F_C - \frac{m_C v_1^2}{2d} = 5000 - \frac{(1400)(20)^2}{(2)(57.778)}$$

Trailer hitch force on car: $\mathbf{H} = 154\text{ N} \longrightarrow$ ◀

PROBLEM 13.16

A trailer truck enters a 2 percent uphill grade traveling at 72 km/h and reaches a speed of 108 km/h in 300 m. The cab has a mass of 1800 kg and the trailer 5400 kg. Determine (*a*) the average force at the wheels of the cab, (*b*) the average force in the coupling between the cab and the trailer.



SOLUTION

Initial speed: $v_1 = 72 \text{ km/h} = 20 \text{ m/s}$

Final speed: $v_2 = 108 \text{ km/h} = 30 \text{ m/s}$

Vertical rise: $h = (0.02)(300) = 6.00 \text{ m}$

Distance traveled: $d = 300 \text{ m}$

(*a*) Traction force. Use cab and trailer as a free body.

$m = 1800 + 5400 = 7200 \text{ kg}$ $\qquad W = mg = (7200)(9.81) = 70.632 \times 10^3 \text{ N}$

Work and energy: $T_1 + U_{1\to 2} = T_2 \qquad \frac{1}{2}mv_1^2 - Wh + F_t d = \frac{1}{2}mv_2^2$

$$F_t = \frac{1}{d}\left[\frac{1}{2}mv_1^2 + Wh - mv_1^2\right] = \frac{1}{300}\left[\frac{1}{2}(7200)(30)^2 + (70.632\times 10^3)(6.00) - \frac{1}{2}(7200)(20)^2\right]$$

$= 7.4126 \times 10^3 \text{ N}$ $\qquad F_t = 7.41 \text{ kN}$ ◀

(*b*) Coupling force F_c. Use the trailer alone as a free body.

$m = 5400 \text{ kg}$ $\qquad W = mg = (5400)(9.81) = 52.974 \times 10^3 \text{ N}$

Assume that the tangential force at the trailer wheels is zero.

Work and energy: $T_1 + U_{1\to 2} = T_2 \qquad \frac{1}{2}mv_1^2 - Wh + F_c d = \frac{1}{2}mv_2^2$

The plus sign before F_c means that we have assumed that the coupling is in tension.

$$F_c = \frac{1}{d}\left[\frac{1}{2}mv_2^2 + Wh - \frac{1}{2}mv_1^2\right] = \frac{1}{300}\left[\frac{1}{2}(5400)(30)^2 + (52.974\times 10^3)(6.00) - \frac{1}{2}(5400)(20)^2\right]$$

$= 5.5595 \times 10^3 \text{ N}$ $\qquad F_c = 5.56 \text{ kN (tension)}$ ◀

PROBLEM 13.19

Blocks A and B weigh 25 lbs and 10 lbs, respectively, and they are both at a height 6 ft above the ground when the system is released from rest. Just before hitting the ground block A is moving at a speed of 9 ft/s. Determine (*a*) the amount of energy dissipated in friction by the pulley, (*b*) the tension in each portion of the cord during the motion.

SOLUTION

By constraint of the cable block B moves up a distance h when block A moves down a distance h. $(h = 6 \text{ ft})$ Their speeds are equal.

Let F_A and F_B be the tensions on the A and B sides, respectively, of the pulley.

Masses:

$$M_A = \frac{W_A}{g} = \frac{25}{32.2} = 0.7764 \text{ lb} \cdot \text{s}^2/\text{ft}$$

$$M_B = \frac{W_B}{g} = \frac{10}{32.2} = 0.31056 \text{ lb} \cdot \text{s}^2/\text{ft}$$

Let position 1 be the initial position with both blocks a distance h above the ground and position 2 be just before block A hits the ground.

Kinetic energies:

$$(T_1)_A = 0, \qquad (T_1)_B = 0$$

$$(T_2)_A = \frac{1}{2}m_A v^2 = \frac{1}{2}(0.7764)(9)^2 = 31.444 \text{ ft} \cdot \text{lb}$$

$$(T_2)_B = \frac{1}{2}m_B v^2 = \frac{1}{2}(0.31056)(9)^2 = 12.578 \text{ ft} \cdot \text{lb}$$

Principle of work and energy: $T_1 + U_{1\to 2} = T_2$

Block A:

$$U_{1\to 2} = (W_A - F_A)h$$

$$0 + (25 - F_A)(6) = 31.444 \qquad F_A = 19.759 \text{ lb}$$

Block B:

$$U_{1\to 2} = (F_B - W_B)h$$

$$0 + (F_B - 10)(6) = 12.578 \qquad F_B = 12.096 \text{ lb}$$

At the pulley F_A moves a distance h down, and F_B moves a distance h up. The work done is

$$U_{1\to 2} = (F_A - F_B)h = (19.759 - 12.096)(6) = 46.0 \text{ ft} \cdot \text{lb}$$

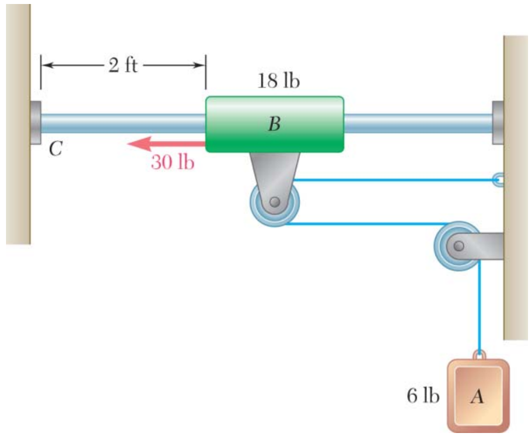
PROBLEM 13.19 (Continued)

Since the pulley is assumed to be massless, it cannot acquire kinetic energy; hence,

(*a*) Energy dissipated by the pulley: $E_p = 46.0 \text{ ft} \cdot \text{lb}$ ◀

(b) Tension in each portion of the cord: $A: 19.76 \text{ lb}$ ◀

$B: 12.10 \text{ lb}$ ◀



PROBLEM 13.20

The system shown is at rest when a constant 30 lb force is applied to collar *B*. (*a*) If the force acts through the entire motion, determine the speed of collar *B* as it strikes the support at *C*. (*b*) After what distance *d* should the 30 lb force be removed if the collar is to reach support *C* with zero velocity?

SOLUTION

Let *F* be the cable tension and v_B be the velocity of collar *B* when it strikes the support. Consider the collar *B*. Its movement is horizontal so only horizontal forces acting on *B* do work. Let *d* be the distance through which the 30 lb applied force moves.

$$(T_1)_B + (U_{1\to 2})_B = (T_2)_B$$

$$0 + 30d - (2F)(2) = \frac{1}{2}\frac{18}{32.2}v_B^2$$

$$30d - 4F = 0.27950 v_B^2 \qquad (1)$$

Now consider the weight *A*. When the collar moves 2 ft to the left, the weight moves 4 ft up, since the cable length is constant. Also, $v_A = 2v_B$.

$$(T_1)_A + (U_{1-2})_A = (T_2)_B$$

$$0 + (F - W_A)(4) = \frac{1}{2}\frac{W_A}{g}v_A^2$$

$$4F - (6)(4) = \frac{1}{2}\frac{6}{32.2}(2v_B)^2$$

$$4F - 24 = 0.37267\, v_B^2 \qquad (2)$$

Add Eqs. (1) and (2) to eliminate *F*.

$$30d - 24 = 0.65217 v_B^2 \qquad (3)$$

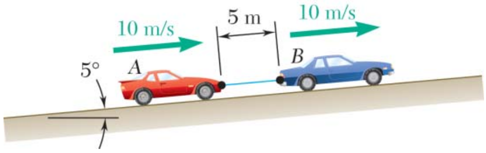
(*a*) Case *a*: $d = 2$ ft, $v_B = ?$

$$(30)(2) - (24) = 0.65217 v_B^2$$

$$v_B^2 = 55.2 \text{ ft}^2/\text{s}^2 \qquad v_B = 7.43 \text{ ft/s} \blacktriangleleft$$

(*b*) Case *b*: $d = ?$, $v_B = 0.$

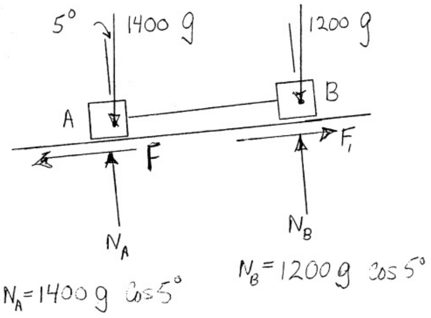
$$30d - 24 = 0 \qquad d = 0.800 \text{ ft} \blacktriangleleft$$



PROBLEM 13.21

Car *B* is towing car *A* at a constant speed of 10 m/s on an uphill grade when the brakes of car *A* are fully applied causing all four wheels to skid. The driver of car *B* does not change the throttle setting or change gears. The masses of the cars *A* and *B* are 1400 kg and 1200 kg, respectively, and the coefficient of kinetic friction is 0.8. Neglecting air resistance and rolling resistance, determine (*a*) the distance traveled by the cars before they come to a stop, (*b*) the tension in the cable.

SOLUTION



$F = 0.8N_A$

Given: Car *B* tows car *A* at 10 m/s uphill.

Car *A* brakes so 4 wheels skid. $\mu_k = 0.8$

Car *B* continues in same gear and throttle setting.

Find: (*a*) Distance *d*, traveled to stop

(*b*) Tension in cable

(*a*) F_1 = traction force (from equilibrium)

$$F_1 = (1400g)\sin 5° + (1200g)\sin 5°$$

$$= 2600(9.81)\sin 5°$$

For system: $A + B$

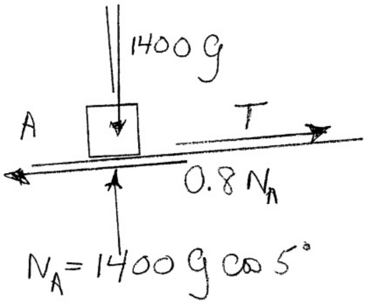
$$U_{1-2} = [(F_1 - 1400g\sin 5° - 1200g\sin 5°) - F]d$$

$$= T_2 - T_1 = 0 - \frac{1}{2}m_{A+B}v^2 = -\frac{1}{2}(2600)(10)^2$$

Since $(F_1 - 1400g\sin 5° - 1200g\sin 5°) = 0$

$$-Fd = -0.8[1400(9.81)\cos 5°]d = -130{,}000\ \text{N}\cdot\text{m}$$

$d = 11.88$ m ◀



(*b*) Cable tension, *T*

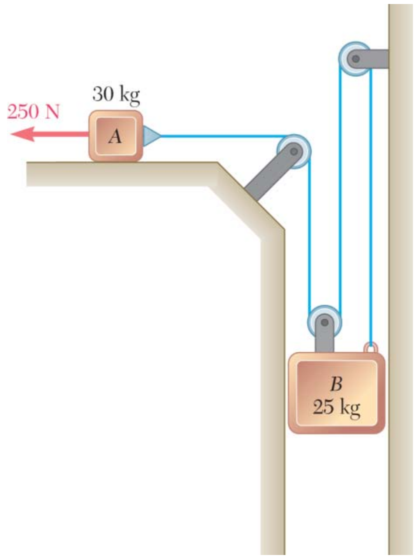
$$U_{1-2} = [T - 0.8N_A](11.88) = T_2 - T_1$$

$$(T - 0.8(1400)(9.81)\cos 5°)11.88 = -\frac{1400}{2}(10)^2$$

$$(T - 10945) = -5892$$

$$= 5.053\ \text{kN}$$

$T = 5.05$ kN ◀

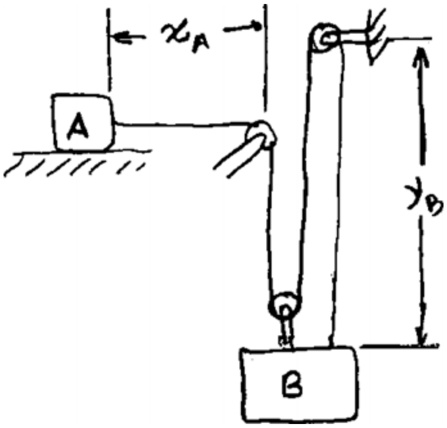


PROBLEM 13.22

The system shown is at rest when a constant 250-N force is applied to block *A*. Neglecting the masses of the pulleys and the effect of friction in the pulleys and between block *A* and the horizontal surface, determine (*a*) the velocity of block *B* after block *A* has moved 2 m, (*b*) the tension in the cable.

SOLUTION

Constraint of cable:



$$x_A + 3y_B = \text{constant}$$

$$\Delta x_A + 3\Delta y_B = 0$$

$$v_A + 3v_B = 0$$

Let *F* be the tension in the cable.

Block *A*: $m_A = 30$ kg, $P = 250$ N, $(T_1)_A = 0$

$$(T_1)_A + (U_{1\to 2})_A = (T_2)_A$$

$$0 + (P - F)(\Delta x_A) = \frac{1}{2}m_A v_A^2$$

$$0 + (250 - F)(2) = \frac{1}{2}(30)(3v_B)^2$$

$$500 - 2F = 135v_B^2 \quad (1)$$

Block *B*: $m_B = 25$ kg, $W_B = m_B g = 245.25$ N

$$(T_1)_B + (U_{1\to 2})_B = (T_2)_B$$

$$0 + (3F - W_B)(-\Delta y_B) = \frac{1}{2}m_B v_B^2$$

$$(3F) - 245.25)\left(\frac{2}{3}\right) = \frac{1}{2}(25)\,v_B^2$$

$$2F - 163.5 = 12.5\ v_B^2 \quad (2)$$

PROBLEM 13.22 (Continued)

Add Eqs. (1) and (2) to eliminate F.

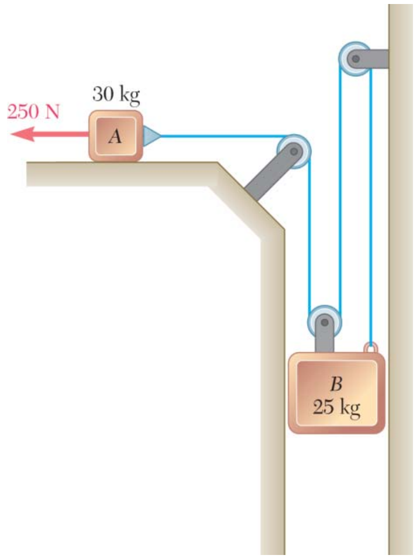
$$500 - 163.5 = 147.5 v_B^2$$

$$v_B^2 = 2.2814 \text{ m}^2/\text{s}^2$$

(a) Velocity of B. $\mathbf{v}_B = 1.510 \text{ m/s} \longleftarrow$ ◀

(b) Tension in the cable.

From Eq. (2), $2F - 163.5 = (12.5)(2.2814)$ $F = 96.0 \text{ N}$ ◀



PROBLEM 13.23

The system shown is at rest when a constant 250-N force is applied to block *A*. Neglecting the masses of the pulleys and the effect of friction in the pulleys and assuming that the coefficients of friction between block *A* and the horizontal surface are $\mu_s = 0.25$ and $\mu_k = 0.20$, determine (*a*) the velocity of block *B* after block *A* has moved 2 m, (*b*) the tension in the cable.

SOLUTION

Check the equilibrium position to see if the blocks move. Let *F* be the tension in the cable.

Block *B*: $3F - m_B g = 0$

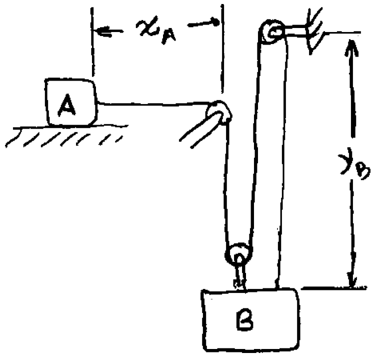
$$F = \frac{m_B g}{3} = \frac{(25)(9.81)}{3} = 81.75 \text{ N}$$

Block *A*: $+\uparrow \Sigma F_y = 0$: $N_A - m_A g = 0$

$$N_A = m_A g = (30)(9.81) = 294.3 \text{ N}$$

$\overset{+}{\longleftarrow} \Sigma F_x = 0$: $250 - F_A - F = 0$

$$F_A = 250 - 81.75 = 168.25 \text{ N}$$



Available static friction force: $\mu_s N_A = (0.25)(294.3) = 73.57 \text{ N}$

Since $F_A > \mu_s N_A$, the blocks move.

The friction force, F_A, during sliding is

$$F_A = \mu_k N_A = (0.20)(294.3) = 58.86 \text{ N}$$

Constraint of cable:

$$x_A + 3y_B = \text{constant}$$
$$\Delta x_A + 3\Delta y_B = 0$$
$$v_A + 3v_B = 0$$

PROBLEM 13.23 (Continued)

Block *A*: $m_A = 30\text{ kg},\quad P = 250\text{ N},\quad (T_1)_A = 0.$

$$(T_1)_A + (U_{1\to 2})_A = (T_2)_A$$

$$0 + (P - F_A - F)(\Delta x_A) = \frac{1}{2} m_A v_A^2$$

$$0 + (250 - 58.86 - F)(2) = \frac{1}{2}(30)(3v_B)^2$$

$$382.28 - 2F = 135 v_B^2 \qquad (1)$$

Block *B*: $M_B = 25\text{ kg},\quad W_B = m_B g = 245.25\text{ N}$

$$(T_1)_B + (U_{1\to 2})_B = (T_2)_B$$

$$0 + (3F - W_B)(-\Delta y_B) = \frac{1}{2} m_B v_B^2$$

$$(3F - 245.25)\left(\frac{2}{3}\right) = \frac{1}{2}(25) v_B^2$$

$$2F - 163.5 = 12.5 v_B^2 \qquad (2)$$

Add Eqs. (1) and (2) to eliminate *F*.

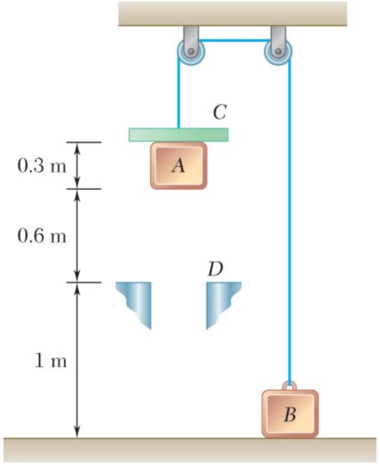
$$382.28 - 163.5 = 147.5 v_B^2$$

$$v_B^2 = 1.48325\text{ m}^2/\text{s}^2$$

(*a*) Velocity of *B*: $\mathbf{v}_B = 1.218\text{ m/s} \longleftarrow$ ◀

(*b*) Tension in the cable:

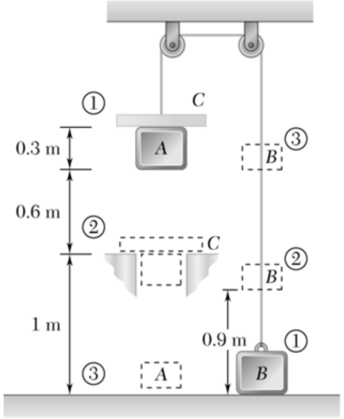
From Eq. (2), $2F - 163.5 = (12.5)(1.48325)$ $F = 91.0\text{ N}$ ◀



PROBLEM 13.24

Two blocks *A* and *B*, of mass 4 kg and 5 kg, respectively, are connected by a cord which passes over pulleys as shown. A 3 kg collar *C* is placed on block *A* and the system is released from rest. After the blocks have moved 0.9 m, collar *C* is removed and blocks *A* and *B* continue to move. Determine the speed of block *A* just before it strikes the ground.

SOLUTION



Position ① to Position ②. $v_1 = 0 \quad T_1 = 0$

At ② before *C* is removed from the system

$$T_2 = \frac{1}{2}(m_A + m_B + m_C)v_2^2 = \frac{1}{2}(12\text{ kg})v_2^2 = 6v_2^2$$

$$U_{1-2} = (m_A + m_C - m_B)g(0.9\text{ m})$$

$$U_{1-2} = (4 + 3 - 5)(g)(0.9\text{ m}) = (2\text{ kg})(9.81\text{ m/s}^2)(0.9\text{ m})$$

$$U_{1-2} = 17.658\text{ J}$$

$$T_1 + U_{1-2} = T_2:$$

$$0 + 17.658 = 6v_2^2 \qquad v_2^2 = 2.943$$

At Position ②, collar *C* is removed from the system.

Position ② to Position ③. $T_2' = \frac{1}{2}(m_A + m_B)v_2^2 = \left(\frac{9}{2}\text{ kg}\right)(2.943) = 13.244\text{ J}$

$$T_3 = \frac{1}{2}(m_A + m_B)(v_3)^2 = \frac{9}{2}v_3^2$$

$$U_{2'-3} = (m_A - m_B)(g)(0.7\text{ m}) = (-1\text{ kg})(9.81\text{ m/s}^2)(0.7\text{ m}) = -6.867\text{ J}$$

$$T_2' + U_{2-3} = T_3$$

$$13.244 - 6.867 = 4.5v_3^2 \qquad v_3^2 = 1.417$$

$$v_A = v_3 = 1.190\text{ m/s}$$

$v_A = 1.190\text{ m/s}$ ◀

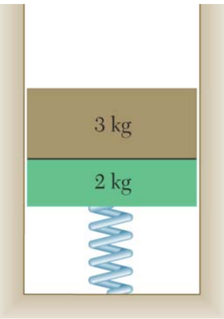
$$U_{2-3} = 47.088\text{ J}$$

$$T_2' + U_{2-3} = T_3 = 47.088 + 47.088 = 3v_3^2$$

$$v_3^2 = 31.392$$

$$v_3 = 5.6029$$

$v_3 = 5.60$ m/s ◀



PROBLEM 13.26

A 3-kg block rests on top of a 2-kg block supported by, but not attached to, a spring of constant 40 N/m. The upper block is suddenly removed. Determine (*a*) the maximum speed reached by the 2-kg block, (*b*) the maximum height reached by the 2-kg block.

SOLUTION

Call blocks A and B. $m_A = 2\text{ kg}, \quad m_B = 3\text{ kg}$

(*a*) Position 1: Block B has just been removed.

Spring force: $F_S = -(m_A + m_B)g = -kx \uparrow$

Spring stretch:

$$x_1 = -\frac{(m_A + m_B)g}{k} = -\frac{(5\text{ kg})(9.81\text{ m/s}^2)}{40\text{ N/m}} = -1.22625\text{ m}$$

Let position 2 be a later position while the spring still contacts block A.

Work of the force exerted by the spring:

$$(U_{1\to 2})_e = -\int_{x_1}^{x_2} kx\,dx$$

$$= -\frac{1}{2}kx^2\Big|_{x_1}^{x_2} = \frac{1}{2}kx_1^2 - \frac{1}{2}kx_2^2$$

$$= \frac{1}{2}(40)(-1.22625)^2 - \frac{1}{2}(40)x_2^2 = 30.074 - 20x_2^2$$

Work of the gravitational force:

$$(U_{1\to 2})_g = -m_A g(x_2 - x_1)$$

$$= -(2)(9.81)(x_2 + 1.22625) = -19.62x_2 - 24.059$$

Total work: $U_{1\to 2} = -20x_2^2 + 19.62x_2 + 6.015$

Kinetic energies: $T_1 = 0$

$$T_2 = \frac{1}{2}m_A v_2^2 = \frac{1}{2}(2)v_2^2 = v_2^2$$

Principle of work and energy: $T_1 + U_{1\to 2} = T_2$

$$0 + 20x_2^2 - 19.62x_2 + 6.015 = v_2^2$$

Speed squared:

$$v_2^2 = -20x_2^2 - 19.62x_2 + 6.015 \qquad (1)$$

At maximum speed,

$$\frac{dv_2}{dx_2} = 0$$

PROBLEM 13.26 (Continued)

Differentiating Eq. (1), and setting equal to zero,

$$2v_2 \frac{dv_2}{dx} = -40x_2 = -19.62 = 0$$

$$x_2 = -\frac{19.62}{40} = -0.4905 \text{ m}$$

Substituting into Eq. (1), $v_2^2 = -(20)(-0.4905)^2 - (19.62)(-0.4905) + 6.015 = 10.827 \text{ m}^2/\text{s}^2$

Maximum speed: $v^2 = 3.29 \text{ m/s}$ ◀

(*b*) Position 3: Block *A* reaches maximum height. Assume that the block has separated from the spring. Spring force is zero at separation.

Work of the force exerted by the spring:

$$(U_{1\to 3})_e = -\int_{x_1}^{0} kxdx = \frac{1}{2}kx_1^2 = \frac{1}{2}(40)(1.22625)^2 = 30.074 \text{ J}$$

Work of the gravitational force:

$$(U_{1\to 3})_g = -m_A gh = -(2)(9.81)h = -19.62\ h$$

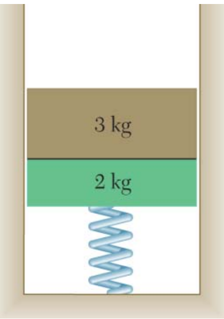
Total work: $U_{1\to 3} = 30.074 - 19.62\ h$

At maximum height, $v_3 = 0, \quad T_3 = 0$

Principle of work and energy: $T_1 + U_{1\to 3} = T_3$

$$0 + 30.074 - 19.62\ h = 0$$

Maximum height: $h = 1.533 \text{ m}$ ◀



PROBLEM 13.27

Solve Problem 13.26, assuming that the 2-kg block is attached to the spring.

PROBLEM 13.26 A 3-kg block rests on top of a 2-kg block supported by, but not attached to, a spring of constant 40 N/m. The upper block is suddenly removed. Determine (*a*) the maximum speed reached by the 2-kg block, (*b*) the maximum height reached by the 2-kg block.

SOLUTION

Call blocks *A* and *B*. $m_A = 2\text{ kg}, \quad m_B = 3\text{ kg}$

(*a*) Position 1: Block *B* has just been removed.

Spring force: $F_S = -(m_A + m_B)g = -kx_1$

Spring stretch: $x_1 = -\dfrac{(m_A + m_B)g}{k} = -\dfrac{(5\text{ kg})(9.81\text{ m/s}^2)}{40\text{ N/m}} = -1.22625\text{ m}$

Let position 2 be a later position. Note that the spring remains attached to block *A*.

Work of the force exerted by the spring: $(U_{1\to 2})_e = -\int_{x_1}^{x_2} kx dx$

$$= -\frac{1}{2}kx^2\Big|_{x_1}^{x_2} = \frac{1}{2}kx_1^2 - \frac{1}{2}kx_2^2$$

$$= \frac{1}{2}(40)(-1.22625)^2 - \frac{1}{2}(40)x_2^2 = 30.074 - 20x_2^2$$

$$x_2 = -\frac{19.62}{40} = -0.4905 \text{ m}$$

Substituting into Eq. (1), $v_2^2 = -(20)(-0.4905)^2 - (19.62)(-0.4905) + 6.015 = 10.827 \text{ m}^1/\text{s}^2$

Maximum speed: $v_2 = 3.29 \text{ m/s}$ ◀

(*b*) Maximum height occurs when $v_2 = 0$.

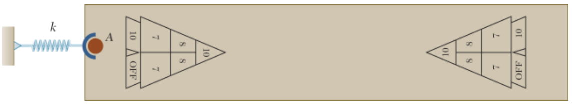
Substituting into Eq. (1), $0 = -20x_2^2 - 19.62x_2 + 6.015$

Solving the quadratic equation

$$x_2 = -1.22625 \text{ m} \quad \text{and} \quad 0.24525 \text{ m}$$

Using the larger value, $x_2 = 0.24525 \text{ m}$

Maximum height: $h = x_2 - x_1 = 0.24525 + 1.22625$ $h = 1.472 \text{ m}$ ◀



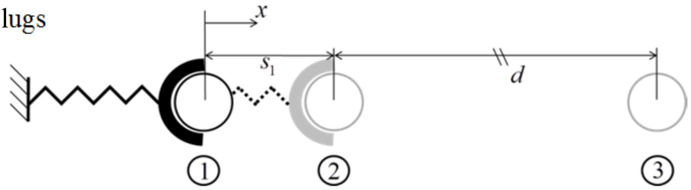
PROBLEM 13.28

People with mobility impairments can gain great health and social benefits from participating in different recreational activities. You are tasked with designing an adaptive spring-powered shuffleboard attachment that can be utilized by people who use wheelchairs. Knowing that the coefficient of kinetic friction between the 15 ounce puck *A* and the wooden surface is 0.3, the maximum spring displacement you desire is 6 inches, and that you want the puck to travel at least 30 ft/s, determine (*a*) the spring constant *k*, (*b*) how far the athlete should pull back the spring to make the puck come to rest after 34 ft.

SOLUTION

Given: $\mu_k = 0.3$

Sketch:



$$m = \frac{15\text{ oz}}{16\ \frac{\text{oz}}{\text{lbs}}} \div 32.2\text{ft/s}^2 = 0.02911\text{ slugs}$$

$$s_{1,\max} = \frac{6\text{ in}}{12\ \frac{\text{in}}{\text{ft}}} = 0.5\text{ ft}$$

$$v_{2,\max} = 30\text{ ft/s}$$

$$d_3 = 34\text{ ft}$$

(a) Find spring constant k, for maximum conditions:

$T_1 + U_{1\to 2} = T_2$ where: $T_1 = 0$ and $T_2 = \frac{1}{2}mv_{2,\max}^2$

$$U_{1\to 2} = \int_0^{s_{1,\max}} kxdx - \int_0^{s_{1,\max}} \mu_k mgdx$$

$$= \frac{1}{2}ks_{1,\max}^2 - \mu_k mgs_{1,\max}$$

$$0 + \frac{1}{2}k(0.5)^2 - 0.3(0.02911)(32.2)(0.5) = \frac{1}{2}(0.02911)(30)^2$$

$k = 105.9$ lb/ft $\qquad$ $k = 8.828$ lb/in ◀

(b) Find pull back distance, s_1 so that puck stops after d=34 ft.

$T_1 + U_{1\to 3} = T_3$ where: $T_1 = 0$ and $T_3 = 0$

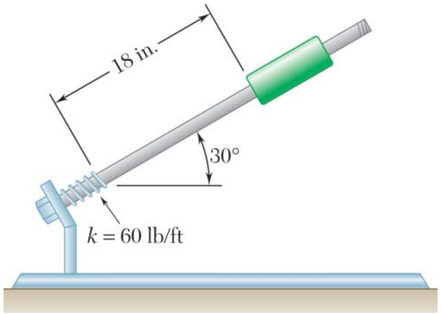
$$U_{1\to 3} = \int_0^{s_1} kxdx - \int_0^{s_1+d} \mu_k mgdx$$

$$= \frac{1}{2}ks_{1,\max}^2 - \mu_k mg(s_1 + d)$$

$$0 + \frac{1}{2}(105.9)s_1^2 - 0.3(0.02911)(32.2)(s_1 + 34) = 0$$

$$52.95s_1^2 - 0.28125s_1 - 9.5625 = 0$$

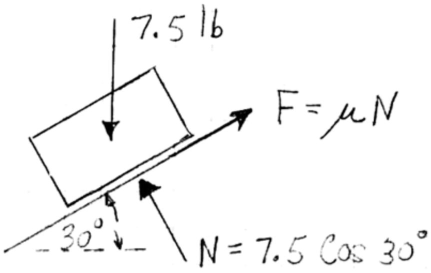
$s_1 = 0.4276$ ft or ~~$s_1 = -0.4221$ ft~~ $\qquad$ s_1=5.13 in ◀



PROBLEM 13.29

A 7.5-lb collar is released from rest in the position shown, slides down the inclined rod, and compresses the spring. The direction of motion is reversed and the collar slides up the rod. Knowing that the maximum deflection of the spring is 5 in., determine (*a*) the coefficient of kinetic friction between the collar and the rod, (*b*) the maximum speed of the collar.

SOLUTION



Position 1, initial condition

Position 2, spring deflected 5 inches

Position 3, initial contact of spring with collar

$$U_{1\to 2} = -F\underbrace{\left(\frac{18+5}{12}\right)}_{\text{(Friction)}} - \underbrace{\frac{1}{2}(60)\left(\frac{5}{12}\right)^2}_{\text{(Spring)}} + \underbrace{7.5\left(\frac{18+5}{12}\right)\sin 30°}_{\text{(Gravity)}}$$

$$T_1 = T_2 = 0, \therefore U_{1-2} = 0$$

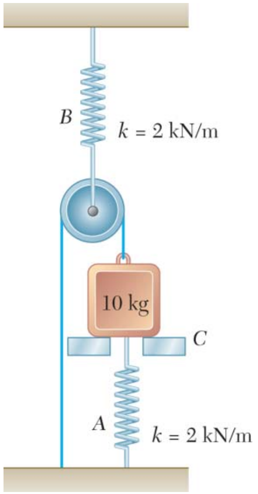
$$0 = -\mu(7.5)(0.866)\left(\frac{23}{12}\right) - \frac{1}{2}(60)\left(\frac{5}{12}\right)^2 + 7.5\left(\frac{23}{12}\right)(0.5)$$

(*a*) $\mu = 0.1590$ ◀

(*b*) Max speed occurs just before contact with the spring

$$U_{1\to 3} = -\mu(7.5)(0.866)\left(\frac{18}{12}\right) + 7.5\left(\frac{18}{12}\right)(0.5) = T_3 = \frac{1}{2}\left(\frac{7.5}{32.2}\right)v_{\max}^2$$

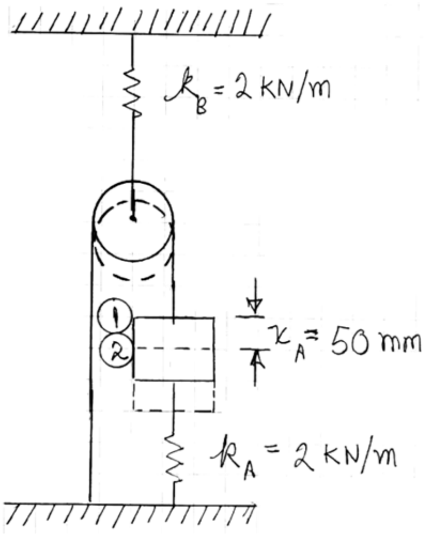
$v_{\max} = 5.92$ ft/s ◀



PROBLEM 13.30

A 10-kg block is attached to spring *A* and connected to spring *B* by a cord and pulley. The block is held in the position shown with both springs unstretched when the support is removed and the block is released with no initial velocity. Knowing that the constant of each spring is 2 kN/m, determine (*a*) the velocity of the block after it has moved down 50 mm, (*b*) the maximum velocity achieved by the block.

SOLUTION



(*a*) W = weight of the block $= 10\,(9.81) = 98.1$ N

$$x_B = \frac{1}{2}x_A$$

$$U_{1-2} = W(x_A) - \frac{1}{2}k_A(x_A)^2 - \frac{1}{2}k_B(x_B)^2$$

(Gravity) (Spring *A*) (Spring *B*)

$$U_{1-2} = (98.1\text{ N})(0.05\text{ m}) - \frac{1}{2}(2000\text{ N/m})(0.05\text{ m})^2$$

$$-\frac{1}{2}(2000\text{ N/m})(0.025\text{ m})^2$$

$$U_{1-2} = \frac{1}{2}(m)v^2 = \frac{1}{2}(10\text{ kg})v^2$$

$$4.905 - 2.5 - 0.625 = \frac{1}{2}(10)v^2$$

$v = 0.597$ m/s ◀

(*b*) Let x = distance moved down by the 10 kg block

$$U_{1-2} = W(x) - \frac{1}{2}k_A(x)^2 - \frac{1}{2}k_B\left(\frac{x}{2}\right)^2 = \frac{1}{2}(m)v^2$$

$$\frac{d}{dx}\left[\frac{1}{2}(m)v^2\right] = 0 = W - k_A(x) - \frac{k_B}{8}(2x)$$

PROBLEM 13.30 (Continued)

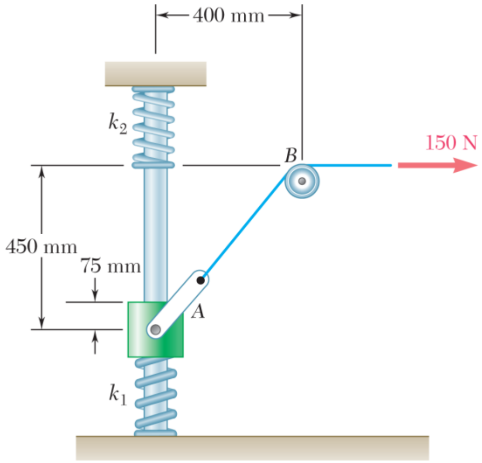
$$0 = 98.1 - 2000\,(x) - \frac{2000}{8}\,(2x) = 98.1 - (2000 + 250)x$$

$x = 0.0436$ m (43.6 mm)

For $x = 0.0436,\ U = 4.2772 - 1.9010 - 0.4752 = \frac{1}{2}(10)v^2$

$v_{\max} = 0.6166$ m/s

$v_{\max} = 0.617$ m/s ◀



PROBLEM 13.31

A 5-kg collar *A* is at rest on top of, but not attached to, a spring with stiffness k_1 = 400 N/m; when a constant 150-N force is applied to the cable. Knowing *A* has a speed of 1 m/s when the upper spring is compressed 75 mm, determine the spring stiffness k_2. Ignore friction and the mass of the pulley.

SOLUTION

Use the method of work and energy applied to the collar *A*.

$$T_1 + U_{1\to 2} = T_2$$

Since collar is initially at rest, $T_1 = 0.$

In position 2, where the upper spring is compressed 75 mm and $v_2 = 1.00$ m/s, the kinetic energy is

$$T_2 = \frac{1}{2}mv_2^2 = \frac{1}{2}(5 \text{ kg})(1.00 \text{ m/s})^2 = 2.5 \text{ J}$$

As the collar is raised from level *A* to level *B*, the work of the weight force is

$$(U_{1\to 2})_g = -mgh$$

where $m = 5$ kg, $g = 9.81$ m/s^2 and $h = 450$ mm $= 0.450$ m

Thus, $(U_{1\to 2})_g = -(5)(9.81)(0.450) = -22.0725$ J

In position 1, the force exerted by the lower spring is equal to the weight of collar *A*.

$$F_1 = mg = -(5 \text{ kg})(9.81 \text{ m/s}) = -49.05 \text{ N}$$

As the collar moves up a distance x_1, the spring force is

$$F = F_1 - k_1 x_2$$

until the collar separates from the spring at

$$x_f = \frac{F_1}{k_1} = \frac{49.05 \text{ N}}{400 \text{ N/m}} = 0.122625 \text{ m} = 122.625 \text{ mm}$$

Work of the force exerted by the lower spring:

$$(U_{1\to 2})_1 = \int_0^{x_f} (F_1 - k_1 x)dx$$

$$= F_1 x_f - \frac{1}{2}kx_f^2 = k_1 x_f^2 - \frac{1}{2}k_1 x_f^2 = \frac{1}{2}k_1 x_f^2$$

$$= \frac{1}{2}(400 \text{ N/m})(0.122625)^2 = 3.0074 \text{ J}$$

In position 2, the upper spring is compressed by $y = 75$ mm $= 0.075$ m. The work of the force exerted by this spring is

$$(U_{1\to 2})_2 = -\frac{1}{2}k_2 y^2 = -\frac{1}{2}k_2(0.075)^2 = -0.0028125 \text{ k}_2$$

Finally, we must calculate the work of the 150 N force applied to the cable. In position 1, the length *AB* is

$$(l_{AB})_1 = \sqrt{(450)^2 + (400)^2} = 602.08 \text{ mm}$$

In position 2, the length *AB* is $(l_{AB})_2 = 400$ mm.

The displacement *d* of the 150 N force is

$$d = (l_{AB})_1 - (l_{AB})_2 = 202.08 \text{ mm} = 0.20208 \text{ m}$$

The work of the 150 N force *P* is

$$(U_{1\to 2})_P = Pd = (150 \text{ N})(0.20208 \text{ m}) = 30.312 \text{ J}$$

Total work:

$$U_{1\to 2} = -22.0725 + 3.0074 - 0.0028125k_2 + 30.312$$

$$= 11.247 - 0.0028125k_2$$

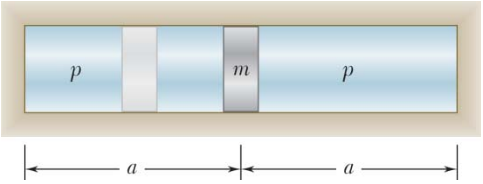
Principle of work and energy:

$$T_1 + U_{1\to 2} = T_2$$

$$0 + 11.247 - 0.0028125k_2 = 2.5$$

$$k_2 = 3110 \text{ N/m}$$

$k_2 = 3110$ N/m ◀

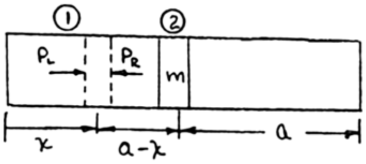


PROBLEM 13.32

A piston of mass m and cross-sectional area A is equilibrium under the pressure p at the center of a cylinder closed at both ends. Assuming that the piston is moved to the left a distance $a/2$ and released, and knowing that the pressure on each side of the piston varies inversely with the volume, determine the velocity of the piston as it again reaches the center of the cylinder. Neglect friction between the piston and the cylinder and express your answer in terms of m, a, p, and A.

SOLUTION

Pressures vary inversely as the volume



$$\frac{p_L}{P} = \frac{Aa}{Ax} \qquad p_L = \frac{pa}{x}$$

$$\frac{p_R}{P} = \frac{Aa}{A(2a-x)} \quad p_R = \frac{pa}{(2a-x)}$$

Initially at ①, $\quad v = 0 \quad x = \dfrac{a}{2}$

$$T_1 = 0$$

At ②, $\quad x = a, \quad T_2 = \dfrac{1}{2}mv^2$

$$U_{1-2} = \int_{a/2}^{a} (p_L - p_R)A\,dx = \int_{a/2}^{a} paA\left[\frac{1}{x} - \frac{1}{2a-x}\right]dx$$

$$U_{1-2} = paA[\ln x + \ln (2a-x)]_{a/2}^{a}$$

$$U_{1-2} = paA\left[\ln a + \ln a - \ln\left(\frac{a}{2}\right) - \ln\left(\frac{3a}{2}\right)\right]$$

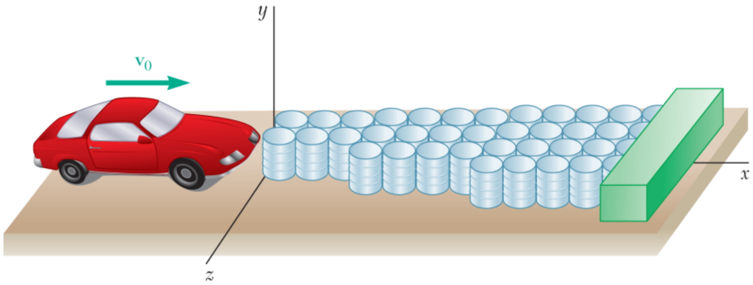
$$U_{1-2} = paA\left[\ln a^2 - \ln\frac{3a^2}{4}\right] = paA\,\ln\left(\frac{4}{3}\right)$$

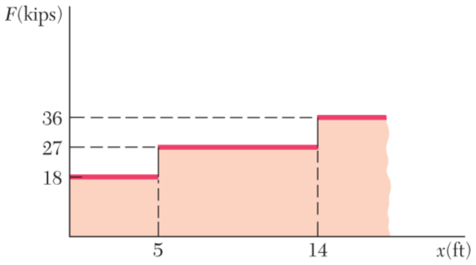
$$T_1 + U_{1-2} = T_2 \quad 0 + paA\,\ln\left(\frac{4}{3}\right) = \frac{1}{2}mv^2$$

$$v^2 = \frac{2paA\,\ln\left(\frac{4}{3}\right)}{m} = 0.5754\frac{paA}{m} \qquad v = 0.759\sqrt{\frac{paA}{m}} \blacktriangleleft$$

PROBLEM 13.33

An uncontrolled automobile traveling at 65 mph strikes squarely a highway crash cushion of the type shown in which the automobile is brought to rest by successively crushing steel barrels. The magnitude *F* of the force required to crush the barrels is shown as a function of the distance *x* the automobile has moved into the cushion. Knowing that the weight of the automobile is 2250 lb and neglecting the effect of friction, determine (*a*) the distance the automobile will move into the cushion before it comes to rest, (*b*) the maximum deceleration of the automobile.

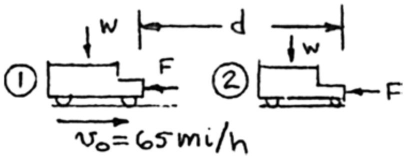




SOLUTION

(*a*) 65 mi/h = 95.3 ft/s

Assume auto stops in $5 \le d \le 14$ ft.



$$v_1 = 95.33 \text{ ft/s}$$

$$T_1 = \frac{1}{2}mv_1^2\,\frac{1}{2}\left(\frac{2250 \text{ lb}}{32.2 \text{ ft/s}^2}\right)(95.3 \text{ ft/s})^2$$

$$T_1 = 317{,}530 \text{ lb}\cdot\text{ft}$$

$$= 317.63 \text{ k}\cdot\text{ft}$$

$$v_2 = 0$$

$$T_2 = 0$$

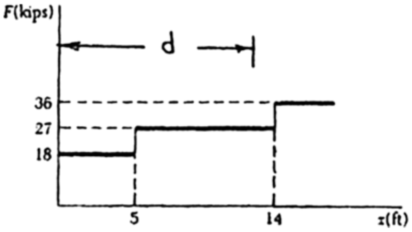
$$U_{1-2} = (18 \text{ k})(5 \text{ ft}) + (27 \text{ k})(d-5)$$

$$= 90 + 27d - 135$$

$$= 27d - 45 \text{ k}\cdot\text{ft}$$

$$T_1 + U_{1-2} = T_2$$

$$317.53 = 27d - 45$$



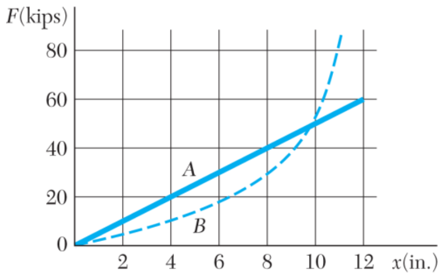
$d = 13.43$ ft ◀

Assumption that $d \le 14$ ft is ok.

(*b*) Maximum deceleration occurs when *F* is largest. For $d = 13.43$ ft, $F = 27$ k. Thus, $F = ma_D$

$$(27{,}000 \text{ lb}) = \left(\frac{2250 \text{ lb}}{32.2 \text{ ft/s}^2}\right)(a_D)$$

$a_D = 386 \text{ ft/s}^2$ ◀



PROBLEM 13.34

Two types of energy-absorbing fenders designed to be used on a pier are statically loaded. The force-deflection curve for each type of fender is given in the graph. Determine the maximum deflection of each fender when a 90-ton ship moving at 1 mi/h strikes the fender and is brought to rest.

SOLUTION

Weight: $W_1 = (90 \text{ ton})(2000 \text{ lb/ton}) = 180 \times 10^3 \text{ lb}$

Mass: $m = \dfrac{W}{g} = \dfrac{180 \times 10^3}{32.2} = 5590 \text{ lb} \cdot \text{s}^2/\text{ft}$

Speed: $v_1 = 1 \text{ mi/h} = \dfrac{5280 \text{ ft}}{3600 \text{ s}} = 1.4667 \text{ ft/s}$

Kinetic energy:

$$T_1 = \frac{1}{2} m v_1^2 = \frac{1}{2}(5590)(1.4667)^2$$

$$= 6012 \text{ ft} \cdot \text{lb}$$

$$T_2 = 0 \qquad \text{(rest)}$$

Principle of work and energy: $T_1 + U_{1\to2} = T_2$

$$6012 + U_{1\to2} = 0$$

$$U_{1\to2} = -6012 \text{ ft} \cdot \text{lb} = -72.15 \text{ kip} \cdot \text{in.}$$

The area under the force-deflection curve up to the maximum deflection is equal to $72.15 \text{ kip} \cdot \text{in.}$

Fender *A*: From the force-deflection curve $F = kx$ $\quad k = \dfrac{F_{\max}}{x_{\max}} = \dfrac{60}{12} = 5 \text{ kip/in.}$

$$\text{Area} = \int_0^x f dx = \int_0^x kx\, dx = \frac{1}{2} kx^2$$

$$\frac{1}{2}(5)x^2 = 72.51$$

$$x^2 = 28.86 \text{ in.}^2$$

$x = 5.37 \text{ in.}$ ◀

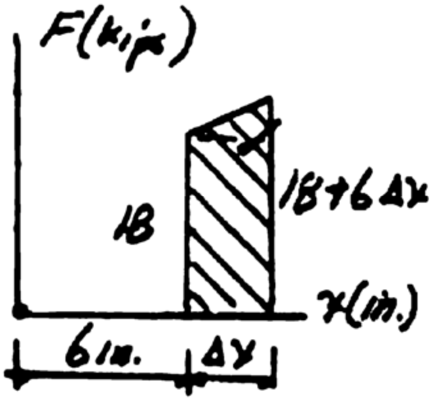
Fender *B*: We divide area under curve *B* into trapezoids

		Partial area	Total Area
From $x = 0$	to $x = 2$ in.:	$\frac{1}{2}(2 \text{ in.})(4 \text{ kips}) = 4 \text{ kip} \cdot \text{in.}$	$4 \text{ kip} \cdot \text{in.}$
From $x = 2$ in.	to $x = 4$ in.:	$\frac{1}{2}(2 \text{ in.})(4 + 10) = 14 \text{ kip} \cdot \text{in.}$	$18 \text{ kip} \cdot \text{in.}$
From $x = 4$ in.	to $x = 6$ in.:	$\frac{1}{2}(2 \text{ in.})(10 + 18) = 28 \text{ kip} \cdot \text{in.}$	$46 \text{ kip} \cdot \text{in.}$

PROBLEM 13.34 (Continued)

We still need $\Delta U = 72.15 - 46 = 26.15 \text{ kip}\cdot\text{in.}$

Equation of straight line approximating curve B from $x = 6$ in. to $x = 8$ in. is



$$\frac{\Delta x}{2} = \frac{F-18}{30-18} \quad F = 18 + 6\Delta x$$

$$\Delta U = 18\Delta x + \frac{1}{2}(6\Delta x)\Delta x = 26.15 \text{ kip}\cdot\text{in.}$$

$$(\Delta x)^2 + 6\Delta x - 8.716 = 0$$

$$\Delta x = 1.209 \text{ in.}$$

Thus: $x = 6 \text{ in.} + 1.209 \text{ in.} = 7.209 \text{ in.}$ $x = 7.21 \text{ in.}$ ◀

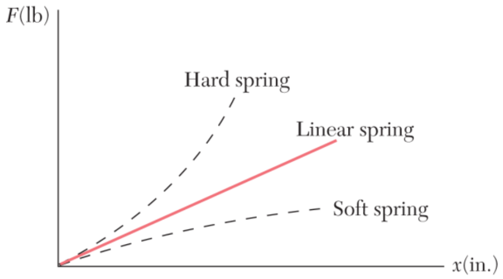
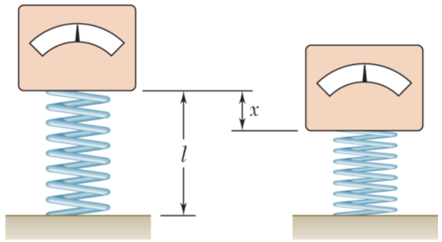
PROBLEM 13.35

Nonlinear springs are classified as hard or soft, depending upon the curvature of their force-deflection curve (see figure). If a delicate instrument having a mass of 5 kg is placed on a spring of length l so that its base is just touching the undeformed spring and then inadvertently released from that position, determine the maximum deflection x_m of the spring and the maximum force F_m exerted by the spring, assuming (*a*) a linear spring of constant $k = 3$ kN/m, (*b*) a hard, nonlinear spring, for which $F = (3 \text{ kN/m})(x + 160x^2)$.

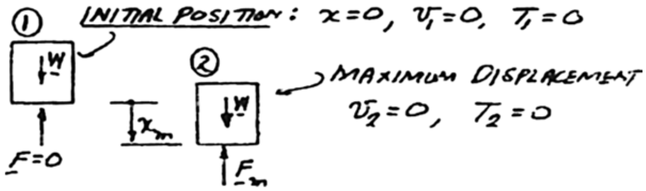




SOLUTION

$W = mg = (5 \text{ kg})g$

$W = 49.05 \text{ N}$



Since $T_1 = T_2 = 0, \quad T_1 + U_{1-2} = T_2$ yields $U_{1-2} = 0$

$$U_{1-2} = Wx_m - \int_0^{x_m} F dx = 49.05x_m - \int_0^{x_m} F dx = 0 \qquad (1)$$

(*a*) For $F = kx = (300 \text{ N/m})x$

Eq. (1): $49.05x_m - \int_0^{x_m} 3000x\, dx = 0$

$$49.05x_m - 1500x_m^2 = 0$$

$x_m = 32.7 \times 10^{-3} \text{ m} = 32.7 \text{ mm}$ ◀

$F_m = 3000x_m = 3000(32.7 \times 10^{-3})$

$\mathbf{F}_m = 98.1 \text{ N} \uparrow$ ◀

(*b*) For $F = (3000 \text{ N/m})x(1 + 160x^2)$

Eq. (1) $49.05x_m - \int_0^{x_m} 3000(x + 160x^3)dx = 0$

$$49.05x_m - 3000\left(\frac{1}{2}x_m^2 + 40x_m^4\right) = 0 \qquad (2)$$

Solve by trial: $x_m = 30.44 \times 10^{-3} \text{ m}$

$x_m = 30.4 \text{ mm}$ ◀

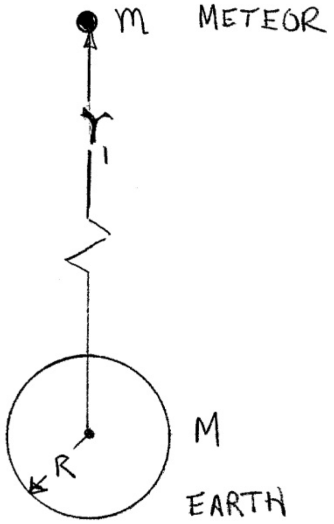
$F_m = (3000)(30.44 \times 10^{-3})[1 + 160(30.44 \times 10^{-3})^2]$

$\mathbf{F}_m = 104.9 \text{ N} \uparrow$ ◀

PROBLEM 13.36

A meteor starts from rest at a very great distance from the earth. Knowing that the radius of the earth is 6370 km and neglecting all forces except the gravitational attraction of the earth, determine the speed of the meteor (*a*) when it enters the ionosphere at an altitude of 1000 km, (*b*) when it enters the stratosphere at an altitude of 50 km, (*c*) when it strikes the earth's surface.

SOLUTION



Given: $R = 6370$ km

$$U_{1-2} = T_2 - T_1$$
$$= \frac{GMm}{r_2} - \frac{GMm}{r_1}$$

Since r_1 is very large,

$$\frac{GMm}{r_1} \approx 0 \qquad \text{thus} \qquad T_1 \approx 0$$

$$\frac{1}{2}\cancel{m}v^2 = \frac{GM\cancel{m}}{r_2}$$

$$\frac{v^2}{2} = g\frac{R^2}{r_2}$$

$$v^2 = \frac{2gR^2}{r_2}$$
$$= \frac{2\left(9.81 \text{ m/s}^2\right)\left(6,370,000 \text{ m}\right)^2}{r_2}$$

(*a*) For $r_2 = 6,370,000 \text{ m} + 1,000,000 \text{ m} = 7,370,000 \text{ m}$

$v = 10.3933$ km/s

$v = 10.39$ km/s ◀

(*b*) For $r_2 = 6,370,000 \text{ m} + 50,000 \text{ m} = 6,420,000 \text{ m}$

$v = 11.1358$ km/s

$v = 11.14$ km/s ◀

(*c*) For $r_2 = 6,370,000 \text{ m}$

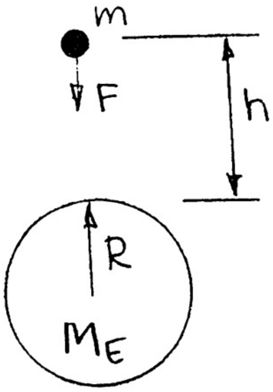
$v = 11.1794$ km/s

$v = 11.18$ km/s ◀

PROBLEM 13.37

Express the acceleration of gravity g_h at an altitude h above the surface of the earth in terms of the acceleration of gravity g_0 at the surface of the earth, the altitude h, and the radius R of the earth. Determine the percent error if the weight that an object has on the surface of the earth is used as its weight at an altitude of (*a*) 0.625 mi, (*b*) 625 mi.

SOLUTION



$$F = \frac{GM_E m}{(h+R)^2} = \frac{GM_E m/R^2}{\left(\frac{h}{R}+1\right)^2} = mg_h$$

At earths' surface $(h = 0)$ $$\frac{GM_E\, m}{R^2} = mg_0$$

$$\frac{GM_E}{R^2} = g_0 \qquad g_h = \frac{\frac{GM_E}{R^2}}{\left(\frac{h}{R}+1\right)^2}$$

Thus $$g_h = \frac{g_0}{\left(\frac{h}{R}+1\right)^2}$$

$$R = 3960 \text{ mi}$$

At altitude *h*, "true" weight $F = mg_h = W_T$

Assume weight $W_0 = mg_0$

$$\text{Error} = E = \frac{W_0 - W_T}{W_0} = \frac{mg_0 - mg_h}{mg_0} = \frac{g_0 - g_h}{g_0}$$

$$g_h = \frac{g_0}{\left(\frac{h}{R}+1\right)^2} \qquad E = \frac{g_0 - \frac{g_0}{\left(1+\frac{h}{R}\right)^2}}{g_0} = \left[1 - \frac{1}{\left(1+\frac{h}{R}\right)^2}\right]$$

(*a*) $h = 0.625 \text{ mi}: \quad P = 100E = 100\left[1 - \frac{1}{\left(1+\frac{0.625}{3960}\right)^2}\right]$ $P = 0.0316\%$ ◀

(*b*) $h = 625 \text{ mi}: \quad P = 100E = 100\left[1 - \frac{1}{\left(1+\frac{625}{3960}\right)^2}\right]$ $P = 25.4\%$ ◀

v_H
Moon trajectory
②
h_m
v
v_H
Earth trajectory
$h_e = 60$ m
x
①
$R_e = 230$ m

Solve for h_m.

At maximum height, the total velocity is the horizontal component of the velocity, which is constant and the same in both cases.

$$T_1 = \frac{1}{2}mv^2 \qquad T_2 = \frac{1}{2}mv_H^2$$

$$U_{1-2} = -mg_e h_e \quad \text{Earth}$$

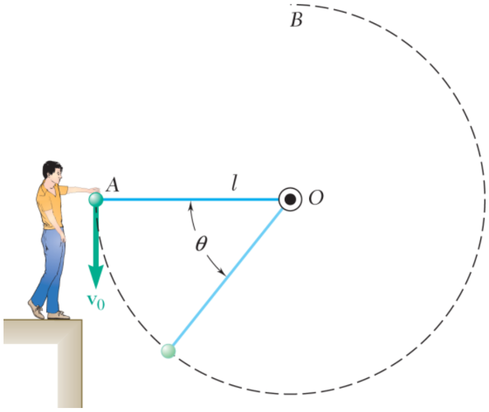
$$U_{1-2} = -mg_m h_m \quad \text{Moon}$$

Earth $$\frac{1}{2}mv^2 - mg_e h_e = \frac{1}{2}mv_H^2$$

Moon $$\frac{1}{2}mv^2 - mg_m h_m = \frac{1}{2}mv_H^2$$

$$-g_e h_e + g_m h_m = 0 \qquad \frac{h_m}{h_e} = \frac{g_e}{g_m}$$

Subtracting $$h_m = (60\text{ m})\left(\frac{g_e}{0.165 g_e}\right)$$ $h_m = 364$ m ◀



PROBLEM 13.39

The sphere at A is given a downward velocity $\mathbf{v}_0$ of magnitude 5 m/s and swings in a vertical plane at the end of a rope of length $l = 2$ m attached to a support at O. Determine the angle θ at which the rope will break, knowing that it can withstand a maximum tension equal to twice the weight of the sphere.

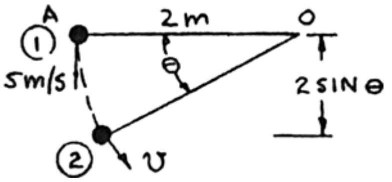
SOLUTION

$$T_1 = \frac{1}{2}mv_0^2 = \frac{1}{2}m\,(5)^2$$

$$T_1 = 12.5\text{ m}$$

$$T_2 = \frac{1}{2}mv^2$$

$$U_{1-2} = mg(l)\sin\theta$$

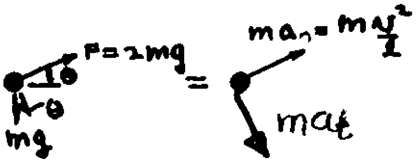


$$T_1 + U_{1-2} = T_2 \qquad 12.5m + 2mg\sin\theta = \frac{1}{2}mv^2$$

$$25 + 4g\sin\theta = v^2 \qquad (1)$$

Newton's law at ②.

$$+\nearrow\ 2mg - mg\sin\theta = m\frac{v^2}{\ell} = m\frac{v^2}{2} \qquad (2)$$



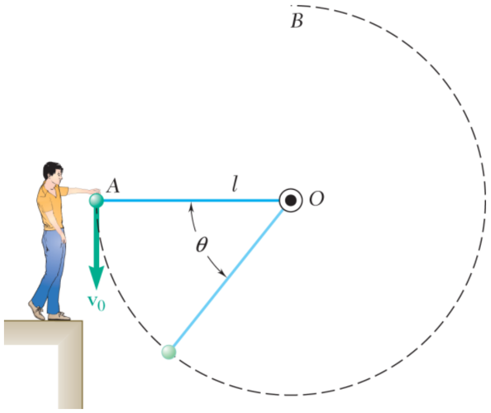
$$v^2 = 4g - 2g\sin\theta$$

Substitute for v^2 from Eq. (2) into Eq. (1)

$$25 + 4g\sin\theta = 4g - 2g\sin\theta$$

$$\sin\theta = \frac{(4)(9.81) - 25}{(6)(9.81)} = 0.2419$$

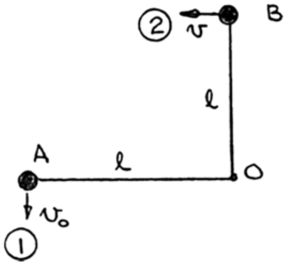
$\theta = 14.00°$ ◀



PROBLEM 13.40

The sphere at A is given a downward velocity $\mathbf{v}_0$ and swings in a vertical circle of radius l and center O. Determine the smallest velocity $\mathbf{v}_0$ for which the sphere will reach Point B as it swings about Point O (a) if AO is a rope, (b) if AO is a slender rod of negligible mass.

SOLUTION



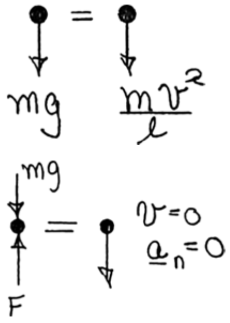
$$T_1 = \frac{1}{2}mv_0^2$$

$$T_2 = \frac{1}{2}mv^2$$

$$U_{1-2} = -mgl$$

$$T_1 + U_{1-2} = T_2 \qquad \frac{1}{2}mv_0^2 - mgl = \frac{1}{2}mv^2$$

$$v_0^2 = v^2 + 2gl$$



Newton's law at ②

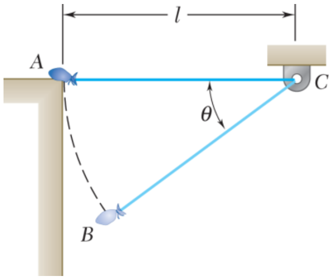
(a) For minimum v, tension in the cord must be zero.

Thus, $v^2 = gl$

$$v_0^2 = v^2 + 2gl = 3gl \qquad v_0 = \sqrt{3gl} \blacktriangleleft$$

(b) Force in the rod can support the weight so that v can be zero.

Thus, $v_0^2 = 0 + 2gl \qquad v_0 = \sqrt{2gl} \blacktriangleleft$



PROBLEM 13.41

A bag is gently pushed off the top of a wall at *A* and swings in a vertical plane at the end of a rope of length *l* Determine the angle θ for which the rope will break, knowing that it can withstand a maximum tension equal to twice the weight of the bag.

SOLUTION

Use work - energy: position 1 is at *A*, position 2 is at *B*.

$$T_1 + U_{1\to 2} = T_2 \qquad (1)$$

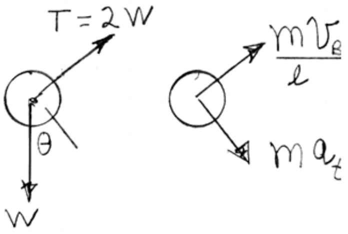
Where $T_1 = 0;\quad U_{1\to 2} = mgl\sin\theta;\quad T_2 = \frac{1}{2}mv_B^2$

Substitute

$$0 + mgl\sin\theta = \frac{1}{2}mv_B^2$$

$$v_B^2 = 2gl\sin\theta \qquad (2)$$

For $T = 2\,W$ use Newton's 2nd law.



$$\nearrow\ \Sigma F_n = ma_n \Rightarrow 2W - W\sin\theta = \frac{mv_B^2}{l} \qquad (3)$$

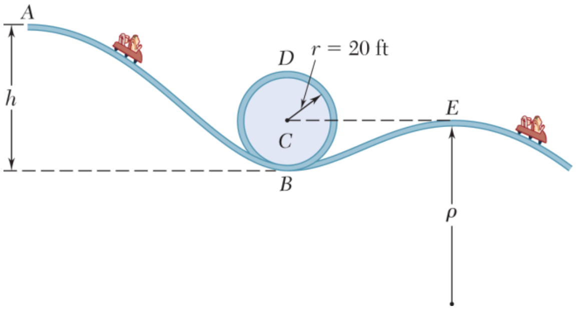
Substitute (2) into (3)

$$2\cancel{m}g - \cancel{m}g\sin\theta = 2\cancel{m}g\frac{\cancel{l}\sin\theta}{\cancel{l}}$$

$$2 = 3\sin\theta$$

$$\text{or } \sin\theta = \frac{2}{3} \Rightarrow \theta = 41.81°$$

$\theta = 41.8°$ ◀



PROBLEM 13.42

A roller coaster starts from rest at A, rolls down the track to B, describes a circular loop of 40-ft diameter, and moves up and down past Point E. Knowing that $h = 60$ ft and assuming no energy loss due to friction, determine (a) the force exerted by his seat on a 160-lb rider at B and D, (b) the minimum value of the radius of curvature at E if the roller coaster is not to leave the track at that point.

SOLUTION

Let y_p be the vertical distance from Point A to any Point P on the track. Let position 1 be at A and position 2 be at P. Apply the principle of work and energy.

$$T_1 = 0 \qquad T_2 = \frac{1}{2}mv_P^2$$

$$U_{1\to 2} = mgy_P$$

$$T_1 + U_{1\to 2} = T_2: \quad 0 + mgy_P = \frac{1}{2}mv_P^2$$

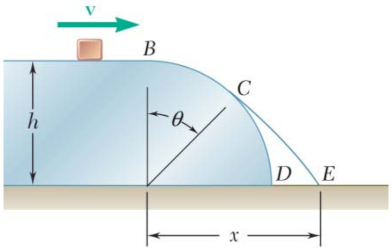
For $N_E > 0, \quad 115 - 2h > 0$

$$h < 57.5 \text{ ft}$$

Range of values for *h*: $50.0 \text{ ft} \le h \le 57.5 \text{ ft}$ ◀

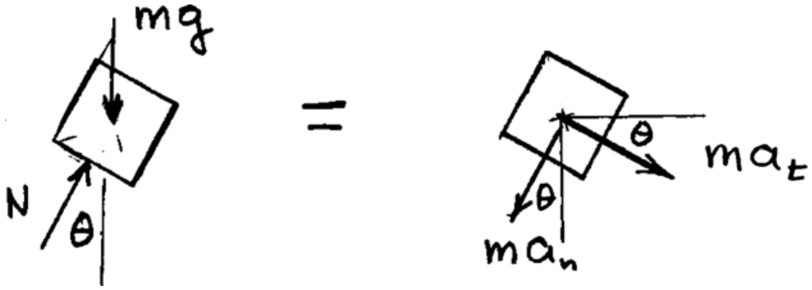


PROBLEM 13.44

A small block slides at a speed v on a horizontal surface. Knowing that $h = 0.9$ m, determine the required speed of the block if it is to leave the cylindrical surface BCD when $\theta = 30°$.

SOLUTION

At Point C where the block leaves the surface BCD the contact force is reduced to zero. Apply Newton's second law at Point C.



n-direction: $$N - mg\cos\theta = -ma_n = -\frac{mv_C^2}{h}$$

With $N = 0$, we get $$v_c^2 = gh\cos\theta$$

Apply the work-energy principle to the block sliding over the path BC. Let position 1 correspond to Point B and position 2 to C.

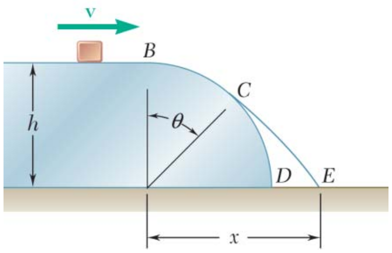
$$T_1 = \frac{1}{2}mv_B^2 \qquad T_2 = \frac{1}{2}\,mv_C^2 = \frac{1}{2}mgh\cos\theta$$

$$U_{1\to2} = \text{ weight} \times \text{change in vertical distance}$$
$$= mgh(1-\cos\theta)$$

$$T_1 + U_{1\to2} = T_2 : \frac{1}{2}mv_B^2 + mg(1-\cos\theta) = \frac{1}{2}mgh\cos\theta$$
$$v_B^2 = gh\cos\theta - 2gh(1-\cos\theta) = gh(3\cos\theta - 2)$$

Data: $$g = 9.81 \text{ m/s}^2,\ h = 0.9 \text{ m},\ \theta = 30°.$$
$$v_B^2 = (9.81)(0.9)(3\cos30° - 2) = 5.2804 \text{ m}^2/\text{s}^2$$

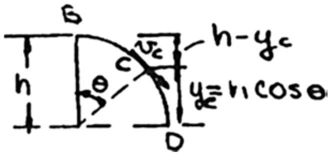
$$v_B = 2.30 \text{ m/s} \blacktriangleleft$$

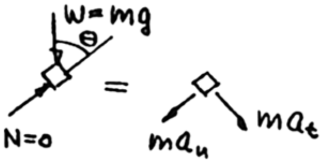


PROBLEM 13.45

A small block slides at a speed $v = 8$ ft/s on a horizontal surface at a height $h = 3$ ft above the ground. Determine (*a*) the angle θ at which it will leave the cylindrical surface *BCD*, (*b*) the distance *x* at which it will hit the ground. Neglect friction and air resistance.

SOLUTION





Block leaves surface at *C* when the normal force $N = 0$.

$$+\swarrow \; mg\cos\theta = ma_n$$

$$g\cos\theta = \frac{v_C^2}{h}$$

$$v_C^2 = gh\cos\theta = gy \qquad (1)$$

Work-energy principle.

(*a*)
$$T_B = \frac{1}{2}mv^2 = \frac{1}{2}m(8)^2 = 32m$$

$$T_C = \frac{1}{2}mv_C^2 \qquad U_{B-C} = W(h-g) = mg(h-y_C)$$

$$T_B + U_{B-C} = T_C$$

$$32m + mg(h-y) = \frac{1}{2}mv_C^2$$

Use Eq. (1)
$$32 + g(h-y_C) = \frac{1}{2}gy_C \qquad (2)$$

$$32 + gh = \frac{3}{2}gy_C$$

$$y_C = \frac{(32+gh)}{\left(\frac{3}{2}g\right)}$$

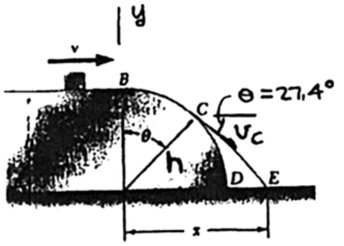
$$y_C = \frac{(32+(32.2)(3))}{\frac{3}{2}(32.2)}$$

$$y_C = 2.6625 \text{ ft} \qquad (3)$$

$$y_C = h\cos\theta \qquad \cos\theta = \frac{y_C}{h} = \frac{2.6625}{3} = 0.8875$$

$\theta = 27.4°$ ◀

PROBLEM 13.45 (Continued)



(*b*) From (1) and (3)

$$v_C = \sqrt{gy}$$
$$v_C = \sqrt{(32.2)(2.6625)}$$
$$v_C = 9.259 \text{ ft/s}$$

At *C*: $(v_C)_x = v_C \cos\theta = (9.259)(\cos 27.4°) = 8.220 \text{ ft/s}$

$$(v_C)_y = -v_C \sin\theta = -(9.259)(\sin 27.4°) = 4.261 \text{ ft/s}$$

$$y = y_C + (v_C)_y\, t - \frac{1}{2} g t^2 = 2.6625 - 4.261t - 16.1t^2$$

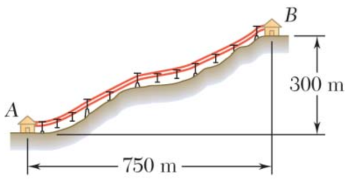
At *E*: $y_E = 0$: $t^2 + 0.2647t - 0.1654 = 0$

$$t = 0.2953 \text{ s}$$

At *E*: $x = h(\sin\theta) + (v_C)_x\, t = (3)(\sin 27.4°) + (8.220)(0.2953)$

$$x = 1.381 + 2.427 = 3.808 \text{ ft}$$

$x = 3.81$ ft ◀



PROBLEM 13.46

A chair-lift is designed to transport 1000 skiers per hour from the base *A* to the summit *B*. The average mass of a skier is 70 kg and the average speed of the lift is 75 m/min. Determine (*a*) the average power required, (*b*) the required capacity of the motor if the mechanical efficiency is 85 percent and if a 300 percent overload is to be allowed.

SOLUTION

Note: Solution is independent of speed.

(*a*)

$$\text{Average power } = \frac{\Delta U}{\Delta t} = \frac{(1000)(70\text{ kg})(9.81\text{ m/s}^2)(300\text{ m})}{3600\text{ s}} = 57{,}225\ \frac{\text{N}\cdot\text{m}}{\text{s}}$$

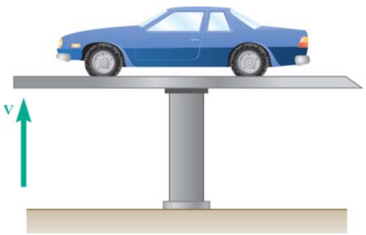
$$\text{Average power } = 57.2\text{ kW} \blacktriangleleft$$

(*b*) Maximum power required with 300% over load

$$= \frac{100+300}{100}(57.225\text{ kW}) = 229\text{ kW}$$

Required motor capacity (85% efficient)

$$\text{Motor capacity } = \frac{229\text{ kW}}{0.85} = 269\text{ kW} \blacktriangleleft$$



PROBLEM 13.47

It takes 15 s to raise a 1200-kg car and the supporting 300-kg hydraulic car-lift platform to a height of 2.8 m. Determine (*a*) the average output power delivered by the hydraulic pump to lift the system, (*b*) the average power electric required, knowing that the overall conversion efficiency from electric to mechanical power for the system is 82 percent.

SOLUTION

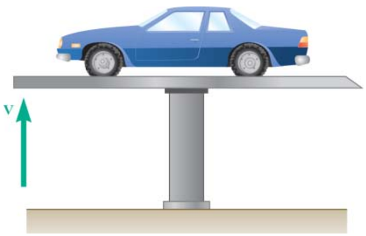
(*a*) $(P_P)_A = (F)(v_A) = (m_C + m_L)(g)(v_A)$

$v_A = \text{s/t} = (2.8\text{ m})/(15\text{ s}) = 0.18667\text{ m/s}$

$(P_P)_A = [(1200\text{ kg}) + (300\text{ kg})](9.81\text{ m/s}^2)(0.18667\text{ m/s})^3$

$(P_P)_A = 2.747\text{ kJ/s}$ $\qquad (P_P)_A = 2.75\text{ kW}$ ◀

(*b*) $(P_E)_A = (P_P)/\eta = (2.75\text{ kW})/(0.82)$ $\qquad (P_E)_A = 3.35\text{ kW}$ ◀



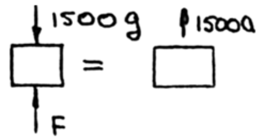
PROBLEM 13.48

The velocity of the lift of Problem 13.47 increases uniformly from zero to its maximum value at mid-height 7.5 s and then decreases uniformly to zero in 7.5 s. Knowing that the peak power output of the hydraulic pump is 6 kW when the velocity is maximum, determine the maximum life force provided by the pump.

PROBLEM 13.47 It takes 15 s to raise a 1200-kg car and the supporting 300-kg hydraulic car-lift platform to a height of 2.8 m. Determine (*a*) the average output power delivered by the hydraulic pump to lift the system, (*b*) the average power electric required, knowing that the overall conversion efficiency from electric to mechanical power for the system is 82 percent.

SOLUTION

Newton's law



$$Mg = (M_C + M_L)g = (1200 + 300)g$$

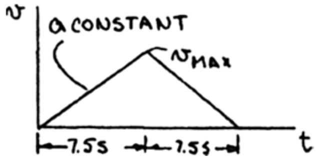
$$Mg = 1500g$$

$$+\uparrow \quad \Sigma F = F - 1500g = 1500a \qquad (1)$$

Since motion is uniformly accelerated, a = constant

Thus, from (1), F is constant and peak power occurs when the velocity is a maximum at 7.5 s.

$$a = \frac{v_{\max}}{7.5\text{ s}}$$



$$P = (6000\text{ W}) = (F)(v_{\max})$$

$$v_{\max} = (6000)/F$$

Thus,

$$a = (6000)/(7.5)(F) \qquad (2)$$

Substitute (2) into (1)

$$F - 1500g = (1500)(6000)/(7.5)(F)$$

$$F^2 - (1500\text{ kg})(9.81\text{ m/s}^2)F - \frac{(1500\text{ kg})(6000\text{ N}\cdot\text{m/s})}{(7.5\text{ s})} = 0$$

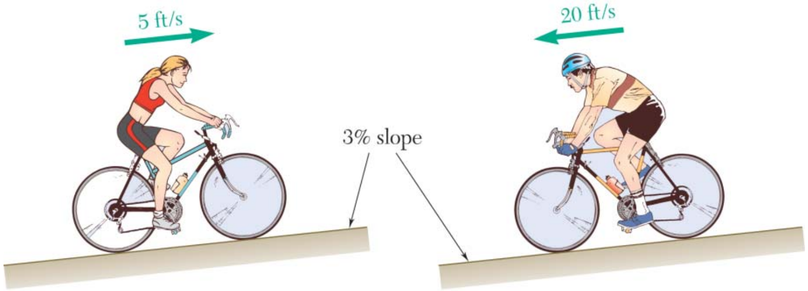
$$F^2 - 14{,}715F - 1.2\times10^6 = 0$$

$$F = 14{,}800\text{ N}$$

$$F = 14.8\text{ kN} \blacktriangleleft$$

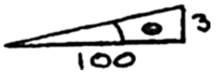
PROBLEM 13.49

(a) A 120-lb woman rides a 15-lb bicycle up a 3-percent slope at a constant speed of 5 ft/s. How much power must be developed by the woman? (*b*) A 180-lb man on an 18-lb bicycle starts down the same slope and maintains a constant speed of 20 ft/s by braking. How much power is dissipated by the brakes? Ignore air resistance and rolling resistance.

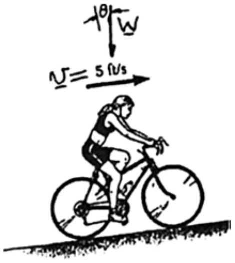


(*a*) (*b*)

SOLUTION



$$\tan\theta = \frac{3}{100} \qquad \theta = 1.718°$$



(*a*)

(*a*)

$$W = W_B + W_W = 15 + 120$$

$$W = 135 \text{ lb}$$

$$P_W = \mathbf{W}\cdot\mathbf{v} = (W\sin\theta)(v)$$

$$P_W = (135)(\sin 1.718°)(5)$$

$$P_W = 20.24 \text{ ft}\cdot\text{lb/s}$$

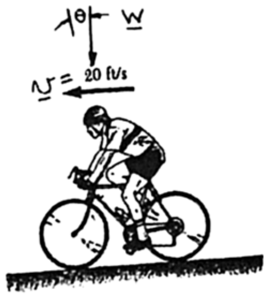
$P_W = 20.2 \text{ ft}\cdot\text{lb/s}$ ◀

(*b*)

$$W = W_B + W_m = 18 + 180$$

$$W = 198 \text{ lb}$$

Brakes must dissipate the power generated by the bike and the man going down the slope at 20 ft/s.

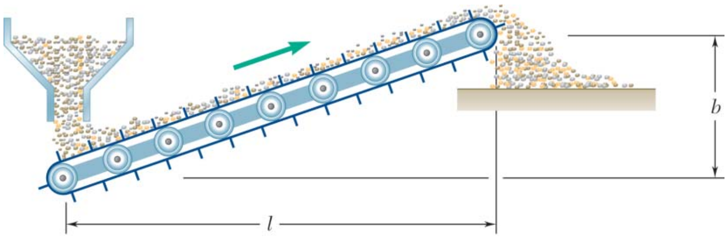


(*b*)

$$P_B = \mathbf{W}\cdot\mathbf{v} = (W\sin\theta)(v)$$

$$P_B = (198)(\sin 1.718)(20)$$

$P_B = 118.7 \text{ ft}\cdot\text{lb/s}$ ◀



PROBLEM 13.50

A power specification formula is to be derived for electric motors which drive conveyor belts moving solid material at different rates to different heights and distances. Denoting the efficiency of the motors by η and neglecting the power needed to drive the belt itself, derive a formula (*a*) in the SI system of units for the power P in kW, in terms of the mass flow rate m in kg/h, the height b and horizontal distance l in meters, and (*b*) in U.S. customary units, for the power in hp, in terms of the material flow rate w in tons/h, and the height b and horizontal distance l in feet.

SOLUTION

(*a*) Material is lifted to a height b at a rate, $(m \text{ kg/h})(g \text{ m/s}^2) = [mg(\text{N/h})]$

Thus,

$$\frac{\Delta U}{\Delta t} = \frac{[mg(\text{N/h})][b(m)]}{(3600 \text{ s/h})} = \left(\frac{mgb}{3600}\right) \text{N} \cdot \text{m/s}$$

$$1000 \text{ N} \cdot \text{m/s} = 1 \text{ kW}$$

Thus, including motor efficiency, η

$$P(\text{kw}) = \frac{mgb(\text{N} \cdot \text{m/s})}{(3600)\left(\frac{1000 \text{ N} \cdot \text{m/s}}{\text{kW}}\right)(\eta)}$$

$$P(\text{kW}) = 0.278 \times 10^{-6} \frac{mgb}{\eta} \blacktriangleleft$$

(*b*)

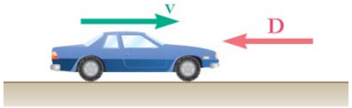
$$\frac{\Delta U}{\Delta t} = \frac{[W(\text{tons/h})(2000 \text{ lb/ton})][b(\text{ft})]}{3600 \text{ s/h}}$$

$$= \frac{Wb}{1.8} \text{ ft} \cdot \text{lb/s}; \quad 1 \text{ hp} = 550 \text{ ft} \cdot \text{lb/s}$$

With η,

$$hp = \left[\frac{Wb}{1.8}(\text{ft} \cdot \text{lb/s})\right]\left[\frac{1 \text{ hp}}{550 \text{ ft} \cdot \text{lb/s}}\right]\left[\frac{1}{\eta}\right]$$

$$hp = \frac{1.010 \times 10^{-3} Wb}{\eta} \blacktriangleleft$$



PROBLEM 13.51

A 1400-kg automobile starts from rest and travels 400 m during a performance test. The motion of the automobile is defined by the relation $x = 4000\ln(\cosh 0.03t)$, where x and t are expressed in meters and seconds, respectively. The magnitude of the aerodynamic drag is $D = 0.35v^2$, where D and v are expressed in newtons and m/s, respectively. Determine the power dissipated by the aerodynamic drag when (*a*) $t = 10$ s, (*b*) $t = 15$ s.

SOLUTION

Motion is determined as a function of time as

$$x = 4000\ln(\cosh 0.03t)$$

Velocity
$$v = \frac{dx}{dt} = 4000\left(\frac{1}{\cosh 0.03t}\right)(\sinh 0.03t)(0.03)$$

$$v = \frac{120\sinh 0.03t}{\cosh 0.03t}$$

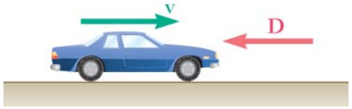
Power dissipated
$$P = Dv = (0.35v^2)v = 0.35v^3$$

$$P = 0.35(120)^3\left[\frac{\sinh 0.03t}{\cosh 0.03t}\right]^3$$

$$= 604.8(10)^3\left[\frac{e^{0.03t} - e^{-0.03t}}{e^{0.03t} + e^{-0.03t}}\right]^3$$

(*a*) $t = 10$ s, $P = 14.95(10)^3 \text{ W} = 14.95 \text{ kW}$ ◀

(*b*) $t = 15$ s, $P = 45.4(10)^3 \text{ W} = 45.4 \text{ kW}$ ◀



PROBLEM 13.52

A 1400-kg automobile starts from rest and travels 400 m during a performance test. The motion of the automobile is defined by the relation $a = 3.6e^{-0.0005x}$, where a and x are expressed in $\mathrm{m/s^2}$ and meters, respectively. The magnitude of the aerodynamic drag is $D = 0.35v^2$, where D and v are expressed in newtons and m/s, respectively. Determine the power dissipated by the aerodynamic drag when (*a*) $x = 200$ m, (*b*) $x = 400$ m.

SOLUTION

Motion is defined by the following function:

$$a = 3.6e^{-0.0005x}$$

$$= v\frac{dv}{dx}$$

$$\int_0^v v\,dv = 3.6\int_0^x e^{-0.0005x}dx$$

$$= \frac{-3.6}{0.0005}\int_0^{-0.0005x} e^u du$$

$$\frac{v^2}{2} = -7200\left(e^{-0.0005x} - 1\right)$$

$$v^2 = 14400\left(1 - e^{-0.0005x}\right)$$

$$v = 120\left(1 - e^{-0.0005x}\right)^{\frac{1}{2}}$$

$$\text{Power dissipated} = P = Dv = 0.35v^3$$

$$P = 604.8(10)^3\left[1 - e^{-0.0005x}\right]^{\frac{3}{2}}$$

(a) $x = 200$ m, $P = 17.75(10)^3\,W = 17.75$ kW ◀

(*b*) $x = 400$ m, $P = 46.7(10)^3\,W = 46.7$ kW ◀

PROBLEM 13.53

The fluid transmission of a 15-Mg truck allows the engine to deliver an essentially constant power of 50 kW to the driving wheels. Determine the time required and the distance traveled as the speed of the truck is increased (*a*) from 36 km/h to 54 km/h, (*b*) from 54 km/h to 72 km/h.

SOLUTION

For constant power, P:

$$\begin{aligned} P &= Fv \\ &= mav \\ &= m\frac{dv}{dt}v \end{aligned}$$

Separate variables

$$\int_0^t dt = \int_0^{v_1} \frac{m}{P}\frac{dv}{v} \Rightarrow t = \frac{m}{P}\left(\frac{v_1^2}{2} - \frac{v_0^2}{2}\right) \tag{1}$$

Distance

$$P = mv\frac{dv}{dx}\frac{dx}{dt} = mv^2\frac{dv}{dx}$$

Separate variables

$$\int_0^x dx = \frac{m}{P}\int_{v_0}^{v_1} v^2 dv \Rightarrow x = \frac{m}{P}\left(\frac{v_1^3}{3} - \frac{v_0^3}{3}\right) \tag{2}$$

with numbers

(*a*) $v_0 = 36 \text{ km/h} = 10 \text{ m/s};\ \ v_1 = 54 \text{ km/h} = 15 \text{ m/s},$ so,

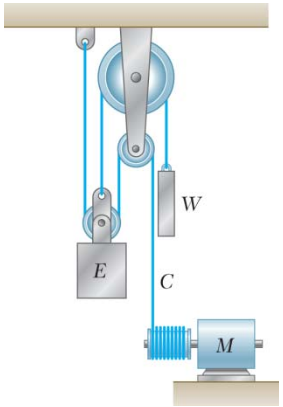
$$t = \frac{15 \times 10^3 \text{ kg}}{2\left(50 \times 10^3 \text{ W}\right)}\left[(15 \text{ m/s})^2 - (10 \text{ m/s})^2\right] \qquad \Rightarrow t = 18.75 \text{ s} \blacktriangleleft$$

$$x = \frac{15 \times 10^3}{(3)\left(50 \times 10^3\right)}\left[15^3 - 10^3\right] = 237.5 \text{ m} \qquad \Rightarrow x = 238 \text{ m} \blacktriangleleft$$

(*b*) $v_0 = 54 \text{ km/h} = 15 \text{ m/s};\ \ v_1 = 72 \text{ km/h} = 20 \text{ m/s}$

$$t = \frac{15 \times 10^3}{(2)\left(50 \times 10^3\right)}\left[20^2 - 15^2\right] = 26.25 \text{ s} \qquad \Rightarrow t = 26.2 \text{ s} \blacktriangleleft$$

$$x = \frac{15 \times 10^3}{(3)\left(50 \times 10^3\right)}\left[20^3 - 15^3\right] = 462.5 \text{ m} \qquad \Rightarrow x = 462 \text{ m} \blacktriangleleft$$



PROBLEM 13.54

The elevator E has a weight of 6600 lbs when fully loaded and is connected as shown to a counterweight W of weight of 2200 lb. Determine the power in hp delivered by the motor (a) when the elevator is moving down at a constant speed of 1 ft/s, (b) when it has an upward velocity of 1 ft/s and a deceleration of 0.18 ft/s^2.

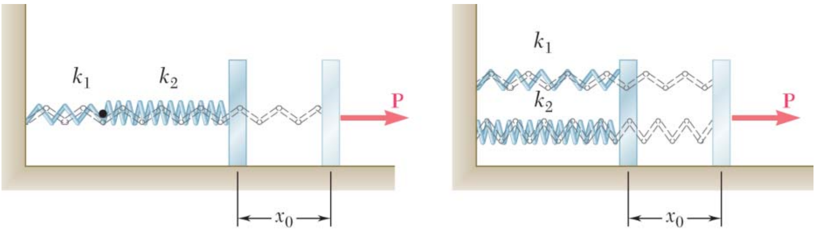
$$= 7.911 \text{ hp}$$

$P = 7.91$ hp ◀

PROBLEM 13.55

A force **P** is slowly applied to a plate that is attached to two springs and causes a deflection x_0. In each of the two cases shown, derive an expression for the constant k_e, in terms of k_1 and k_2, of the single spring equivalent to the given system, that is, of the single spring which will undergo the same deflection x_0 when subjected to the same force **P**.

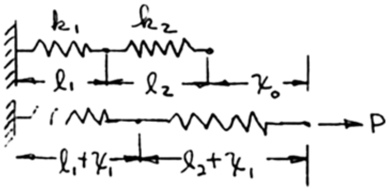


(*a*) (*b*)

SOLUTION

System is in equilibrium in deflected x_0 position.

Case (*a*) Force in both springs is the same $= P$



$$x_0 = x_1 + x_2$$

$$x_0 = \frac{P}{k_e}$$

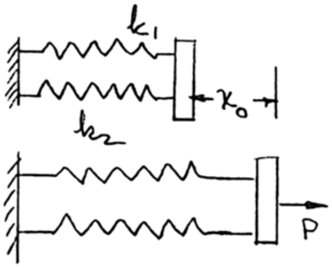
$$x_1 = \frac{P}{k_1} \qquad x_2 = \frac{P}{k_2}$$

Thus,
$$\frac{P}{k_e} = \frac{P}{k_1} + \frac{P}{k_2}$$

$$\frac{1}{k_e} = \frac{1}{k_1} + \frac{1}{k_2}$$

$$k_e = \frac{k_1 k_2}{k_1 + k_2} \blacktriangleleft$$

Case (*b*) Deflection in both springs is the same $= x_0$

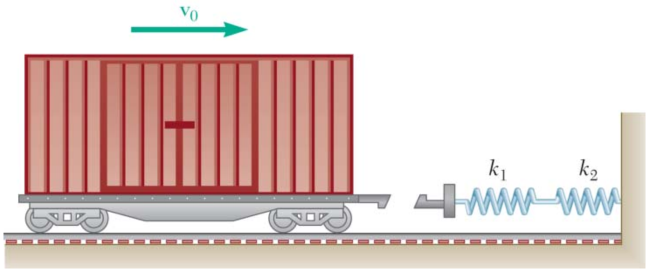


$$P = k_1 x_0 + k_2 x_0$$
$$P = (k_1 + k_2) x_0$$
$$P = k_e x_0$$

Equating the two expressions for

$$P = (k_1 + k_2) x_0 = k_e x_0$$

$$k_e = k_1 + k_2 \blacktriangleleft$$



PROBLEM 13.56

A loaded railroad car of mass m is rolling at a constant velocity $\mathbf{v_0}$ when it couples with a massless bumper system. Determine the maximum deflection of the bumper assuming the two springs are (*a*) in series (as shown), (*b*) in parallel.

SOLUTION

Let position A be at the beginning of contact and position B be at maximum deflection.

$$T_A = \frac{1}{2}mv_0^2$$

$$V_A = 0 \qquad \text{(zero force in springs)}$$

$$T_B = 0 \qquad (v = 0 \text{ at maximum deflection})$$

$$V_B = \frac{1}{2}k_1x_1^2 + \frac{1}{2}k_2x_2^2$$

where x_1 is deflection of spring k_1 and x_2 is that of spring k_2.

Conservation of energy: $T_A + V_A = T_B + V_B$

$$\frac{1}{2}mv_0^2 + 0 = 0 + \frac{1}{2}k_1x_1^2 + \frac{1}{2}k_2x_2^2$$

$$k_1x_1^2 + k_2x_2^2 = mv_0^2 \qquad (1)$$

(*a*) *Springs are in series.*

Let F be the force carried by the two springs.

Then, $x_1 = \dfrac{F}{k_1}$ and $x_2 = \dfrac{F}{k_2}$

Eq. (1) becomes $F^2\left(\dfrac{1}{k_1} + \dfrac{1}{k_2}\right) = mv_0^2$

so that $F = v_0\sqrt{m/\left(\dfrac{1}{k_1} + \dfrac{1}{k_2}\right)}$

The maximum deflection is

$$\delta = x_1 + x_2 = \left(\frac{1}{k_1} + \frac{1}{k_2}\right)F$$

$$= \left(\frac{1}{k_1} + \frac{1}{k_2}\right)v_0\sqrt{m/\left(\frac{1}{k_1} + \frac{1}{k_2}\right)}$$

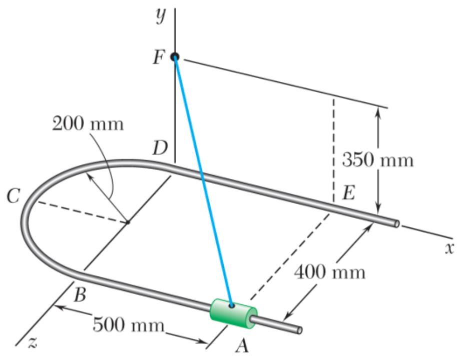
$$= v_0\sqrt{m\left(\frac{1}{k_1} + \frac{1}{k_2}\right)} \qquad \delta = v_0\sqrt{m(k_1 + k_2)/k_1k_2} \blacktriangleleft$$

PROBLEM 13.56 (Continued)

(*b*) *Springs are in parallel.*

$$x_1 = x_2 = \delta$$

Eq. (1) becomes $(k_1 + k_2)\delta^2 = mv_0^2$ $\delta = v_0\sqrt{\dfrac{m}{k_1 + k_2}}$ ◀



PROBLEM 13.57

A 750-g collar can slide along the horizontal rod shown. It is attached to an elastic cord with an undeformed length of 300 mm and a spring constant of 150 N/m. Knowing that the collar is released from rest at A and neglecting friction, determine the speed of the collar (*a*) at B, (*b*) at E.

SOLUTION

Use conservation of energy $$T_1 + V_1 = T_2 + V_2 \qquad (1)$$

(*a*) Position 1 is at A and position 2 is at B

$$T_1 = 0; \qquad V_1 = \frac{1}{2}kx_1^2 \qquad \text{where} \quad x_1 = \ell - \ell_0$$

$$\ell = \left[500^2 + 400^2 + 350^2\right]^{\frac{1}{2}} = 729.726 \text{ mm}$$

So $\ell - \ell_0 = 429.726$ mm

$$V_1 = \frac{1}{2}(1500 \text{ N/m})(0.429726 \text{ m})^2 = 13.8498 \text{ J}$$

At B $$\ell = \left[350^2 + 400^2\right]^{\frac{1}{2}} = 531.507 \text{ mm} \Rightarrow \ell - \ell_0 = 231.507 \text{ mm}$$

$$T_2 = \frac{1}{2}mv_2^2 = \frac{1}{2}(0.75)v_2^2 = 0.375\ v_2^2$$

$$V_2 = \frac{1}{2}(150)(0.231507)^2 = 4.01966 \text{ J}$$

Substituting into (1) $$0 + 13.8498 = 0.375\ v_2^2 + 4.01966$$

$$v_2 = v_B = 5.12 \text{ m/s} \blacktriangleleft$$

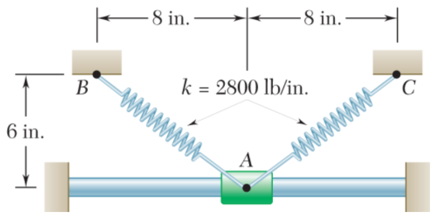
(*b*) At E $$T_1 = 0; \quad V_1 = 13.8498 \text{ (same as before)}$$

At E $$\ell = \left[350^2 + 500^2\right]^{\frac{1}{2}} = 610.328 \text{ mm} \Rightarrow \ell - \ell_0 = 310.328 \text{ mm}$$

$$T_3 = \frac{1}{2}mv_E^2 = 0.375\ v_E^2$$

$$v_E = \frac{1}{2}kx^2 = \frac{1}{2}(150)(0.310328)^2 = 7.223 \text{ J}$$

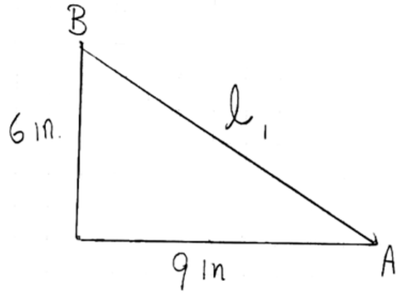
Substituting into (1) $$0 + 13.8498 = 0.375\ v_E^2 + 7.223 \Rightarrow v_E = 4.20 \text{ m/s} \blacktriangleleft$$



PROBLEM 13.58

A 4-lb collar can slide without friction along a horizontal rod and is in equilibrium at *A* when it is pushed 1 in. to the right and released from rest. The springs are undeformed when the collar is at *A* and the constant of each spring is 2800 lb/in. Determine the maximum velocity of the collar.

SOLUTION

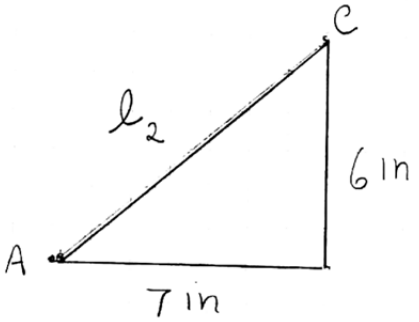


$$\ell_1 = \sqrt{6^2 + 9^2} = 10.817 \text{ in.}$$

$$\ell_0 = \sqrt{(6)^2 + (8)^2} = 10 \text{ in.} = 0.8333 \text{ ft}$$

$$\text{Stretch} = 10.817 - 10 = 0.817 \text{ in.}$$

$$S_1 = 0.06805 \text{ ft}$$



$$\ell_2 = \sqrt{(7)^2 + (6)^2} = 9.215 \text{ in.}$$

$$\text{Stretch} = 9.2195 - 10 = -0.7805 \text{ in.}$$

$$S_2 = 0.06504 \text{ ft}$$

$$T_1 = 0, \quad V_2 = 0$$

$$T_2 = \frac{1}{2}mv_2^2$$

$$= \frac{1}{2}\left(\frac{4}{32.2}\right)v_2^2$$

$$V_1 = \frac{1}{2}(33{,}600 \text{ lb/ft})\left(S_1^2 + S_2^2\right)$$

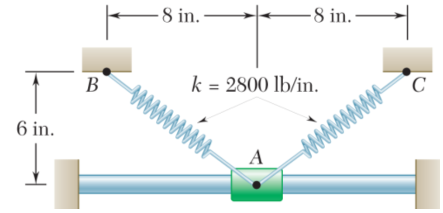
$$V_1 = (16{,}800)(0.008861) = 148.86 \text{ ft}\cdot\text{lb}$$

$$\cancel{T_1} + V_1 = T_2 + \cancel{V_2}$$

$$148.86 = \frac{1}{2}\left(\frac{4}{32.2}\right)v_2^2$$

$$v_2^2 = 2396.7$$

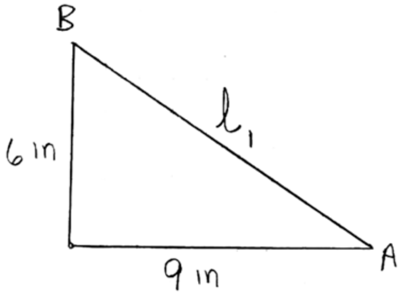
$v_2 = 49.0$ ft/s ◀

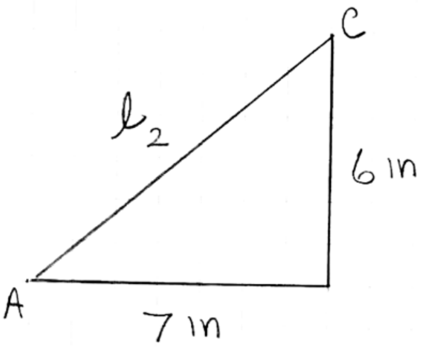


PROBLEM 13.59

A 4-lb collar can slide without friction along a horizontal rod and is released from rest at *A*. The undeformed lengths of springs *BA* and *CA* are 10 in. and 9 in., respectively, and the constant of each spring is 2800 lb/in. Determine the velocity of the collar when it has moved 1 in. to the right.

SOLUTION





$$k = 2800 \text{ lb/in.} = 33{,}600 \text{ lb/ft}$$

$$T_1 = 0$$

$$V_1 = \frac{1}{2}k\left(\Delta l_1\right)^2 = \frac{1}{2}(33{,}600)\left(\frac{1}{12}\right)^2$$

$$= 116.667 \text{ ft} \cdot \text{lb}$$

$$\ell_1 = \sqrt{6^2 + 9^2} = 10.817 \text{ in.} = 0.9014 \text{ ft}$$

$$S_1 = \text{Stretch} = 10.817 - 10 = 0.817 \text{ in.} = 0.06808 \text{ ft}$$

$$\ell_2 = \sqrt{6^2 + 7^2} = 9.2195 \text{ in.}$$

$$S_2 = \text{Stretch} = 9.2195 - 9 = 0.2195 \text{ in.} = 0.018295 \text{ ft}$$

$$T_2 = \frac{1}{2}mv_2^2 = \frac{1}{2}\left(\frac{4}{32.2}\right)v_2^2 = 0.0621\, v_2^2$$

$$V_2 = \frac{1}{2}(33{,}600)\left(S_1^2 + S_2^2\right)$$

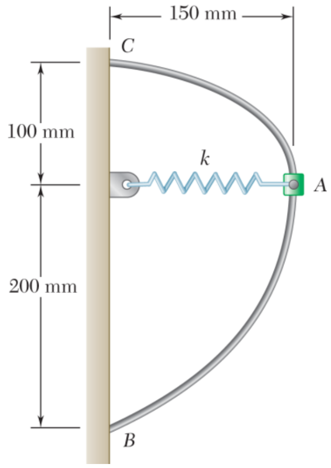
$$= 16800\left[(0.06808)^2 + (0.018295)^2\right]$$

$$= 83.489 \text{ ft}\cdot\text{lb}$$

$$\cancel{T_1} + V_1 = T_2 + V_2$$

$$116.667 = 0.06211\, v_2^2 + 83.489$$

$v_2 = 23.1$ ft/s ◀

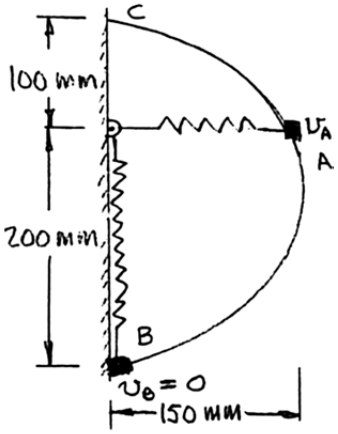


PROBLEM 13.60

A 500-g collar can slide without friction on the curved rod BC in a *horizontal* plane. Knowing that the undeformed length of the spring is 80 mm and that $k = 400$ kN/m, determine (*a*) the velocity that the collar should be given at A to reach B with zero velocity, (*b*) the velocity of the collar when it eventually reaches C.

SOLUTION

(*a*) Velocity at A:



$$T_A = \frac{1}{2}mv_A^2 = \left(\frac{0.5}{2}\text{ kg}\right)v_A^2$$

$$T_A = (0.25)v_A^2$$

$$\Delta L_A = 0.150\text{ m} - 0.080\text{ m}$$

$$\Delta L_A = 0.070\text{ m}$$

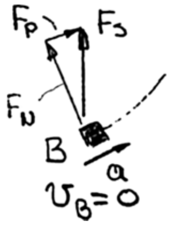
$$V_A = \frac{1}{2}k(\Delta L_A)^2$$

$$V_A = \frac{1}{2}(400\times 10^3\text{ N/m})(0.070\text{ m})^2$$

$$V_A = 980\text{ J}$$

$$v_B = 0 \qquad T_B = 0$$

$$\Delta L_B = 0.200\text{ m} - 0.080\text{ m} = 0.120\text{ m}$$



$$V_B = \frac{1}{2}k(\Delta L_B)^2 = \frac{1}{2}(400\times 10^3\text{ N/m})(0.120\text{ m})^2$$

$$V_B = 2880\text{ J}$$

Substitute into conservation of energy.

$$T_A + V_A = T_B + V_B \qquad 0.25v_A^2 + 980 = 0 + 2880$$

$$v_A^2 = \frac{(2880 - 980)}{(0.25)}$$

$$v_A^2 = 7600\text{ m}^2/\text{s}^2$$

$v_A = 87.2$ m/s ◀

(*b*) Velocity at C:

Since slope at B is positive, the component of the spring force F_P, parallel to the rod, causes the block to move back toward A.

$$T_B = 0, \quad V_B = 2880 \text{ J} \quad [\text{from part } (a)]$$

$$T_C = \frac{1}{2}mv_C^2 = \frac{(0.5 \text{ kg})}{2}v_C^2 = 0.25v_C^2$$

$$\Delta L_C = 0.100 \text{ m} - 0.080 \text{ m} = 0.020 \text{ m}$$

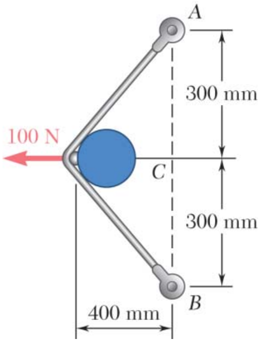
$$V_C = \frac{1}{2}k(\Delta L_C)^2 = \frac{1}{2}(400 \times 10^3 \text{ N/m})(0.020 \text{ m})^2 = 80.0 \text{ J}$$

Substitute into conservation of energy.

$$T_B + V_B = T_C + V_C \quad 0 + 2880 = 0.25v_C^2 + 80.0$$

$$v_C^2 = 11{,}200 \text{ m}^2/\text{s}^2$$

$$v_C = 105.8 \text{ m/s} \blacktriangleleft$$



PROBLEM 13.61

For the adapted shuffleboard device in Prob 13.28, you decide to utilize an elastic cord instead of a compression spring to propel the puck forward. When the cord is stretched directly between points *A* and *B*, the tension is 20 N. The 425 gram puck is placed in the center and pulled back through a distance of 400 mm; a force of 100 N is required to hold it at this location. Knowing that the coefficient of friction is 0.3, determine how far the puck will travel.

SOLUTION

Given:

$\mu_k = 0.3$

$m = 0.425\text{ kg}$

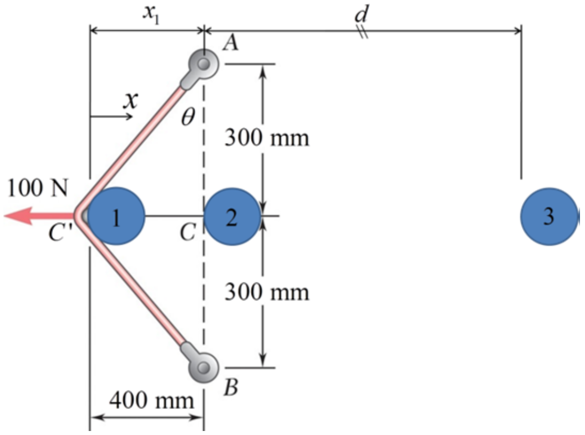
$F_{C,2} = 20\text{ N}$, Force in cord at positon 2

l_i = length of cord at positon i

s_i = stretch of cord in position i

l_O = unstretched length of cord

Sketch:



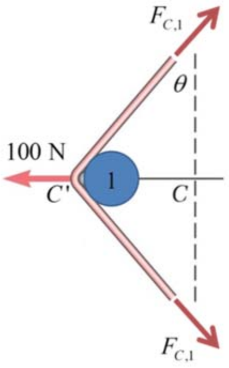
At Position 1:

$$l_1 = 2\left(0.3^2 + 0.4^2\right) \Rightarrow l_1 = 1\text{ m}$$

$$\theta = \tan^{-1}\left(\frac{40}{30}\right) = 53.13°$$

Find Force in cord:

FBD:



For Equilibrium:

$$\sum F_x = 0$$

$$2F_{C,1}\sin\theta - 100 = 0$$

$$F_{C,1} = 62.5\text{ N}$$

At Position 2:

$$l_2 = 0.6\text{ m}$$

PROBLEM 13.61 (Continued)

Find Stiffness of cord, *k*:

$$F_{C,1} = ks_1, \quad F_{C,2} = ks_2$$

$$F_{C,1} - F_{C,2} = k(s_1 - s_2)$$
$$62.5 - 20 = k[(1.0 - l_0) - (0.6 - l_0)]$$
$$k = 106.25 \text{ N/m}$$

Find stretch in cord at positions 1, 2 and 3:

$$s_1 = \frac{F_{C,1}}{k} = \frac{62.5 \text{ N}}{106.25 \text{ N/m}} = 0.5882 \text{ m} \qquad s_2 = s_3 = \frac{F_{C,2}}{k} = \frac{20 \text{ N}}{106.25 \text{ N/m}} = 0.1882 \text{ m}$$

Work Energy from position 1 to 3:

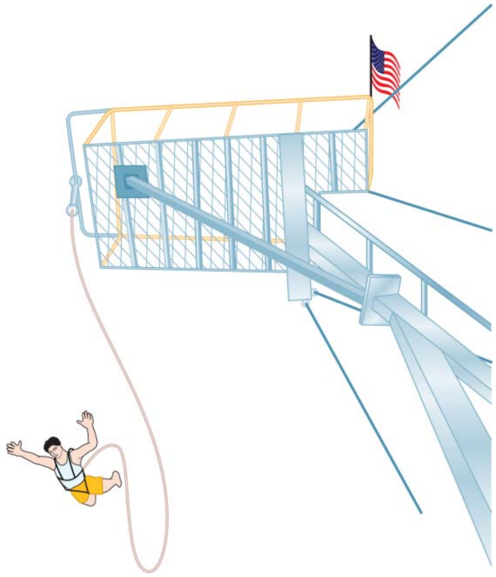
$$\cancel{T_1} + \cancel{V_{g_1}} + V_{e_1} + U_{1\to3}^{NC} = \cancel{T_3} + \cancel{V_{g_3}} + V_{e_3} \quad \text{where:} \quad V_{e_1} = \frac{1}{2}ks_1^2$$
$$U_{1\to3}^{NC} = \int_0^{x_1+d} -\mu_k mg\,dx$$
$$V_{e_3} = \frac{1}{2}ks_3^2$$

Therefore: $$\frac{1}{2}ks_1^2 - \mu_k mg(x_1 + d) = \frac{1}{2}ks_3^2$$

Substitute known values:

$$\frac{1}{2}(106.25)(0.5882)^2 - 0.3(0.425)(9.81)(0.4 + d) = \frac{1}{2}(106.25)(0.1882)^2$$

Solve for *d*: $d = 12.79 \text{ m}$ ◀



PROBLEM 13.62

An elastic cable is to be designed for bungee jumping from a tower 130 ft high. The specifications call for the cable to be 85 ft long when unstretched, and to stretch to a total length of 100 ft when a 600-lb weight is attached to it and dropped from the tower. Determine (*a*) the required spring constant *k* of the cable, (*b*) how close to the ground a 186-lb man will come if he uses this cable to jump from the tower.

SOLUTION

(*a*) Conservation of energy:

$$V_1 = 0 \quad T_1 = 0 \quad V_1 = 100\,W$$

Datum at ②:

$$V_1 = (100 \text{ ft})(600 \text{ lb})$$

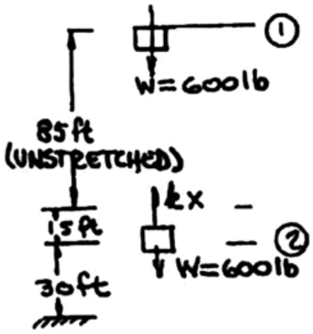
$$= 6 \times 10^4 \text{ ft} \cdot \text{lb}$$

$$V_2 = 0 \quad T_2 = 0$$

$$V_2 = V_g + V_e = 0 + \frac{1}{2}k(15 \text{ ft})^2$$

$$T_1 + V_1 = T_2 + V_2$$

$$0 + 6 \times 10^4 = 0 + (112.5)k$$



①
W=600lb
85ft
(UNSTRETCHED)
x
15ft
②
W=600lb

$k = 533$ lb/ft ◀

(*b*) From (*a*), $k = 533$ lb/ft

$$T_1 = 0$$

$$W = 186 \text{ lb}$$

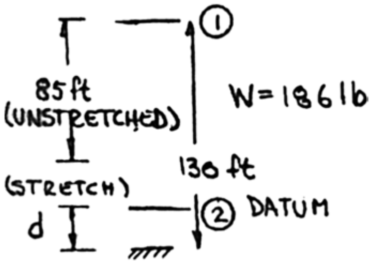
$$V_1 = (186)(130 - d)$$

$$T_2 = 0$$

Datum:

$$V_2 = V_g + V_e = 0 + \frac{1}{2}(533)(130 - 85 - d)^2$$

$$V_2 = (266.67)(45 - d)^2$$



①
85ft
(UNSTRETCHED)
W=186lb
130 ft
(STRETCH)
d
② DATUM

PROBLEM 13.62 (Continued)

d = distance from the ground $\qquad T_1 + V_1 = T_2 + V_2$

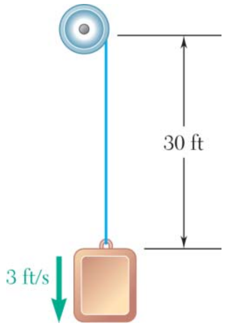
$$0 + (186)(130 - d) = 0 + (266.67)(45 - d)^2$$

$$266.7d^2 - 23815d + 515827 = 0$$

$$d = \frac{23815 \mp \sqrt{(23815)^2 - 4(266.7)(515827)}}{(2)(266.7)} = \begin{matrix} 36.99 \text{ ft} \\ 52.3 \text{ ft} \end{matrix}$$

Discard 52.3 ft (since the cord acts in compression when rebound occurs).

$d = 37.0$ ft ◀



PROBLEM 13.63

It is shown in mechanics of materials that the stiffness of an elastic cable is $k = AE/L$ where A is the cross sectional area of the cable, E is the modulus of elasticity and L is the length of the cable. A winch is lowering a 4000-lb piece of machinery using at a constant speed of 3ft/s when the winch suddenly stops. Knowing that the steel cable has a diameter of 0.4 in., $E = 29 \times 10^6$ lb/in^2, and when the winch stops $L = 30$ ft, determine the maximum downward displacement of the piece of machinery from the point it was when the winch stopped.

SOLUTION

Mass of machinery:
$$m = \frac{W}{g} = \frac{4000}{32.2} = 124.22\ \text{lb}\cdot\text{s}^2/\text{ft}$$

Let position 1 be the state just before the winch stops and the gravitational potential V_g be equal to zero at this state.

For the cable,
$$A = \frac{\pi}{4}(\text{diameter})^2 = \frac{\pi}{4}(0.4\ \text{in.})^2 = 0.12566\ \text{in}^2$$

$$AE = (0.12556\ \text{in.}^2)(29\times 10^6\ \text{lb/in}^2) = 3.6442\times 10^6\ \text{lb}$$

For
$$L = 30\ \text{ft},\quad k = \frac{AE}{L} = \frac{3.6442\times 10^6\ \text{lb}}{30\ \text{ft}} = 121.47\times 10^3\ \text{lb/ft}$$

Initial force in cable (equilibrium):
$$F_1 = W = 4000\ \text{lb.}$$

Elongation in position 1:
$$x_1 = \frac{F_1}{k} = \frac{4000}{121.47\times 10^3} = 0.03293\ \text{ft}$$

Potential energy:
$$V_1 = \frac{1}{2}kx_1^2 = \frac{F_1^2}{2k}$$

$$V_1 = \frac{(4000\ \text{lb})^2}{(2)(121.47\times 10^3\ \text{lb/ft})} = 65.860\ \text{ft}\cdot\text{lb}$$

Kinetic energy:
$$T_1 = \frac{1}{2}mv_1^2$$

$$T_1 = \frac{1}{2}(124.22\ \text{lb}\cdot\text{s}^2/\text{ft})(3\ \text{ft/s}^2) = 558.99\ \text{ft}\cdot\text{lb}$$

Let position 2 be the position of maximum downward displacement. Let x_2 be the elongation in this position.

Potential energy:
$$V_2 = \frac{1}{2}kx_2^2 - W(x_2 - x_1)$$

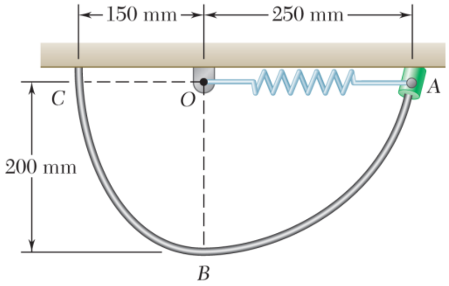
$$V_2 = \frac{1}{2}(121.47\times10^3)x_2^2 - (4000)(x_2 - 0.03293)$$
$$= 60.735\times10^3 x^2 - 4000x_2 + 131.72$$

Kinetic energy: $T_2 = 0$ (since $v_2 = 0$)

Principle of work and energy: $T_1 + V_1 = T_2 + V_2$

$$558.99 + 65.860 = 60.735\times10^3 x_2^2 - 4000x_2 + 131.72$$
$$60.735\times10^3 x_2^2 - 4000x_2 - 493.13 = 0$$
$$x_2 = 0.12887\text{ ft}$$

Maximum displacement: $\delta = x_2 - x_1 = 0.09594\text{ ft}$ $\delta = 1.151\text{ in.}$



PROBLEM 13.64

A 2-kg collar is attached to a spring and slides without friction in a vertical plane along the curved rod *ABC*. The spring is undeformed when the collar is at *C* and its constant is 600 N/m. If the collar is released at *A* with no initial velocity, determine its velocity (*a*) as it passes through *B*, (*b*) as it reaches *C*.

SOLUTION

Spring elongations:

At *A*, $x_A = 250 \text{ mm} - 150 \text{ mm} = 100 \text{ mm} = 0.100 \text{ m}$

At *B*, $x_B = 200 \text{ mm} - 150 \text{ mm} = 50 \text{ mm} = 0.050 \text{ m}$

At *C*, $x_C = 0$

PROBLEM 13.66 (Continued)

(*b*) Velocity at *A*:

Point *D*:

$$V_D = 0 \quad T_D = 0 \quad V_D = 1\ \text{lb}\cdot\text{ft}[\text{see Part }(a)]$$

Point *A*:

$$T_A = \frac{1}{2}mv_A^2 = \frac{1}{2}\frac{(0.5\ \text{lb})}{(32.2\ \text{ft/s}^2)}v_A^2$$

$$T_A = 0.0077640v_A^2$$

$$V_A = (V_A)_g = W(R) = (0.5\ \text{lb})(1\ \text{ft}) = 0.5\ \text{lb}\cdot\text{ft}$$

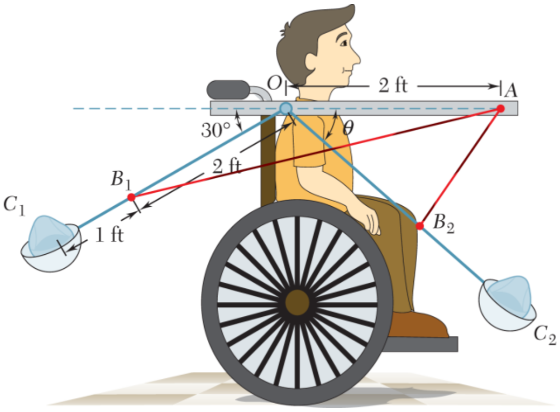
$$T_A + V_A = T_D + V_D$$

$$0.0077640v_A^2 + 0.5 = 0 + 1$$

$$v_A^2 = 64.4\ \text{ft}^2/\text{s}^2$$

$\mathbf{v}_A = 8.02$ ft/s ↓ ◀

PROBLEM 13.67



Cornhole is a game that requires you to toss beanbags through a hole in a wooden board. People with limited arm mobility often have difficulty enjoying this favorite tailgating activity. An adapted launching device attaches to a wheelchair so that points O and A are fixed. The device mimics an underhand throw by utilizing an elastic band to power the arm OC, which rotates about pin O. The elastic cord has an unstretched length of 1 ft and is attached to fixed point A and to point B on the arm. The combined weight of the beanbag and holder at C is 4 lbs, and you can neglect the weight of the rod OB. Knowing that the starting position is 30 degrees from the horizontal as shown in the figure, determine the spring constant if the velocity of the bean bag is 31 ft/s when the bag is released at an angle of θ = 45 degrees.

SOLUTION

Given:

$l_O = 1$ ft

$m = \dfrac{4 \text{ lbs}}{32.2 \text{ ft/s}^2} = 0.1242$ slugs

$v_2 = 31$ ft/s

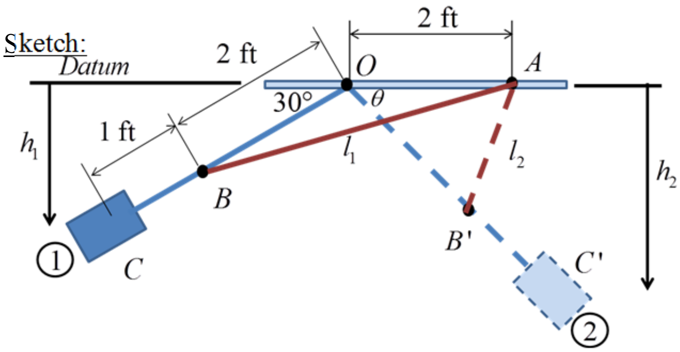
$\theta_2 = 45°$

l_i = length of cord at positon i

s_i = stretch of cord in position i

h_i = height of beanbag at position i

Sketch:



At Position 1:

From law of cosines:

$$l_1^2 = 2^2 + 2^2 + 2(2)(2)\cos 30°$$
$$l_1 = 3.864 \text{ ft}$$

Stretch in cord:

$$s_1 = l_1 - l_0$$
$$s_1 = 2.864 \text{ ft}$$

Height of beanbag:

$$h_1 = -3\sin 30°$$
$$h_1 = -1.5 \text{ ft}$$

At Position 2:

From law of cosines:

$$l_2^2 = 2^2 + 2^2 - 2(2)(2)\cos 45°$$
$$l_2 = 1.531 \text{ ft}$$

PROBLEM 13.67 (Continued)

Stretch in cord: $s_2 = l_2 - l_0$

$s_2 = 0.5307 \text{ ft}$

Height of beanbag: $h_2 = -3\sin 45°$

$h_2 = -2.1213 \text{ ft}$

Work Energy from position 1 to 2:

$$\cancel{T_1} + V_{g_1} + V_{e_1} + \cancel{U_{1\to 2}^{NC}} = T_2 + V_{g_2} + V_{e_2} \qquad \text{where:}$$

$$V_{g_1} = mgh_1,\ V_{e_1} = \frac{1}{2}ks_1^2$$

$$T_2 = \frac{1}{2}mv_2^2,\ V_{g_2} = mgh_2$$

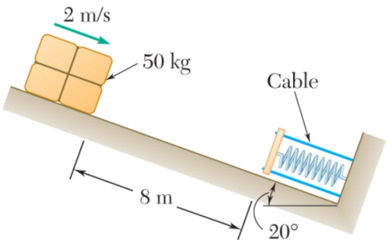
$$V_{e_2} = \frac{1}{2}ks_2^2$$

Therefore: $mgh_1 + \frac{1}{2}ks_1^2 = \frac{1}{2}mv_2^2 + mgh_2 + \frac{1}{2}ks_2^2$

Substitute known values:

$$(0.1242)(32.2)(-1.5) + \frac{1}{2}k(2.864)^2 = \frac{1}{2}(0.1242)31^2 + (0.1242)(32.2)(-2.1213) + \frac{1}{2}k(0.5307)^2$$

Solve for *k*: $k = 14.447 \text{ lb/ft}$ $\qquad k = 1.204 \text{ lb/in}$ ◀



PROBLEM 13.68

A spring is used to stop a 50-kg package which is moving down a 20º incline. The spring has a constant $k = 30$ kN/m and is held by cables so that it is initially compressed 50 mm. Knowing that the velocity of the package is 2 m/s when it is 8 m from the spring and neglecting friction, determine the maximum additional deformation of the spring in bringing the package to rest.

SOLUTION

Let position 1 be the starting position 8 m from the end of the spring when it is compressed 50 mm by the cable. Let position 2 be the position of maximum compression. Let x be the additional compression of the spring. Use the principle of conservation of energy. $T_1 + V_1 = T_2 + V_2$.

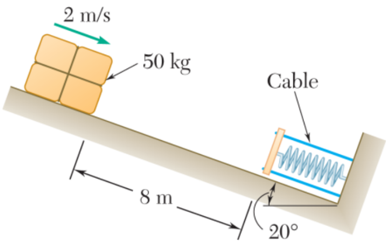
Position 1:
$$T_1 = \frac{1}{2}mv_1^2 = \frac{1}{2}(50)(2)^2 = 100 \text{ J}$$
$$V_{1g} = mgh_1 = (50)(9.81)(8 \sin 20°) = 1342.09 \text{ J}$$
$$V_{1e} = \frac{1}{2}ke_1^2 = \frac{1}{2}(30 \times 10^3)(0.050)^2 = 37.5 \text{ J}$$

Position 2:
$$T_2 = \frac{1}{2}mv_2^2 = 0 \quad \text{since} \quad v_2 = 0.$$
$$V_{2g} = mgh_2 = (50)(9.81)(-x \sin 20°) = -167.76x$$
$$V_{2e} = \frac{1}{2}ke_2^2 = \frac{1}{2}(30 \times 10^3)(0.05 + x)^2 = 37.5 + 1500x + 15000x^2$$

Principle of conservation of energy:
$$100 + 1342.09 + 37.5 = -167.61x + 37.5 + 1500x + 15000x^2$$
$$15{,}000x^2 + 1332.24x - 1442.09 = 0$$

Solving for x,
$$x = 0.26882 \quad \text{and} \quad -0.357\,64$$

$x = 0.269$ m ◀



PROBLEM 13.69

Solve Problem 13.68 assuming the kinetic coefficient of friction between the package and the incline is 0.2.

PROBLEM 13.68 A spring is used to stop a 50-kg package which is moving down a 20° incline. The spring has a constant $k = 30$ kN/m and is held by cables so that it is initially compressed 50 mm. Knowing that the velocity of the package is 2 m/s when it is 8 m from the spring and neglecting friction, determine the maximum additional deformation of the spring in bringing the package to rest.

SOLUTION

Let position 1 be the starting position 8 m from the end of the spring when it is compressed 50 mm by the cable. Let position 2 be the position of maximum compression. Let x be the additional compression of the spring. Use the principle of work and energy. $T_1 + V_1 + U_{1\to 2} = T_2 + V_2$

Position 1.

$$T_1 = \frac{1}{2}mv_1^2 = \frac{1}{2}(50)(2)^2 = 100 \text{ J}$$

$$V_{1g} = mgh_1 = (50)(9.81)(8\sin 20°) = 1342.09 \text{ J}$$

$$V_{1e} = \frac{1}{2}ke_1^2 = \frac{1}{2}(30\times 10^3)(0.05)^2 = 37.5 \text{ J}$$

Position 2.

$$T_2 = \frac{1}{2}mv_2^2 = 0 \quad \text{since} \quad v_2 = 0.$$

$$V_{2g} = mgh_2 = (50)(9.81)(-x\sin 20°) = -167.76x$$

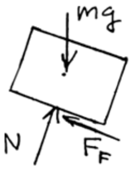
$$V_{2e} = \frac{1}{2}ke_2^2 = \frac{1}{2}(30\times 10^3)(0.05 + x)^2 = 37.5 + 1500x + 15{,}000x^2$$

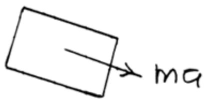
Work of the friction force.

$$+\nearrow \; \Sigma F_n = 0$$

$$N - mg\cos 20° = 0$$

$$\begin{aligned} N &= mg\cos 20° \\ &= (50)(9.81)\cos 20° \\ &= 460.92 \text{ N} \\ F_f &= \mu_k N \\ &= (0.2)(460.92) \\ &= 92.184 \\ U_{1\to 2} &= -F_f d \\ &= -92.184(8 + x) \\ &= -737.47 - 92.184x \end{aligned}$$





PROBLEM 13.69 (Continued)

Principle of work and energy: $T_1 + V_1 + U_{1-2} = T_2 + V_2$

$$100 + 1342.09 + 37.5 - 737.47 - 92.184x$$

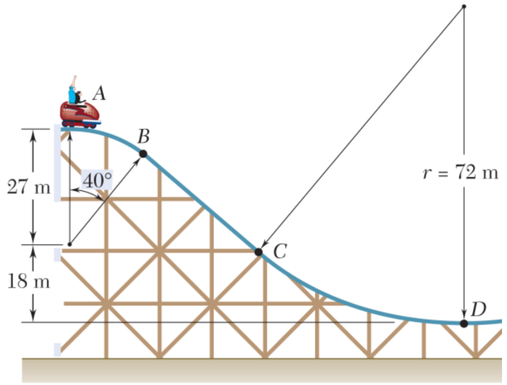
$$= -167.76x + 37.5 + 1500x + 15,000x^2$$

$$15,000\,x^2 + 1424.42x - 704.62 = 0$$

Solving for *x*,

$$x = 0.17440 \quad \text{and} \quad -0.26936$$

$x = 0.1744$ m ◀



PROBLEM 13.70

A section of track for a roller coaster consists of two circular arcs *AB* and *CD* joined by a straight portion *BC*. The radius of *AB* is 27 m and the radius of *CD* is 72 m. The car and its occupants, of total mass 250 kg, reach Point *A* with practically no velocity and then drop freely along the track. Determine the normal force exerted by the track on the car as the car reaches point *B*. Ignore air resistance and rolling resistance.

SOLUTION

Calculate the speed of the car as it reaches Point *B* using the principle of conservation of energy as the car travels from position *A* to position *B*.

Position *A*: $v_A = 0, \quad T_A = \frac{1}{2}mv_A^2 = 0, \quad V_A = 0$ (datum)

Position *B*: $V_B = -mgh$

where *h* is the decrease in elevation between *A* and *B*.

$$T_B = \frac{1}{2}mv_B^2$$

Conservation of energy: $T_A + V_A = T_B + V_B$:

$$0 + 0 = \frac{1}{2}mv_B^2 - mgh$$

$$v_B^2 = 2gh$$

$$= (2)(9.81\ \text{m/s}^2)(27\ \text{m})(1-\cos 40^\circ)$$

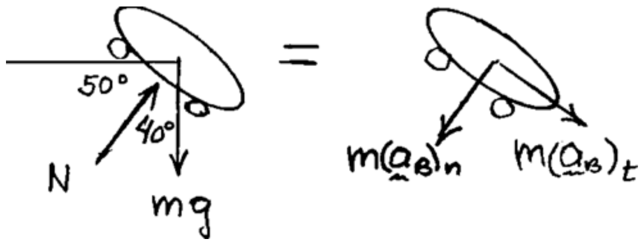
$$= 123.94\ \text{m}^2/\text{s}^2$$

Normal acceleration at *B*:

$$(a_B)_n = \frac{v_B^2}{\rho} = \frac{123.94\ \text{m}^2/\text{s}^2}{27\ \text{m}} = 4.59\ \text{m/s}^2$$

$$(\mathbf{a}_B)_n = 4.59\ \text{m/s}^2 \swarrow 50^\circ$$

Apply Newton's second law to the car at *B*.



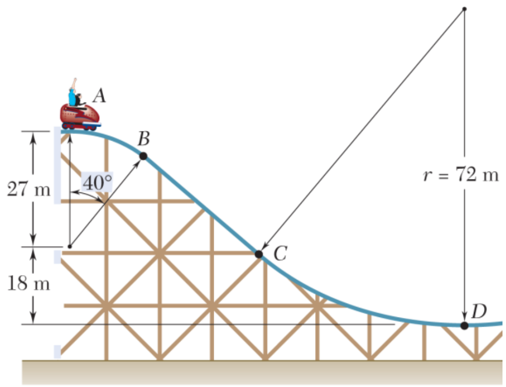
PROBLEM 13.70 (Continued)

$$\measuredangle 50^\circ \Sigma F_n = ma_n: \quad N - mg\cos 40^\circ = -ma_n$$

$$N = mg\cos 40^\circ - ma_n = m(g\cos 40^\circ - a_n)$$

$$= (250\text{ kg})[(9.81\text{ m/s}^2)\cos 40^\circ - 4.59\text{ m/s}^2]$$

$$= 1878.7 - 1147.5 \qquad N = 731\text{ N} \blacktriangleleft$$



PROBLEM 13.71

A section of track for a roller coaster consists of two circular arcs *AB* and *CD* joined by a straight portion *BC*. The radius of *AB* is 27 m and the radius of *CD* is 72 m. The car and its occupants, of total mass 250 kg, reach Point *A* with practically no velocity and then drop freely along the track. Determine the maximum and minimum values of the normal force exerted by the track on the car as the car travels from *A* to *D*. Ignore air resistance and rolling resistance.

SOLUTION

Calculate the speed of the car as it reaches Point *P*, any point on the roller coaster track. Apply the principle of conservation of energy.

Position *A*: $v_A = 0, \quad T_A = \frac{1}{2}mv_A^2 = 0, \quad V_A = 0$ (datum)

Position *P*: $V_P = -mgh$

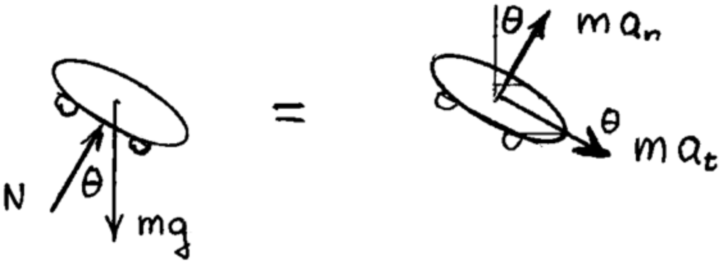
where *h* is the decrease in elevation along the track.

$$T_P = \frac{1}{2}mv^2$$

Conservation of energy: $T_A + V_A = T_P + V_P$

$$0 + 0 = \frac{1}{2}mv^2 - mgh \qquad v^2 = 2gh \qquad (1)$$

Calculate the normal force using Newton's second law. Let θ be the slope angle of the track.



$$\Sigma F_n = ma_n: \quad N - mg\cos\theta = ma_n$$

$$N = mg\cos\theta + ma_n \qquad (2)$$

Over portion *AB* of the track, $h = \rho(1 - \cos\theta)$

and $a_n = -\frac{mv^2}{\rho}$

where ρ is the radius of curvature. ($\rho = 27$ m)

$$N = mg\cos\theta - \frac{2mg\rho(1-\cos\theta)}{\rho} = mg(3\cos\theta - 2)$$

At Point A ($\theta = 0$) $\quad N_A = mg = (250)(9.81) = 2452.5 \text{ N}$

At Point B ($\theta = 40°$) $\quad N_B = (2452.5)(3\cos 40° - 2)$

$$N_B = 731 \text{ N}$$

Over portion BC, $\quad \theta = 40°, \quad a_n = 0 \quad$ (straight track)

$$N_{BC} = mg\cos 40° = 2452.5\cos 40°$$
$$N_{BC} = 1879 \text{ N}$$

Over portion CD, $\quad h = h_{\max} - r(1-\cos\theta)$

and $\quad a_n = \dfrac{mv^2}{r}$

where r is the radius of curvature. ($r = 72$ m)

$$\begin{aligned} N &= mg\cos\theta + \frac{2mgh}{r} \\ &= mg\cos\theta + 2mg\left(\frac{h_{\max}}{r} - 1 - \cos\theta\right) \\ &= mg\left(3\cos\theta - 2 + \frac{2h_{\max}}{r}\right) \end{aligned}$$

which is maximum at Point D, where

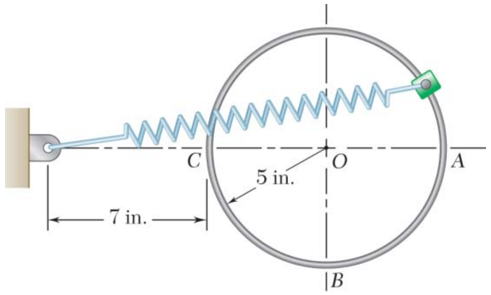
$$N_D = mg\left(1 + \frac{2h_{\max}}{r}\right)$$

Data: $\quad h_{\max} = 27 + 18 = 45 \text{ m}, \quad r = 72 \text{ m}$

$$N_D = (2452.5)\left[1 + \frac{(2)(45)}{72}\right] = 5520 \text{ N}$$

Summary: minimum (just above B): 731 N ◀

maximum (at D): 5520 N ◀



PROBLEM 13.72

A 1-lb collar is attached to a spring and slides without friction along a circular rod in a *vertical* plane. The spring has an undeformed length of 5 in. and a constant $k = 10$ lb/ft. Knowing that the collar is released from being held at A determine the speed of the collar and the normal force between the collar and the rod as the collar passes through B.

SOLUTION

For the collar, $$m = \frac{W}{g} = \frac{1}{32.2} = 0.031056 \text{ lb}\cdot\text{s}^2/\text{ft}$$

For the spring, $$k = 10 \text{ lb/ft} \quad l_0 = 5 \text{ in.}$$

At A: $$\ell_A = 7 + 5 + 5 = 17 \text{ in.}$$
$$\ell_\Delta - \ell_0 = 12 \text{ in.} = 1 \text{ ft}$$

At B: $$\ell_B = \sqrt{(7+5)^2 + 5^2} = 13 \text{ in.}$$
$$\ell_B - \ell_0 = 1.8 \text{ in.} = \frac{2}{3}\text{ft}$$

Velocity of the collar at B.

Use the principle of conservation of energy.

$$T_A + V_A = T_B + V_B$$

Where $$T_A = \frac{1}{2}mv_A^2 = 0$$

$$V_A = \frac{1}{2}k(\ell_A - \ell_0)^2 + W(0)$$
$$= \frac{1}{2}(10)(1)^2 + 0 = 5 \text{ ft}\cdot\text{lb}$$
$$T_B = \frac{1}{2}mv_B^2 = \frac{1}{2}(0.031056)v_B^2 = 0.015528v_B^2$$
$$V_B = \frac{1}{2}k(\ell_B - \ell_0)^2 + Wh$$
$$= \frac{1}{2}(10)\left(\frac{2}{3}\right)^2 + (1)\left(-\frac{5}{12}\right)$$
$$= 1.80556 \text{ ft}\cdot\text{lb}$$
$$0 + 5 = 0.015528v_B^2 = 1.80556$$
$$v_B^2 = 205.72 \text{ ft}^2/\text{s}^2$$

$v_B = 14.34$ ft/s ◀

PROBLEM 13.72 (Continued)

$$\rho = 14\text{ in.} = 1.16667\text{ ft}$$

$$(a_A)_n = \frac{285.32\text{ ft}^2/\text{s}^2}{1.16667\text{ ft}} \qquad (\mathbf{a}_A)_n = 244.56\text{ ft/s}^2 \downarrow$$

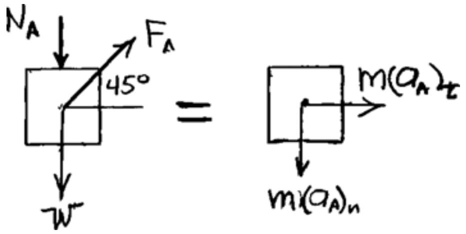
$$(a_B)_n = \frac{189.10\text{ ft}^2/\text{s}^2}{1.16667\text{ ft}} \qquad (\mathbf{a}_B)_n = 159.58\text{ ft/s}^2 \longleftarrow$$

Spring forces at *A* and *B*: $F = kx$

$$F_A = (4\text{ lb/in.})(5.799\text{ in.}) \qquad \mathbf{F}_A = 23.196\text{ lb} \measuredangle 45^\circ$$

$$F_B = (4\text{ lb/in.})(14\text{ in.}) \qquad \mathbf{F}_B = 56.0\text{ lb} \uparrow$$

To determine the forces $(\mathbf{N}_A$ and $\mathbf{N}_B)$ exerted by the rod on the collar, apply Newton's second law.



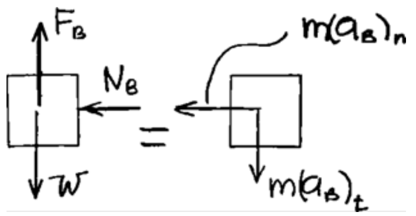
(*a*) At Point *A*:

$$\downarrow \Sigma F = m(a_A)_n:$$

$$W + N_A - F_A \sin 45^\circ = m(a_A)_n$$

$$10 + N_A - 23.196 \sin 45^\circ = (0.31056)(244.56)$$

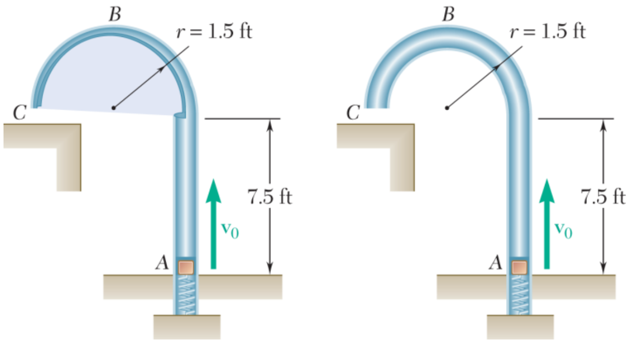
$$\mathbf{N}_A = 82.4\text{ lb} \downarrow \blacktriangleleft$$



(*b*) At Point *B*:

$$\overset{+}{\longleftarrow} \Sigma F = m(a_B)_n:$$

$$N_B = (0.31056)(159.58) \qquad \mathbf{N}_B = 49.6\text{ lb} \longleftarrow \blacktriangleleft$$

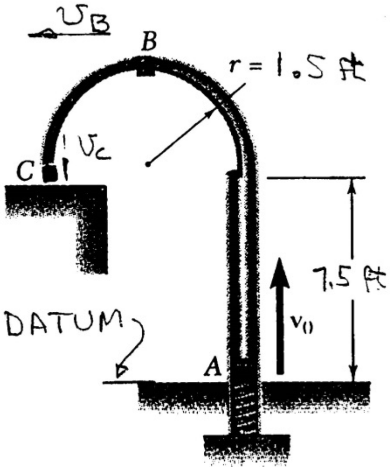


PROBLEM 13.74

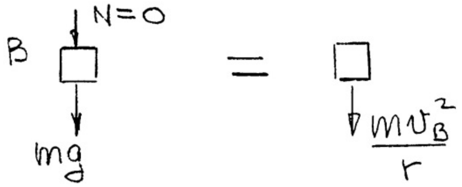
An 8-oz package is projected upward with a velocity $\mathbf{v}_0$ by a spring at *A*; it moves around a frictionless loop and is deposited at *C*. For each of the two loops shown, determine (*a*) the smallest velocity $\mathbf{v}_0$ for which the package will reach *C*, (*b*) the corresponding force exerted by the package on the loop just before the package leaves the loop at *C*.

SOLUTION

Loop 1



(*a*) The smallest velocity at *B* will occur when the force exerted by the tube on the package is zero.



$$+\downarrow\ \Sigma F = 0 + mg = \frac{mv_B^2}{r}$$

$$v_B^2 = rg = 1.5\text{ ft}(32.2\text{ ft/s}^2)$$

$$v_B^2 = 48.30$$

At *A* $\quad T_A = \frac{1}{2}mv_0^2$

$$V_A = 0 \quad \left(8\text{ oz} = 0.5\text{ lb} \Rightarrow = \frac{0.5}{32.2} = 0.01553\right)$$

At *B* $\quad T_B = \frac{1}{2}mv_B^2 = \frac{1}{2}m(48.30) = 24.15\text{ m}$

$$V_B = mg(7.5 + 1.5) = 9mg = 9(0.5) = 4.5\text{ lb}\cdot\text{ft}$$

$$T_A + V_A = T_B + V_B:\quad \frac{1}{2}(0.01553)v_0^2 = 24.15(0.01553) + 4.5$$

$$v_0^2 = 627.82 \qquad v_0 = 25.056 \qquad\qquad v_0 = 25.1\text{ ft/s} \blacktriangleleft$$

At *C*

$$T_C = \frac{1}{2}mv_C^2 = 0.007765v_C^2 \qquad V_C = 7.5mg = 7.5(0.5) = 3.75$$

$$T_A + V_A = T_C + V_C:\quad 0.007765v_0^2 = 0.007765v_C^2 + 3.75$$

$$0.007765(25.056)^2 - 3.75 = 0.007765v_C^2$$

$$v_C^2 = 144.87$$

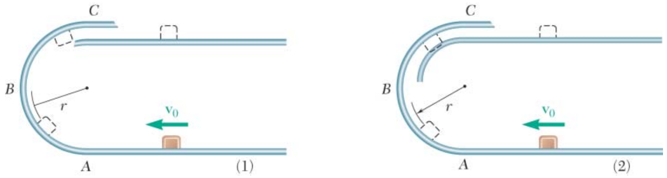
PROBLEM 13.76

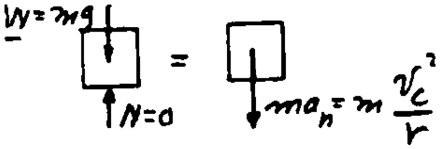


A small package of weight W is projected into a vertical return loop at A with a velocity $\mathbf{v}_0$. The package travels without friction along a circle of radius r and is deposited on a horizontal surface at C. For each of the two loops shown, determine (a) the smallest velocity $\mathbf{v}_0$ for which the package will reach the horizontal surface at C, (b) the corresponding force exerted by the loop on the package as it passes Point B.

SOLUTION

Loop 1:

(a) Newton's second law at position C:



$$+\downarrow \Sigma F = ma:$$

$$mg = m\frac{v_c^2}{r} \qquad v_c^2 = gr$$

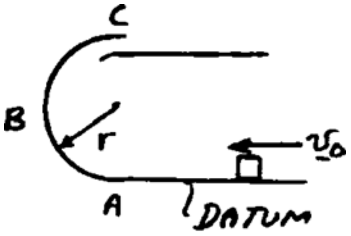
Conservation of energy between position A and B.

$$T_A = \frac{1}{2}mv_0^2$$

$$V_A = 0$$

$$T_C = \frac{1}{2}mv_C^2 = \frac{1}{2}mgr$$

$$V_C = mg(2r) = 2mgr$$



$$T_A + V_A = T_C + V_C: \quad \frac{1}{2}mv_0^2 + 0 = \frac{1}{2}mgr + 2mgr$$

$$v_0^2 = 5gr$$

Smallest velocity $\mathbf{v}_0$: $v_0 = \sqrt{5gr} \longleftarrow$ ◀

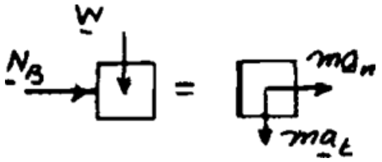
(b) Conservation of energy between positions A and B.

$$(b)\ T_B = \frac{1}{2}mv_B^2; \quad V_B = mg(r)$$

$$T_A + V_A = T_B + V_B: \quad \frac{1}{2}mv_A^2 + 0 = \frac{1}{2}mv_B^2 + mgr$$

$$\frac{1}{2}m(5gr) + 0 = \frac{1}{2}mv_B^2 + mgr \qquad v_B^2 = 3gr$$

PROBLEM 13.76 (Continued)



Newton's second law at position *B*.

$$ma_n = m\frac{v_B^2}{r} = m\frac{3gr}{r} = 3\ mg$$

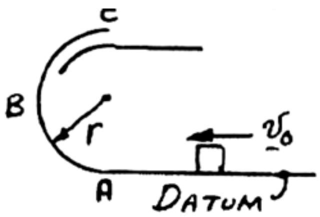
$$\xrightarrow{+} \Sigma F = \Sigma F_{eff}: \qquad N_B = 3\ mg$$

Force exerted by the loop: $N_B = 3W \longrightarrow$ ◀

Loop 2:

(*a*) At point *C*, $v_c = 0$

Conservation of energy between positions *A* and *C*.



$$T_C = \frac{1}{2}mv_C^2 = 0$$

$$V_C = mg(2r) = 2mgr$$

$$T_A + V_A = T_C + V_C:$$

$$\frac{1}{2}mv_0^2 + 0 = 0 + 2mgr$$

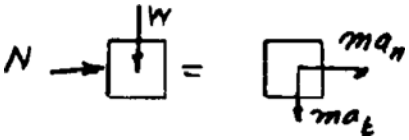
$$v_0^2 = 4gr$$

Smallest velocity $\mathbf{v}_0$: $v_0 = \sqrt{4gr} \longleftarrow$ ◀

(*b*) Conservation of energy between positions *A* and *B*.

$$T_A + V_A - T_B + V_B: \ \frac{1}{2}mv_0^2 + 0 = \frac{1}{2}mv_B^2 + mgr$$

$$\frac{1}{2}m(4gr) = \frac{1}{2}mv_B^2 + mgr \qquad v_B^2 = 2gr$$



Newton's second law at position *B*.

$$ma_n = m\frac{v_B^2}{r} = m\frac{2gr}{r} = 2\ mg$$

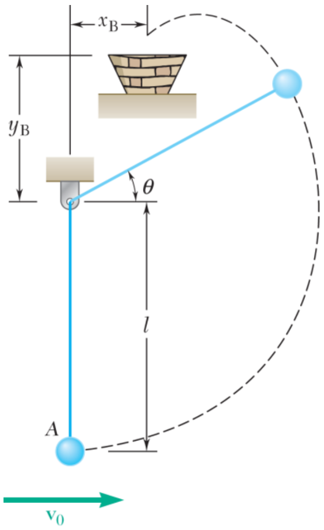
Force exerted by loop: $\mathbf{N} = 2W \longrightarrow$ ◀



PROBLEM 13.77

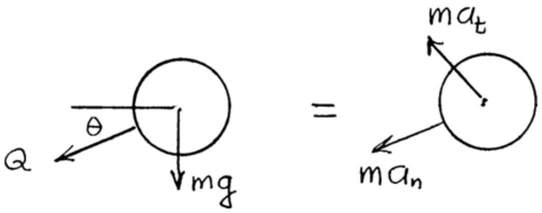
The 1 kg ball at A is suspended by an inextensible cord and given an initial horizontal velocity of 5 m/s. If $l = 0.6$ m and $x_B = 0$, determine y_B so that the ball will enter the basket.

SOLUTION

Let position 1 be at A. $v_1 = v_0$

Let position 2 be the point described by the angle where the path of the ball changes from circular to parabolic. At position 2, the tension Q in the cord is zero.

Relationship between v_2 and θ based on $Q = 0$. Draw the free body diagram.



$$+\swarrow \Sigma F = 0: \quad Q + mg\sin\theta = ma_n = \frac{mv_2^2}{l}$$

With $Q = 0, \quad v_2^2 = gl\sin\theta \quad$ or $\quad v_2 = \sqrt{gl\sin\theta}$ (1)

Relationship among v_0, v_2 and θ based on conservation of energy.

$$T_1 + V_1 = T_2 + V_2$$

$$\frac{1}{2}mv_0^2 - mgl = \frac{1}{2}mv_2^2 + mgl\sin\theta$$

$$v_0^2 - v_2^2 = 2gl(1 + \sin\theta) \qquad (2)$$

Eliminating v_2 from Eqs. (1) and (2),

$$v_0^2 - gl\sin\theta = 2gl(1+\sin\theta)$$

$$\sin\theta = \frac{1}{3}\left[\frac{v_0^2}{gl} - 2\right] = \frac{1}{3}\left[\frac{(5)^2}{(9.81)(0.6)} - 2\right] = 0.74912$$

$$\theta = 48.514°$$

From Eq. (1),

$$v_2^2 = (9.81)(0.6)\sin 48.514° = 4.4093\ \text{m}^2/\text{s}^2$$

$$v_2 = 2.0998\ \text{m/s}$$

x and y coordinates at position 2.

$$x_2 = l\cos\theta = 0.6\cos 48.514° = 0.39746\ \text{m}$$

$$y_2 = l\sin\theta = 0.6\sin 48.514° = 0.44947\ \text{m}$$

Let t_2 be the time when the ball is a position 2.

Motion on the parabolic path. The horizontal motion is

$$\dot{x} = -v_2\sin\theta = -2.0998\sin 48.514°$$

$$= -1.5730\ \text{m/s}$$

$$x = x_2 - 1.5730(t - t_2)$$

At Point B,

$$x_B = 0$$

$$0 = 0.39746 - 1.5730(t_B - t_2) \quad t_B - t_2 = 0.25267\ \text{s}$$

The vertical motion is

$$y = y_2 + v_2\cos\theta(t - t_2) - \frac{1}{2}g(t - t_2)^2$$

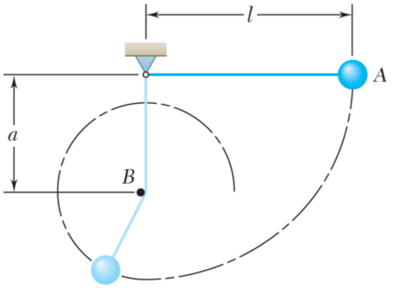
At Point B,

$$y_B = y_2 + v_2\cos\theta(t_B - t_2) - \frac{1}{2}g(t_B - t_2)^2$$

$$y_B = 0.44947 + (2.0998\cos 48.514°)(0.25267) - \frac{1}{2}(9.81)(0.25267)^2$$

$$= 0.48779\ \text{m}$$

$y_B = 0.448$ m ◀



PROBLEM 13.78

The pendulum shown is released from rest at *A* and swings through 90° before the cord touches the fixed peg *B*. Determine the smallest value of *a* for which the pendulum bob will describe a circle about the peg.

SOLUTION

Use conservation of energy from the point of release (*A*) and the top of the circle.

$$T_1 + V_1 = T_2 + V_2 \qquad \text{(1) (datum at lowest point)}$$

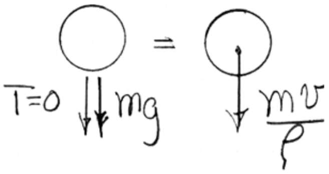
where

$$T_1 = 0; \quad V_1 = mg\ell$$

At 2 $$T_2 = \frac{1}{2}mv^2; \; V_2 = mgz = mg(2)(\ell - a)$$

Substituting into (1) $$0 + mg\ell = \frac{1}{2}mv^2 + 2mg(\ell - a) \qquad (2)$$

We need another equation – use Newton's 2nd law at the top. $\left(\text{Tension, } T_0 = 0 \text{ at top}\right)$



$$+\!\downarrow \sum F_n = ma_n \Rightarrow \cancel{m}g = \frac{\cancel{m}v^2}{\rho}$$

$$v^2 = g\rho = g(\ell - a)$$

Substituting into (2)

$$mg\ell = \frac{1}{2}mg(\ell - a) + 2mg(\ell - a)$$

$$2\ell = \ell - a + 4\ell - 4a$$

$$5a = 3\ell$$

$$a = \frac{3}{5}\ell \blacktriangleleft$$

PROBLEM 13.79*

Prove that a force $F(x, y, z)$ is conservative if, and only if, the following relations are satisfied:

$$\frac{\partial F_x}{\partial y} = \frac{\partial F_y}{\partial x} \quad \frac{\partial F_y}{\partial z} = \frac{\partial F_z}{\partial y} \quad \frac{\partial F_z}{\partial x} = \frac{\partial F_x}{\partial z}$$

SOLUTION

For a conservative force, Equation (13.22) must be satisfied.

$$F_x = -\frac{\partial V}{\partial x} \quad F_y = -\frac{\partial V}{\partial y} \quad F_z = -\frac{\partial V}{\partial z}$$

We now write $$\frac{\partial F_x}{\partial y} = -\frac{\partial^2 V}{\partial x \partial y} \quad \frac{\partial F_y}{\partial x} = -\frac{\partial^2 V}{\partial y \partial x}$$

Since $\dfrac{\partial^2 V}{\partial x \partial y} = \dfrac{\partial^2 V}{\partial y \partial x}$: $$\frac{\partial F_x}{\partial y} = \frac{\partial F_y}{\partial x} \blacktriangleleft$$

We obtain in a similar way

$$\frac{\partial F_y}{\partial z} = \frac{\partial F_z}{\partial y} \quad \frac{\partial F_z}{\partial x} = \frac{\partial F_x}{\partial z} \blacktriangleleft$$

PROBLEM 13.80

The force $\mathbf{F} = (yz\mathbf{i} + zx\mathbf{j} + xy\mathbf{k})/xyz$ acts on the particle $P(x, y, z)$ which moves in space. (*a*) Using the relation derived in Problem 13.79, show that this force is a conservative force. (*b*) Determine the potential function associated with **F**.

SOLUTION

(*a*)

$$F_x = \frac{yz}{xyz} \quad F_y = \frac{zx}{xyz} \quad F_z = \frac{xy}{xyz}$$

$$\frac{\partial F_x}{\partial y} = \frac{\partial\left(\frac{1}{x}\right)}{\partial y} = 0 \quad \frac{\partial F_y}{\partial x} = \frac{\partial\left(\frac{1}{y}\right)}{\partial x} = 0$$

Thus,

$$\frac{\partial F_x}{\partial y} = \frac{\partial F_y}{\partial x}$$

The other two equations derived in Problem 13.79 are checked in a similar way.

(*b*) Recall that

$$F_x = -\frac{\partial V}{\partial x}, \qquad F_y = -\frac{\partial V}{\partial y}, \qquad F_z = -\frac{\partial V}{\partial z}$$

$$F_x = \frac{1}{x} = -\frac{\partial V}{\partial x} \qquad V = -\ln x + f(y, z) \tag{1}$$

$$F_y = \frac{1}{y} = -\frac{\partial V}{\partial y} \qquad V = -\ln y + g(z, x) \tag{2}$$

$$F_z = \frac{1}{z} = -\frac{\partial V}{\partial z} \qquad V = -\ln z + h(x, y) \tag{3}$$

Equating (1) and (2)

$$-\ln x + f(y, z) = -\ln y + g(z, x)$$

Thus,

$$f(y, z) = -\ln y + k(z) \tag{4}$$

$$g(z, x) = -\ln x + k(z) \tag{5}$$

Equating (2) and (3)

$$-\ln z + h(x, y) = -\ln y + g(z, x)$$

$$g(z, x) = -\ln z + l(x)$$

From (5),

$$g(z, x) = -\ln x + k(z)$$

PROBLEM 13.80 (Continued)

Thus,

$$k(z) = -\ln z$$

$$l(x) = -\ln x$$

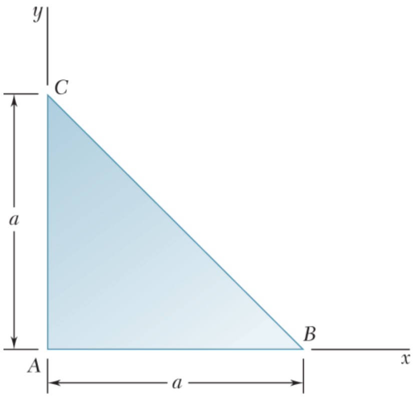
From (4),

$$f(y,z) = -\ln y - \ln z$$

Substitute for $f(y,z)$ in (1)

$$V = -\ln x - \ln y - \ln z$$

$V = -\ln xyz$ ◀

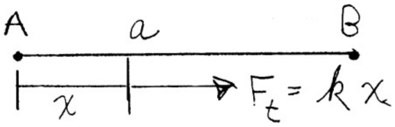


PROBLEM 13.81*

A force **F** acts on a particle $P(x, y)$ which moves in the xy plane. Determine whether **F** is a conservative force and compute the work of **F** when P describes the path $ABCA$ knowing that (*a*) $\mathbf{F} = (kx + y)\mathbf{i} + (kx + y)\mathbf{j}$, (*b*) $\mathbf{F} = (kx + y)\mathbf{i} + (x + ky)\mathbf{j}$.

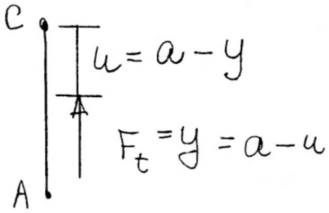
SOLUTION

(*a*)



$$U_{AB} = \int_0^a kx\,dx = k\frac{a^2}{2}$$

$$F_x = F_y, \quad \therefore \quad F \text{ is normal } to\ BC, \quad U_{BC} = 0$$



$$U_{CA} = \int_0^a -(a-u)\,du = \frac{-a^2}{2}$$

$$U_{ABCA} = (k-1)\frac{a^2}{2}, \text{ not conservative} ◀$$

(*b*) From Problem 13.79,

$$\frac{\partial F_x}{\partial y} = 1 = \frac{\partial F_y}{\partial x}$$

Conservative, $U_{ABCA} = 0$ ◀

PROBLEM 13.82*

The potential function associated with a force **P** in space is known to be $V(x, y, z) = -(x^2 + y^2 + z^2)^{1/2}$. (*a*) Determine the *x*, *y*, and *z* components of **P**. (*b*) Calculate the work done by **P** from *O* to *D* by integrating along the path *OABD*, and show that it is equal to the negative of the change in potential from *O* to *D*.

SOLUTION

(*a*) $$P_x = -\frac{\partial V}{\partial x} = -\frac{\partial[-(x^2 + y^2 + z^2)^{1/2}]}{\partial x} = x(x^2 + y^2 + z^2)^{-1/2}$$ ◀

$$P_y = -\frac{\partial V}{\partial y} = -\frac{\partial[-(x^2 + y^2 + z^2)^{1/2}]}{\partial y} = y(x^2 + y^2 + z^2)^{-1/2}$$ ◀

$$P_z = -\frac{\partial V}{\partial z} = -\frac{\partial[-(x^2 + y^2 + z^2)^{1/2}]}{\partial z} = z(x^2 + y^2 + z^2)^{-1/2}$$ ◀

(*b*) $U_{OABD} = U_{OA} + U_{AB} + U_{BD}$

O–A: P_y and P_x are perpendicular to *O–A* and do no work.

Also, on *O–A* $\quad x = y = 0$ and $P_z = 1$

Thus, $$U_{O-A} = \int_0^a P_z dz = \int_0^a dz = a$$

A–B: P_z and P_y are perpendicular to *A–B* and do no work.

Also, on *A–B* $\quad y = 0, \quad z = a$ and $P_x = \dfrac{x}{(x^2 + a^2)^{1/2}}$

Thus, $$U_{A-B} = \int_0^a \frac{xdx}{(x^2 + a^2)^{1/2}}$$
$$= a(\sqrt{2} - 1)$$

B–D: P_x and P_z are perpendicular to *B–D* and do no work.

On *B–D*, $\quad k = a$

$z = a$

$$P_y = \frac{y}{(y^2 + 2a^2)^{1/2}}$$

PROBLEM 13.82* (Continued)

Thus, $$U_{BD} = \int_0^a \frac{y}{(y^2 + 2a^2)^{1/2}}\,dy = (y^2 + 2a^2)^{1/2}\Big|_0^a$$

$$U_{BD} = (a^2 + 2a^2)^{1/2} - (2a^2)^{1/2} = a(\sqrt{3} - \sqrt{2})$$

$$U_{OABD} = U_{O-A} + U_{A-B} + U_{B-D}$$

$$= a + a(\sqrt{2} - 1) + a(\sqrt{3} - \sqrt{2})$$

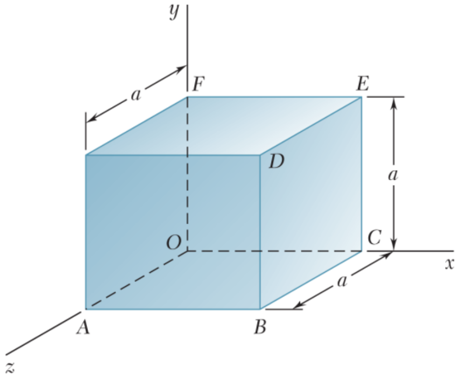
$U_{OABD} = a\sqrt{3}$ ◀

$$\Delta V_{OD} = V(a,a,a) - V(0,0,0)$$

$$= -(a^2 + a^2 + a^2)^{1/2} - 0$$

$\Delta V_{OD} = -a\sqrt{3}$ ◀

Thus, $$U_{OABD} = -\Delta V_{OD}$$

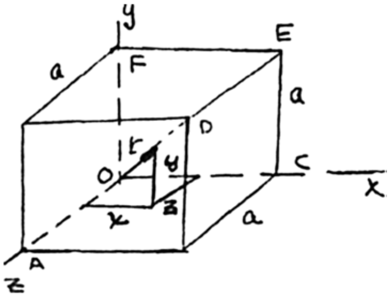


PROBLEM 13.83*

(*a*) Calculate the work done from *D* to *O* by the force **P** of Problem 13.82 by integrating along the diagonal of the cube. (*b*) Using the result obtained and the answer to part *b* of Problem 13.82, verify that the work done by a conservative force around the closed path *OABDO* is zero.

PROBLEM 13.82 The potential function associated with a force **P** in space is known to be $V(x, y, z) = -(x^2 + y^2 + z^2)^{1/2}$. (*a*) Determine the *x*, *y*, and *z* components of **P**. (*b*) Calculate the work done by **P** from *O* to *D* by integrating along the path *OABD*, and show that it is equal to the negative of the change in potential from *O* to *D*.

SOLUTION



From solution to (*a*) of Problem 13.82

$$\mathbf{P} = \frac{x\mathbf{i} + y\mathbf{j} + z\mathbf{k}}{(x^2 + y^2 + z^2)^{1/2}}$$

(*a*) $U_{OD} = \int_O^D \mathbf{P} \cdot d\mathbf{r}$

$$\mathbf{r} = x\mathbf{i} + y\mathbf{j} + z\mathbf{k}$$

$$d\mathbf{r} = dx\mathbf{i} + dy\mathbf{j} + dz\mathbf{k}$$

$$\mathbf{P} = \frac{x\mathbf{i} + y\mathbf{j} + z\mathbf{k}}{(x^2 + y^2 + z^2)^{1/2}}$$

Along the diagonal. $x = y = z$

Thus, $\mathbf{P} \cdot dr = \frac{3x}{(3x^2)^{1/2}} = \sqrt{3}$

$$U_{O-D} = \int_0^a \sqrt{3}\, dx = \sqrt{3}a$$

$U_{OD} = \sqrt{3}a$ ◀

(*b*) $U_{OABDO} = U_{OABD} + U_{DO}$

From Problem 13.82

$U_{OABD} = \sqrt{3}a$ at left

The work done from *D* to *O* along the diagonal is the negative of the work done from *O* to *D*.

$U_{DO} = -U_{OD} = -\sqrt{3}a$ [see part (*a*)]

Thus,

$U_{OABDO} = \sqrt{3}a - \sqrt{3}a = 0$ ◀

PROBLEM 13.84*

The force $\mathbf{F} = (x\mathbf{i} + y\mathbf{j} + z\mathbf{k})/(x^2 + y^2 + z^2)^{3/2}$ acts on the particle $P(x, y, z)$ which moves in space. (*a*) Using the relations derived in Problem 13.79, prove that **F** is a conservative force. (*b*) Determine the potential function $V(x, y, z)$ associated with **F**.

SOLUTION

(*a*)

$$F_x = \frac{x}{(x^2 + y^2 + z^2)^{3/2}}$$

$$F_y = \frac{y}{(x^2 + y^2 + z^2)^{1/2}}$$

$$\frac{\partial F_x}{\partial y} = \frac{x\left(-\frac{3}{2}\right)(2y)}{(x^2 + y^2 + z^2)^{5/2}}$$

$$\frac{\partial F_y}{\partial x} = \frac{y\left(-\frac{3}{2}\right)2y}{(x^2 + y^2 + z^2)^{5/2}}$$

Thus,

$$\frac{\partial F_x}{\partial y} = \frac{\partial F_y}{\partial x}$$

The other two equations derived in Problem 13.79 are checked in a similar fashion.

(*b*) Recalling that

$$F_x = -\frac{\partial V}{\partial x}, \quad F_y = -\frac{\partial V}{\partial y}, \quad F_z = -\frac{\partial V}{\partial z}$$

$$F_x = -\frac{\partial V}{\partial x} \quad V = -\int \frac{x}{(x^2 + y^2 + z^2)^{3/2}} dx$$

$$V = (x^2 + y^2 + z^2)^{-1/2} + f(y, z)$$

Similarly integrating $\partial V/\partial y$ and $\partial V/\partial z$ shows that the unknown function $f(x, y)$ is a constant.

$$V = \frac{1}{(x^2 + y^2 + z^2)^{1/2}} \blacktriangleleft$$

PROBLEM 13.85

(*a*) Determine the kinetic energy per unit mass which a missile must have after being fired from the surface of the earth if it is to reach an infinite distance from the earth. (*b*) What is the initial velocity of the missile (called the *escape velocity*)? Give your answers in SI units and show that the answer to part *b* is independent of the firing angle.

SOLUTION

At the surface of the earth, $g = 9.81 \text{ m/s}^2$

$$r_1 = R = 6370 \text{ km} = 6.37 \times 10^6 \text{ m}$$

Centric force at the surface of the earth,

$$F = mg = \frac{GMm}{R^2}$$

$$GM = gR^2 = (9.81)(6.37 \times 10^6)^2 = 398.06 \times 10^{12} \text{ m}^3/\text{s}^2$$

Let position 1 be on the surface of the earth $(r_1 = R)$ and position 2 be at $r_2 = OD$. Apply the conservation of energy principle.

$$T_1 + V_1 = T_2 + V_2$$

$$\frac{1}{2}mv_1^2 - \frac{GMm}{r_1} = \frac{1}{2}mv_2^2 + \frac{GMm}{r_2}$$

$$T_1 = T_2 + \frac{GMm}{R} - \frac{GMm}{\infty}$$

$$\frac{T_1}{m} = \frac{T_2}{m} + \frac{GM}{R} = \frac{T_2}{m} + gR$$

For the escape condition set $\frac{T_2}{m} = 0$

$$\frac{T_1}{m} = gR = (9.81 \text{ m/s}^2)(6.37 \times 10^6 \text{ m}) = 62.49 \times 10^6 \text{ m}^2/\text{s}^2$$

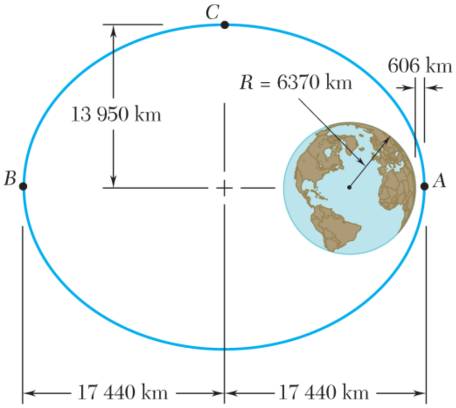
(*a*) $\frac{T_1}{m} = 62.5 \text{ MJ/kg}$ ◀

$$\frac{1}{2}mv_{\text{esc}}^2 = mgr$$

$$v_{\text{esc}} = \sqrt{2gR}$$

(*b*) $v_{\text{esc}} = \sqrt{(2)(9.81)(6.37 \times 10^6)} = 11.18 \times 10^3 \text{ m/s}$ $\quad v_{\text{esc}} = 11.18 \text{ km/s}$ ◀

Note that the escape condition depends only on the speed in position 1 and is independent of the direction of the velocity (firing angle).



PROBLEM 13.86

A satellite describes an elliptic orbit of minimum altitude 606 km above the surface of the earth. The semimajor and semiminor axes are 17,440 km and 13,950 km, respectively. Knowing that the speed of the satellite at Point C is 4.78 km/s, determine (*a*) the speed at Point A, the perigee, (*b*) the speed at Point B, the apogee.

SOLUTION

$$r_A = 6370 + 606 = 6976 \text{ km} = 6.976\times 10^6 \text{ m}$$

$$r_C = \sqrt{(17440-6976)^2 + (13950)^2} = 17438.4 \text{ km} = 17.4384\times 10^6 \text{ m}$$

$$r_B = (2)(17440) - 6976 = 27904 \text{ km} = 27.904\times 10^6 \text{ m}$$

For earth, $R = 6370 \text{ km} = 6.37\times 10^6 \text{ m}$

$$GM = gR^2 = (9.81 \text{ m/s}^2)(6.370\times 10^6)^2 = 398.06\times 10^{12} \text{ m}^3/\text{s}^2$$

$$v_C = 4.78 \text{ km/s} = 4780 \text{ m/s}$$

(*a*) *Speed at Point A*: Use conservation of energy.

$$T_A + V_A = T_C + V_C$$

$$\frac{1}{2}mv_A^2 - \frac{GMm}{r_A} = \frac{1}{2}mv_C^2 - \frac{GMm}{r_C}$$

$$v_A^2 = v_C^2 + 2GM\left(\frac{1}{r_A} - \frac{1}{r_C}\right)$$

$$= (4780)^2 + (2)(398.06\times 10^{12})\left[\frac{1}{6.976\times 10^6} - \frac{1}{17.4384\times 10^6}\right]$$

$$= 91.318\times 10^6 \text{ m}^2/\text{s}^2$$

$$V_A = 9.556\times 10^3 \text{ m/s}$$

$v_A = 9.56$ km/s ◀

(*b*) *Speed at Point B*: Use conservation of energy.

$$T_B + V_B = T_C + V_C$$

$$\frac{1}{2}mv_B^2 - \frac{GMm}{r_B} = \frac{1}{2}mv_C^2 - \frac{GMm}{r_C}$$

$$v_B^2 = v_C^2 + 2GM\left(\frac{1}{r_B} - \frac{1}{r_C}\right)$$

$$= (4780)^2 + (2)(398.06\times 10^{12})\left[\frac{1}{27.904\times 10^6} - \frac{1}{17.4384\times 10^6}\right]$$

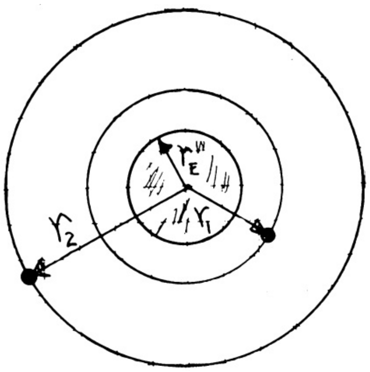
$$= 5.7258\times 10^6 \text{ m}^2/\text{s}^2$$

$v_B = 2.39\times 10^3$ m/s $\qquad$ $v_B = 2.39$ km/s ◀

PROBLEM 13.87

While describing a circular orbit 200 mi above the earth a space vehicle launches a 6000-lb communications satellite. Determine (*a*) the additional energy required to place the satellite in a geosynchronous orbit at an altitude of 22,000 mi above the surface of the earth, (*b*) the energy required to place the satellite in the same orbit by launching it from the surface of the earth, excluding the energy needed to overcome air resistance. (A *geosynchronous orbit* is a circular orbit in which the satellite appears stationary with respect to the ground).

SOLUTION



Geosynchronous orbit

$$r_1 = 3960 + 200 = 4160\text{ mi} = 21.965 \times 10^6\text{ ft}$$

$$r_2 = 3960 + 22{,}000 = 25{,}960\text{ mi} = 137.07 \times 10^6\text{ ft}$$

Total energy $\quad E = T + V = \frac{1}{2}mv^2 - \frac{GMm}{r}$

M = mass of earth

m = mass of satellite

Newton's second law $\quad F = ma_n\!: \quad \frac{GMm}{r^2} = \frac{mv^2}{r} \Rightarrow v^2 = \frac{GM}{r}$

$$T = \frac{1}{2}mv^2 = m\frac{GM}{2r} \qquad V = -\frac{GMm}{r}$$

$$E = T + V = \frac{1}{2}\frac{GMm}{r} - \frac{GMm}{r} = -\frac{1}{2}\frac{GMm}{r}$$

$$GM = gR_E^2 \qquad E = -\frac{1}{2}\frac{gR_E^2 m}{r} = -\frac{1}{2}\frac{R_E^2 W}{r} \text{ where } (W = mg)$$

$$E = -\frac{1}{2}\frac{(6000)(20.9088 \times 10^6\text{ ft})^2}{r} = -\frac{1.3115 \times 10^{18}}{r}\text{ ft}\cdot\text{lb}$$

Geosynchronous orbit at $r_2 = 137.07 \times 10^6$ ft

$$E_{Gs} = \frac{-1.3115 \times 10^{18}}{137.07 \times 10^6} = -9.5681 \times 10^9\text{ ft}\cdot\text{lb}$$

(*a*) At 200 mi, $\quad r_1 = 21.965 \times 10^6$ ft

$$E_{200} = -\frac{1.3115 \times 10^{18}}{21.965 \times 10^6} = -5.9709 \times 10^{10}$$

$$\Delta E_{300} = E_{Gs} - E_{200} = 5.0141 \times 10^{10}$$

$$\Delta E_{300} = 50.1 \times 10^9\text{ ft}\cdot\text{lb} \blacktriangleleft$$

PROBLEM 13.87 (Continued)

(*b*) Launch from earth

At launch pad $E_E = -\dfrac{GMm}{R_E} = \dfrac{-gR_E^2 m}{R_E} = -WR_E$

$$E_E = -6000(3960 \times 5280) = -1.25453 \times 10^{11}$$

$$\Delta E_E = E_{Gs} - E_E = -9.5681 \times 10^9 + 125.453 \times 10^9$$

$$\Delta E_E = 115.9 \times 10^9 \text{ ft} \cdot \text{lb} \blacktriangleleft$$

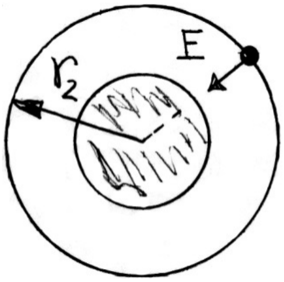
PROBLEM 13.88

How much energy per pound should be imparted to a satellite in order to place it in a circular orbit at an altitude of (*a*) 400 mi, (*b*) 4000 mi?

SOLUTION

Before launching: $r_1 = R = 3960\text{ mi}: \quad v_1 = 0, \ T = 0$

$$E_1 = -\frac{GMm}{R} = -\frac{gR^2m}{R} = -mgR$$



In circular orbit of radius $r_2 \left[cf.\text{ Equation 12.30}\right]$

Newton's second law

$$F = ma_n \qquad \frac{GMm}{r_2^2} = \frac{mv_2^2}{r_2} \qquad v_2^2 = \frac{GM}{r_2} = \frac{gR^2}{r_2}$$

$$E_2 = \frac{1}{2}mv_2^2 - \frac{GMm}{r_2} = \frac{1}{2}mg\frac{R^2}{r_2} - \frac{gR^2m}{r_2} = -\frac{1}{2}\frac{gRm}{r_2}$$

Energy imparted is $\Delta E = E_2 - E_1$

$$\Delta E = -\frac{1}{2}\frac{gmR^2}{r_2} - \left(-mgR\right) = mgR\left(1 - \frac{R}{2r_2}\right)$$

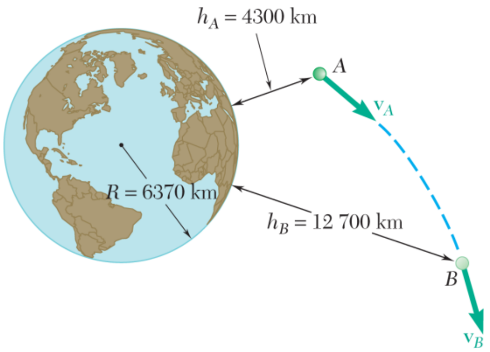
Unit weight $W = mg \qquad \dfrac{\Delta E}{W} = R\left(1 - \dfrac{R}{2r_2}\right)$

(*a*) $r_2 = 3960 + 400 = 4360\text{ mi}$

$$\frac{\Delta E}{W} = 3960\left(1 - \frac{3960}{4360}\right) \times 5280\text{ ft/mi} \qquad \frac{\Delta E}{W} = 1.918 \times 10^6\text{ ft}\cdot\text{lb/lb} \blacktriangleleft$$

(*b*) $r_2 = 3960 + 4000 = 7960\text{ mi}$

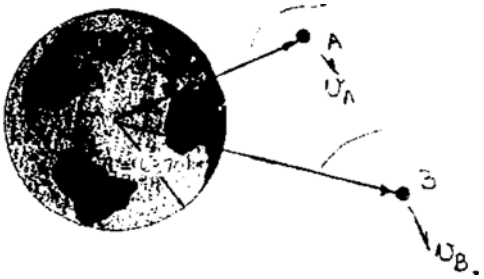
$$\frac{\Delta E}{W} = 3960\left(1 - \frac{3960}{7960}\right) \times 5280\text{ ft/mi} \qquad \frac{\Delta E}{W} = 10.51 \times 10^6\text{ ft}\cdot\text{lb/lb} \blacktriangleleft$$



PROBLEM 13.89

Knowing that the velocity of an experimental space probe fired from the earth has a magnitude $v_A = 32.5$ Mm/h at Point A, determine the speed of the probe as it passes through Point B.

SOLUTION



$$r_A = R + h_A = 6370 + 4300 = 10740 \text{ km} = 10.670 \times 10^6 \text{ m}$$

$$r_B = 6370 + 12700 = 19070 \text{ km} = 19.070 \times 10^6 \text{ m}$$

$$GM = gR^2 = (9.81)(6.370 \times 10^6)^2 = 398.06 \times 10^{12} \text{ m}^3/\text{s}^2$$

$$v_A = 32.5 \text{ Mm/h} = 9.0278 \times 10^3 \text{ m/s}$$

Use conservation of energy.

$$T_B + V_B = T_A + V_A$$

$$\frac{1}{2}mv_B^2 - \frac{GMm}{r_B} = \frac{1}{2}mv_A^2 - \frac{GMm}{r_A}$$

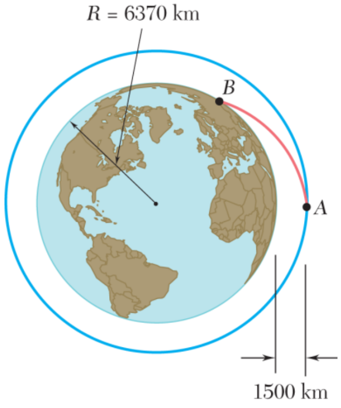
$$v_B^2 = v_A^2 + 2GM\left(\frac{1}{r_B} - \frac{1}{r_A}\right)$$

$$= (9.0278 \times 10^3)^2 + (2)(398.06 \times 10^{12})\left[\frac{1}{19.070 \times 10^6} - \frac{1}{10.670 \times 10^6}\right]$$

$$= 48.635 \times 10^6 \text{ m}^2/\text{s}^2$$

$$v_B = 6.97 \times 10^3 \text{ m/s}$$

$v_B = 25.1$ Mm/h ◀



PROBLEM 13.90

A spacecraft is describing a circular orbit at an altitude of 1500 km above the surface of the earth. As it passes through Point *A*, its speed is reduced by 40 percent and it enters an elliptic crash trajectory with the apogee at Point *A*. Neglecting air resistance, determine the speed of the spacecraft when it reaches the earth's surface at Point *B*.

SOLUTION

Circular orbit velocity

$$\frac{v_C^2}{r} = \frac{GM}{r^2}, \quad GM = gR^2$$

$$v_C^2 = \frac{GM}{r} = \frac{gR^2}{r} = \frac{(9.81\text{ m/s}^2)(6.370\times 10^6\text{ m})^2}{(6.370\times 10^6\text{ m} + 1.500\times 10^6\text{ m})}$$

$$v_C^2 = 50.579\times 10^6\text{ m}^2/\text{s}^2$$

$$v_C = 7112\text{ m/s}$$

Velocity reduced to 60% of v_C gives $v_A = 4267$ m/s.

Conservation of energy:

$$T_A + V_A = T_B + V_B$$

$$\frac{1}{2}\cancel{m}v_A^2 - \frac{GM\cancel{m}}{r_A} = \frac{1}{2}\cancel{m}v_B^2 - \frac{GM\cancel{m}}{r_B}$$

$$\frac{1}{2}(4.267\times 10^3)^2 - \frac{9.81(6.370\times 10^6)^2}{(7.870\times 10^6)} = \frac{v_B^2}{2} - \frac{9.81(6.370\times 10^6)^2}{(6.370\times 10^6)}$$

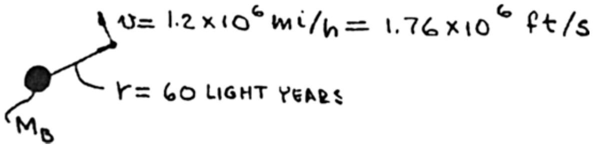
$$v_B = 6.48\times 10^3\text{ m/s}$$

$v_B = 6.48$ km/s ◀

PROBLEM 13.91

Observations show that a celestial body traveling at 1.2×10^6 mi/h appears to be describing about Point *B* a circle of radius equal to 60 light years. Point *B* is suspected of being a very dense concentration of mass called a black hole. Determine the ratio M_B/M_S of the mass at *B* to the mass of the sun. (The mass of the sun is 330,000 times the mass of the earth, and a light year is the distance traveled by light in one year at a velocity of 186,300 mi/s.)

SOLUTION



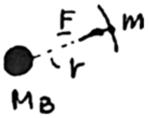
One light year is the distance traveled by light in one year.

Speed of light = 186,300 mi/s

$$r = (60\text{ yr})(186{,}300\text{ mi/s})(5280\text{ ft/mi})(365\text{ days/yr})(24\text{ h/day})(3600\text{ s/h})$$

$$r = 1.8612\times10^{18}\text{ ft}$$

Newton's second law



$$F = \frac{GM_Bm}{r^2} = m\frac{v^2}{r}$$

$$M_B = \frac{rv^2}{G}$$

$$GM_{\text{earth}} = gR_{\text{earth}}^2$$

$$= (32.2\text{ ft/s}^2)(3960\text{ mi}\times5280\text{ ft/mi})^2$$

$$= 14.077\times10^{15}(\text{ft}^3/\text{s}^2)$$

$$M_{\text{sun}} = 330{,}000M_E:\quad GM_{\text{sun}} = 330{,}000\,GM_{\text{earth}}$$

$$GM_{\text{sun}} = (330{,}000)(14.077\times10^{15})$$

$$= 4.645\times10^{21}\text{ ft}^3/\text{s}^2$$

$$G = \frac{4.645\times10^{21}}{M_{\text{sun}}}$$

$$M_B = \frac{rv^2}{G} = \frac{rv^2M_{\text{sun}}}{4.645\times10^{21}}$$

$$\frac{M_B}{M_{\text{sun}}} = \frac{(1.8612\times10^{18})(1.76\times10^6)^2}{4.645\times10^{21}}$$

$$\frac{M_B}{M_{\text{sun}}} = 1.241\times10^9 \blacktriangleleft$$

PROBLEM 13.92

(*a*) Show that, by setting $r = R + y$ in the right-hand member of Eq. (13.17′) and expanding that member in a power series in y/R, the expression in Eq. (13.16) for the potential energy V_g due to gravity is a first-order approximation for the expression given in Eq. (13.17′). (*b*) Using the same expansion, derive a second-order approximation for V_g.

SOLUTION

$$V_g = -\frac{WR^2}{r} \quad \text{setting } r = R + y\text{:} \quad V_g = -\frac{WR^2}{R+y} = -\frac{WR}{1+\frac{y}{R}}$$

$$V_g = -WR\left(1+\frac{y}{R}\right)^{-1} = -WR\left[1+\frac{(-1)}{1}\frac{y}{R}+\frac{(-1)(-2)}{1\cdot 2}\left(\frac{y}{R}\right)^2+\cdots\right]$$

We add the constant *WR*, which is equivalent to changing the datum from $r = \infty$ to $r = R$:

$$V_g = WR\left[\frac{y}{R}-\left(\frac{y}{R}\right)^2+\cdots\right]$$

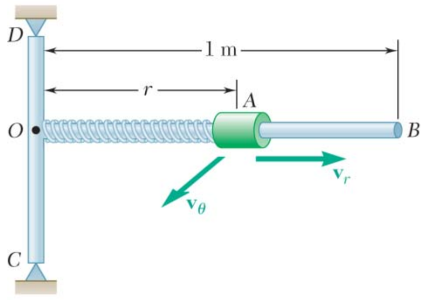
(*a*) First order approximation:

$$V_g = WR\left(\frac{y}{R}\right) = Wy \quad ◀$$

[Equation 13.16]

(*b*) Second order approximation: $V_g = WR\left[\frac{y}{R}-\left(\frac{y}{R}\right)^2\right]$

$$V_g = Wy - \frac{Wy^2}{R} \quad ◀$$



PROBLEM 13.93

Collar *A* has a mass of 3 kg and is attached to a spring of constant 1200 N/m and of undeformed length equal to 0.5 m. The system is set in motion with $r = 0.3$ m, $v_\theta = 2$ m/s, and $v_r = 0$. Neglecting the mass of the rod and the effect of friction, determine the radial and transverse components of the velocity of the collar when $r = 0.6$ m.

SOLUTION

Let position 1 be the initial position.

$$r_1 = 0.3 \text{ m}$$

$$(v_r)_1 = 0, \qquad (v_\theta)_1 = 2 \text{ m/s}, \qquad v_1 = 2 \text{ m/s}$$

$$x_1 = r_1 - l_0 = (0.3 - 0.5) = -0.2 \text{ m}$$

Let position 2 be when $r = 0.6$ m.

$$r_2 = 0.6 \text{ m}$$

$$(v_r)_2 = ?, \qquad (v_\theta)_2 = ?, \qquad v_2 = ?$$

$$x_2 = r_2 - l_0 = (0.6 - 0.5) = 0.1 \text{ m}$$

Conservation of angular momentum: $r_1 m(v_\theta)_1 = v_2 m(v_\theta)_2$

$$(v_\theta)_2 = \frac{r_1(v_\theta)_1}{r_2} = \frac{(0.3)(2)}{0.6} = 1.000 \text{ m/s}$$

Conservation of energy: $T_1 + V_1 = T_2 + V_2$

$$\frac{1}{2}mv_1^2 + \frac{1}{2}kx_1^2 = \frac{1}{2}mv_2^2 + \frac{1}{2}kx_2^2$$

$$v_2^2 = v_1^2 + \frac{k}{m}\left(x_1^2 - x_2^2\right)$$

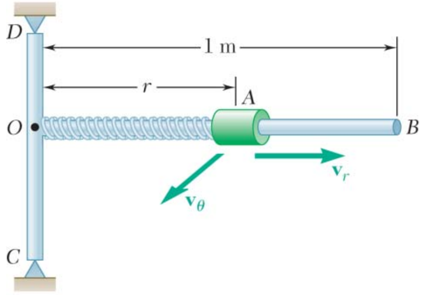
$$= (2)^2 + \frac{1200}{3}\left[(0.2)^2 - (0.1)^2\right] = 16 \text{ m}^2/\text{s}^2$$

$$(v_r)_2^2 = v_2^2 - (v_\theta)^2 = 16 - 1 = 15 \text{ m}^2/\text{s}^2$$

$$v_r = \pm 3.87 \text{ m/s}$$

$v_r = \pm 3.87$ m/s ◀

$v_\theta = 1.000$ m/s ◀



PROBLEM 13.94

Collar *A* has a mass of 3 kg and is attached to a spring of constant 1200 N/m and of undeformed length equal to 0.5 m. The system is set in motion with $r = 0.3$ m, $v_\theta = 2$ m/s, and $v_r = 0$. Neglecting the mass of the rod and the effect of friction, determine (*a*) the maximum distance between the origin and the collar, (*b*) the corresponding speed. (*Hint:* Solve the equation obtained for *r* by trial and error.)

SOLUTION

Let position 1 be the initial position.

$$r_1 = 0.3 \text{ m}$$

$$(v_r)_1 = 0, \qquad (v_\theta)_1 = 2 \text{ m/s}, \qquad v_1 = 2 \text{ m/s}$$

$$x_1 = r_1 - l_0 = 0.3 - 0.5 = -0.2 \text{ m}$$

$$T_1 = \frac{1}{2}mv^2 = \frac{1}{2}(3)(2)^2 = 6 \text{ J}$$

$$V_1 = \frac{1}{2}kx_1^2 = \frac{1}{2}(1200)(-0.2)^2 = 24 \text{ J}$$

Let position 2 be when *r* is maximum. $(v_r)_2 = 0$

$$r_2 = r_m$$

$$x_2 = (r_m - 0.5)$$

$$T_2 = \frac{1}{2}mv_2^2 = \frac{1}{2}(3)(v_\theta)_2^2 = 1.5(v_\theta)_2^2$$

$$V_2 = \frac{1}{2}kx_2^2 = \frac{1}{2}(1200)(r_m - 0.5)^2$$

$$= 600(r_m - 0.5)^2$$

Conservation of angular momentum: $r_1 m(v_\theta)_1 = v_2 m(v_\theta)_2$

$$(v_\theta)_2 = \frac{r_1}{r_2}(v_\theta),= \frac{(0.3)}{r_m}(2) = \frac{0.6}{r_m}$$

Conservation of energy: $T_1 + V_1 = T_2 + V_2$

$$6 + 24 = 1.5(v_\theta)_2^2 + 600(r_m - 0.5)^2$$

$$30 = (1.5)\left(\frac{0.6}{r_m}\right)^2 + 600(r_m - 0.5)^2$$

$$f(r_m) = \frac{0.54}{r_m^2} + 600(r_m - 0.5)^2 - 30 = 0$$

PROBLEM 13.94 (Continued)

Solve for r_m by trial and error.

r_m (m)	0.5	1.0	0.8	0.7	0.72	0.71
$f(r_m)$	–27.8	120.5	24.8	–4.9	0.080	–2.469

$$r_m = 0.72 - \frac{(0.01)(0.08)}{2.467 + 0.08} = 0.7197 \text{ m}$$

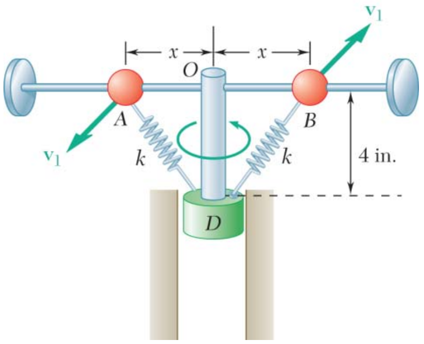
(*a*) *Maximum distance.* $r_m = 0.720 \text{ m}$ ◀

(*b*) *Corresponding speed.*

$$(v_\theta)_2 = \frac{0.6}{0.7197} = 0.8337 \text{ m/s}$$

$$(v_r)_2 = 0$$

$v_2 = 0.834 \text{ m/s}$ ◀



PROBLEM 13.95

A governor is designed so that the valve of negligible mass at *D* will open once a vertical force greater than 20 lbs is exerted on it. In initial testing of the device, the two 1 lb masses are at *x* = 1 in., and are prevented from sliding along the rod by stops. Each mass is connected to the valve by a 10 lb/in spring, which are both unstretched at *x* = 1 in. The governor is rotating so that $v_1 = 30$ ft/s when the stops are removed. When the valve opens, determine the position and velocity of the masses.

SOLUTION

Given:

$$x_1 = 1\text{ in} = \frac{1}{12}\text{ ft}$$

$$m = \frac{1\text{ lbs}}{32.2\text{ ft/s}^2} = 0.03106\text{ slugs}$$

$$v_{\theta,1} = 30\text{ ft/s},\ v_{r,1} = 0$$

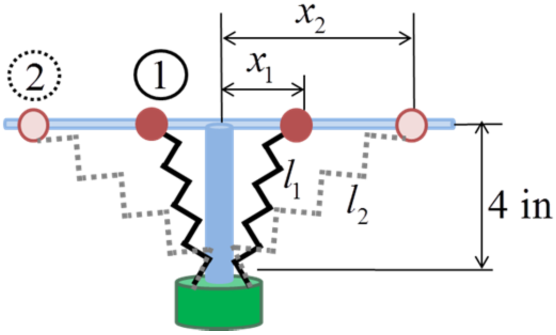
l_i = length of spring at positon i

s_i = stretch of spring in position i

$$F_{y,2} = 20\text{ lbs}$$

$$k = 10\text{ lb/in} = 120\text{ lb/ft}$$

Sketch: Pos. 1 with stops, Pos. 2 when valve opens.

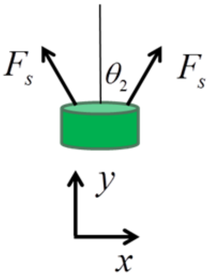


At Position 1: $s_1 = 0$

$$l_1 = \frac{\sqrt{4^2 + x_1^2}}{12}$$

$$l_1 = \frac{\sqrt{17}}{12}\text{ ft}$$

At Position 2: FBD of valve where: $F_s = ks_2$



Equilibrium in y-direction:

$$\sum F_y = 20\text{ lbs}$$

$$2F_s\cos\theta_2 = 20\text{ lbs}$$

$$2ks_2\left(\frac{4/12}{l_2}\right) = 20$$

$$s_2 = 30\frac{l_2}{k}$$

Note $s_2 = l_2 - l_1$ so:

$$l_2 - l_1 = 30\frac{l_2}{k}$$

$$l_2 = \frac{l_1 k}{k - 30} \Rightarrow l_2 = 0.4581\text{ ft}$$

$$s_2 = 0.1145\text{ ft}$$

PROBLEM 13.95 (Continued)

Location of mass, $x_2 = \sqrt{l_2^2 - \left(\frac{4}{12}\right)^2} \quad \Rightarrow \quad x_2 = 0.3143 \text{ ft}$ $\qquad x_2 = 3.771 \text{ in}$ ◀

Conservation of angular momentum for each mass:

$$mx_1 v_{\theta,1} = mx_2 v_{\theta,2}$$

$$v_{\theta,2} = \frac{x_1}{x_2} v_{\theta,1}$$

$$v_{\theta,2} = 7.955 \text{ ft/s}$$

Work Energy from position 1 to 2:

$$T_1 + \cancel{V_{g_1}} + \cancel{V_{e_1}} + \cancel{U_{1\to 2}^{NC}} = T_2 + \cancel{V_{g_2}} + V_{e_2}$$

where:

$$T_2 = 2\left(\frac{1}{2}mv_1^2\right)$$

$$T_2 = 2\left(\frac{1}{2}mv_2^2\right)$$

$$V_{e_2} = 2\left(\frac{1}{2}ks_2^2\right)$$

Therefore:

$$2\left(\frac{1}{2}mv_1^2\right) = 2\left(\frac{1}{2}mv_2^2\right) + 2\left(\frac{1}{2}ks_2^2\right)$$

$$v_2 = \sqrt{v_1^2 - \frac{k}{m}s_2^2}$$

Substitute known values:

$$v_2 = \sqrt{30^2 - \frac{120}{0.03106}(0.1145)^2}$$

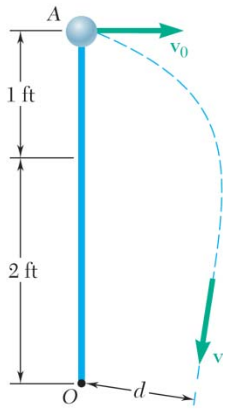
$$v_2 = 29.14 \text{ ft/s}$$

Solve for $v_{r,2}$:

$$v_{r,2} = \sqrt{v_2^2 - v_{\theta,2}^2}$$

$$v_{r,2} = 28.04 \text{ ft/s}$$

$\mathbf{v}_2 = (28.04 \text{ ft/s})\ \mathbf{e}_r + (7.96 \text{ ft/s})\ \mathbf{e}_r$ ◀



PROBLEM 13.96

A 1.5-lb ball that can slide on a *horizontal* frictionless surface is attached to a fixed Point *O* by means of an elastic cord of constant $k = 1$ lb/in. and undeformed length 2 ft. The ball is placed at Point *A*, 3 ft from *O*, and given an initial velocity $\mathbf{v}_0$ perpendicular to *OA*. Determine (*a*) the smallest allowable value of the initial speed v_0 if the cord is not to become slack, (*b*) the closest distance *d* that the ball will come to Point *O* if it is given half the initial speed found in part *a*.

SOLUTION

Let L_1 be the initial stretched length of the cord and L_2 the length of the closest approach to Point *O* if the cord does not become slack. Let position 1 be the initial state and position 2 be that of closest approach to Point *O*. The only horizontal force acting on the ball is the conservative central force due to the elastic cord. At the point of closest approach the velocity of the ball is perpendicular to the cord.

Conservation of angular momentum:

$$r_1 m v_1 = r_2 m v_2$$

$$L_1 m v_0 = L_2 m v_2 \quad \text{or} \quad v_2 = \frac{L_1 v_0}{L_2}$$

Conservation of energy:

$$T_1 + V_1 = T_2 + V_2$$

$$\frac{1}{2}mv_1^2 + \frac{1}{2}k(L_1 - L_0)^2 = \frac{1}{2}mv_2^2 + \frac{1}{2}k(L_2 - L_0)^2$$

$$v_1^2 - v_2^2 = -\frac{k}{m}[(L_1 - L_0)^2 + (L_2 - L_0)^2]$$

$$v_0^2 - \frac{L_1^2}{L_2^2}v_0^2 = -\frac{k}{m}[(L_1 - L_0)^2 + (L_2 - L_0)^2]$$

Data:

$$L_0 = 2 \text{ ft}, \quad L_1 = 3 \text{ ft}$$

$L_2 = L_0 = 2$ ft for zero tension in the cord at the point of closest approach.

$$k = 1 \text{ lb/in.} = 12 \text{ lb/ft}$$

$$m = W/g = 1.5/32.2 = 0.04658 \text{ lb}\cdot\text{s}^2/\text{ft}$$

$$v_0^2 - \frac{(3)^2}{(2)^2}v_0 = -\frac{12}{0.04658}[(3-2)^2 + (2-2)^2]$$

$$-1.25\, v_0^2 = -257.6$$

(*a*) $$v_0^2 = 206.1 \text{ ft}^2/\text{s}^2$$ $v_0 = 14.36$ ft/s ◀

PROBLEM 13.96 (Continued)

(*b*) Let $v_0 = \frac{1}{2}(14.36 \text{ ft/s}) = 7.18 \text{ ft/s}^2$ so that the cord is slack in the position of closest approach to Point *O*.

Let position 1 be the initial position and position 2 be position of closest approach with the cord being slack.

Conservation of energy: $T_1 + V_1 = T_2 + V_2$

$$\frac{1}{2}mv_0^2 + \frac{1}{2}k(L_1 - L_0)^2 = \frac{1}{2}mv_2^2$$

$$v_2^2 = v_0^2 + \frac{k}{m}(L - L_0)^2$$

$$= (7.18)^2 + \frac{12}{0.04658}(3 - 2)^2 = 309.17 \text{ ft}^2/\text{s}^2$$

$$v_2 = 17.583 \text{ ft/s}$$

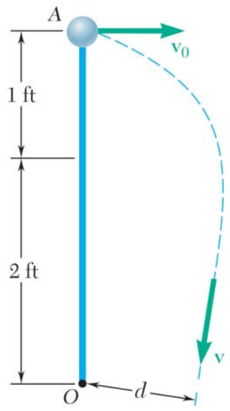
Conservation of angular momentum:

$$r_1 m v_1 = r_2 m v_2 \sin\phi$$

$$r_2 \sin\phi = d = \frac{r_1 v_1}{v_2} = \frac{L_1 v_0}{v_2}$$

$$d = \frac{(3)(7.18)}{17.583}$$

$d = 1.225$ ft ◀



PROBLEM 13.97

A 1.5-lb ball that can slide on a *horizontal* frictionless surface is attached to a fixed Point O by means of an elastic cord of constant $k = 1$ lb/in. and undeformed length 2 ft. The ball is placed at Point A, 3 ft from O, and given an initial velocity $\mathbf{v}_0$ perpendicular to OA, allowing the ball to come within a distance $d = 9$ in. of Point O after the cord has become slack. Determine (*a*) the initial speed v_0 of the ball, (*b*) its maximum speed.

SOLUTION

Let L_1 be the initial stretched length of the cord. Let position 1 be the initial position. Let position 2 be the position of closest approach to point after the cord has become slack. While the cord is slack there are no horizontal forces acting on the ball, so the velocity remains constant. While the cord is stretched, the only horizontal force acting on the ball is the conservative central force due to the elastic cord. At the point of closest approach the velocity of the ball is perpendicular to the radius vector.

Conservation of angular momentum: $r_1 m v_1 = r_2 m v_2$

$$L_1 v_0 = d\, v_2 \qquad \text{or} \qquad v_2 = \frac{L_1}{d} v_0$$

Conservation of energy: $T_1 + V_1 = T_2 + V_2$

$$\frac{1}{2} m v_0^2 + \frac{1}{2} k (L_1 - L_0)^2 = \frac{1}{2} m v_2^2 + 0$$

$$v_0^2 - v_2^2 = -\frac{k}{m}(L_1 - L_0)^2$$

$$v_0^2 - \left(\frac{L_1}{d^2} v_0\right)^2 = -\frac{k}{m}(L_1 - L_0)$$

Data: $L_0 = 2$ ft, $L_1 = 3$ ft, $d = 9$ in. $= 0.75$ ft

$k = 1$ lb/in. $= 12$ lb/ft

$m = W/g = 1.5/32.2 = 0.04658$ lb $\cdot$ s^2/ft

$$v_0^2 - \left(\frac{3\, v_0}{0.75}\right)^2 = -\frac{12}{0.04658}(3-2)^2$$

$$-15 v_0^2 = -257.6$$

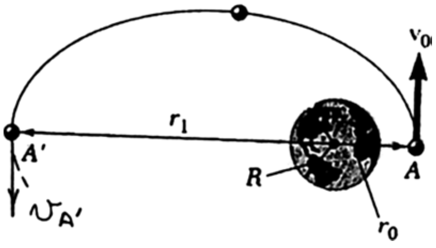
(*a*) $v_0^2 = 17.17$ ft^2/s^2 $\qquad v_0 = 4.14$ ft/s ◀

(*b*) Maximum speed. $v_m = v_2 = \dfrac{3 v_0}{0.75}$ $\qquad v_m = 16.58$ ft/s ◀

PROBLEM 13.98

Using the principles of conservation of energy and conservation of angular momentum, solve part *a* of Sample Problem 12.14.

SOLUTION



$$R = 6370 \text{ km}$$
$$r_0 = 500 \text{ km} + 6370 \text{ km}$$
$$r_0 = 6870 \text{ km} = 6.87 \times 10^6 \text{ m}$$
$$v_0 = 36{,}900 \text{ km/h}$$
$$= \frac{36.9 \times 10^6 \text{ m}}{3.6 \times 10^3 \text{ s}}$$
$$= 10.25 \times 10^3 \text{ m/s}$$

Conservation of angular momentum:

$$r_0 m v_0 = r_1 m v_A, \qquad r_0 = r_{\min},\ r_1 = r_{\max}$$
$$v_{A'} = \left(\frac{r_0}{r_1}\right) v_0 = \left(\frac{6.870 \times 10^6}{r_1}\right)(10.25 \times 10^3)$$
$$v_{A'} = \frac{70.418 \times 10^9}{r_1} \qquad (1)$$

Conservation of energy:

Point A:

$$v_0 = 10.25 \times 10^3 \text{ m/s}$$
$$T_A = \frac{1}{2} m v_0^2 = \frac{1}{2} m (10.25 \times 10^3)^2$$
$$T_A = (m)(52.53 \times 10^6)(\text{J})$$
$$V_A = -\frac{GMm}{r_0}$$
$$GM = gR^2 = (9.81 \text{ m/s}^2)(6.37 \times 10^6 \text{ m})^2$$
$$GM = 398 \times 10^{12} \text{ m}^3/\text{s}^2$$
$$r_0 = 6.87 \times 10^6 \text{ m}$$
$$V_A = -\frac{(398 \times 10^{12} \text{ m}^3/\text{s}^2) m}{(6.87 \times 10^6 \text{ m})}$$
$$= -57.93 \times 10^6\, m \text{ (J)}$$

PROBLEM 13.98 (Continued)

Point A':

$$T_{A'} = \frac{1}{2} m v_{A'}^2$$

$$V_{A'} = -\frac{GMm}{r_1}$$

$$= -\frac{398 \times 10^{12}\, m}{r_1}\,(\mathrm{J})$$

$$T_A + V_A = T_{A'} + V_{A'}$$

$$52.53 \times 10^6\, \cancel{m} - 57.93 \times 10^6\, \cancel{m} = \frac{1}{2}\cancel{m} v_{A'}^2 - \frac{398 \times 10^{12}\, \cancel{m}}{r_1}$$

Substituting for $v_{A'}$ from (1)

$$-5.402 \times 10^6 = \frac{(70.418 \times 10^9)^2}{(2)(r_1)^2} - \frac{398 \times 10^{12}}{r_1}$$

$$-5.402 \times 10^6 = \frac{(2.4793 \times 10^{21})}{r_1^2} - \frac{398 \times 10^{12}}{r_1}$$

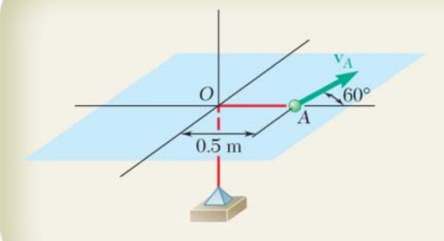
$$(5.402 \times 10^6) r_1^2 - (398 \times 10^{12}) r_1 + 2.4793 \times 10^{21} = 0$$

$$r_1 = 66.7 \times 10^6 \text{ m},\ 6.87 \times 10^6 \text{ m}$$

$r_{\max} = 66{,}700$ km ◀

PROBLEM 13.99

Solve sample Problem 13.11, assuming that the elastic cord is replaced by a central force **F** of magnitude $(80/r^2)$ N directed toward *O*.



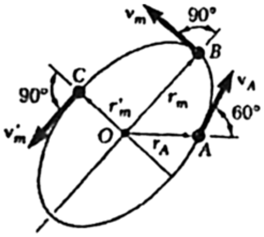
SAMPLE PROBLEM 13.11 A sphere of mass $m = 6$ kg is attached to an elastic cord of constant $k = 100$ N/m, which is undeformed when the sphere is located at the origin *O*. Knowing that the sphere may slide without friction on the horizontal surface and that in the position shown its velocity $\mathbf{v}_A$ has a magnitude of 20 m/s, determine *(a)* the maximum and minimum distances from the sphere to the origin *O*, *(b)* the corresponding values of its speed.

SOLUTION

(*a*) The force exerted on the sphere passes through *O*. Angular momentum about *O* is conserved.

Minimum velocity is at *B*, where the distance from *O* is maximum.

Maximum velocity is at *C*, where distance from *O* is minimum.



$$r_A m v_A \sin 60° = r_m m v_m$$

$$(0.5 \text{ m})(0.6 \text{ kg})(20 \text{ m/s})\sin 60° = r_m (0.6 \text{ kg}) v_m$$

$$v_m = \frac{8.66}{r_m} \tag{1}$$

Conservation of energy:

At Point *A*, $$T_A = \frac{1}{2} m v_A^2 = \frac{1}{2}(0.6 \text{ kg})(20 \text{ m/s})^2 = 120 \text{ J}$$

$$V = \int F dr = \int \frac{80}{r^2} dr = \frac{-80}{r},$$

$$V_A = \frac{-80}{0.5} = -160 \text{ J}$$

At Point *B*, $$T_B = \frac{1}{2} m v_m^2 = \frac{1}{2}(0.6 \text{ kg}) v_m^2 = 0.3 v_m^2$$

and Point *C*: $$V_B = \frac{-80}{r_m}$$

$$T_A + V_A = T_B + V_B$$

$$120 - 160 = 0.3 v_m^2 - \frac{80}{r_m} \tag{2}$$

PROBLEM 13.99 (Continued)

Substitute (1) into (2)

$$-40 = (0.3)\left(\frac{8.66}{r_m}\right)^2 - \frac{80}{r_m}$$

$$r_m^2 - 2r_m + 0.5625 = 0$$

$$r_m' = 0.339 \text{ m} \quad \text{and} \quad r_m = 1.661 \text{ m}$$

$r_{\text{max}} = 1.661 \text{ m}$ ◀

$r_{\text{min}} = 0.339 \text{ m}$ ◀

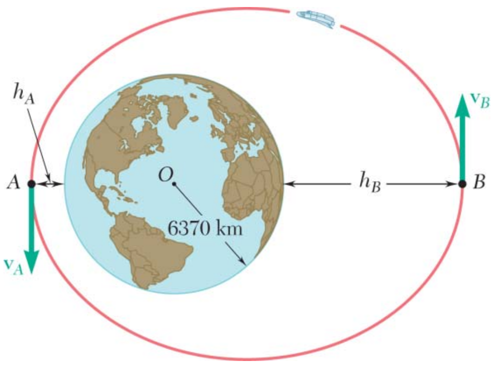
(*b*) Substitute r_m' and r_m from results of part (*a*) into (1) to get corresponding maximum and minimum values of the speed.

$$v_m' = \frac{8.66}{0.339} = 25.6 \text{ m/s}$$

$v_{\text{max}} = 25.6 \text{ m/s}$ ◀

$$v_m = \frac{8.66}{1.661} = 5.21 \text{ m/s}$$

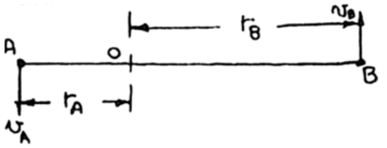
$v_{\text{min}} = 5.21 \text{ m/s}$ ◀



PROBLEM 13.100

A spacecraft is describing an elliptic orbit of minimum altitude $h_A = 2400$ km and maximum altitude $h_B = 9600$ km above the surface of the earth. Determine the speed of the spacecraft at A.

SOLUTION



$$r_A = 6370 \text{ km} + 2400 \text{ km}$$
$$r_A = 8770 \text{ km}$$
$$r_B = 6370 \text{ km} + 9600 \text{ km}$$
$$= 15{,}970 \text{ km}$$

Conservation of momentum: $r_A m v_A = r_B m v_B$

$$v_B = \frac{r_A}{r_B} v_A = \frac{8770}{15{,}970} v_A = 0.5492 v_A \qquad (1)$$

Conservation of energy: $T_A = \frac{1}{2} m v_A^2 \quad V_A = \frac{-GMm}{r_A} \quad T_B = \frac{1}{2} m v_B^2 \quad V_B = \frac{-GMm}{r_B}$

$$GM = gR^2 = (9.81 \text{ m/s}^2)(6370 \times 10^3 \text{ m})^2 = 398.1 \times 10^{12} \text{ m}^3/\text{s}^2$$

$$V_A = \frac{-(398.1 \times 10^{12})m}{8770 \times 10^3} = -45.39 \times 10^6 \, m$$

$$V_B = \frac{-(398.1 \times 10^{12})m}{(15{,}970 \times 10^3)} = -24.93 \, m$$

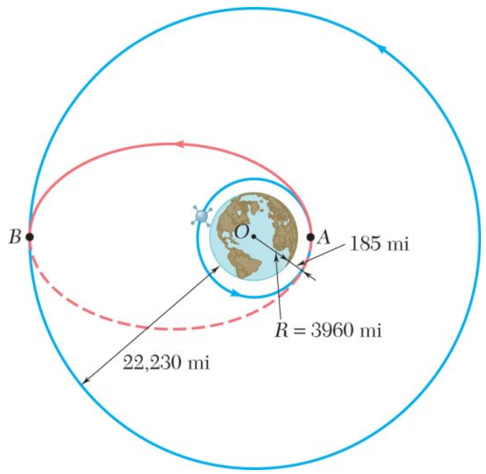
$T_A + V_A = T_B + V_B$:

$$\frac{1}{2} \cancel{m} v_A^2 - 45.39 \times 10^6 \cancel{m} = \frac{1}{2} \cancel{m} v_B^2 - 24.93 \times 10^6 \, m \qquad (2)$$

Substituting for v_B in (2) from (1)

$$v_A^2 [1 - (0.5492)^2] = 40.92 \times 10^6$$
$$v_A^2 = 58.59 \times 10^6 \text{ m}^2/\text{s}^2$$
$$v_A = 7.65 \times 10^3 \text{ m/s}$$

$v_A = 27.6 \times 10^3$ km/h ◀



PROBLEM 13.101

While describing a circular orbit, 185 mi above the surface of the earth, a space shuttle ejects at Point *A* an inertial upper stage (IUS) carrying a communication satellite to be placed in a geosynchronous orbit (see Problem 13.87) at an altitude of 22,230 mi above the surface of the earth. Determine (*a*) the velocity of the IUS relative to the shuttle after its engine has been fired at *A*, (*b*) the increase in velocity required at *B* to place the satellite in its final orbit.

SOLUTION

For earth,

$$R = 3960 \text{ mi} = 20.909\times10^6 \text{ ft}$$

$$g = 32.2 \text{ ft}^2$$

$$GM = gR^2 = (32.2)(20.909\times10^6)^2 = 14.077\times10^{15} \text{ ft}^3/\text{s}^2$$

Speed on a circular orbits of radius r, r_A, and r_B.

$$F = ma_n$$

$$\frac{GMm}{r^2} = \frac{mv^2}{r}$$

$$v^2 = \frac{GM}{r} \qquad v = \sqrt{\frac{GM}{r}}$$

$$r_A = 3960 + 185 = 4145 \text{ mi} = 21.886\times10^6 \text{ ft}$$

$$(v_A)_{\text{circ}} = \sqrt{\frac{14.077\times10^{15}}{21.886\times10^6}} = 25.362\times10^3 \text{ ft/s}$$

$$r_B = 3960 + 22230 = 26190 \text{ mi} = 138.283\times10^6 \text{ ft}$$

$$(v_B)_{\text{circ}} = \sqrt{\frac{14.077\times10^{15}}{138.283\times10^6}} = 10.089\times10^3 \text{ ft/s}$$

Calculate speeds at *A* and *B* for path *AB*.

Conservation of angular momentum: $mr_Av_A \sin\phi_A = mr_Bv_B \sin\phi_A$

$$v_B = \frac{r_Av_A \sin 90^\circ}{r_B \sin 90^\circ} = \frac{21.886\times10^6 v_A}{138.283\times10^6} = 0.15816 v_A$$

PROBLEM 13.101 (Continued)

Conservation of energy: $$T_A + V_A = T_B + V_B$$

$$\frac{1}{2}mv_A^2 + \frac{GMm}{r_A} = \frac{1}{2}mv_B^2 - \frac{GMm}{r_B}$$

$$v_A^2 - v_B^2 = 2GM\left(\frac{1}{r_A} - \frac{1}{r_B}\right) = \frac{2GM(r_B - r_A)}{r_A r_B}$$

$$v_A^2 - (0.15816v_A)^2 = \frac{(2)(14.077\times10^{15})(116.397\times10^6)}{(21.886\times10^6)(138.283\times10^6)}$$

$$0.97499v_A^2 = 1.082796\times10^9$$

$$v_A = 33.325\times10^3 \text{ ft/s}$$

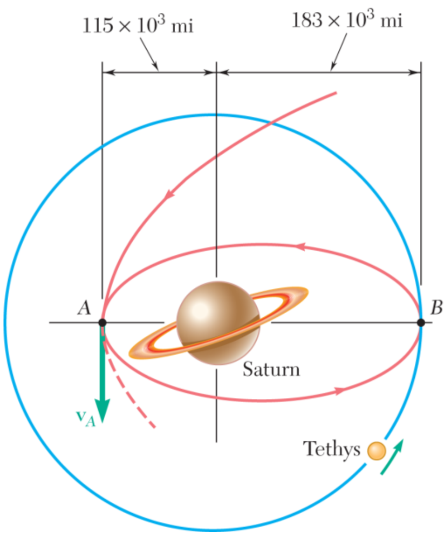
$$v_B = (0.15816)(33.325\times10^6) = 5.271\times10^3 \text{ ft/s}$$

(*a*) Increase in speed at *A*:

$$\Delta v_A = 33.325\times10^3 - 25.362\times10^3 = 7.963\times10^3 \text{ ft/s} \qquad \Delta v_A = 7960 \text{ ft/s} ◀$$

(*b*) Increase in speed at *B*:

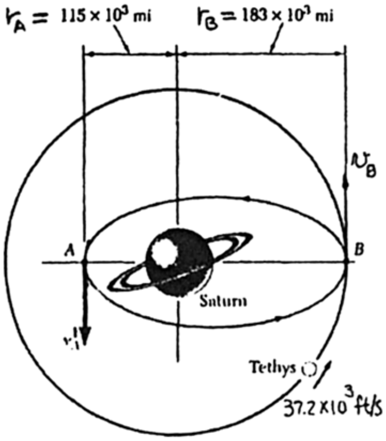
$$\Delta v_B = 10.089\times10^3 - 5.271\times10^3 = 4.818\times10^3 \text{ ft/s} \qquad \Delta v_B = 4820 \text{ ft/s} ◀$$



PROBLEM 13.102

A spacecraft approaching the planet Saturn reaches Point A with a velocity $\mathbf{v}_A$ of magnitude 68.8×10^3 ft/s. It is to be placed in an elliptic orbit about Saturn so that it will be able to periodically examine Tethys, one of Saturn's moons. Tethys is in a circular orbit of radius 183×10^3 mi about the center of Saturn, traveling at a speed of 37.2×10^3 ft/s. Determine (a) the decrease in speed required by the spacecraft at A to achieve the desired orbit, (b) the speed of the spacecraft when it reaches the orbit of Tethys at B.

SOLUTION



(a)

$$r_A = 607.2\times10^6 \text{ ft}$$
$$r_B = 966.2\times10^6 \text{ ft}$$

$v_A' =$ speed of spacecraft in the elliptical orbit after its speed has been decreased.

Elliptical orbit between A and B.

Conservation of energy

Point A: $$T_A = \frac{1}{2}mv_A'^2$$
$$V_A = \frac{-GM_{\text{sat}}m}{r_A}$$

$M_{\text{sa}} =$ Mass of Saturn, determine GM_{sa} from the speed of Tethys in its circular orbit.

(Eq. 12.44) $$v_{\text{circ}} = \sqrt{\frac{GM_{\text{sat}}}{r}} \quad GM_{\text{sat}} = r_B v_{\text{circ}}^2$$

$$GM_{\text{sat}} = (966.2\times10^6 \text{ ft}^2)(37.2\times10^3 \text{ ft/s})^2$$
$$= 1.337\times10^{18} \text{ ft}^3/\text{s}^2$$
$$V_A = -\frac{(1.337\times10^{18} \text{ ft}^3/\text{s}^2)\, m}{(607.2\times10^6 \text{ ft})}$$
$$= -2.202\times10^9\, m$$

PROBLEM 13.102 (Continued)

Point B:
$$T_B = \frac{1}{2}mv_B^2 \qquad V_B = \frac{-GM_{\text{sat}}m}{r_B} = -\frac{(1.337\times10^{18}\ \text{ft}^3/\text{s}^2)\,m}{(966.2\times10^6\ \text{ft})}$$
$$V_B = 1.384\times10^9$$

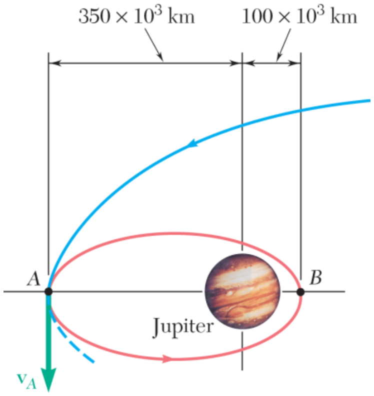
$$T_A + V_A = T_B + V_B;$$
$$\frac{1}{2}\cancel{m}v_A'^2 - 2.202\times10^9\,\cancel{m} = \frac{1}{2}\cancel{m}v_B^2 - 1.384\times10^9\,\cancel{m}$$
$$v_A'^2 - v_B^2 = 1.636\times10^9$$

Conservation of angular momentum:

$$r_Amv_A' = r_Bmv_B \quad v_B = \frac{r_A}{r_B}v_A' = \frac{607.2\times10^6}{966.2\times10^6}v_A' = 0.6284v_A'$$
$$v_A'^2[1-(0.6284)^2] = 1.636\times10^9$$
$$v_A' = 52{,}005\ \text{ft/s}$$

(*a*) $\Delta v_A = v_A - v_A' = 68{,}800 - 52{,}005$ $\qquad \Delta v_A = 16{,}795\ \text{ft/s}$ ◀

(*b*) $v_B = \dfrac{r_A}{r_B}v_A' = (0.6284)(52{,}005)$ $\qquad v_B = 32{,}700\ \text{ft/s}$ ◀



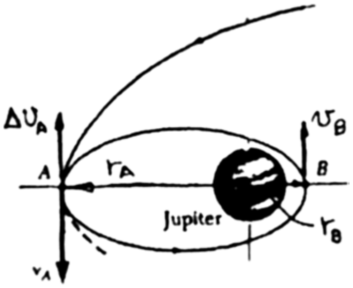
PROBLEM 13.103

A spacecraft traveling along a parabolic path toward the planet Jupiter is expected to reach Point A with a velocity $\mathbf{v}_A$ of magnitude 26.9 km/s. Its engines will then be fired to slow it down, placing it into an elliptic orbit which will bring it to within 100×10^3 km of Jupiter. Determine the decrease in speed Δv at Point A which will place the spacecraft into the required orbit. The mass of Jupiter is 319 times the mass of the earth.

SOLUTION

Conservation of energy.

Point A:



$$T_A = \frac{1}{2}m(v_A - \Delta v_A)^2$$

$$V_A = \frac{-GM_J m}{r_A}$$

$$GM_J = 319 GM_E = 319 g R_E^2$$

$$R_E = 6.37 \times 10^6 \text{ m}$$

$$GM_J = (319)(9.81 \text{ m/s}^2)(6.37 \times 10^6 \text{ m})^2$$

$$GM_J = 126.98 \times 10^{15} \text{ m}^3/\text{s}^2$$

$$r_A = 350 \times 10^6 \text{ m}$$

$$V_A = \frac{-(126.98 \times 10^{15} \text{ m}^3/\text{s}^2)m}{(350 \times 10^6 \text{ m})}$$

$$V_A = -(362.8 \times 10^6)m$$

Point B:

$$T_B = \frac{1}{2}mv_B^2$$

$$V_B = \frac{-GM_J m}{r_B} = \frac{-(126.98 \times 10^{15} \text{ m}^3/\text{s}^2)m}{(100 \times 10^6 m)}$$

$$V_B = -(1269.8 \times 10^6)m$$

$$T_A + V_A = T_B + V_B$$

$$\frac{1}{2}m(v_A - \Delta v_A)^2 - 362.8 \times 10^6 m = \frac{1}{2}mv_B^2 - 1269.8 \times 10^6 \text{ m}$$

$$(v_A - \Delta v_A)^2 - v_B^2 = -1814 \times 10^6 \qquad (1)$$

PROBLEM 13.103 (Continued)

Conservation of angular momentum.

$$r_A = 350 \times 10^6 \text{ m}$$
$$r_B = 100 \times 10^6 \text{ m}$$
$$r_A m(v_A - \Delta v_A) = r_B m v_B$$
$$v_B = \left(\frac{r_A}{r_B}\right)(v_A - \Delta v_A)$$
$$= \left(\frac{350}{100}\right)(v_A - \Delta v_A) \qquad (2)$$

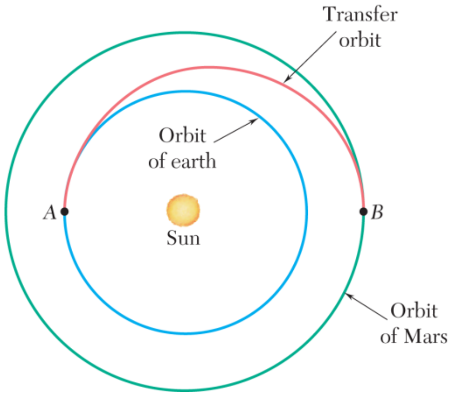
Substitute v_B in (2) into (1)

$$(v_A - \Delta v_A)^2[1-(3.5)^2] = -1814 \times 10^6$$
$$(v_A - \Delta v_A)^2 = 161.24 \times 10^6$$
$$(v_A - \Delta v_A) = \mp 12.698 \times 10^3 \text{ m/s}$$

(Take positive root; negative root reverses flight direction.)

$$v_A = 26.9 \times 10^3 \text{ m/s} \qquad \text{(given)}$$
$$\Delta v_A = (26.9 \times 10^3 \text{ m/s} - 12.698 \times 10^3 \text{ m/s})$$

$\Delta v_A = 14.20$ km/s ◀



PROBLEM 13.104

As a first approximation to the analysis of a space flight from the earth to Mars, it is assumed that the orbits of the earth and Mars are circular and coplanar. The mean distances from the sun to the earth and to Mars are 149.6×10^6 km and 227.8×10^6 km, respectively. To place the spacecraft into an elliptical transfer orbit at Point *A*, its speed is increased over a short interval of time to v_A which is faster than the earth's orbital speed. When the spacecraft reaches Point *B* on the elliptical transfer orbit, its speed v_B is increased to the orbital speed of Mars. Knowing that the mass of the sun is 332.8×10^3 times the mass of the earth, determine the increase in velocity required (*a*) at *A*, (*b*) at *B*.

SOLUTION

M = mass of the sun

$$GM = 332.8(10)^3(9.81\text{ m/s}^2)(6.37 \times 10^6\text{ m})^2 = 1.3247(10)^{20}\text{ m}^3/\text{s}^2$$

Circular orbits

$$\text{Earth } v_E = \sqrt{\frac{GM}{149.6(10)^9}} = 29.758\text{ m/s}$$

$$\text{Mars } v_M = \sqrt{\frac{GM}{227.8(10)^9}} = 24.115\text{ m/s}$$

Conservation of angular momentum

Elliptical orbit $\quad v_A(149.6) = v_B(227.8)$

Conservation of energy

$$\frac{1}{2}v_A^2 - \frac{GM}{149.6(10)^9} = \frac{1}{2}v_B^2 - \frac{GM}{227.8(10)^9}$$

$$v_A = v_B\frac{(227.8)}{(149.6)} = 1.52273v_B$$

$$\frac{1}{2}(1.52273)^2v_B^2 - \frac{1.3247(10)^{20}}{149.6(10)^9} = \frac{1}{2}v_B^2 - \frac{1.3247(10)^{20}}{227.8(10)^9}$$

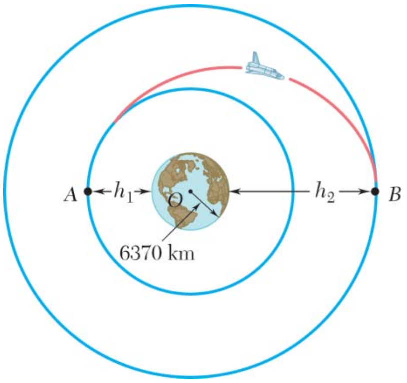
$$0.65935v_B^2 = 3.0398(10)^8$$

$$v_B^2 = 4.6102(10)^8$$

$$v_B = 21{,}471\text{ m/s},\; v_A = 32{,}695\text{ m/s}$$

(*a*) Increase at *A*, $\quad v_A - v_E = 32.695 - 29.758 = 2.94\text{ km/s}$ ◀

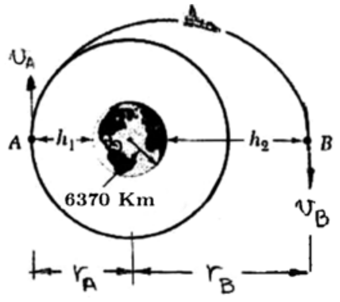
(*b*) Increase at *B*, $\quad v_B - v_M = 24.115 - 21.471 = 2.64\text{ km/s}$ ◀



PROBLEM 13.105

The optimal way of transferring a space vehicle from an inner circular orbit to an outer coplanar circular orbit is to fire its engines as it passes through *A* to increase its speed and place it in an elliptic transfer orbit. Another increase in speed as it passes through *B* will place it in the desired circular orbit. For a vehicle in a circular orbit about the earth at an altitude $h_1 = 200$ mi, which is to be transferred to a circular orbit at an altitude $h_2 = 500$ mi, determine (*a*) the required increases in speed at *A* and at *B*, (*b*) the total energy per unit mass required to execute the transfer.

SOLUTION



Elliptical orbit between *A* and *B*

Conservation of angular momentum

$$mr_A v_A = mr_B v_B$$

$$v_A = \frac{r_B}{r_A} v_B = \frac{7.170}{6.690} v_B$$

$$r_A = 6370\text{ km} + 320\text{ km} = 6690\text{ km}, \qquad r_A = 6.690 \times 10^6\text{ m}$$

$$v_A = 1.0718 v_B \qquad (1)$$

$$r_B = 6370\text{ km} + 800\text{ km} = 7170\text{ km}, \qquad r_B = 7.170 \times 10^6\text{ m}$$

$$R = (6370\text{ km}) = 6.37 \times 10^6\text{ m}$$

Conservation of energy

$$GM = gR^2 = (9.81\text{ m/s}^2)(6.37 \times 10^6\text{ m})^2 = 398.060 \times 10^{12}\text{ m}^3/\text{s}^2$$

Point A:

$$T_A = \frac{1}{2} m v_A^2 \qquad V_A = -\frac{GMm}{r_A} = -\frac{(398.060 \times 10^{12})m}{(6.690 \times 10^6)}$$

$$V_A = 59.501 \times 10^6\text{ m}$$

Point B:

$$T_B = \frac{1}{2} m v_B^2 \qquad V_B = -\frac{GMm}{r_B} = -\frac{(398.060 \times 10^{12})m}{(7.170 \times 10^6)}$$

$$V_B = 55.5 \times 10^6\text{ m}$$

PROBLEM 13.105 (Continued)

$$T_A + V_A = T_B + V_B$$

$$\frac{1}{2}mv_A^2 - 59.501 \times 10^6 \text{ m} = \frac{1}{2}mv_B^2 - 55.5 \times 10^6 \text{ m}$$

$$v_A^2 - v_B^2 = 8.002 \times 10^6$$

From (1) $\quad v_A = 1.0718v_B \qquad v_B^2[(1.0718)^2 - 1] = 8.002 \times 10^6$

$$v_B^2 = 53.79 \times 10^6 \text{ m}^2/\text{s}^2, \qquad v_B = 7334 \text{ m/s}$$

$$v_A = (1.0718)(7334 \text{ m/s}) = 7861 \text{ m/s}$$

Circular orbit at *A* and *B*

(Equation 12.44)

$$(v_A)_C = \sqrt{\frac{GM}{r_A}} = \sqrt{\frac{398.060 \times 10^{12}}{6.690 \times 10^6}} = 7714 \text{ m/s}$$

$$(v_B)_C = \sqrt{\frac{GM}{r_B}} = \sqrt{\frac{398.060 \times 10^{12}}{7.170 \times 10^6}} = 7451 \text{ m/s}$$

(*a*) Increases in speed at *A* and *B*

$$\Delta v_A = v_A - (v_A)_C = 7861 - 7714 = 147 \text{ m/s} \blacktriangleleft$$

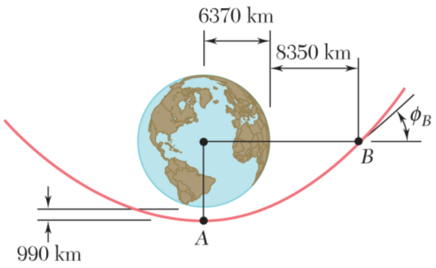
$$\Delta v_B = (v_B)_C - v_B = 7451 - 7334 = 117 \text{ m/s} \blacktriangleleft$$

(*b*) Total energy per unit mass

$$E/m = \frac{1}{2}[(v_A)^2 - (v_A)_C^2 + (v_B)_C^2 - (v_B)^2]$$

$$E/m = \frac{1}{2}[(7861)^2 - (7714)^2 + (7451)^2 - (7334)^2]$$

$$E/m = 2.01 \times 10^6 \text{ J/kg} \blacktriangleleft$$



PROBLEM 13.106

During a flyby of the earth, the velocity of a spacecraft is 10.4 km/s as it reaches its minimum altitude of 990 km above the surface at Point A. At Point B the spacecraft is observed to have an altitude of 8350 km. Determine (a) the magnitude of the velocity at Point B, (b) the angle ϕ_B.

SOLUTION

At A:

$$h_A = vr = [1.04(10)^4 \text{ m/s}][6.37(10)^6 \text{ m} + 0.990(10)^6 \text{ m}]$$

$$h_A = 76.544(10)^9 \text{ m}^2/\text{s}$$

$$\frac{1}{m}(T_A + V_A) = \frac{1}{2}v^2 - \frac{GM}{r}$$

$$= \frac{1}{2}[1.04(10)^4]^2 - \frac{(9.81)[6.37(10)^6]^2}{[6.37(10)^6 + 0.990(10)^6]} \cong 0$$

(Parabolic orbit)

At B:

$$\frac{1}{m}(T_B + V_B) = \frac{1}{2}v_B^2 - \frac{GM}{r_B} = 0$$

$$\frac{1}{2}v_B^2 = \frac{(9.81)[6.37(10^6)]^2}{[6.37(10)^6 + 8.35(10)^6]}$$

$$v_B^2 = 54.084(10)^6$$

(a) $v_B = 7.35$ km/s ◀

$$h_B = v_B \sin\phi_B r_B = 76.544(10)^9$$

$$\sin\phi_B = \frac{76.544(10)^9}{7.35(10^6)[6.37(10)^6 + 8.35(10)^6]}$$

$$= 0.707483$$

$$R = 6370 \text{ km}$$

$$r_A = 6370 \text{ km} + 300 \text{ km}$$

$$r_A = 6.67 \times 10^6 \text{ m}$$

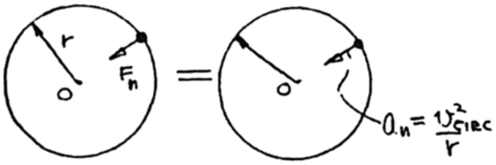
$$r_C = 42.14 \times 10^6 \text{ m}$$

$$GM = gR^2$$

$$GM = (9.81 \text{ m/s})(6.37 \times 10^6 \text{ m})^2$$

$$GM = 398.1 \times 10^{12} \text{ m}^3/\text{s}^2$$

For any circular orbit:



r
O
F_n
=
O
$a_n = \frac{v^2_{\text{circ}}}{r}$

$$F_n = ma_n = \frac{mv^2_{\text{circ}}}{r}$$

$$F_n = \frac{GMm}{r^2} = m\frac{mv^2_{\text{circ}}}{r}$$

$$v_{\text{circ}} = \sqrt{\frac{GM}{r}}$$

Velocity at *A*:

$$(v_A)_{\text{circ}} = \sqrt{\frac{GM}{r_A}} = \sqrt{\frac{(398.1 \times 10^{12} \text{ m}^3/\text{s}^3)}{(6.67 \times 10^6 \text{ m})}} = 7.726 \times 10^3 \text{ m/s}$$

$$v_A = (v_A)_{\text{circ}} + (v_A)_R = 7.726 \times 10^3 + 3.44 \times 10^3 = 11.165 \times 10^3 \text{ m/s}$$

PROBLEM 13.107 (Continued)

Velocity at *C*:

Conservation of energy: $T_A + V_A = T_C + V_C$

$$\frac{1}{2}\cancel{m}v_A^2 - \frac{GM\cancel{m}}{r_A} = \frac{1}{2}\cancel{m}v_C^2 - \frac{GM\cancel{m}}{r_C}$$

$$v_C^2 = v_A^2 + 2GM\left(\frac{1}{r_C} - \frac{1}{r_A}\right)$$

$$= (11.165\times10^3)^2 + 2(398.1\times10^{12})\left(\frac{1}{42.14\times10^6} - \frac{1}{6.67\times10^6}\right)$$

$$v_C^2 = 124.67\times10^6 - 100.48\times10^6$$

$$= 24.19\times10^6 \text{ m}^2/\text{s}^2$$

$$v_C = 4.919\times10^3 \text{ m/s}$$

Conservation of angular momentum:

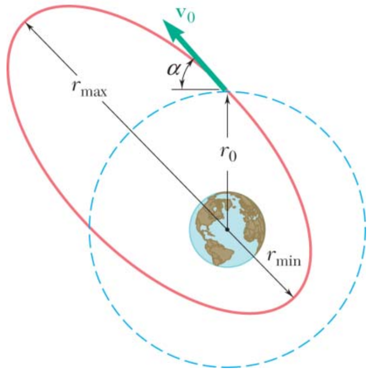
$$r_A m v_A = r_C m v_C \cos\gamma$$

$$\cos\gamma = \frac{r_A v_A}{r_C v_C}$$

$$= \frac{(6.67\times10^6)(11.165\times10^3)}{(42.14\times10^6)(4.919\times10^3)}$$

$$\cos\gamma = 0.35926$$

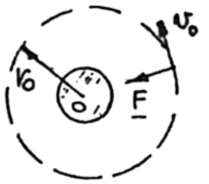
$\gamma = 68.9°$ ◀



PROBLEM 13.108

A satellite is projected into space with a velocity $\mathbf{v}_0$ at a distance r_0 from the center of the earth by the last stage of its launching rocket. The velocity $\mathbf{v}_0$ was designed to send the satellite into a circular orbit of radius r_0. However, owing to a malfunction of control, the satellite is not projected horizontally but at an angle α with the horizontal and, as a result, is propelled into an elliptic orbit. Determine the maximum and minimum values of the distance from the center of the earth to the satellite.

SOLUTION



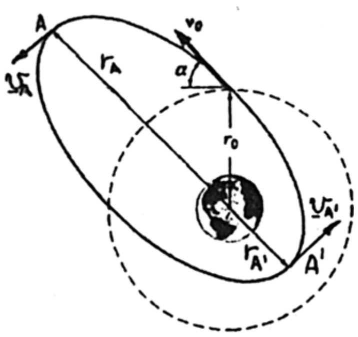
For circular orbit of radius r_0

$$F = ma_n \qquad \frac{GMm}{r_0^2} = m\frac{v_0^2}{r_0}$$

$$v_0^2 = \frac{GM}{r_0}$$

But v_0 forms an angle α with the intended circular path.

For elliptic orbit.



Conservation of angular momentum:

$$r_0 m v_0 \cos\alpha = r_A m v_A$$

$$v_A = \left(\frac{r_0}{r_A}\cos\alpha\right)v_0 \tag{1}$$

Conservation of energy:

$$\frac{1}{2}mv_0^2 - \frac{GMm}{r_0} = \frac{1}{2}mv_A^2 - \frac{GMm}{r_A}$$

$$v_0^2 - v_A^2 = \frac{2GM}{r_0}\left(1 - \frac{r_0}{r_A}\right)$$

Substitute for v_A from (1)

$$v_0^2\left[1 - \left(\frac{r_0}{r_A}\right)^2 \cos^2\alpha\right] = \frac{2GM}{r_0}\left(1 - \frac{r_0}{r_A}\right)$$

But $\quad v_0^2 = \dfrac{GM}{r_0}, \qquad$ thus $\quad 1 - \left(\dfrac{r_0}{r_A}\right)^2 \cos^2\alpha = 2\left(1 - \dfrac{r_0}{r_A}\right)$

$$\cos^2\alpha\left(\frac{r_0}{r_A}\right)^2 - 2\left(\frac{r_0}{r_A}\right) + 1 = 0$$

PROBLEM 13.108 (Continued)

Solving for $\frac{r_0}{r_A}$

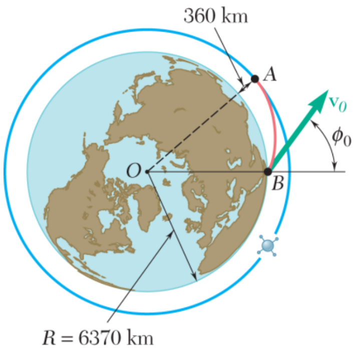
$$\frac{r_0}{r_A} = \frac{+2 \pm \sqrt{4 - 4\cos^2\alpha}}{2\cos^2\alpha} = \frac{1 \pm \sin\alpha}{1 - \sin^2\alpha}$$

$$r_A = \frac{(1+\sin\alpha)(1-\sin\alpha)}{1 \pm \sin\alpha} r_0 = (1 \mp \sin\alpha) r_0$$

also valid for Point A'

Thus,

$$r_{\max} = (1+\sin\alpha) r_0 \qquad r_{\min} = (1-\sin\alpha) r_0$$ ◀



PROBLEM 13.109

A space vehicle is to rendezvous with an orbiting laboratory which circles the earth at a constant altitude of 360 km. The shuttle has reached an altitude of 60 km when its engine is shut off, and its velocity $\mathbf{v}_0$ forms an angle $\phi_0 = 50°$ with the vertical OB at that time. What magnitude should $\mathbf{v}_0$ have if the shuttle's trajectory is to be tangent at A to the orbit of the laboratory?

SOLUTION

Conservation of energy

$$\frac{1}{2}mv_0^2 - \frac{GMm}{r_B} = \frac{1}{2}mv_A^2 - \frac{GMm}{r_A}$$

So

$$v_A^2 = v_0^2 - \frac{2GM}{r_B}\left(1 - \frac{r_B}{r_A}\right)$$

(1)

Given

$$R = 6370 \text{ km} = 6.37 \times 10^6 \text{ m}$$

$$GM = gR^2 = (9.81)\left(6.37 \times 10^6\right)^2 = 398 \times 10^{12}$$

$$r_A = 6370 + 360 = 6730 \text{ km} = 6.73 \times 10^6 \text{ m}$$

$$r_B = 6370 + 60 = 6430 \text{ km} = 6.43 \times 10^6 \text{ m}$$

Substitute into (1)

$$v_A^2 = v_0^2 - \frac{2\left(398 \times 10^{12}\right)}{6.43 \times 10^6}\left(1 - \frac{6.43 \times 10^6}{6.73 \times 10^6}\right)$$

$$v_A^2 = v_0^2 - 5.518 \times 10^6 \qquad (2)$$

We need another equation → conservation of angular momentum

$$r_B mv \sin\phi = r_A m v_A$$

$$v_A = \frac{r_B v_0 \sin\phi}{r_A} = \left(\frac{6.43 \times 10^6}{6.73 \times 10^6}\right) v_0 \sin 50°$$

$$v_A = 0.7319 v_0$$

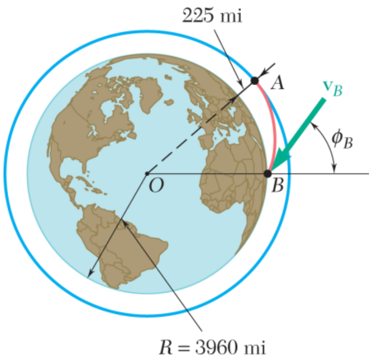
Substitute into (2)

$$\left(0.7319 v_0\right)^2 = v_0^2 - 5.518 \times 10^6$$

$$0.46433 v_0^2 = 5.518 \times 10^6$$

$$v_0 = 3477 \text{ m/s}$$

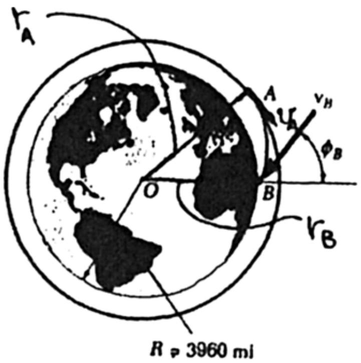
$v_0 = 3450$ m/s ◀



PROBLEM 13.110

A space vehicle is in a circular orbit at an altitude of 225 mi above the earth. To return to earth, it decreases its speed as it passes through *A* by firing its engine for a short interval of time in a direction opposite to the direction of its motion. Knowing that the velocity of the space vehicle should form an angle $\phi_B = 60°$ with the vertical as it reaches Point *B* at an altitude of 40 mi, determine (*a*) the required speed of the vehicle as it leaves its circular orbit at *A*, (*b*) its speed at Point *B*.

SOLUTION



(*a*)

$$r_A = 3960 \text{ mi} + 225 \text{ mi} = 4185 \text{ mi}$$

$$r_A = 4185 \text{ mi} \times 5280 \text{ ft/mi} = 22{,}097 \times 10^3 \text{ ft}$$

$$r_B = 3960 \text{ mi} + 40 \text{ mi} = 4000 \text{ mi}$$

$$r_B = 4000 \times 5280 = 21{,}120 \times 10^3 \text{ ft}$$

$$R = 3960 \text{ mi} = 20{,}909 \times 10^3 \text{ ft}$$

$$GM = gR^2 = (32.2 \text{ ft/s}^2)(20{,}909 \times 10^3 \text{ ft})^2$$

$$GM = 14.077 \times 10^{15} \text{ ft}^3/\text{s}^2$$

Conservation of energy:

$$T_A = \frac{1}{2}mv_A^2$$

$$V_A = \frac{-GMm}{r_A}$$

$$= \frac{-14.077 \times 10^{15} m}{22{,}097 \times 10^3}$$

$$= -637.1 \times 10^6 m$$

$$T_B = \frac{1}{2}mv_B^2$$

$$V_B = \frac{-GMm}{r_B}$$

$$= \frac{-14.077 \times 10^{15} m}{21{,}120 \times 10^3}$$

$$= -666.5 \times 10^6 m$$

$$T_A + V_A = T_B + V_B$$

$$\frac{1}{2}\cancel{m}v_A^2 - 637.1 \times 10^6 \cancel{m} = \frac{1}{2}\cancel{m}v_B^2 - 666.5 \times 10^6 \cancel{m}$$

$$v_A^2 = v_B^2 - 58.94 \times 10^6 \qquad (1)$$

PROBLEM 13.110 (Continued)

Conservation of angular momentum:

$$r_A m v_A = r_B m v_B \sin\phi_B$$

$$v_B = \frac{(r_A)v_A}{(r_B)(\sin\phi_B)} = \frac{4185}{4000}\left(\frac{1}{\sin 60°}\right)v_A$$

$$v_B = 1.208\, v_A \qquad (2)$$

Substitute v_B from (2) in (1)

$$v_A^2 = (1.208 v_A)^2 - 58.94\times 10^6$$

$$v_A^2[(1.208)^2 - 1] = 58.94\times 10^6$$

$$v_A^2 = 128.27\times 10^6 \text{ ft}^2/\text{s}^2$$

(*a*) $v_A = 11.32\times 10^3$ ft/s ◀

(*b*) From (2)

$$v_B = 1.208 v_A$$

$$= 1.208(11.32\times 10^6)$$

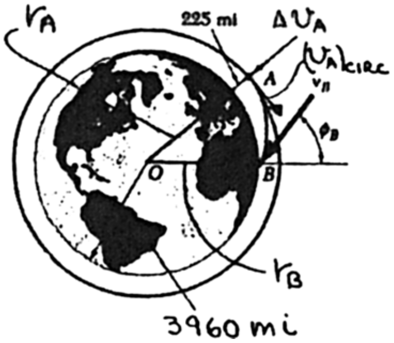
$$= 13.68\times 10^3 \text{ ft/s}$$

$v_B = 13.68\times 10^3$ ft/s ◀

PROBLEM 13.111*

In Problem 13.110, the speed of the space vehicle was decreased as it passed through *A* by firing its engine in a direction opposite to the direction of motion. An alternative strategy for taking the space vehicle out of its circular orbit would be to turn it around so that its engine would point away from the earth and then give it an incremental velocity $\Delta\mathbf{v}_A$ toward the center *O* of the earth. This would likely require a smaller expenditure of energy when firing the engine at *A*, but might result in too fast a descent at *B*. Assuming this strategy is used with only 50 percent of the energy expenditure used in Problem 13.109, determine the resulting values of ϕ_B and v_B.

SOLUTION



$$r_A = 3960 \text{ mi} + 225 \text{ mi}$$

$$r_A = 4185 \text{ mi} = 22.097 \times 10^6 \text{ ft}$$

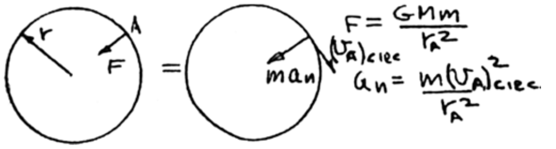
$$r_B = 3960 \text{ mi} + 40 \text{ mi} = 4000 \text{ mi}$$

$$r_B = 21.120 \times 10^6 \text{ ft}$$

$$GM = gR^2 = (32.2 \text{ ft/s}^2)[(3960)(5280) \text{ ft}^2]$$

$$GM = 14.077 \times 10^{15} \text{ ft}^3/\text{s}^2$$

Velocity in circular orbit at 225 m altitude:



Newton's second law

$$F = ma_n: \quad \frac{GMm}{r_A^2} = \frac{m(v_A)_{\text{circ}}^2}{r_A}$$

$$(v_A)_{\text{circ}} = \sqrt{\frac{GM}{r_A}} = \sqrt{\frac{14.077 \times 10^{15}}{22.097 \times 10^6}}$$

$$= 25.24 \times 10^3 \text{ ft/s}$$

Energy expenditure:

From Problem 13.110, $\quad v_A = 11.32 \times 10^3 \text{ ft/s}$

Energy, $\quad \Delta E_{109} = \frac{1}{2}m(v_A)_{\text{circ}}^2 - \frac{1}{2}mv_A^2$

$$\Delta E_{109} = \frac{1}{2}m(25.24 \times 10^3)^2 - \frac{1}{2}m(11.32 \times 10^3)^2$$

$$\Delta E_{109} = 254.46 \times 10^6\, m \text{ ft} \cdot \text{lb}$$

$$\Delta E_{110} = (0.50)\Delta E_{109} = \frac{(254.46 \times 10^6\, m)}{2} \text{ft} \cdot \text{lb}$$

PROBLEM 13.111* (Continued)

Thus, additional kinetic energy at A is

$$\frac{1}{2}m(\Delta v_A)^2 = \Delta E_{110} = \frac{(254.46\times 10^6 m)}{2}\text{ ft}\cdot\text{lb} \qquad (1)$$

Conservation of energy between A and B:

$$T_A = \frac{1}{2}m[(v_A)^2_{\text{circ}} + (\Delta v_A)^2] \qquad V_A = \frac{-GMm}{r_A}$$

$$T_B = \frac{1}{2}mv_B^2 \qquad V_B = \frac{-GMm}{r_A}$$

$$T_A + V_A = T_B + V_B$$

$$\frac{1}{2}m(25.24\times 10^3)^2 + \frac{254.46\times 10^6 m}{2} - \frac{14.077\times 10^{15} m}{22.097\times 10^6} = \frac{1}{2}mv_B^2 - \frac{14.077\times 10^{15} m}{21.120\times 10^6}$$

$$v_B^2 = 637.06\times 10^6 + 254.46\times 10^6 - 1274.1\times 10^6 + 1333\times 10^6$$
$$v_B^2 = 950.4\times 10^3$$

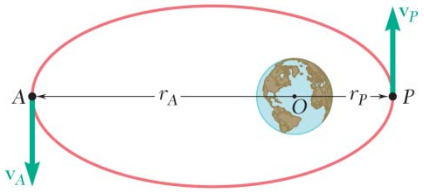
$$v_B = 30.88\times 10^3\text{ ft/s} \blacktriangleleft$$

Conservation of angular momentum between A and B:

$$r_A m(v_A)_{\text{circ}} = r_B m v_B \sin\phi_B$$

$$\sin\phi_B = \left(\frac{r_A}{r_B}\right)\frac{(v_A)_{\text{circ}}}{(v_B)} = \frac{(4185)}{(4000)}\frac{(25.24\times 10^3)}{(30.88\times 10^3)} = 0.8565$$

$$\phi_B = 58.9° \blacktriangleleft$$



PROBLEM 13.112

Show that the values v_A and v_P of the speed of an earth satellite at the apogee A and the perigee P of an elliptic orbit are defined by the relations

$$v_A^2 = \frac{2GM}{r_A + r_P}\frac{r_P}{r_A} \qquad v_P^2 = \frac{2GM}{r_A + r_P}\frac{r_A}{r_P}$$

where M is the mass of the earth, and r_A and r_P represent, respectively, the maximum and minimum distances of the orbit to the center of the earth.

SOLUTION

Conservation of angular momentum:

$$r_A m v_A = r_P m v_P$$

$$v_A = \frac{r_P}{r_A} v_P \qquad (1)$$

Conservation of energy:

$$\frac{1}{2} m v_P^2 - \frac{GMm}{r_P} = \frac{1}{2} m v_A^2 - \frac{GMm}{r_A} \qquad (2)$$

Substituting for v_A from (1) into (2)

$$v_P^2 - \frac{2GM}{r_P} = \left(\frac{r_P}{r_A}\right)^2 v_P^2 - \frac{2GM}{r_A}$$

$$\left(1 - \left(\frac{r_P}{r_A}\right)^2\right) v_P^2 = 2GM\left(\frac{1}{r_P} - \frac{1}{r_A}\right)$$

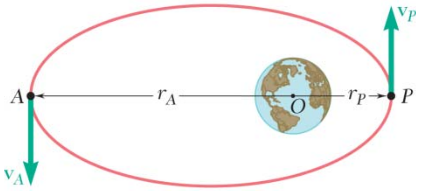
$$\frac{r_A^2 - r_P^2}{r_A^2} v_P^2 = 2GM \frac{r_A - r_P}{r_A r_P}$$

with $r_A^2 - r_P^2 = (r_A - r_P)(r_A + r_P)$

$$v_P^2 = \frac{2GM}{r_A + r_P}\left(\frac{r_A}{r_P}\right) \quad (3)□ \quad ◀$$

Exchanging subscripts P and A

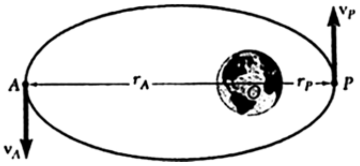
$$v_A^2 = \frac{2GM}{r_A + r_P}\left(\frac{r_P}{r_A}\right) \qquad \text{Q.E.D.} \quad ◀$$



PROBLEM 13.113

Show that the total energy E of an earth satellite of mass m describing an elliptic orbit is $E = -GMm/(r_A + r_P)$, where M is the mass of the earth, and r_A and r_P represent, respectively, the maximum and minimum distances of the orbit to the center of the earth. (Recall that the gravitational potential energy of a satellite was defined as being zero at an infinite distance from the earth.)

SOLUTION



See solution to Problem 13.112 (above) for derivation of Equation (3).

$$v_P^2 = \frac{2GM}{(r_A + r_P)} \frac{r_A}{r_P}$$

Total energy at Point P is

$$E = T_P + V_P = \frac{1}{2} m v_P^2 - \frac{GMm}{r_P}$$

$$= \frac{1}{2}\left[\frac{2GMm}{(r_A + r_0)} \frac{r_A}{r_P}\right] - \frac{GMm}{r_P}$$

$$= GMm\left[\frac{r_A}{r_P(r_A + r_P)} - \frac{1}{r_P}\right]$$

$$= GMm \frac{(r_A - r_A - r_P)}{r_P(r_A + r_P)}$$

$$E = -\frac{GMm}{r_A + r_P} \blacktriangleleft$$

Note: Recall that gravitational potential of a satellite is defined as being zero at an infinite distance from the earth.

PROBLEM 13.114*

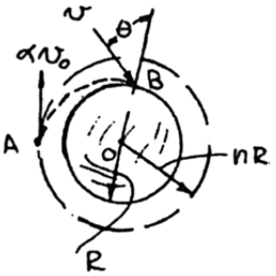
A space probe describes a circular orbit of radius nR with a velocity $\mathbf{v}_0$ about a planet of radius R and center O. Show that (a) in order for the probe to leave its orbit and hit the planet at an angle θ with the vertical, its velocity must be reduced to $\alpha\mathbf{v}_0$, where

$$\alpha = \sin\theta\sqrt{\frac{2(n-1)}{n^2-\sin^2\theta}}$$

(b) the probe will not hit the planet if α is larger than $\sqrt{2/(1+n)}$.

SOLUTION

(a) Conservation of energy:



At A:

$$T_A = \frac{1}{2}m(\alpha v_0)^2$$

$$V_A = -\frac{GMm}{nR}$$

At B:

$$T_B = \frac{1}{2}mv^2$$

$$V_B = -\frac{GMm}{R}$$

M = mass of planet

m = mass of probe

$$T_A + V_A = T_B + V_B$$

$$\frac{1}{2}\cancel{m}(\alpha v_0)^2 - \frac{GM\cancel{m}}{nR} = \frac{1}{2}\cancel{m}v^2 - \frac{GM\cancel{m}}{R} \qquad (1)$$

Conservation of angular momentum:

$$nRm\alpha v_0 = Rmv\sin\theta$$

$$v = \frac{n\alpha v_0}{\sin\theta} \qquad (2)$$

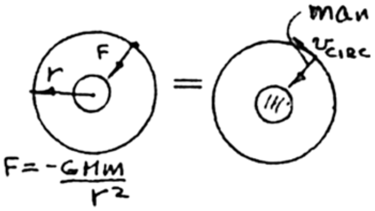
Replacing v in (1) by (2)

$$(\alpha v_0)^2 - \frac{2GM}{nR} = \left(\frac{n\alpha v_0}{\sin\theta}\right)^2 - \frac{2GM}{R} \qquad (3)$$

PROBLEM 13.114* (Continued)

For any circular orbit.

$$a_n = \frac{v^2}{r}$$



Newton's second law

$$\frac{-GMm}{r^2} = \frac{m(v)^2_{\text{circ}}}{r}$$

$$v_{\text{circ}} = \sqrt{\frac{GM}{r}}$$

For $r = nR$, $$v_0 = v_{\text{circ}} = \sqrt{\frac{GM}{nR}}$$

Substitute for v_0 in (3)

$$\alpha^2 \frac{G\cancel{M}}{n\cancel{R}} - \frac{2G\cancel{M}}{n\cancel{R}} = \frac{n^2\alpha^2}{\sin^2\theta}\left(\frac{G\cancel{M}}{n\cancel{R}}\right) - \frac{2G\cancel{M}}{\cancel{R}}$$

$$\alpha^2\left[1 - \frac{n^2}{\sin^2\theta}\right] = 2(1-n)$$

$$\alpha^2 = \frac{2(1-n)(\sin^2\theta)}{(\sin^2\theta - n^2)} = \frac{2(n-1)\sin^2\theta}{(n^2 - \sin^2\theta)}$$

$$\alpha = \sin\theta\sqrt{\frac{2(n-1)}{n^2 - \sin^2\theta}} \qquad \text{Q.E.D.}$$ ◀

(*b*) Probe will just miss the planet if $\theta > 90°$,

$$\alpha = \sin 90°\sqrt{\frac{2(n-1)}{n^2 - \sin^2 90°}} = \sqrt{\frac{2}{n+1}}$$ ◀

Note: $$n^2 - 1 = (n-1)(n+1)$$

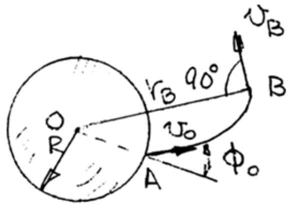
PROBLEM 13.115

A missile is fired from the ground with an initial velocity $\mathbf{v}_0$ forming an angle ϕ_0 with the vertical. If the missile is to reach a maximum altitude equal to αR, where R is the radius of the earth, (*a*) show that the required angle ϕ_0 is defined by the relation

$$\sin\phi_0 = (1+\alpha)\sqrt{1-\frac{\alpha}{1+\alpha}\left(\frac{v_{\text{esc}}}{v_0}\right)^2}$$

where v_{esc} is the escape velocity, (*b*) determine the range of allowable values of v_0.

SOLUTION



(*a*) $$r_A = R$$

Conservation of angular momentum:

$$Rmv_0\sin\phi_0 = r_B m v_B$$

$$r_B = R+\alpha R = (1+\alpha)R$$

$$v_B = \frac{Rv_0\sin\phi_0}{(1+\alpha)R} = \frac{v_0\sin\phi_0}{(1+\alpha)} \qquad (1)$$

Conservation of energy:

$$T_A + V_A = T_B + V_B \qquad \frac{1}{2}mv_0^2 - \frac{GMm}{R} = \frac{1}{2}mv_B^2 - \frac{GMm}{(1+\alpha)R}$$

$$v_0^2 - v_B^2 = \frac{2GMm}{R}\left(1-\frac{1}{1+\alpha}\right) = \frac{2GMm}{R}\left(\frac{\alpha}{1+\alpha}\right)$$

Substitute for v_B from (1)

$$v_0^2\left(1-\frac{\sin^2\phi_0}{(1+\alpha)^2}\right) = \frac{2GMm}{R}\left(\frac{\alpha}{1+\alpha}\right)$$

From Equation (12.43): $$v_{\text{esc}}^2 = \frac{2GM}{R}$$

$$v_0^2\left(1-\frac{\sin^2\phi_0}{(1+\alpha)^2}\right) = v_{\text{esc}}^2\left(\frac{\alpha}{1+\alpha}\right)$$

$$\frac{\sin^2\phi_0}{(1+\alpha)^2} = 1-\left(\frac{v_{\text{esc}}}{v_0}\right)^2\frac{\alpha}{1+\alpha} \qquad (2)$$

$$\sin\phi_0 = (1+\alpha)\sqrt{1-\frac{\alpha}{1+\alpha}\left(\frac{v_{\text{esc}}}{v_0}\right)^2} \qquad \text{Q.E.D.}$$

(*b*) Allowable values of v_0 (for which maximum altitude = αR)

$$0 < \sin^2 \phi_0 < 1$$

For $\sin \phi_0 = 0$, from (2)

$$0 = 1 - \left(\frac{v_{\text{esc}}}{v_0}\right)^2 \frac{\alpha}{1+\alpha}$$

$$v_0 = v_{\text{esc}} \sqrt{\frac{\alpha}{1+\alpha}}$$

For $\sin \phi_0 = 1$, from (2)

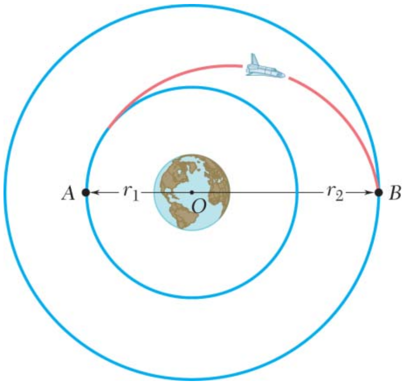
$$\frac{1}{(1+\alpha)^2} = 1 - \left(\frac{v_{\text{esc}}}{v_0}\right)^2 \frac{\alpha}{1+\alpha}$$

$$\left(\frac{v_{\text{esc}}}{v_0}\right)^2 = \frac{1}{\alpha}\left(1+\alpha - \frac{1}{1+\alpha}\right) = \frac{1+2\alpha+\alpha^2-1}{\alpha(1+\alpha)} = \frac{2+\alpha}{1+\alpha}$$

$$v_0 = v_{\text{esc}} \sqrt{\frac{1+\alpha}{2+\alpha}}$$

$$v_{\text{esc}} \sqrt{\frac{\alpha}{1+\alpha}} < v_0 < v_{\text{esc}} \sqrt{\frac{1+\alpha}{2+\alpha}} \blacktriangleleft$$

PROBLEM 13.116



A spacecraft of mass m describes a circular orbit of radius r_1 around the earth. (*a*) Show that the additional energy ΔE which must be imparted to the spacecraft to transfer it to a circular orbit of larger radius r_2 is

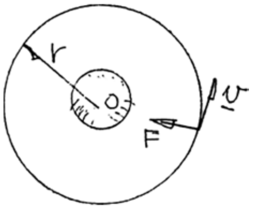
$$\Delta E = \frac{GMm(r_2 - r_1)}{2r_1r_2}$$

where M is the mass of the earth. (*b*) Further show that if the transfer from one circular orbit to the other is executed by placing the spacecraft on a transitional semielliptic path AB, the amounts of energy ΔE_A and ΔE_B which must be imparted at A and B are, respectively, proportional to r_2 and r_1:

$$\Delta E_A = \frac{r_2}{r_1 + r_2}\Delta E \qquad \Delta E_B = \frac{r_1}{r_1 + r_2}\Delta E$$

SOLUTION

(*a*) For a *circular* orbit of radius r



$$F = ma_n: \quad \frac{GMm}{r^2} = m\frac{v^2}{r}$$

$$v^2 = \frac{GM}{r}$$

$$E = T + V = \frac{1}{2}mv^2 - \frac{GMm}{r} = -\frac{1}{2}\frac{GMm}{r} \qquad (1)$$

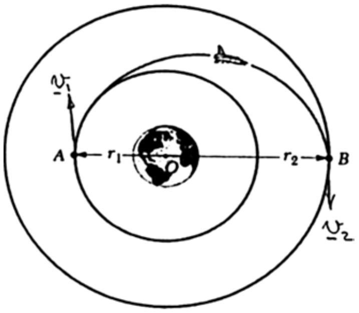
Thus ΔE required to pass from circular orbit of radius r_1 to circular orbit of radius r_2 is

$$\Delta E = E_1 - E_2 = -\frac{1}{2}\frac{GMm}{r_1} + \frac{1}{2}\frac{GMm}{r_2}$$

$$\Delta E = \frac{GMm(r_2 - r_1)}{2r_1r_2} \qquad \text{Q.E.D.} \qquad (2)$$

(*b*) For an elliptic orbit, we recall Equation (3) derived in Problem 13.113 (with $v_P = v_1$)

$$v_1^2 = \frac{2Gm}{(r_1 + r_2)}\frac{r_2}{r_1}$$



PROBLEM 13.116 (Continued)

At Point *A*: Initially spacecraft is in a circular orbit of radius r_1.

$$v_{\text{circ}}^2 = \frac{GM}{r_1}$$

$$T_{\text{circ}} = \frac{1}{2}mv_{\text{circ}}^2 = \frac{1}{2}m\frac{GM}{r_1}$$

After the spacecraft engines are fired and it is placed on a semi-elliptic path *AB*, we recall

$$v_1^2 = \frac{2GM}{(r_1 + r_2)} \cdot \frac{r_2}{r_1}$$

and

$$T_1 = \frac{1}{2}mv_1^2 = \frac{1}{2}m\frac{2GMr_2}{r_1(r_1 + r_2)}$$

At Point *A*, the increase in energy is

$$\Delta E_A = T_1 - T_{\text{circ}} = \frac{1}{2}m\frac{2GMr_2}{r_1(r_1 + r_2)} - \frac{1}{2}m\frac{GM}{r_1}$$

$$\Delta E_A = \frac{GMm(2r_2 - r_1 - r_2)}{2r_1(r_1 + r_2)} = \frac{GMm(r_2 - r_1)}{2r_1(r_1 + r_2)}$$

$$\Delta E_A = \frac{r_2}{r_1 + r_2}\left[\frac{GMm(r_2 - r_1)}{2r_1r_2}\right]$$

Recall Equation (2):

$$\Delta E_A = \frac{r_2}{(r_1 + r_2)}\Delta E \qquad \text{Q.E.D.}$$

A similar derivation at Point *B* yields,

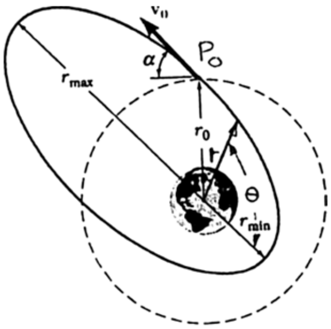
$$\Delta E_B = \frac{r_1}{(r_1 + r_2)}\Delta E \qquad \text{Q.E.D.}$$

PROBLEM 13.117*

Using the answers obtained in Problem 13.108, show that the intended circular orbit and the resulting elliptic orbit intersect at the ends of the minor axis of the elliptic orbit.

PROBLEM 13.108 A satellite is projected into space with a velocity $\mathbf{v}_0$ at a distance r_0 from the center of the earth by the last stage of its launching rocket. The velocity $\mathbf{v}_0$ was designed to send the satellite into a circular orbit of radius r_0. However, owing to a malfunction of control, the satellite is not projected horizontally but at an angle α with the horizontal and, as a result, is propelled into an elliptic orbit. Determine the maximum and minimum values of the distance from the center of the earth to the satellite.

SOLUTION



If the point of intersection P_0 of the circular and elliptic orbits is at an end of the minor axis, then v_0 is parallel to the major axis. This will be the case only if $\alpha + 90° = \theta_0$, that is if $\cos\theta_0 = -\sin\alpha$. We must therefore prove that

$$\cos\theta_0 = -\sin\alpha \tag{1}$$

We recall from Equation (12.39):

$$\frac{1}{r} = \frac{GM}{h^2} + C\cos\theta \tag{2}$$

When $\theta = 0$, $r = r_{\text{min}}$ and $r_{\text{min}} = r_0(1-\sin\alpha)$

$$\frac{1}{r_0(1-\sin\alpha)} = \frac{GM}{h^2} + C \tag{3}$$

For $\theta = 180°$, $r = r_{\text{max}} = r_0(1+\sin\alpha)$

$$\frac{1}{r_0(1+\sin\alpha)} = \frac{GM}{h^2} - C \tag{4}$$

Adding (3) and (4) and dividing by 2:

$$\frac{GM}{h^2} = \frac{1}{2r_0}\left(\frac{1}{1-\sin\alpha} + \frac{1}{1+\sin\alpha}\right)$$
$$= \frac{1}{r_0\cos^2\alpha}$$

Subtracting (4) from (3) and dividing by 2:

$$C = \frac{1}{2r_0}\left(\frac{1}{1-\sin\alpha} - \frac{1}{1+\sin\alpha}\right) = \left(\frac{1}{2r_0}\right)\frac{2\sin\alpha}{1-\sin^2\alpha}$$
$$C = \frac{\sin\alpha}{r_0\cos^2\alpha}$$

PROBLEM 13.117* (Continued)

Substituting for $\frac{GM}{h^2}$ and C into Equation (2)

$$\frac{1}{r}=\frac{1}{r_0\cos^2\alpha}(1+\sin\alpha\cos\theta) \tag{5}$$

Letting $r=r_0$ and $\theta=\theta_0$ in Equation (5), we have

$$\cos^2\alpha=1+\sin\alpha\cos\theta_0$$

$$\cos\theta_0=\frac{\cos^2\alpha-1}{\sin\alpha}$$

$$=-\frac{\sin^2\alpha}{\sin\alpha}$$

$$=-\sin\alpha$$

This proves the validity of Equation (1) and thus P_0 is an end of the minor axis of the elliptic orbit.

PROBLEM 13.118*

(*a*) Express in terms of $r_{\min}$ and $v_{\max}$ the angular momentum per unit mass, *h*, and the total energy per unit mass, *E*/*m*, of a space vehicle moving under the gravitational attraction of a planet of mass *M* (Figure 13.15).
(*b*) Eliminating $v_{\max}$ between the equations obtained, derive the formula

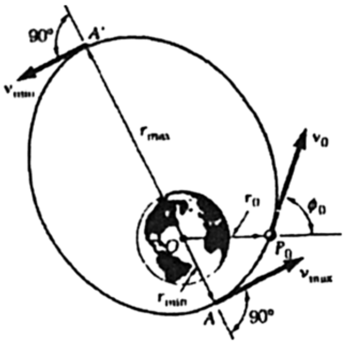
$$\frac{1}{r_{\min}} = \frac{GM}{h^2}\left[1+\sqrt{1+\frac{2E}{m}\left(\frac{h}{GM}\right)^2}\right]$$

(*c*) Show that the eccentricity ε of the trajectory of the vehicle can be expressed as

$$\varepsilon = \sqrt{1+\frac{2E}{m}\left(\frac{h}{GM}\right)^2}$$

(*d*) Further show that the trajectory of the vehicle is a hyperbola, an ellipse, or a parabola, depending on whether *E* is positive, negative, or zero.

SOLUTION



(*a*) Point *A*:

Angular momentum per unit mass.

$$h = \frac{H_0}{m}$$

$$= \frac{r_{\min} m v_{\max}}{m}$$

$$h = r_{\min} v_{\max} \qquad (1) \blacktriangleleft$$

Energy per unit mass

$$\frac{E}{m} = \frac{1}{m}(T+V)$$

$$\frac{E}{m} = \frac{1}{m}\left(\frac{1}{2}mv_{\max}^2 - \frac{GMm}{r_{\min}}\right) = \frac{1}{2}v_{\max}^2 - \frac{GM}{r_{\min}} \qquad (2) \blacktriangleleft$$

(*b*) From Eq. (1): $v_{\max} = h/r_{\min}$ substituting into (2)

$$\frac{E}{m} = \frac{1}{2}\frac{h^2}{r_{\min}^2} - \frac{GM}{r_{\min}}$$

$$\left(\frac{1}{r_{\min}}\right)^2 - \frac{2GM}{h^2}\cdot\frac{1}{r_{\min}} - \frac{2\left(\frac{E}{m}\right)}{h^2} = 0$$

Solving the quadratic: $$\frac{1}{r_{\min}} = \frac{GM}{h^2} + \sqrt{\left(\frac{GM}{h^2}\right)^2 + \frac{2\left(\frac{E}{m}\right)}{h^2}}$$

Rearranging

$$\frac{1}{r_{\min}} = \frac{GM}{h^2}\left[1 + \sqrt{1 + \frac{2E}{m}\left(\frac{h}{GM}\right)^2}\right] \tag{3}$$ ◀

(*c*) Eccentricity of the trajectory:

Eq. (12.39′) $$\frac{1}{r} = \frac{GM}{h^2}(1 + \varepsilon\cos\theta)$$

When $\theta = 0$, $\cos\theta = 1$ and $r = r_{\min}$

Thus,

$$\frac{1}{r_{\min}} = \frac{GM}{h^2}(1 + \varepsilon) \tag{4}$$

Comparing (3) and (4), $$\varepsilon = \sqrt{1 + \frac{2E}{m}\left(\frac{h}{GM}\right)^2} \tag{5}$$

(*d*) Recalling discussion in section 12.12 and in view of Eq. (5)

1. Hyperbola if $\varepsilon > 1$, that is, if $E > 0$ ◀
2. Parabola if $\varepsilon = 1$, that is, if $E = 0$ ◀
3. Ellipse if $\varepsilon < 1$, that is, if $E < 0$ ◀

Note: For circular orbit $\varepsilon = 0$ and

$$1 + \frac{2E}{m}\left(\frac{h}{GM}\right)^2 = 0 \qquad \text{or} \qquad E = -\left(\frac{GM}{h}\right)^2 \frac{m}{2},$$

but for circular orbit $$v^2 = \frac{GM}{r} \qquad \text{and} \qquad h^2 = v^2 r^2 = GMr,$$

thus $$E = -\frac{1}{2}m\frac{(GM)^2}{GMr} = -\frac{1}{2}\frac{GMm}{r}$$

PROBLEM 13.119

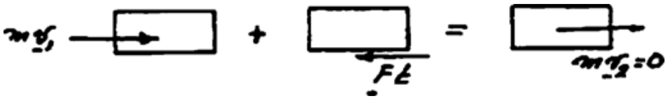
A 35,000 Mg ocean liner has an initial velocity of 4 km/h. Neglecting the frictional resistance of the water, determine the time required to bring the liner to rest by using a single tugboat which exerts a constant force of 150 kN.

SOLUTION

$$m = 35{,}000\ \ Mg = 35 \times 10^6 \text{ kg}$$

$$F = 150 \times 10^3 \text{ N}$$

$$v_1 = 4 \text{ km/hr} = 1.1111 \text{ m/s}$$



$$mv_1 - Ft = 0$$

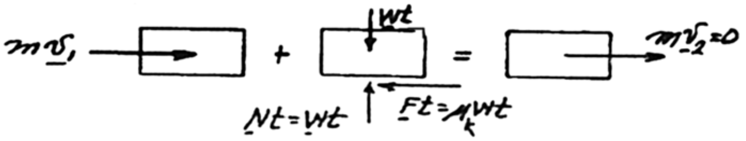
$$(35 \times 10^6 \text{ kg})(1.1111 \text{ m/s}) - (150 \times 10^3 \text{ N})t = 0$$

$$t = 259.26 \text{ s} \qquad t = 4 \text{ min} 19 \text{ s} ◀$$

PROBLEM 13.120

A 2500-lb automobile is moving at a speed of 60 mi/h when the brakes are fully applied, causing all four wheels to skid. Determine the time required to stop the automobile (*a*) on dry pavement ($\mu_k = 0.75$), (*b*) on an icy road ($\mu_k = 0.10$).

SOLUTION



$m\underline{v}_1$
+
Wt
=
$m\underline{v}_2=0$
$\underline{N}t=\underline{W}t$
$\underline{F}t=\mu_k Wt$

$$v_1 = 60 \text{ mph} = 88 \text{ ft/s}$$

$$mv_1 - \mu_k Wt = 0$$

$$t = \frac{mv_1}{\mu_k W} = \frac{mv_1}{\mu_k mg} = \frac{v_1}{\mu_k g}$$

(*a*) For $\mu_k = 0.75$

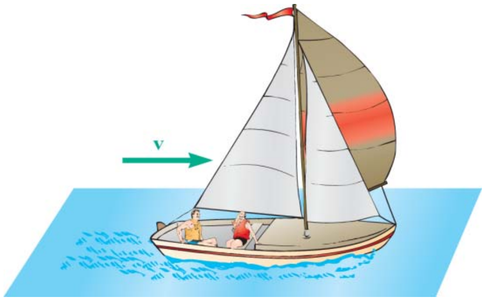
$$t = \frac{88 \text{ ft/s}}{(0.75)(32.2 \text{ ft/s}^2)}$$

$t = 3.64$ s ◀

(*b*) For $\mu_k = 0.10$

$$t = \frac{88 \text{ ft/s}}{(0.10)(32.2 \text{ ft/s}^2)}$$

$t = 27.3$ s ◀



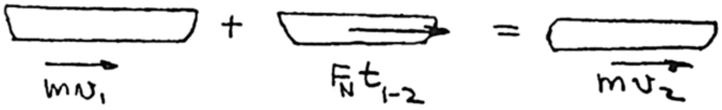
PROBLEM 13.121

A sailboat weighing 980 lb with its occupants is running down wind at 8 mi/h when its spinnaker is raised to increase its speed. Determine the net force provided by the spinnaker over the 10-s interval that it takes for the boat to reach a speed of 12 mi/h.

SOLUTION

$$v_1 = 8 \text{ mi/h} = 11.73 \text{ ft/s} \quad t_{1-2} = 10 \text{ sec}$$

$$v_2 = 12 \text{ mi/h} = 17.60 \text{ ft/s}$$

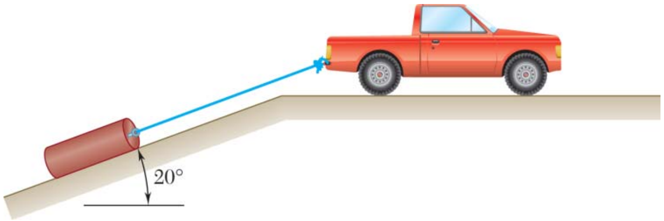


$$m \cdot v_1 + \text{imp}_{1-2} = mv_2$$

$$m(11.73 \text{ ft/s}) + F_n(10 \text{ s}) = m(17.60 \text{ ft/s})$$

$$F_n = \frac{(980 \text{ lb})(17.60 \text{ ft/s} - 11.73 \text{ ft/s})}{(32.2 \text{ ft/s}^2)(10 \text{ s})} \qquad F_n = 17.86 \text{ lb} \blacktriangleleft$$

Note: F_n is the *net* force *provided* by the sails. The force on the sails is actually greater and includes the force needed to overcome the water resistance on the hull.

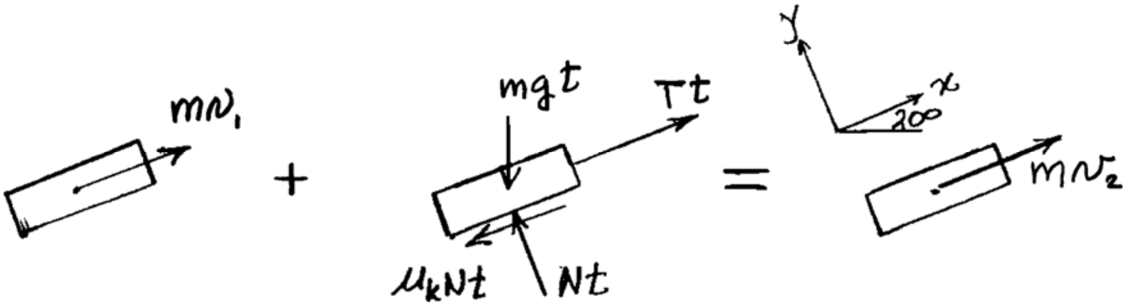


PROBLEM 13.122

A truck is hauling a 300-kg log out of a ditch using a winch attached to the back of the truck. Knowing the winch applies a constant force of 2500 N and the coefficient of kinetic friction between the ground and the log is 0.45, determine the time for the log to reach a speed of 0.5m/s.

SOLUTION

Apply the principle of impulse and momentum to the log.



$$m\mathbf{v}_1 + \Sigma\mathbf{Imp}_{1\to 2} = m\mathbf{v}_2$$

Components in y-direction:

$$0 + Nt - mgt\cos 20° = 0$$

$$N = mg\cos 20°$$

Components in x-direction:

$$0 + Tt - mgt\sin 20° - \mu_k Nt = mv_2$$

$$(T - mg\sin 20° - \mu_k mg\cos 20°)t = mv_2$$

$$[T - mg(\sin 20° + \mu_k \cos 20°)]t = mv_2$$

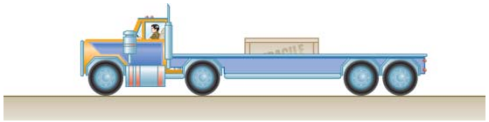
Data: $T = 2500\text{ N}, \quad m = 300\text{ kg}, \quad \mu_k = 0.45,$

$g = 9.81\text{ m/s}^2, \quad v_2 = 0.5\text{ m/s}$

$$[2500 - (300)(9.81)(\sin 20° + 0.45\cos 20°)]t = (300)(0.5)$$

$$248.95\, t = 150$$

$t = 0.603$ s ◀



PROBLEM 13.123

The coefficients of friction between the load and the flatbed trailer shown are $\mu_s = 0.40$ and $\mu_k = 0.35$. Knowing that the speed of the rig is 55 mi/h, determine the shortest time in which the rig can be brought to a stop if the load is not to shift.

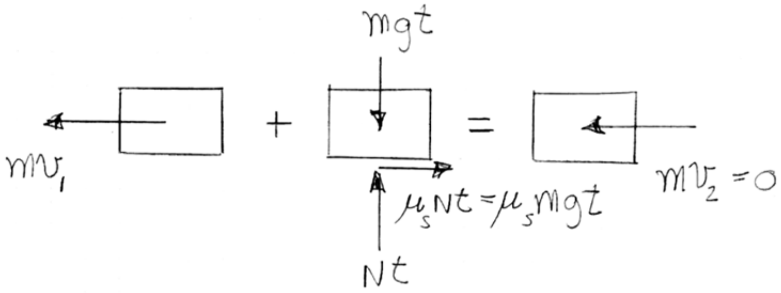
SOLUTION

Apply the principle impulse-momentum to the crate, knowing that, if the crate does not shift, the velocity of the crate matches that of the truck. For impending slip the friction and normal components of the contact force between the crate and the flatbed trailer satisfy the following equation:

$$F_f = \mu_s N$$

Given:
$$v_1 = 55\,\text{mi/h} = 80.667\ \text{ft/s}$$
$$\mu_s = 0.40,\ \mu_k = 0.35$$

Impulse Momentum Diagram:



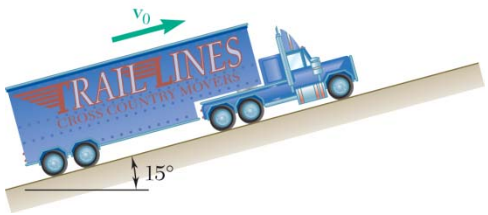
Using impulse momentum in the x-Direction ⟵

$$\cancel{m} v_1 - \mu_s \cancel{m} gt = 0$$

$$t = \frac{v_1}{\mu_s g} = \frac{80.667\ \text{ft/s}}{(0.4)\left(32.2\ \text{ft/s}^2\right)}$$

$t = 6.26$ s ◀

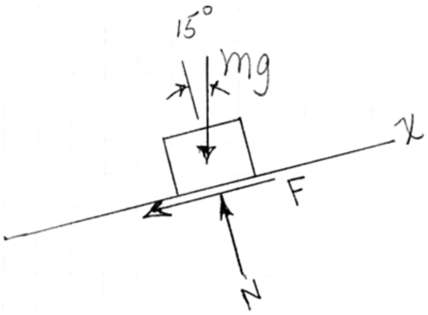
Since this is the shortest time the load can be brought to rest and the load does not slide it is also the shortest time the rig can be brought to rest.



PROBLEM 13.124

Steep safety ramps are built beside mountain highways to enable vehicles with defective brakes to stop. A 10-ton truck enters a 15° ramp at a high speed $v_0 = 108$ ft/s and travels for 6 s before its speed is reduced to 36 ft/s. Assuming constant deceleration, determine (*a*) the magnitude of the braking force, (*b*) the additional time required for the truck to stop. Neglect air resistance and rolling resistance.

SOLUTION



$$W = 20{,}000 \text{ lb}$$

$$m = \frac{20{,}000}{32.2} = 621.118 \text{ lb}\cdot\text{s}^2/\text{ft}$$

Momentum in the *x* direction

$$x\text{: } mv_0 - (F + mg\sin 15°)t = mv_1$$

$$621.118(108) - (F + mg\sin 15°)6 = (621.118)(36)$$

$$F + mg\sin 15° = 7453.4$$

(*a*) $F = 7453.4 - 20{,}000 \sin 15° = 2277$ lb

$F = 2280$ lb ◀

(*b*) $mv_0 - (F + mg\sin 15°)t = 0$ $t =$ total time

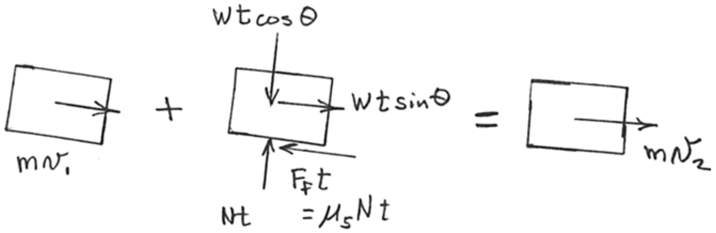
$621.118(108) - 7453.4t = 0;$ $t = 9.00$ s

Additional time = 9 – 6 $t = 3.00$ s ◀

PROBLEM 13.125

Baggage on the floor of the baggage car of a high-speed train is not prevented from moving other than by friction. The train is travelling down a 5 percent grade when it decreases its speed at a constant rate from 120 mi/h to 60 mi/h in a time interval of 12 s. Determine the smallest allowable value of the coefficient of static friction between a trunk and the floor of the baggage car if the trunk is not to slide.

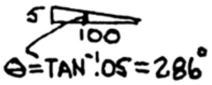
SOLUTION



$$v_1 = 120 \text{ mi/h} = 176 \text{ ft/s}$$

$$v_2 = 60 \text{ mi/h} = 88 \text{ ft/s}$$

$$t_{1-2} = 12 \text{ s}$$



$$Nt_{1-2} = Wt_{1-2}\cos\theta$$

$$\overset{+}{\searrow}\ \cancel{m}v_1 - \mu_s \cancel{m} g t_{1-2}\cos\theta + \cancel{m} g t_{1-2}\sin\theta = \cancel{m}v_2$$

$$(176 \text{ ft/s}) - \mu_s(32.2 \text{ ft/s}^2)(12 \text{ s})(\cos 2.86°) + (32.2 \text{ ft/s}^2)(12 \text{ s})(\sin 2.86°) = 88 \text{ ft/s}$$

$$\mu_s = \frac{176 - 88 + (32.2)(12)(\sin 2.86°)}{(32.2)(12)(\cos 2.86°)}$$

$\mu_s = 0.278$ ◀

PROBLEM 13.126

The 18000-kg F-35B uses thrust vectoring to allow it to take off vertically. In one maneuver, the pilot reaches the top of her static hover at 200 m. The combined thrust and lift force on the airplane applied at the end of the static hover can be expressed as F= $(44t + 2500t^2)$**i** + $(250t^2 + t + 176580)$**j,** where *F* and *t* are expressed in newtons and seconds, respectively. Determine (a) how long it will take the airplane to reach a cruising speed of 1000 km/hr (cruising speed is defined to be in the x-direction only), (b) the altitude of the plane at this time.

SOLUTION

Given:

$y_1 = 200$ m

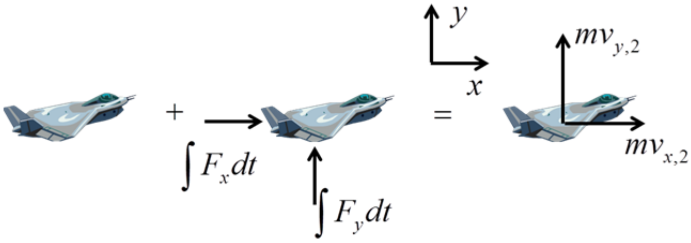
$m = 18000$ kg

$F_x = 44t + 2500t^2$

$F_y = 250t^2 + t + 176580$

$v_{x,2} = 1000$ km/hr $= 277.78$ m/s

Impulse-Momentum Diagram:



Impulse-Momentum in the x-direction:

$$0 + \int F_x dt = mv_{x,2}$$

$$\int_0^t \left(44t + 2500t^2\right) dt = 18000 * 277.78$$

$$\frac{2500}{3}t^3 + 22t^2 = 5{,}000{,}000$$

$$t^3 + \frac{33}{1250}t^2 - 6000 = 0$$

(a) Solve for *t*: $t = 18.162$ s ◀

Impulse-Momentum in the y-direction:

$$0 + \int F_y dt = mv_{\mathrm{y},2}$$

$$\int_0^t \left(250t^2 + t + 176580\right) dt = mv_{\mathrm{y},2}$$

$$\frac{250}{3}t^3 + \frac{1}{2}t^2 + 176580t = mv_{\mathrm{y},2}$$

Solve for velocity as function of time:

$$v_{\mathrm{y},2} = \frac{1}{m}\left(\frac{250}{3}t^3 + \frac{1}{2}t^2 + 176580t\right)$$

From kinematics:

$$v_{\mathrm{y},2} = \frac{dy}{dt} \Rightarrow v_{\mathrm{y},2}dt = dy$$

PROBLEM 13.126 (Continued)

Integrating:

$$\int_0^t v_{y,2}\,dt = \int_{200}^{y_2} dy$$

$$\frac{1}{m}\int_0^{18.162}\left(\frac{250}{3}t^3 + \frac{1}{2}t^2 + 176580t\right)dt = \int_{200}^{y_2} dy$$

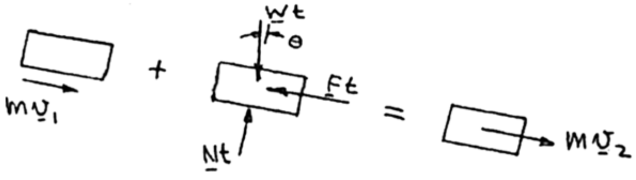
$$\frac{1}{18000}\left(\frac{125}{6}t^4 + \frac{1}{6}t^3 + 88290t^2\right) = y_2 - 200$$

(b) Find y_2 for t=18.162 s: $y_2 = 1944$ m $\qquad y_2 = 1.944$ km ◀

PROBLEM 13.127

A truck is traveling down a road with a 4-percent grade at a speed of 60 mi/h when its brakes are applied to slow it down to 20 mi/h. An antiskid braking system limits the braking force to a value at which the wheels of the truck are just about to slide. Knowing that the coefficient of static friction between the road and the wheels is 0.60, determine the shortest time needed for the truck to slow down.

SOLUTION



$$\theta = \tan^{-1}\frac{4}{100} = 2.29^\circ$$

$$m\mathbf{v}_1 + \Sigma\,\mathbf{imp}_{1-2} = m\mathbf{v}_2$$

$$+\searrow \quad mv_1 + Wt\sin\theta - Ft = mv_2$$

$$v_1 = 60 \text{ mi/h} = 88 \text{ ft/s} \qquad N = W\cos\theta \quad W = mg$$

$$v_2 = 20 \text{ mi/h} = 29.33 \text{ ft/s} \qquad F = \mu_s N = \mu_s W\cos\theta$$

$$(\cancel{m})(88 \text{ ft/s}) + (\cancel{m})(32.2 \text{ ft/s}^2)(t)(\sin 2.29^\circ) - (0.60)(\cancel{m})(32.2 \text{ ft/s}^2)(\cos 2.29^\circ)(t) = (\cancel{m})(29.33 \text{ ft/s})$$

$$t = \frac{88 - 29.33}{32.2[(0.60)\cos 2.29^\circ - \sin 2.29^\circ]} \qquad t = 3.26 \text{ s} \blacktriangleleft$$

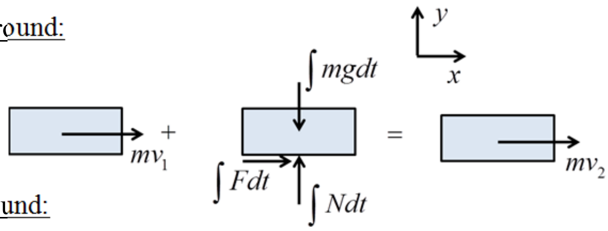
PROBLEM 13.128

In anticipation of a long 6° upgrade, a bus driver accelerates at a constant rate from 80 km/h to 100 km/h in 8 s while still on a level section of the highway. Knowing that the speed of the bus is 100 km/h as it begins to climb the grade at time $t = 0$ and that the driver does not change the setting of the throttle or shift gears, determine (*a*) the speed of the bus when $t = 10$ s, (*b*) the time when the speed is 60 km/h.

SOLUTION

Given: $v_2 = 100\ \text{km/h} = 27.778\ \text{m/s}$, $v_1 = 80\ \text{km/h} = 22.222\ \text{m/s}$, $t = 8\ \text{s}$

Impulse Momentum Diagram for acceleration on level ground:

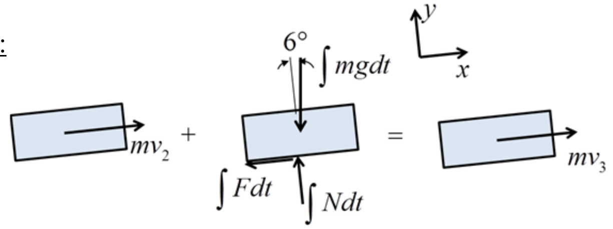


Impulse-Momentum in the x-direction while on level ground:

$$mv_1 + \int_0^8 Fdt = mv_2$$

$$F(8) = m(v_2 - v_1) \Rightarrow F = 0.6944m$$

Impulse Momentum Diagram for acceleration on incline:



Impulse-Momentum in the x-direction while on incline:

$$mv_2 + \int_0^{10} (F - mg\sin 6°)dt = mv_3$$

$$\cancel{m}(0.6944 - (9.81)\sin 6°)(10) = \cancel{m}(v_3 - 27.778)$$

(*a*) Solve for v_3: $v_3 = 24.47$ m/s $v_3 = 88.08$ km/h ◀

$$mv_2 + \int_0^{t} (F - mg\sin 6°)dt = mv_3$$

$$\cancel{m}(0.6944 - (9.81)\sin 6°)(t) = \cancel{m}(16.667 - 27.778)$$

(b) Solve for t: $t = 33.57$ s ◀

PROBLEM 13.131

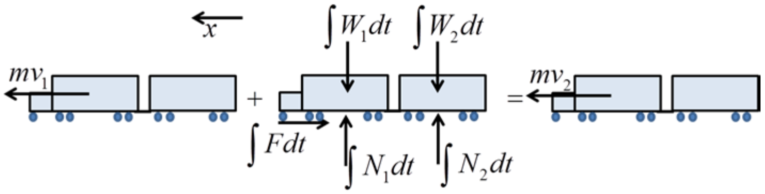
A tractor-trailer rig with a 2000-kg tractor, a 4500-kg trailer, and a 3600-kg trailer is traveling on a level road at 90 km/h. The brakes on the rear trailer fail and the antiskid system of the tractor and front trailer provide the largest possible force which will not cause the wheels to slide. Knowing that the coefficient of static friction is 0.75, determine (*a*) the shortest time for the rig to a come to a stop, (*b*) the force in the coupling between the two trailers during that time. Assume that the force exerted by the coupling on each of the two trailers is horizontal.

SOLUTION

Given: $v_1 = 90\,\text{km/h} = 25\ \text{m/s}\,,\ v_2 = 0$

$$W_1 = (6500)(9.81) = 63765\ \text{N};\quad W_2 = (3600)(9.81) = 35316\ \text{N}$$

Impulse Momentum diagram for combined cab and trailer:



From Equilibrium: $N_1 = W_1;\quad N_2 = W_2 \qquad F = 0.75 N_1$

Impulse-Momentum in the x-direction:

$$mv_1 - \int_0^t 0.75 N_1 dt = mv_2$$

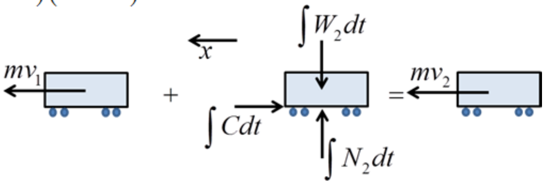
$$0.75 N_1 t = m(v_2 - v_1)$$

$$t = \frac{m(v_1 - \cancel{v_2})}{0.75 N_1}$$

(*a*) $$t = \frac{10{,}100(25)}{(0.75)(63765)} = 5.2798\ \text{s}$$ $t = 5.28\ \text{s}$ ◀

Impulse Momentum diagram for the trailer alone:

Impulse-Momentum in the x-direction:

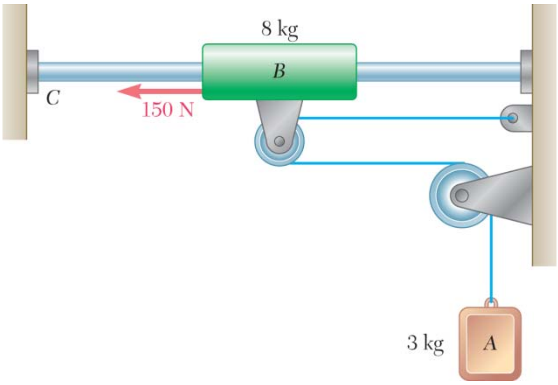


$$mv_1 - \int_0^{5.2798} C dt = mv_2$$

$$5.2798 C = m(v_1 - 0)$$

$$C = \frac{3600(25 - \cancel{v_2})}{5.2798} \Rightarrow C = 17046\ \text{N}$$

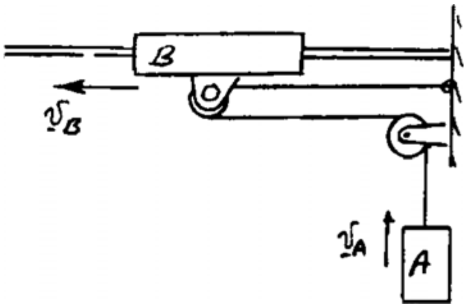
(*b*) $C = 17.05\ \text{kN}$ Compression ◀



PROBLEM 13.132

The system shown is at rest when a constant 150-N force is applied to collar *B*. Neglecting the effect of friction, determine (*a*) the time at which the velocity of collar *B* will be 2.5 m/s to the left, (*b*) the corresponding tension in the cable.

SOLUTION



Constraint of cord. When the collar *B* moves 1 unit to the left, the weight *A* moves up 2 units. Thus

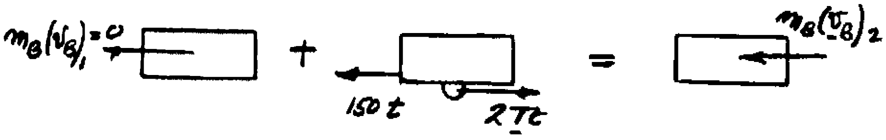
$$v_A = 2v_B \qquad v_B = \frac{1}{2}v_A$$

Masses and weights: $m_A = 3\text{ kg}$ $\quad W_A = 29.43\text{ N}$

$m_B = 8\text{ kg}$

Let *T* be the tension in the cable.

Principle of impulse and momentum applied to collar *B*.



$$\overset{+}{\leftarrow}:\ 0+150t-2Tt=m_B(v_B)_2$$

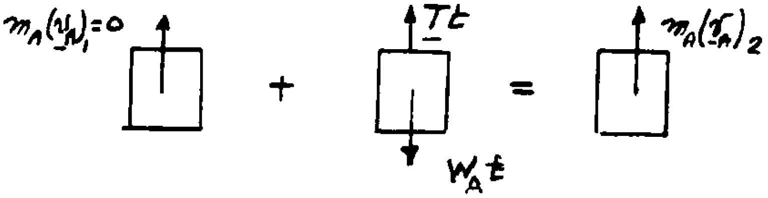
For $(v_B)_2 = 2.5\text{ m/s}$

$$150t-2Tt=(8\text{ kg})(2.5\text{ m/s})$$

$$150t-2Tt=20 \qquad (1)$$

PROBLEM 13.132 (Continued)

Principle of impulse and momentum applied to weight *A*.



$$+\!\uparrow:\quad 0 + Tt - W_A t = m_A(v_A)_2$$

$$Tt + W_A t = m_A(2V_{B2})$$

$$Tt - 29.43t = (3\text{ kg})(2)(2.5\text{ m/s})$$

$$Tt - 29.43t = 15 \qquad (2)$$

To eliminate *T* multiply Eq. (2) by 2 and add to Eq. (1).

(*a*) Time: $91.14t = 50$ $\quad t = 0.549\text{ s}$ ◀

From Eq. (2), $T = \dfrac{15}{t} + 29.43$

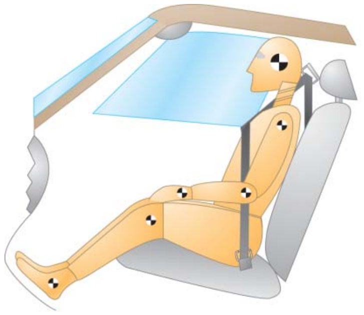
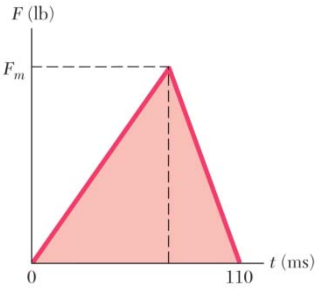
Solving for F_C in (3)

$$F_C = \frac{(4\text{ kg})(3.92\text{ m/s})}{(0.8\text{ s})} - (4\text{ kg})(9.81\text{ m/s}^2) + 58.84\text{ N}$$

$$F_C = 39.2\text{ N} \blacktriangleleft$$



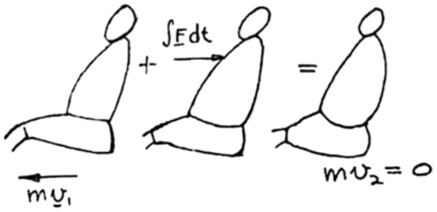


PROBLEM 13.134

An estimate of the expected load on over-the-shoulder seat belts is to be made before designing prototype belts that will be evaluated in automobile crash tests. Assuming that an automobile traveling at 45 mi/h is brought to a stop in 110 ms, determine (*a*) the average impulsive force exerted by a 200-lb man on the belt, (*b*) the maximum force F_m exerted on the belt if the force-time diagram has the shape shown.

SOLUTION

(*a*) Force on the belt is opposite to the direction shown.



$$v_1 = 45 \text{ mi/h} = 66 \text{ ft/s},$$

$$W = 200 \text{ lb}$$

$$m\mathbf{v}_1 - \int \mathbf{F} dt = m\mathbf{v}_2$$

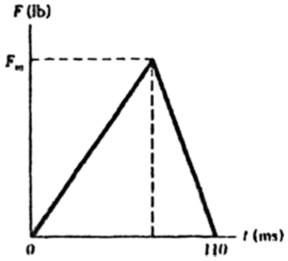
$$\int F dt = F_{\text{ave}} \Delta t$$

$$\Delta t = 0.110 \text{ s}$$

$$\frac{(200 \text{ lb})(66 \text{ ft/s})}{(32.2 \text{ ft/s}^2)} - F_{\text{ave}}(0.110 \text{ s}) = 0$$

$$F_{\text{ave}} = \frac{(200)(66)}{(32.2)(0.110)} = 3727 \text{ lb}$$

$F_{\text{ave}} = 3730 \text{ lb}$ ◀

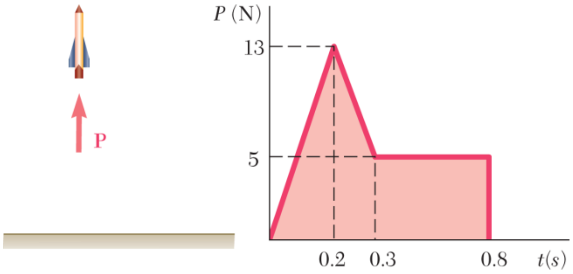


(*b*) Impulse = area under $F-t$ diagram $= \frac{1}{2} F_m (0.110 \text{ s})$

From (*a*), impulse $= F_{\text{ave}} \Delta t = (3727 \text{ lb})(0.110 \text{ s})$

$$\frac{1}{2} F_m (0.110) = (3727)(0.110)$$

$F_m = 7450 \text{ lb}$ ◀



PROBLEM 13.135

A 60-g model rocket is fired vertically. The engine applies a thrust **P** which varies in magnitude as shown. Neglecting air resistance and the change in mass of the rocket, determine (*a*) the maximum speed of the rocket as it goes up, (*b*) the time for the rocket to reach its maximum elevation.

SOLUTION

Mass: $m = 0.060\text{ kg}$

Weight: $mg = (0.060)(9.81) = 0.5886\text{ N}$

Forces acting on the model rocket:

Thrust: $P(t)(\text{given function of } t)\uparrow$

Weight: $W\ (\text{constant})\downarrow$

Support: $S\ (\text{acts until } P > W)\uparrow$

Over $0 < t < 0.2\text{ s}$:

$$P = \frac{13}{0.2}t = 65t$$

$$W = 0.5886\text{ N}$$

Before the rocket lifts off, $S = W - P = 0.5886 - 65t$

S become zero when $t = t_1$.

$$0 = 0.5886 - 65t_1 \qquad t_1 = 0.009055\text{ s.}$$

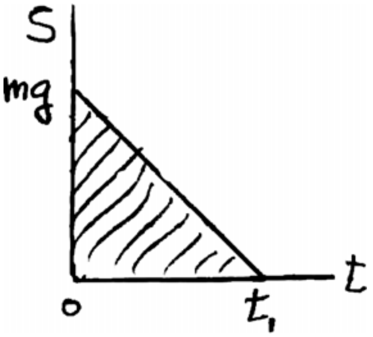
Impulse due to S: $(t > t_1)$

$$\int_0^t S dt = \int_0^{t_1} S dt$$

$$= \frac{1}{2}mgt_1$$

$$= (0.5)(0.5886)(0.009055)$$

$$= 0.00266\text{ N}\cdot\text{s}$$



The maximum speed occurs when $\frac{dv}{dt} = a = 0.$

At this time, $W - P = 0,$ which occurs at $t_2 = 0.8\text{ s.}$

PROBLEM 13.135 (Continued)

(*a*) Maximum speed (upward motion):

Apply the principle of impulse-momentum to the rocket over $0 \le t \le t_2$.

$$\int_0^{0.8} P dt = \text{area under the given thrust-time plot.}$$

$$\begin{aligned} &= \frac{1}{2}(0.2)(13) + \frac{1}{2}(0.1)(13+5) + (0.8-0.3)(5) \\ &= 4.7 \text{ N} \cdot \text{s} \end{aligned}$$

$$\int_0^{0.8} W dt = (0.5886)(0.8) = 0.47088 \text{ N} \cdot \text{S}$$

$$m_1 v_1 + \int_0^{0.8} P dt + \int_0^{0.8} S dt - \int_0^{0.8} W dt = m v_2$$

$$0 + 4.7 + 0.00266 - 0.47088 = 0.060 \, v_2$$

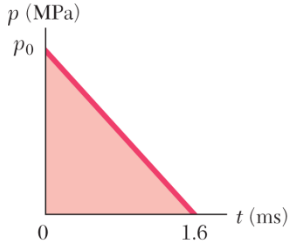
$v_2 = 70.5$ m/s ◀

(*b*) Time t_3 to reach maximum height: $(v_3 = 0)$

$$m v_1 + \int_0^{t_3} P dt + \int_0^{t_3} S dt - W t_3 = m v_3$$

$$0 + 4.7 + 0.00266 - 0.5886 t_3 = 0$$

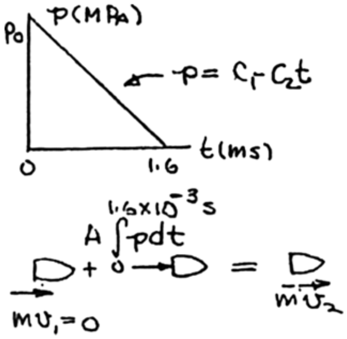
$t_3 = 7.99$ s ◀



PROBLEM 13.136

A simplified model consisting of a single straight line is to be obtained for the variation of pressure inside the 10-mm-diameter barrel of a rifle as a 20-g bullet is fired. Knowing that it takes 1.6 ms for the bullet to travel the length of the barrel and that the velocity of the bullet upon exit is 700 m/s, determine the value of p_0.

SOLUTION



At $t = 0$,

$$p = p_0 = c_1 - c_2 t$$
$$c_1 = p_0$$

At $t = 1.6 \times 10^{-3}$ s,

$$p = 0$$
$$0 = c_1 - c_2 (1.6 \times 10^{-3} \text{ s})$$
$$c_2 = \frac{p_0}{1.6 \times 10^{-3} \text{ s}}$$
$$m = 20 \times 10^{-3} \text{ kg}$$
$$0 + A\int_0^{1.6\times 10^{-3}\text{ s}} p\,dt = m v_2$$
$$A = \frac{\pi (10 \times 10^{-3})^2}{4}$$
$$A = 78.54 \times 10^{-6} \text{ m}^2$$
$$0 + A\int_0^{1.6\times 10^{-3}\text{ s}} (c_1 - c_2 t)\,dt = \frac{20 \times 10^{-3}}{g}$$
$$(78.54 \times 10^{-6} \text{ m}^2)\left[(c_1)(1.6 \times 10^{-3} \text{ s}) - \frac{(c_2)(1.6 \times 10^{-3} \text{ s})^2}{2}\right] = (20 \times 10^{-3} \text{ kg})(700 \text{ m/s})$$
$$1.6 \times 10^{-3} c_1 - 1.280 \times 10^{-6} c_2 = 178.25 \times 10^3$$
$$(1.6 \times 10^{-3} \text{ m}^2 \cdot \text{s}) p_0 - \frac{(1.280 \times 10^{-6} \text{ m}^2 \cdot \text{s}^2)}{(1.6 \times 10^{-3} \text{ s})} p_0 = 178.25 \times 10^3 \text{ kg} \cdot \text{m/s}$$

$p_0 = 222.8 \times 10^6 \text{ N/m}^2$ $\qquad p_0 = 223$ MPa ◀

PROBLEM 13.137

A crash test is performed between an SUV *A* and a 2500 lb compact car *B*. The compact car is stationary before the impact and has its brakes applied. A transducer measures the force during the impact, and the force **P** varies as shown. Knowing that the coefficients of friction between the tires and road are $\mu_s = 0.9$ and $\mu_k = 0.7$, determine (a) the time at which the compact car will start moving, (b) the maximum speed of the car, (c) the time at which the car will come to a stop.

SOLUTION

Given: $m_B = \dfrac{2500\text{ lb}}{32.2\text{ ft/s}^2} = 77.64\text{ slugs}$

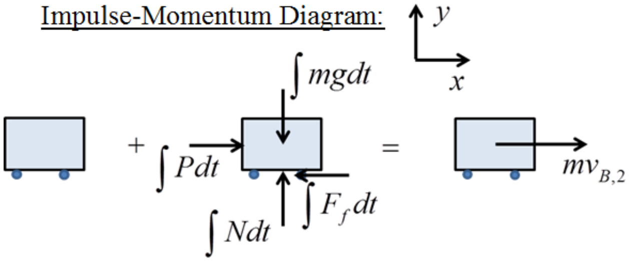
$\mu_s = 0.9,\ \mu_k = 0.7$

$0 \le t \le 0.1 \quad \Rightarrow \quad P = 300000t\text{ lb}$

$0.1 < t \le 0.2 \quad \Rightarrow \quad P = 300000(0.2 - t)\text{ lb}$

$v_{B,1} = 0$

Impulse-Momentum Diagram:



Impulse-Momentum in the x-direction: $\quad 0 + \int (P - F_f)\,dt = m_B v_{\text{B},2} \qquad (1)$

From Equilibrium: $\quad N = m_B g$

(a) Compact car starts moving when: $\quad F_f = \mu_s N = \mu_s m_B g$

Substitute into (1): $\quad 0 + \int (P - \mu_s m_B g)\,dt = 0 \text{ or } P - \mu_s m_B g = 0$

Solving for P: $\quad P = 2250$ lbs when car starts to move

For $0 \le t \le 0.1,\ P = 300000t$ $\quad 2250 = 300000t \qquad t_s = 0.0075\text{ s}$ ◀

(b) Maximum Velocity will occur near the end of the impulse when: $\quad P = F_f = \mu_k N = \mu_k m_B g$

For $\quad 0.1 < t \le 0.2,\ P = 300000(0.2 - t)$

$0.7(2500) = 300000(0.2 - t)$

$t_m = 0.19417\text{ s}$

Use (1) to find maximum velocity:

$$0 + \int_{t_s}^{0.1} 300000t\,dt + \int_{0.1}^{t_m} 300000(0.2 - t)\,dt - \int_{t_s}^{t_m} \mu_k m_B g\,dt = m_B v_{\text{B,max}}$$

$$v_{B,\max} = \frac{1}{m_B}\left[150000t^2\Big|_{t_s}^{0.1} + \left(60000t - 150000t^2\right)\Big|_{0.1}^{t_m}\right] - \mu_k g\Big|_{t_s}^{t_m} \qquad v_{B,\max} = 34.26\text{ ft/s} ◀$$

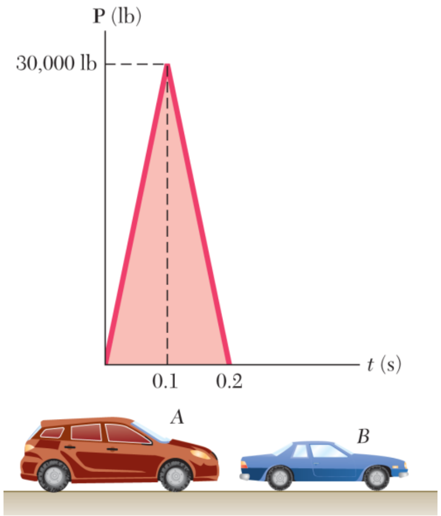
PROBLEM 13.137 (Continued)

(c) Use impulse momentum from t_m until car stops at t_{stp}:

$$m_B v_{B,\max} + \int_{t_m}^{t_{stp}} \left(P - F_f\right) dt = 0$$

$$m_B v_{\mathrm{B,max}} + \int_{t_m}^{0.2} 300000\left(0.2 - t\right) dt - \int_{t_m}^{t_{stp}} \mu_k m_B g dt = 0$$

$$m_B v_{\mathrm{B,max}} + \left(60000t - 150000t^2\right)\Big|_{t_m}^{0.2} - \mu_k m_B g\Big|_{t_m}^{t_{stp}} = 0 \qquad t_{stp} = 1.717 \text{ s} \blacktriangleleft$$



PROBLEM 13.138

A crash test is performed between a 4500 lb SUV *A* and a compact car *B*. A transducer measures the force during the impact, and the force **P** varies as shown. Knowing that the SUV is travelling 30 mph when it hits the car, determine the speed of the SUV immediately after the impact.

SOLUTION

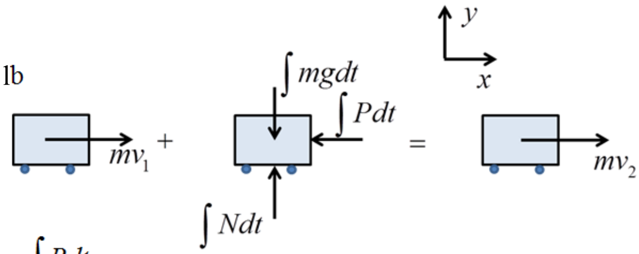
Given: $m = \dfrac{4500 \text{ lb}}{32.2 \text{ ft/s}^2} = 139.75 \text{ slugs}$

$0 \le t \le 0.1 \quad \Rightarrow \quad P = 300000t \text{ lb}$

$0.1 < t \le 0.2 \quad \Rightarrow \quad P = 300000(0.2 - t) \text{ lb}$

$v_1 = 30 \text{ mph} = 44.0 \text{ ft/s}$

Impulse-Momentum Diagram of SUV:



Impulse-Momentum in the x-direction: $mv_1 - \int Pdt = mv_2$

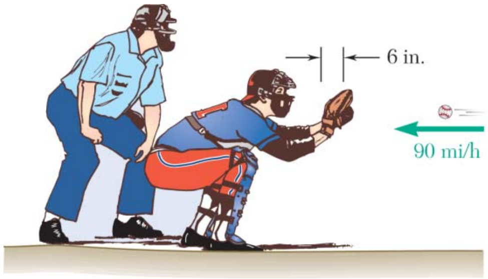
Put in load function P(t): $mv_1 - \int_0^{0.1} 300000t - \int_{0.1}^{0.2} 300000(0.2 - t) = mv_2$

Integrate: $mv_1 - 150000t^2\Big|_0^{0.1} - \left(60000t - 150000t^2\right)\Big|_{0.1}^{0.2} = mv_2$

Solve for v_2: $v_2 = v_1 - \dfrac{1}{m}[3000]$

$v_2 = 22.533 \text{ ft/s}$

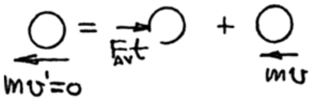
$v_2 = 15.36 \text{ mi/h}$ ◀



PROBLEM 13.139

A baseball player catching a ball can soften the impact by pulling his hand back. Assuming that a 5-oz ball reaches his glove at 90 mi/h and that the player pulls his hand back during the impact at an average speed of 30 ft/s over a distance of 6 in., bringing the ball to a stop, determine the average impulsive force exerted on the player's hand.

SOLUTION



$$v = 90 \text{ mi/h} = 132 \text{ ft/s}$$

$$m = \frac{5}{16}/\text{g}$$

$$t = \frac{d}{v_{av}} = \frac{\left(\frac{6}{12}\right)}{30} = \left(\frac{1}{60}\right) \text{ s}$$

$$\xrightarrow{+} \quad 0 = F_{av}t + mv \qquad F_{av} = \frac{Wv}{gt}$$

$$F_{av} = \frac{mv}{t}$$

$$= \frac{\left(\frac{5}{16}\text{ lb}\right)(132 \text{ ft/s})}{(32.2 \text{ ft/s}^2)\left(\frac{1}{60}\text{ s}\right)}$$

$F_{av} = 76.9$ lb ◀

PROBLEM 13.140

A 1.62 ounce golf ball is hit with a golf club and leaves it with a velocity of 100 mi/h. We assume that for $0 \le t \le t_0$, where t_0 is the duration of the impact, the magnitude F of the force exerted on the ball can be expressed as $F = F_m \sin(\pi t/t_0)$. Knowing that $t_0 = 0.5$ ms, determine the maximum value F_m of the force exerted on the ball.

SOLUTION

$$W = 1.62 \text{ ounces} = 0.10125 \text{ lb} \quad m = 3.1444 \times 10^{-3} \text{ slug}$$

$$t = 0.5 \text{ ms} = 0.5 \times 10^{-3} \text{ s}$$

$$v = 100 \text{ mi/h} = 146.67 \text{ ft/s}$$

The impulse applied to the ball is

$$\int_0^{t_0} F dt = \int_0^{t_0} F_m \sin\frac{\pi t}{t_0} dt = -\frac{F_m t_0}{\pi} \cos\frac{\pi t}{t_0}\bigg|_0^{t_0}$$

$$= -\frac{F_m t_0}{\pi}(\cos\pi - \cos 0) = \frac{2F_m t_0}{\pi}$$

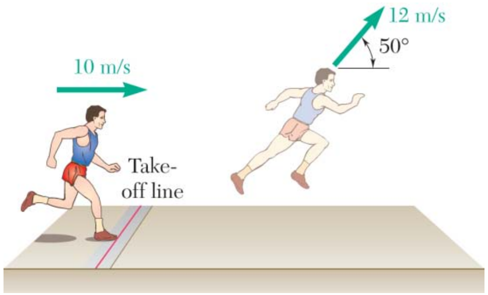
Principle of impulse and momentum.

$$m\mathbf{v}_1 + \int_0^{t_0} \mathbf{F}\, dt = m\mathbf{v}_2$$

with $\mathbf{v}_1 = 0$,

$$0 + \frac{2F_m t_0}{\pi} = mv_2$$

Solving for F_m, $$F_m = \frac{\pi m v_2}{2t_0} = \frac{\pi(3.1444 \times 10^{-3})(146.67)}{(2)(0.5 \times 10^{-3})} = 1.4488 \times 10^3 \text{ lb} \qquad F_m = 1.45 \text{ kip} ◀$$

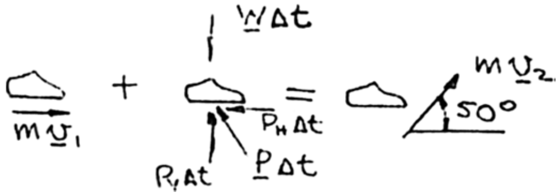


12 m/s
50°
10 m/s
Take-off line

PROBLEM 13.141

The triple jump is a track-and-field event in which an athlete gets a running start and tries to leap as far as he can with a hop, step, and jump. Shown in the figure is the initial hop of the athlete. Assuming that he approaches the takeoff line from the left with a horizontal velocity of 10 m/s, remains in contact with the ground for 0.18 s, and takes off at a 50° angle with a velocity of 12 m/s, determine the vertical component of the average impulsive force exerted by the ground on his foot. Give your answer in terms of the weight W of the athlete.

SOLUTION



$m\underline{v}_1$
+
$\underline{W}\Delta t$
$P_H\Delta t$
$P_v\Delta t$
$\underline{P}\Delta t$
=
$m\underline{v}_2$
50°

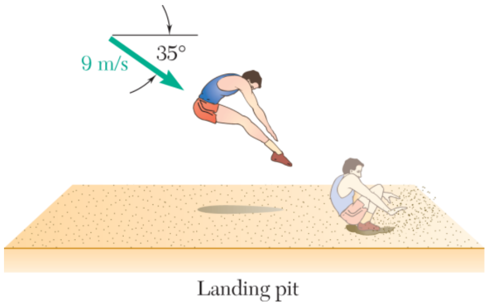
$$m\mathbf{v}_1 + (\mathbf{P} - \mathbf{W})\Delta t = m\mathbf{v}_2 \qquad \Delta t = 0.18 \text{ s}$$

Vertical components

$$0 + (P_v - W)(0.18) = \frac{W}{g}(12)(\sin 50°)$$

$$P_v = W + \frac{(12)(\sin 50°)}{(9.81)(0.18)}W$$

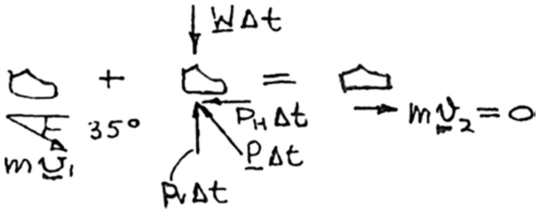
$$P_v = 6.21W \quad ◀$$



PROBLEM 13.142

The last segment of the triple jump track-and-field event is the jump, in which the athlete makes a final leap, landing in a sand-filled pit. Assuming that the velocity of a 80-kg athlete just before landing is 9 m/s at an angle of 35° with the horizontal and that the athlete comes to a complete stop in 0.22 s after landing, determine the horizontal component of the average impulsive force exerted on his feet during landing.

SOLUTION



$$m = 80 \text{ kg}$$

$$\Delta t = 0.22 \text{ s}$$

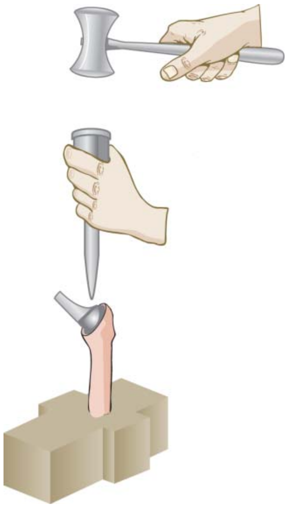
$$m\mathbf{v}_1 + (\mathbf{P} - \mathbf{W})\Delta t = m\mathbf{v}_2$$

Horizontal components

$$m(9)(\cos 35°) - P_H(0.22) = 0$$

$$P_H = \frac{(80 \text{ kg})(9 \text{ m/s})(\cos 35°)}{(0.22 \text{ s})} = 2.6809 \text{ kN}$$

$P_H = 2.68$ kN ◀



PROBLEM 13.143

The design for a new cementless hip implant is to be studied using an instrumented implant and a fixed simulated femur. Assuming the punch applies an average force of 2 kN over a time of 2 ms to the 200 g implant determine (*a*) the velocity of the implant immediately after impact, (*b*) the average resistance of the implant to penetration if the implant moves 1 mm before coming to rest.

SOLUTION

$$m = 200 \text{ g} = 0.200 \text{ kg}$$
$$F_{\text{ave}} = 2 \text{ kN} = 2000 \text{ N}$$
$$\Delta t = 2 \text{ ms} = 0.002 \text{ s}$$

(*a*) Velocity immediately after impact:

Use principle of impulse and momentum:

$$v_1 = 0 \qquad v_2 = ? \qquad \text{Imp}_{1\to 2} = F_{\text{ave}}(\Delta t)$$
$$m\mathbf{v}_1 + \mathbf{Imp}_{1\to 2} = m\mathbf{v}_2$$
$$0 + F_{\text{ave}}(\Delta t) = mv_2$$
$$v_2 = \frac{F_{\text{ave}}(\Delta t)}{m} = \frac{(2000)(0.002)}{0.200}$$

$v_2 = 20.0$ m/s ◀

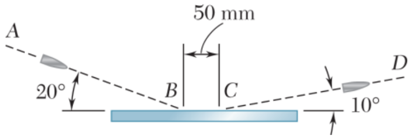
(*b*) Average resistance to penetration:

$$\Delta x = 1 \text{ mm} = 0.001 \text{ m}$$
$$v_2 = 20.0 \text{ ft/s}$$
$$v_3 = 0$$

Use principle of work and energy.

$$T_2 + U_{2\to 3} = T_3 \qquad \text{or} \qquad \frac{1}{2}mv_2^2 - R_{\text{ave}}(\Delta x) = 0$$
$$R_{\text{ave}} = \frac{mv_2^2}{2(\Delta x)} = \frac{(0.200)(20.0)^2}{(2)(0.001)} = 40\times 10^3 \text{ N}$$

$R_{\text{ave}} = 40.0$ kN ◀



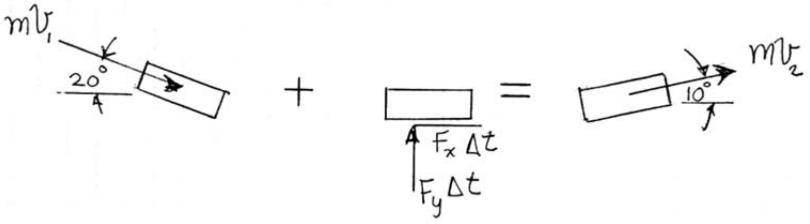
PROBLEM 13.144

A 28-g steel-jacketed bullet is fired with a velocity of 650 m/s toward a steel plate and ricochets along path *CD* with a velocity 500 m/s. Knowing that the bullet leaves a 50-mm scratch on the surface of the plate and assuming that it has an average speed of 600 m/s while in contact with the plate, determine the magnitude and direction of the impulsive force exerted by the plate on the bullet.

SOLUTION

Given: $m = 0.028$ kg, $v_1 = 650$ m/s, $v_2 = 500$ m/s

Impulse-momentum diagram of the bullet:



Impulse momentum in the x-dir ⟶

$$mv_1 \cos 20° - F_x \Delta t = mv_2 \cos 10°$$

So,
$$F_x \Delta t = mv_1 \cos 20° - mv_2 \cos 10°$$

$$= 0.028\,(650)\,\cos 20° - 0.028\,(500)\,\cos 10° = 3.3151 \text{ N}\cdot\text{s}$$

y-dir ↑

$$-mv_1 \sin 20° + F_y \Delta t = mv_2 \sin 10°$$

So,
$$F_y \Delta t = mv_2 \sin 10° + mv_1 \sin 20°$$

$$= 0.028\,(500)\,\sin 10° + 0.028\,(650)\,\sin 20° = 8.6558 \text{ N}\cdot\text{s}$$

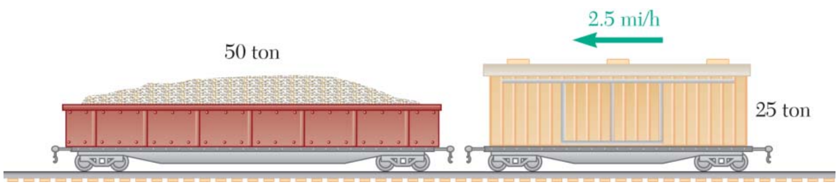
We need Δt. The average velocity is 600 m/s

$$\Delta x = v_{\text{ave}}\,\Delta t;\ \Delta t = \frac{\Delta x}{v_{\text{ave}}} = \frac{0.05 \text{ m}}{600 \text{ m/s}} = 83.33 \times 10^{-6} \text{ s}$$

So

$$\left.\begin{aligned} F_x &= \frac{3.3151}{83.33 \times 10^{-6}} = 39.78 \text{ kN} \\ F_y &= \frac{8.6558}{83.33 \times 10^{-6}} = 103.87 \text{ kN} \end{aligned}\right\}$$

$\overline{F} = 111.2 \text{ kN} \measuredangle 69.0°$ ◀



PROBLEM 13.145

A 25-ton railroad car moving at 2.5 mi/h is to be coupled to a 50 ton car which is at rest with locked wheels ($\mu_k = 0.30$). Determine (*a*) the velocity of both cars after the coupling is completed, (*b*) the time it takes for both cars to come to rest.

SOLUTION

Weight and mass: (Label cars *A* and *B*.)

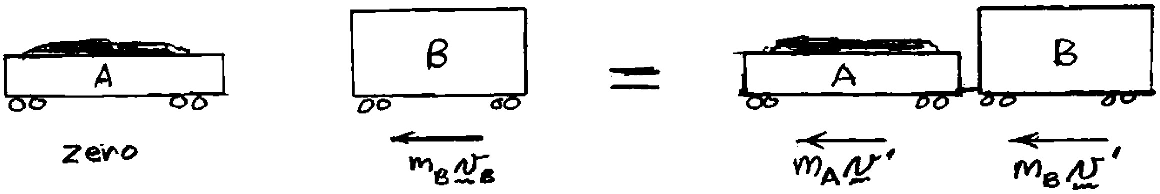
$$\text{Car } A: \quad W_A = 50 \text{ tons} = 100{,}000 \text{ lb}, \quad m_A = 3106 \text{ lb}\cdot\text{s}^2/\text{ft}$$

$$\text{Car } B: \quad W_B = 25 \text{ tons} = 50{,}000 \text{ lb}, \quad m_B = 1553 \text{ lb}\cdot\text{s}^2/\text{ft}$$

Initital velocities: $\mathbf{v}_A = 0$

$$v_B = 2.5 \text{ mi/h} = 3.6667 \text{ ft/s} \qquad \mathbf{v}_B = 3.6667 \text{ ft/s} \leftarrow$$

(*a*) The momentum of the system consisting of the two cars is conserved immediately before and after coupling.



Let $\mathbf{v}'$ be the common velocity of that cars immediately after coupling. Apply conservation of momentum.

$$+\leftarrow: \; m_B v_B = m_A v' + m_B v'$$

$$v' = \frac{m_B v_B}{m_A + m_B} = \frac{(3106)(3.6667)}{4569} = 2.444 \text{ ft/s} \qquad \mathbf{v}' = 1.667 \text{ mi/h} \leftarrow \blacktriangleleft$$

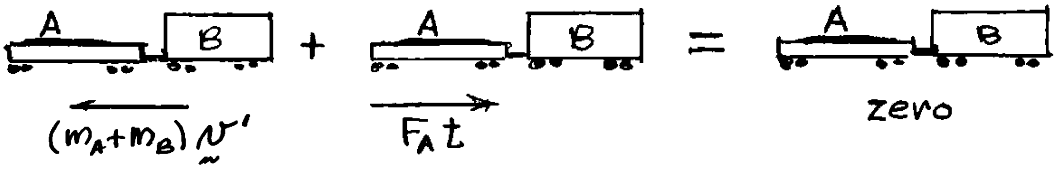
(*b*) After coupling: The friction force acts only on car *A*.

$$+\uparrow \Sigma F = 0_A: \quad N_A - W_A = 0 \qquad N_A = W_A$$

$$F_A = \mu_k N_A = \mu_k W_A \quad \text{(sliding)}$$

$$F_B = 0 \quad \text{(Car } B \text{ is rolling.)}$$

Apply impuslse-momentum to the coupled cars.



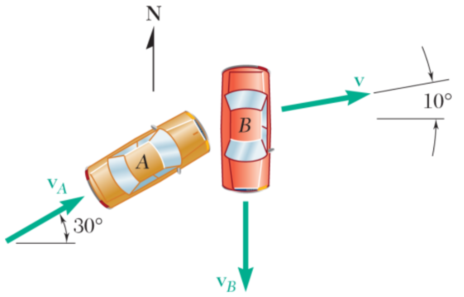
Copyright © McGraw-Hill Education. Permission required for reproduction or display.

$$\xrightarrow{+}: -(m_A + m_B)v' + F_A t = 0$$

$$t = \frac{(m_A + m_B)v_1^1}{F_A} = \frac{m_B v_B}{\mu_k W_A}$$

$$t = \frac{(1553)(3.6667)}{(0.30)(100,000)} = 0.1898$$

$t = 0.190$ s ◀

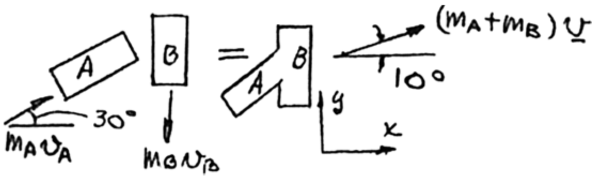


PROBLEM 13.146

At an intersection car *B* was traveling south and car *A* was traveling 30° north of east when they slammed into each other. Upon investigation it was found that after the crash the two cars got stuck and skidded off at an angle of 10° north of east. Each driver claimed that he was going at the speed limit of 50 km/h and that he tried to slow down but couldn't avoid the crash because the other driver was going a lot faster. Knowing that the masses of cars *A* and *B* were 1500 kg and 1200 kg, respectively, determine (*a*) which car was going faster, (*b*) the speed of the faster of the two cars if the slower car was traveling at the speed limit.

SOLUTION

(*a*) Total momentum of the two cars is conserved.



$$\Sigma mv,\ x: \qquad m_A v_A \cos 30° = (m_A + m_B) v \cos 10° \qquad (1)$$

$$\Sigma mv,\ y: \qquad m_A v_A \sin 30° - m_B v_B = (m_A + m_B) v \sin 10° \qquad (2)$$

Dividing (1) into (2),

$$\frac{\sin 30°}{\cos 30°} - \frac{m_B v_B}{m_A v_A \cos 30°} = \frac{\sin 10°}{\cos 10°}$$

$$\frac{v_B}{v_A} = \frac{(\tan 30° - \tan 10°)(m_A \cos 30°)}{m_B}$$

$$\frac{v_B}{v_A} = (0.4010)\frac{(1500)}{(1200)}\cos 30°$$

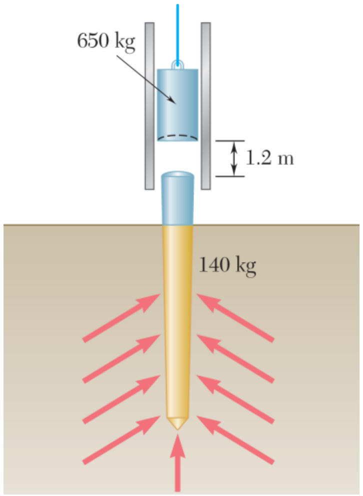
$$\frac{v_B}{v_A} = 0.434 \qquad v_A = 2.30\, v_B$$

Thus, *A* was going faster. ◀

(*b*) Since v_B was the slower car.

$$v_B = 50 \text{ km/h}$$

$$v_A = (2.30)(50) \qquad v_A = 115.2 \text{ km/h} \ ◀$$



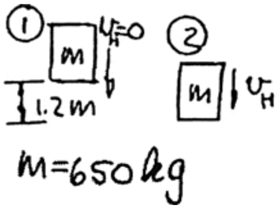
PROBLEM 13.147

The 650-kg hammer of a drop-hammer pile driver falls from a height of 1.2 m onto the top of a 140-kg pile, driving it 110 mm into the ground. Assuming perfectly plastic impact $(e = 0)$, determine the average resistance of the ground to penetration.

SOLUTION

Velocity of the hammer at impact:

Conservation of energy.



$$T_1 = 0$$

$$V_H = mg\ (1.2\text{ m})$$

$$V_H = (650\text{ kg})(9.81\text{ m/s}^2)(1.2\text{ m})$$

$$V_1 = 7652\text{ J}$$

$$T_2 = \frac{1}{2}m$$

$$V_H^2 = \frac{650}{2}v^2 = 325\,v_H^2$$

$$V_2 = 0$$

$$T_1 + V_1 = T_2 + V_2$$

$$0 + 7652 = 325\,v^2$$

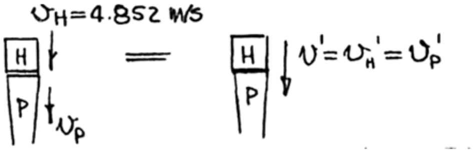
$$v^2 = 23.54\text{ m}^2/\text{s}^2$$

$$v = 4.852\text{ m/s}$$

Velocity of pile after impact:

Since the impact is plastic $(e = 0)$, the velocity of the pile and hammer are the same after impact.

Conservation of momentum:



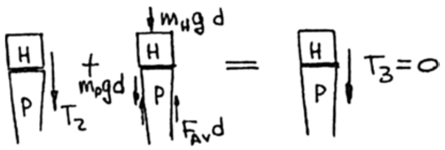
The ground reaction and the weights are non-impulsive.

PROBLEM 13.147 (Continued)

Thus, $m_H v_H = (m_H + m_p)v'$

$$v' = \frac{m_H v_H}{(m_H + m_p)} = \frac{(650)}{(650+140)}(4.852 \text{ m/s}) = 3.992 \text{ m/s}$$

Work and energy: $d = 0.110 \text{ m}$



$$T_2 + U_{2-3} = T_3$$

$$T_2 = \frac{1}{2}(m_H + m_H)(v')^2$$

$$T_3 = 0$$

$$T_2 = \frac{1}{2}(650+140)(3.992)^2$$

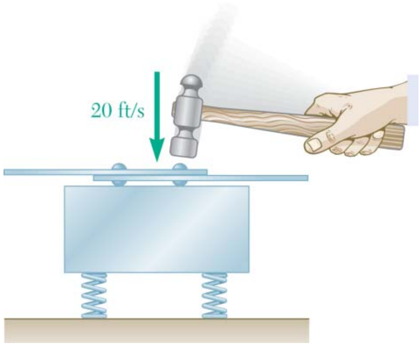
$$T_2 = 6.295 \times 10^3 \text{ J}$$

$$U_{2-3} = (m_H + m_p)gd - F_{AV}d$$
$$= (650+140)(9.81)(0.110) - F_{AV}(0.110)$$
$$U_{2-3} = 852.49 - (0.110)F_{AV}$$

$$T_2 + U_{2-3} = T_3$$

$$6.295 \times 10^3 + 852.49 - (0.110)F_{AV} = 0$$

$$F_{AV} = (7147.5)/(0.110) = 64.98 \times 10^3 \text{ N}$$ $F_{AV} = 65.0 \text{ kN}$ ◀



PROBLEM 13.148

A small rivet connecting two pieces of sheet metal is being clinched by hammering. Determine the impulse exerted on the rivet and the energy absorbed by the rivet under each blow, knowing that the head of the hammer has a weight of 1.5 lbs and that it strikes the rivet with a velocity of 20 ft/s. Assume that the hammer does not rebound and that the anvil is supported by springs and (*a*) has an infinite mass (rigid support), (*b*) has a weight of 9 lb.

SOLUTION

Weight and mass:

Hammer: $W_H = 1.5\text{ lb}$ $\quad m_H = 0.04658\text{ lb}\cdot\text{s}^2/\text{ft}$

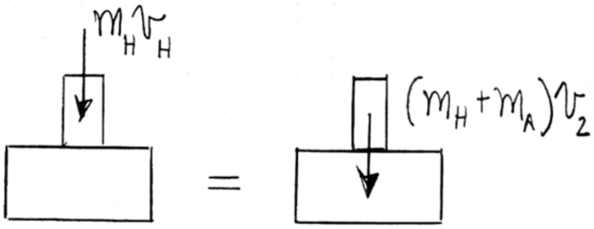
Anvil: Part *a*: $W_A = \infty$ $\quad m_A = \infty$

Part *b*: $W_A = 9\text{ lb}$ $\quad m_A = 0.2795\text{ lb}\cdot\text{s}^2/\text{ft}$

Kinetic energy before impact:

$$T_1 = \frac{1}{2}m_H v_H^2 = \frac{1}{2}(0.04658)(20)^2 = 9.316\text{ ft}\cdot\text{lb}$$

Let v_2 be the velocity common to the hammer and anvil immediately after impact. Apply the principle of conservation of momentum to the hammer and anvil over the duration of the impact.



$$+\downarrow: \Sigma m v_1 = \Sigma m v_2$$

$$m_H v_H = (m_H + m_A)v_2$$

$$v_2 = \frac{m_H v_H}{m_H + m_A} \qquad (1)$$

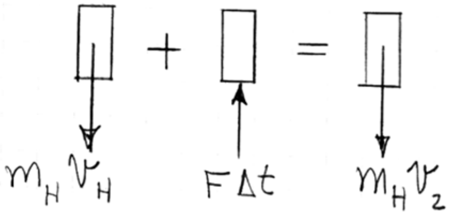
Kinetic energy after impact:

$$T_A = \frac{1}{2}(m_H + m_A)v_2^2 = \frac{1}{2}\frac{m_H^2 v_H^2}{m_H + m_A}$$

$$T_2 = \frac{m_H}{m_H + m_A}T_1 \qquad (2)$$

PROBLEM 13.148 (Continued)

Impulse exerted on the hammer:



$$+\downarrow: m_H v_H - F(\Delta t) = m_H v_2$$

$$F\Delta t = m_H(v_H - v_2) \quad (3)$$

(*a*) $W_A = \infty$:

By Eq. (1), $v_2 = 0$

By Eq. (2), $T_2 = 0$

Energy absorbed: $T_1 - T_2 = 9.32\ \text{ft}\cdot\text{lb}$ ◀

By Eq. (3), $F(\Delta t) = (0.04658)(20-0) = 0.932\ \text{lb}\cdot\text{s}$

The impulse exerted on the rivet the same magnitude but opposite to direction.

$F\Delta t = 0.932\ \text{lb}\cdot\text{s}$ ◀

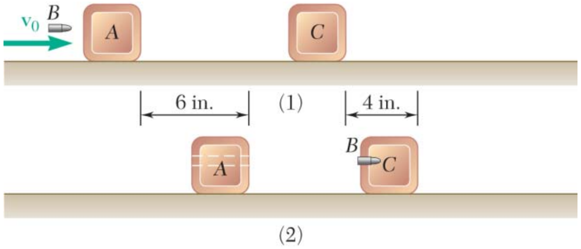
(*b*) $W_A = 9$ lb:

By Eq. (1), $v_2 = \dfrac{(0.04658)(20)}{0.32608} = 2.857$ ft/s

By Eq. (2), $T_2 = \dfrac{(0.04658)(9.316)}{0.32608} = 1.331\ \text{ft}\cdot\text{lb}$

Energy absorbed: $T_1 - T_2 = 7.99\ \text{ft}\cdot\text{lb}$ ◀

By Eq. (3), $F(\Delta t) = (0.04658)(20 - 2.857)$ $F(\Delta t) = 0.799\ \text{lb}\cdot\text{s}$ ◀



PROBLEM 13.149

Bullet B weighs 0.5 oz and blocks A and C both weigh 3 lb. The coefficient of friction between the blocks and the plane is $\mu_k = 0.25$. Initially the bullet is moving at v_0 and blocks A and C are at rest (Figure 1). After the bullet passes through A it becomes embedded in block C and all three objects come to stop in the positions shown (Figure 2). Determine the initial speed of the bullet v_0.

SOLUTION

Masses:

Bullet: $m_B = \dfrac{0.5}{(16)(32.2)} = 970.5 \times 10^{-6}\,\text{lb}\cdot\text{s}^2/\text{ft}$

Blocks A and C: $m_A = m_C = \dfrac{3}{32.2} = 93.168 \times 10^{-3}\,\text{lb}\cdot\text{s}^2/\text{ft}$

Block C + bullet: $m_C + m_B = 94.138 \times 10^{-3}\,\text{lb}\cdot\text{s}^2/\text{ft}$

Normal forces for sliding blocks from $N - mg = 0$

Block A: $N_A = m_A g = 3.00$ lb.

Block C + bullet: $N_C = (m_C + m_B)g = 3.03125$ lb.

Let v_0 be the initial speed of the bullet;

v_1 be the speed of the bullet after it passes through block A;

v_A be the speed of block A immediately after the bullet passes through it;

v_C be the speed block C immediately after the bullet becomes embedded in it.

Four separate processes and their governing equations are described below.

1. The bullet hits block A and passes through it. Use the principle of conservation of momentum.

$$(v_A)_0 = 0$$

$$m_B v_0 + m_A (v_A)_0 = m_B v_1 + m_A v_A$$

$$v_0 = v_1 + \frac{m_A v_A}{m_B} \tag{1}$$

2. The bullet hits block C and becomes embedded in it. Use the principle of conservation of momentum.

$$(v_C)_0 = 0$$

$$m_B v_1 + m_C (v_C)_0 = (m_B + m_C) v_C$$

$$v_1 = \frac{(m_B + m_C) v_C}{m_B} \tag{2}$$

Copyright © McGraw-Hill Education. Permission required for reproduction or display.

3. Block *A* slides on the plane. Use principle of work and energy.

$$T_1 + U_{1\to 2} = T_2$$

$$\frac{1}{2}m_A v_A^2 - \mu_k N_A d_A = 0 \quad \text{or} \quad v_A = \sqrt{\frac{2\mu_k N_A d_A}{m_A}} \tag{3}$$

4. Block *C* with embedded bullet slides on the plane. Use principle of work and energy.

$$d_C = 4\text{ in.} = 0.33333\text{ ft}$$

$$T_1 + U_{1\to 2} = T_2$$

$$\frac{1}{2}(m_C + m_B)v_C^2 - \mu_k N_C d_C = 0 \quad \text{or} \quad v_C = \sqrt{\frac{2\mu_k N_C d_C}{m_C + m_B}} \tag{4}$$

Applying the numerical data:

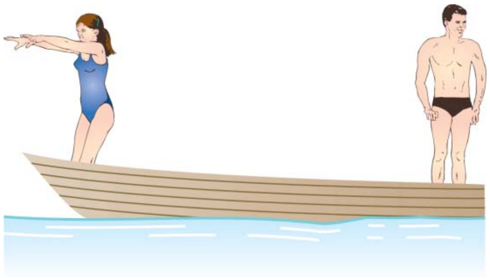
From Eq. (4), $$v_C = \sqrt{\frac{(2)(0.25)(3.03125)(0.33333)}{94.138\times 10^{-3}}} = 2.3166\text{ ft/s}$$

From Eq. (3), $$v_A = \sqrt{\frac{(2)(0.25)(3.00)(0.5)}{93.168\times 10^{-3}}} = 2.8372\text{ ft/s}$$

From Eq. (2), $$v_1 = \frac{(94.138\times 10^{-3})(2.3166)}{970.5\times 10^{-6}} = 224.71\text{ ft/s}$$

From Eq. (1), $$v_0 = 224.71 + \frac{(93.138\times 10^{-3})(2.8372)}{970.5\times 10^{-6}}$$

$v_0 = 497$ ft/s ◀



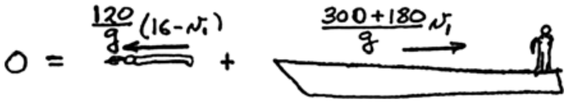
PROBLEM 13.150

A 180-lb man and a 120-lb woman stand at opposite ends of a 300-lb boat, ready to dive, each with a 16-ft/s velocity relative to the boat. Determine the velocity of the boat after they have both dived, if (*a*) the woman dives first, (*b*) the man dives first.

SOLUTION

(*a*) Woman dives first:

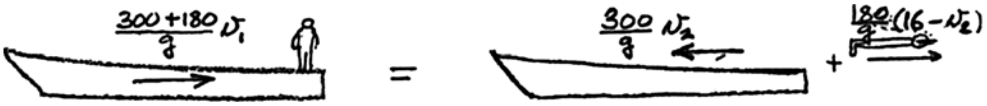
Conservation of momentum:



$$-\frac{120}{g}(16-v_1)+\frac{300+180}{g}v_1=0$$

$$v_1=\frac{(120)(16)}{600}=3.20\text{ ft/s}\longrightarrow$$

Man dives next. Conservation of momentum:



$$\frac{300+180}{g}v_1=-\frac{300}{g}v_2+\frac{180}{g}(16-v_2)$$

$$v_2=\frac{480v_1-(180)(16)}{480}=2.80\text{ ft/s}$$

$$\mathbf{v}_2=2.80\text{ ft/s}\longleftarrow \blacktriangleleft$$

(*b*) Man dives first:

Conservation of momentum:

$$\frac{180}{g}(16-v_1')-\frac{300+120}{g}v_1'=0$$

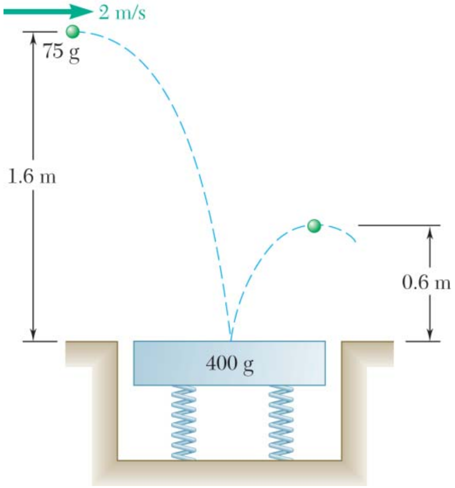
$$v_1'=\frac{(180)(16)}{600}=4.80\text{ ft/s}\longleftarrow$$

Woman dives next. Conservation of momentum:

$$-\frac{300+120}{g}v_1'=\frac{300}{g}v_2'+\frac{120}{g}(16-v_2')$$

$$v_2'=\frac{-420v_1'+(120)(16)}{420}=-0.229\text{ ft/s}$$

$$\mathbf{v}_2'=0.229\text{ ft/s}\longleftarrow \blacktriangleleft$$

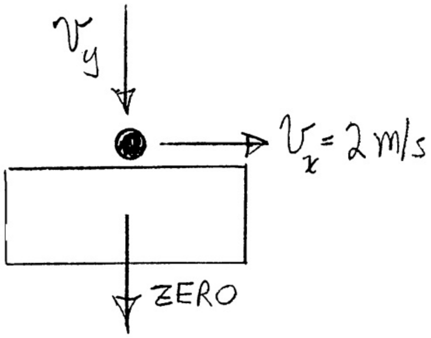


PROBLEM 13.151

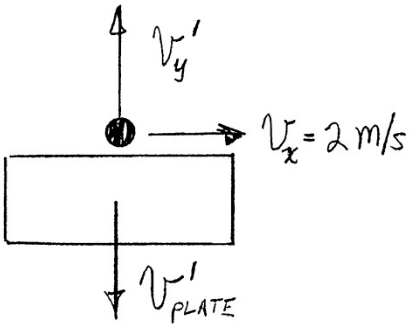
A 75-g ball is projected from a height of 1.6 m with a horizontal velocity of 2 m/s and bounces from a 400-g smooth plate supported by springs. Knowing that the height of the rebound is 0.6 m, determine (*a*) the velocity of the plate immediately after the impact, (*b*) the energy lost due to the impact.

SOLUTION

Just before impact



Just after impact



$$v_y = \sqrt{2g(1.6)} = 5.603 \text{ m/s}$$

$$v_y = \sqrt{2g(0.6)} = 3.431 \text{ m/s}$$

(*a*) Conservation of momentum: $(+y\downarrow)$

$$m_{\text{ball}} v_y + 0 = -m_{\text{ball}} v_y' + m_{\text{plate}} v'_{\text{plate}}$$

$$(0.075)(5.603) + 0 = -0.075(3.431) + 0.4 v'_{\text{plate}}$$

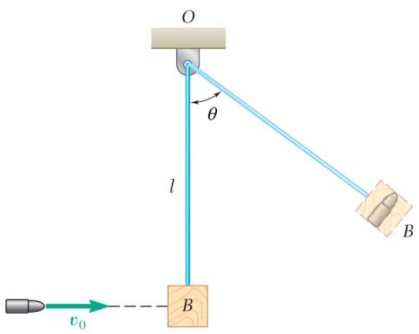
$$v'_{\text{plate}} = 1.694 \text{ m/s} \downarrow \blacktriangleleft$$

(*b*) Energy loss

Initial energy $$(T+V)_1 = \frac{1}{2}(0.075)(2)^2 + 0.075g(1.6)$$

Final energy $$(T+V)_2 = \frac{1}{2}(0.075)(2)^2 + 0.075g(0.6) + \frac{1}{2}(0.4)(1.694)^2$$

$$\text{Energy lost} = (1.3272 - 1.1653)\text{ J} = 0.1619 \text{ J} \blacktriangleleft$$



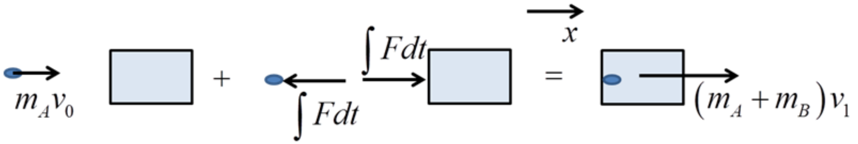
PROBLEM 13.152

A ballistic pendulum is used to measure the speed of high-speed projectiles. A 6-g bullet *A* is fired into a 1-kg wood block *B* suspended by a cord of length *l*= 2.2 m. The block then swings through a maximum angle of θ= 60°. Determine (*a*) the initial speed of the bullet v_o, (b) the impulse imparted by the bullet on the block, (c) the force on the cord immediately after the impact

SOLUTION

Given:
$m_A = 6 \text{ g} = 0.006 \text{ kg}$
$m_B = 1 \text{ kg}$
$l = 2.2 \text{ m}$
$\theta = 60°$

Impulse-Momentum Diagram in x-direction:



Impulse-Momentum in the x-direction during impact:

$$m_A v_0 = (m_A + m_B)v_1 \qquad (1)$$

Apply Work-Energy between the impact location and the maximum swing angle (Datum at the pivot, O):

$$T_1 + V_{g_1} + \cancel{V_{e_1}} + \cancel{U^{NC}_{1\to3}} = \cancel{T_2} + V_{g_2} + \cancel{V_{e_2}}$$

where:
$T_1 = \frac{1}{2}(m_A + m_B)v_1^2$
$V_{g_1} = -(m_A + m_B)gl$
$V_{g_1} = -(m_A + m_B)gl\cos\theta$

Hence:

$$\frac{1}{2}\cancel{(m_A + m_B)}v_1^2 - \cancel{(m_A + m_B)}g = -\cancel{(m_A + m_B)}gl\cos\theta$$

Solving for v_1:

$$v_1 = \sqrt{2gl(1-\cos\theta)}$$
$$= 4.646 \text{ m/s}$$

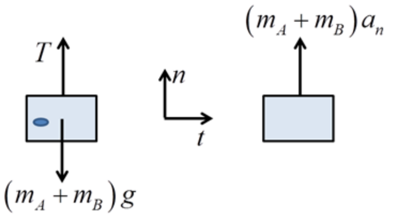
(*a*) Substitute into (1) and solve for v_0:

$$v_0 = \frac{(m_A + m_B)}{m_A}v_1 \qquad v_0 = 778.92 \text{ m/s} ◀$$

(*b*) Write the Impulse Moment Equation for the block during impact:

$$0 + \int Fdt = m_B v_1 \qquad \int Fdt = 4.646J ◀$$

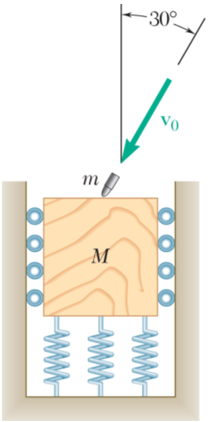
(*c*) FBD of Block just after impact:



$$\sum F_n = ma_n$$

$$T - (m_A + m_B)g = (m_A + m_B)\frac{v_1^2}{l} \qquad T = 19.74 \text{ N} ◀$$

$$T = (m_A + m_B)\left(\frac{v_1^2}{l} + g\right)$$



PROBLEM 13.153

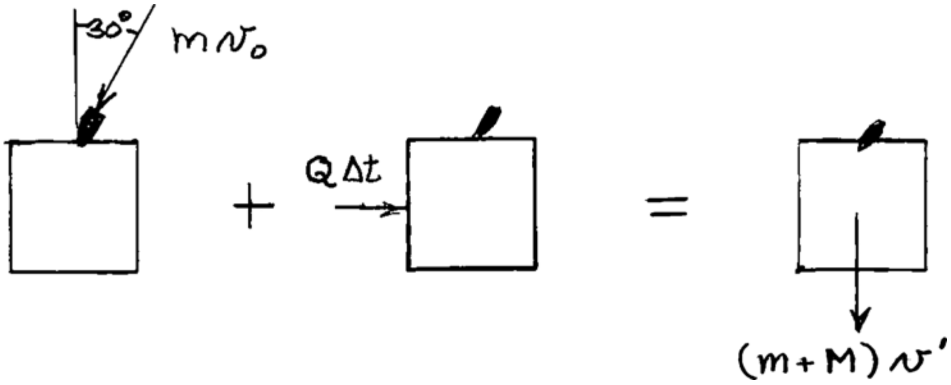
A 1-oz bullet is traveling with a velocity of 1400 ft/s when it impacts and becomes embedded in a 5-lb wooden block. The block can move vertically without friction. Determine (*a*) the velocity of the bullet and block immediately after the impact, (*b*) the horizontal and vertical components of the impulse exerted by the block on the bullet.

SOLUTION

Weight and mass. Bullet: $w = 1 \text{ oz} = \dfrac{1}{16} \text{ lb} \qquad m = 0.001941 \text{ lb} \cdot \text{s}^2/\text{ft.}$

Block: $W = 5 \text{ lb} \qquad M = 0.15528 \text{ lb} \cdot \text{s}^2/\text{ft.}$

(*a*) Use the principle of impulse and momentum applied to the bullet and the block together.



$$\Sigma m\mathbf{v}_1 + \Sigma \mathbf{Imp}_{1\to 2} = m\mathbf{v}_2$$

Components $\downarrow$: $\quad mv_0 \cos 30° + 0 = (m + M)v'$

$$v' = \frac{mv_0 \cos 30°}{m + M} = \frac{(0.001941)(1400)\cos 30°}{0.157221}$$

$$v' = 14.968 \text{ ft/s}$$

$\mathbf{v}' = 14.97 \text{ ft/s} \downarrow$ ◀

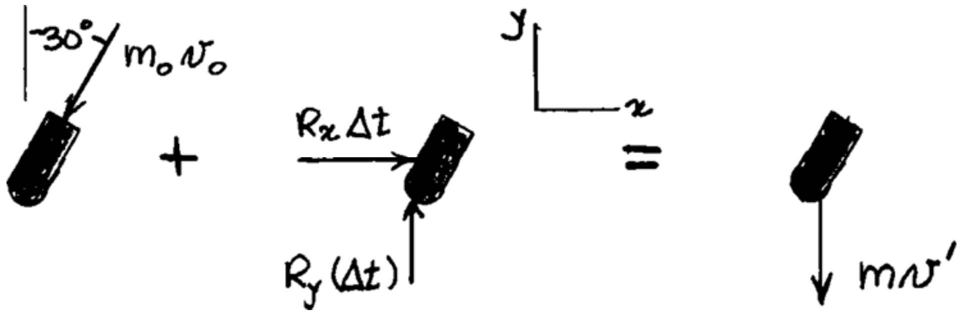
PROBLEM 13.153 (Continued)

(*b*) Use the principle of impulse and momentum applied to the bullet alone.



x-components: $-mv_0\sin 30° + R_x\Delta t = 0$

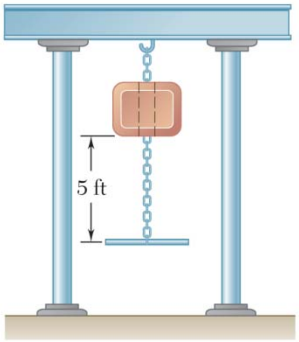
$$R_x\Delta t = mv_0\sin 30° = (0.001941)(1400)\sin 30°$$

$$= 1.3587 \text{ lb}\cdot\text{s} \qquad R_x\Delta t = 1.359 \text{ lb}\cdot\text{s} \blacktriangleleft$$

y-components: $-mv_0\cos 30° + R_y\Delta t = -mv'$

$$R_y\Delta t = m(v_0\cos 30° - v')$$

$$= (0.001941)(1400\cos 30° - 14.968) \qquad R_y\Delta t = 2.32 \text{ lb}\cdot\text{s} \blacktriangleleft$$



PROBLEM 13.154

In order to test the resistance of a chain to impact, the chain is suspended from a 240-lb rigid beam supported by two columns. A rod attached to the last link is then hit by a 60-lb block dropped from a 5-ft height. Determine the initial impulse exerted on the chain and the energy absorbed by the chain, assuming that the block does not rebound from the rod and that the columns supporting the beam are (*a*) perfectly rigid, (*b*) equivalent to two perfectly elastic springs.

SOLUTION

Velocity of the block just before impact:

$$T_1 = 0 \qquad V_1 = Wh = (60\text{ lb})(5\text{ ft}) = 300\text{ lb}\cdot\text{ft}$$

$$T_2 = \frac{1}{2}mv^2 \quad V_2 = 0$$

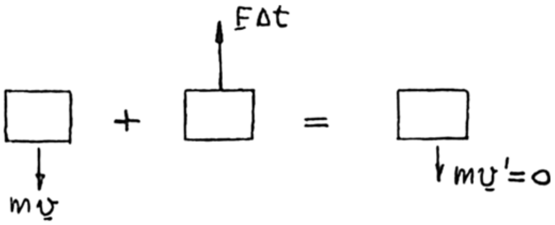
$$T_1 + V_1 = T_2 + V_2$$

$$0 + 300 = \frac{1}{2}\left(\frac{60}{g}\right)v^2$$

$$v = \sqrt{\frac{(600)(32.2)}{60}}$$

$$= 17.94\text{ ft/s}$$

(*a*) Rigid columns:



$$+\!\uparrow\; -mv + F\Delta t = 0 \qquad \left(\frac{60}{g}\right)(17.94) = F\Delta t$$

$$F\Delta t = 33.43\text{ lb}\cdot\text{s}\uparrow \text{ on the block.}$$

$F\Delta t = 33.4$ lb·s ◀

All of the kinetic energy of the block is absorbed by the chain.

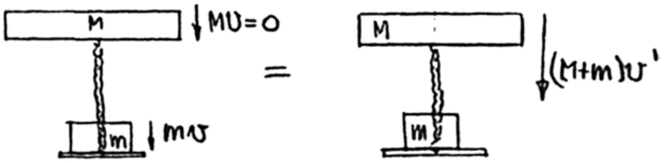
$$T = \frac{1}{2}\left(\frac{60}{g}\right)(17.94)^2$$

$$= 300\text{ ft}\cdot\text{lb}$$

$E = 300$ ft · lb ◀

(*b*) Elastic columns:

Momentum of system of block and beam is conserved.



$$mv = (M + m)v'$$

$$v' = \frac{m}{(m+M)}v = \frac{60}{300}(17.94 \text{ ft/s}) \qquad v' = 3.59 \text{ ft/s}$$

Referring to figure in part (*a*),

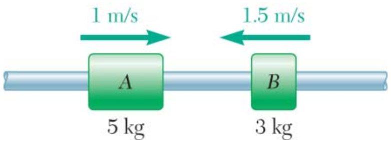
$$-mv + F\Delta t = -mv'$$

$$F\Delta t = m(v - v')$$

$$= \left(\frac{60}{g}\right)(17.94 - 3.59) \qquad F\Delta t = 26.7 \text{ lb}\cdot\text{s} \blacktriangleleft$$

$$E = \frac{1}{2}mv^2 - \frac{1}{2}mv'^2 - \frac{1}{2}Mv'^2$$

$$= \frac{60}{2g}[(17.94)^2 - (3.59)^2] - \frac{240}{2g}(3.59)^2 \qquad E = 240 \text{ ft}\cdot\text{lb} \blacktriangleleft$$



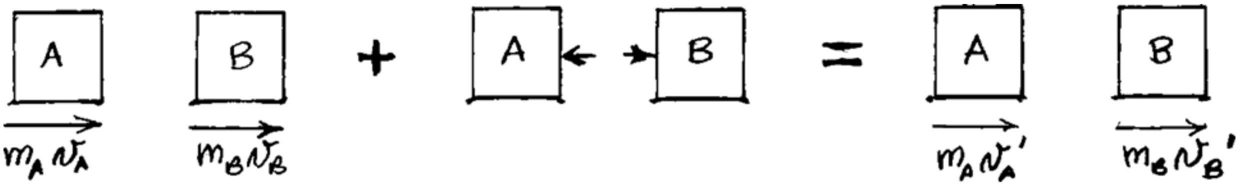
PROBLEM 13.155

The coefficient of restitution between the two collars is known to be 0.70. Determine (*a*) their velocities after impact, (*b*) the energy loss during impact.

SOLUTION

Impulse-momentum principle (collars *A* and *B*):

$$\Sigma m\mathbf{v}_1 + \Sigma \mathbf{Imp}_{1\to 2} = \Sigma m\mathbf{v}_2$$



Horizontal components $\xrightarrow{+}$: $m_A v_A + m_B v_B = m_A v_A' + m_B v_B'$

Using data, $(5)(1) + (3)(-1.5) = 5v_A' + 3v_B'$

or $5v_A' + 3v_B' = 0.5$ (1)

Apply coefficient of restitution.

$$v_B' - v_A' = e(v_A - v_B)$$
$$v_B' - v_A' = 0.70[1 - (-0.5)]$$
$$v_B' - v_A' = 1.75 \quad (2)$$

(*a*) Solving Eqs. (1) and (2) simultaneously for the velocities,

$v_A' = -0.59375$ m/s $\qquad \mathbf{v}_A = 0.594$ m/s ⟵ ◀

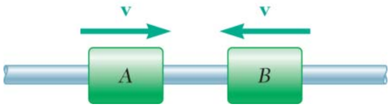
$v_B' = 1.15625$ m/s $\qquad \mathbf{v}_B = 1.156$ m/s ⟶ ◀

Kinetic energies: $T_1 = \frac{1}{2}m_A v_A^2 + \frac{1}{2}m_B v_B^2 = \frac{1}{2}(5)(1)^2 + \frac{1}{2}(3)(-1.5)^2 = 5.875 \text{ J}$

$$T_2 = \frac{1}{2}m_A(v_A')^2 + \frac{1}{2}m_B(v_B')^2 = \frac{1}{2}(5)(-0.59375)^2 + \frac{1}{2}(3)(1.15625)^2 = 2.8867 \text{ J}$$

(*b*) Energy loss: $T_1 - T_2 = 2.99 \text{ J}$ ◀

PROBLEM 13.156

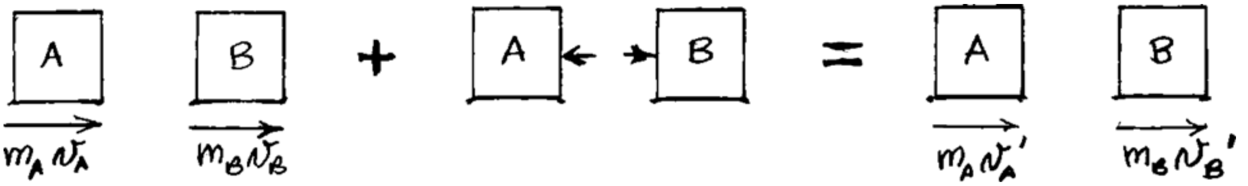


Collars *A* and *B*, of the same mass *m*, are moving toward each other with identical speeds as shown. Knowing that the coefficient of restitution between the collars is *e*, determine the energy lost in the impact as a function of *m*, *e* and *v*.

SOLUTION

Impulse-momentum principle (collars *A* and *B*):

$$\Sigma m\mathbf{v}_1 + \Sigma \mathbf{Imp}_{1\to 2} = \Sigma m\mathbf{v}_2$$



Horizontal components $\xrightarrow{+}$: $m_A v_A + m_B v_B = m_A v_A' + m_B v_B'$

Using data, $mv + m(-v) = mv_A' + mv_B'$

or $v_A' + v_B' = 0$ (1)

Apply coefficient of restitution.

$$v_B' - v_A' = e(v_A - v_B)$$
$$v_B' - v_A' = e[v - (-v)]$$
$$v_B' - v_A' = 2ev \qquad (2)$$

Subtracting Eq. (1) from Eq. (2), $-2v_A = 2ev$

$v_A = -ev$ $\qquad \mathbf{v}_A = ev \longleftarrow$

Adding Eqs. (1) and (2), $2v_B = 2ev$

$v_B = ev$ $\qquad \mathbf{v}_B = ev \longrightarrow$

Kinetic energies: $T_1 = \frac{1}{2}m_A v_A^2 + \frac{1}{2}m_B v_B^2 = \frac{1}{2}mv^2 + \frac{1}{2}m(-v)^2 = mv^2$

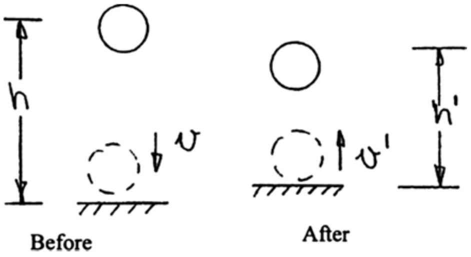
$$T_2 = \frac{1}{2}m_A(v_A')^2 + \frac{1}{2}m_B(v_B')^2 = \frac{1}{2}m(ev)^2 + \frac{1}{2}m(ev)^2 = e^2 mv^2$$

Energy loss: $T_1 - T_2 = (1 - e^2)\, mv^2$ ◀

PROBLEM 13.157

One of the requirements for tennis balls to be used in official competition is that, when dropped onto a rigid surface from a height of 100 in., the height of the first bounce of the ball must be in the range 53 in. $\leq h \leq 58$ in. Determine the range of the coefficient of restitution of the tennis balls satisfying this requirement.

SOLUTION



Uniform accelerated motion:

$$v = \sqrt{2gh}$$

$$v' = \sqrt{2gh'}$$

Coefficient of restitution: $$e = \frac{v'}{v}$$

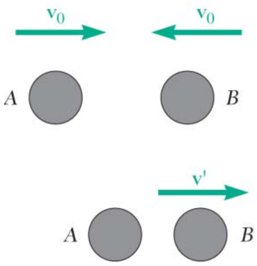
$$e = \sqrt{\frac{h'}{h}}$$

Height of drop $$h = 100 \text{ in.}$$

Height of bounce $$53 \text{ in.} \leq h' \leq 58 \text{ in.}$$

Thus, $$\sqrt{\frac{53}{100}} \leq e \leq \sqrt{\frac{58}{100}}$$

$0.728 \leq e \leq 0.762$ ◀

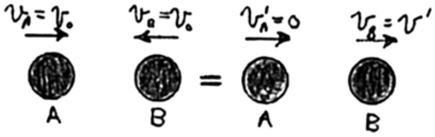


PROBLEM 13.158

Two disks sliding on a frictionless horizontal plane with opposite velocities of the same magnitude v_0 hit each other squarely. Disk *A* is known to have a weight of 6-lb and is observed to have zero velocity after impact. Determine (*a*) the weight of disk *B*, knowing that the coefficient of restitution between the two disks is 0.5, (*b*) the range of possible values of the weight of disk *B* if the coefficient of restitution between the two disks is unknown.

SOLUTION

Total momentum conserved:



$$\xrightarrow{+} m_A v_A + m_B v_B = m_A v'_A + m_B v'$$

$$(m_A)v_0 + m_B(-v_0) = 0 + m_B v'$$

$$v' = \left(\frac{m_A}{m_B} - 1\right)v_0 \qquad (1)$$

Relative velocities:

$$v'_B - v'_A = e(v_A - v_B)$$

$$v' = 2ev_0 \qquad (2)$$

Subtracting Eq. (2) from Eq. (1) and dividing by v_0,

$$\frac{m_A}{m_B} - 1 - 2e = 0 \qquad \frac{m_A}{m_B} = 1 + 2e \qquad m_B = \frac{m_A}{1+2e}$$

Since weight is proportional to mass, $$W_B = \frac{W_A}{1+2e} \qquad (3)$$

(*a*) With $W_A = 6$ lb and $e = 0.5$,

$$W_B = \frac{6}{1+(2)(0.5)}$$

$W_B = 3.00$ lb ◀

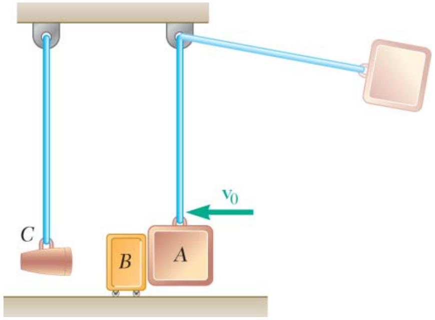
(*b*) With $W_A = 6$ lb and $e = 1$,

$$W_B = \frac{6}{1+(2)(1)} = 2 \text{ lb}$$

With $W_A = 6$ lb and $e = 0$,

$$W_B = \frac{6}{1+(2)(0)} = 6 \text{ lb}$$

Range: $2.00 \text{ lb} \le W_B \le 6.00 \text{ lb}$ ◀



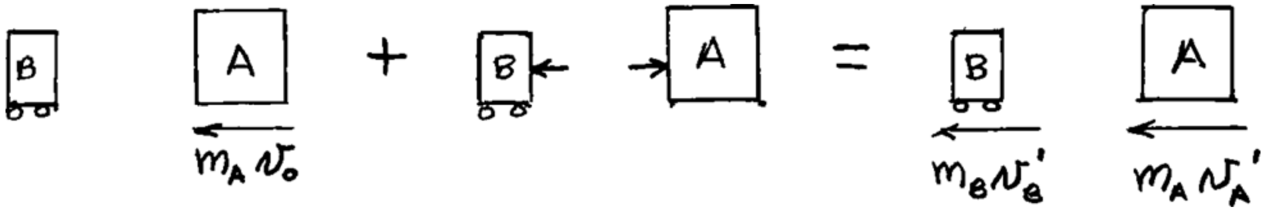
PROBLEM 13.159

To apply shock loading to an artillery shell, a 20-kg pendulum *A* is released from a known height and strikes impactor *B* at a known velocity $\mathbf{v_0}$. Impactor *B* then strikes the 1-kg artillery shell *C*. Knowing the coefficient of restitution between all objects is *e*, determine the mass of *B* to maximize the impulse applied to the artillery shell *C*.

SOLUTION

First impact: *A* impacts *B*. $m_A = 20 \text{ kg}, \ m_B = ?$

Impulse-momentum: $\Sigma m\mathbf{v} + \Sigma \mathbf{Imp}_{1\to 2} = \Sigma m\mathbf{v}_2$



Components directed left:

$$m_A v_0 = m_A v_A' + m_B v_B'$$

$$20v_0 = 20v_A' + m_B v_B' \qquad (1)$$

Coefficient of restitution:

$$v_B' - v_A' = e(v_A - v_B)$$

$$v_B' - v_A' = ev_0$$

$$v_A' = v_B' - ev_0 \qquad (2)$$

Substituting Eq. (2) into Eq. (1) yields

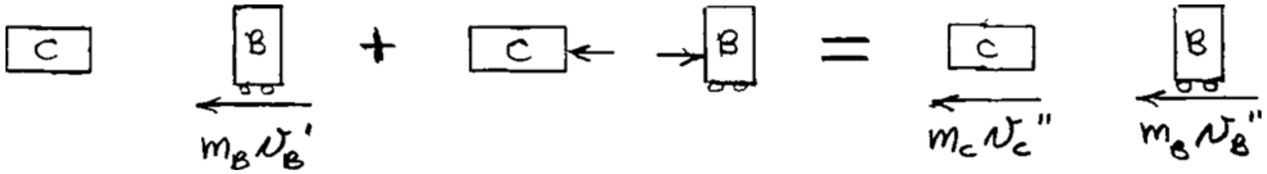
$$20v_0 = 20(v_B' - ev_0) + m_B v_B'$$

$$20v_0(1+e) = (+m_B)v_B'$$

$$v_B' = \frac{20v_0(1+e)}{20 + m_B} \qquad (3)$$

Second impact: *B* impacts *C*. $m_B = ?, \ m_C = 1 \text{ kg}$

Impulse-momentum: $\Sigma m\mathbf{v}_2 + \Sigma \mathbf{Imp}_{2\to 3} = \Sigma m\mathbf{v}_3$



Components directed left:

$$m_B v_B' = m_B v_B'' + m_C v_C''$$

$$m_B v_B' = m_B v_B'' + v_C'' \qquad (4)$$

Coefficient of restitution: $v_C'' - v_B'' = e(v_B' - v_C')$

$$v_C'' - v_B'' = e v_B'$$

$$v_B'' - v_C'' = e v_C' \qquad (5)$$

Substituting Eq. (4) into Eq. (5) yields

$$m_B v_B' = m_B (v_C'' - e v_B') + m_C v_C''$$

$$m_B v_B' (1+e) = (1+m_B) v_C''$$

$$v_C'' = \frac{m_B v_B' (1+e)}{1+m_B} \qquad (6)$$

Substituting Eq. (3) for v_B' in Eq. (6) yields

$$v_C'' = \frac{20 m_B v_0 (1+e)^2}{(20+m_B)(1+m_B)}$$

The impulse applied to the shell C is

$$m_C v_C'' = \frac{(1)(20)\, m_B v_0 (1+e)^2}{(20+m_B)(1+m_B)}$$

To maximize this impulse choose m_B such that

$$Z = \frac{m_B}{(20+m_B)(1+m_B)}$$

is maximum. Set dZ/dm_B equal to zero.

$$\frac{dZ}{dm_B} = \frac{(20+m_B)(1+m_B) - m_B[(20+m_B)+(1+m_B)]}{(20+m_B)^2(1+m_B)^2} = 0$$

$$20 + 21 m_B + m_B^2 - m_B(21 + 2m_B) = 0$$

$$20 - m_B^2 = 0$$

$m_B = 4.47$ kg ◀

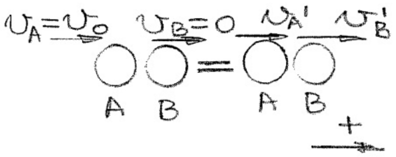
PROBLEM 13.161

Three steel spheres of equal mass are suspended from the ceiling by cords of equal length which are spaced at a distance slightly greater than the diameter of the spheres. After being pulled back and released, sphere *A* hits sphere *B*, which then hits sphere *C*. Denoting by *e* the coefficient of restitution between the spheres and by $\mathbf{v}_0$ the velocity of *A* just before it hits *B*, determine (*a*) the velocities of *A* and *B* immediately after the first collision, (*b*) the velocities of *B* and *C* immediately after the second collision. (*c*) Assuming now that *n* spheres are suspended from the ceiling and that the first sphere is pulled back and released as described above, determine the velocity of the last sphere after it is hit for the first time. (*d*) Use the result of part *c* to obtain the velocity of the last sphere when $n = 8$ and $e = 0.9$.

SOLUTION



(*a*) First collision (between *A* and *B*)

The total momentum is conserved

$$mv_A + mv_B = mv_A' + mv_B'$$

$$v_0 = v_A' + v_B' \qquad (1)$$

Relative velocities

$$(v_A - v_B)e = (v_B' - v_A')$$

$$v_0 e = v_B' - v_A' \qquad (2)$$

Solving equations (1) and (2) simultaneously

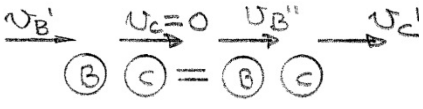
$$v_A' = \frac{v_0(1-e)}{2} \blacktriangleleft$$

$$v_B' = \frac{v_0(1+e)}{2} \blacktriangleleft$$

(*b*) Second collision (Between *B* and *C*)

The total momentum is conserved.

$$mv_B' + mv_C = mv_B'' + mv_C'$$



Using the result from (*a*) for v_B'

$$\frac{v_0(1+e)}{2} + 0 = v_B'' + v_C' \qquad (3)$$

Relative velocities

$$(v_B' - 0)e = v_C' - v_B''$$

Substituting again for v_B' from (*a*)

$$v_0\frac{(1+e)}{2}(e) = v_C' - v_B'' \qquad (4)$$

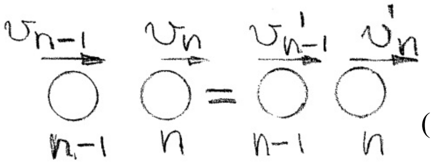
PROBLEM 13.161 (Continued)

Solving equations (3) and (4) simultaneously

$$v'_C = \frac{1}{2}\left[\frac{v_0(1+e)}{2} + v_0(1+e)\frac{(e)}{2}\right]$$

$$v'_C = \frac{v_0(1+e)^2}{4} \blacktriangleleft$$

$$v''_B = \frac{v_0(1-e)^2}{4} \blacktriangleleft$$



(*c*) For *n* spheres

n Balls

$n-1th$ collision

We note from the answer to part (*b*), with $n = 3$

$$v'_n = v'_3 = v'_C = \frac{v_0(1+e)^2}{4}$$

or

$$v'_3 = \frac{v_0(1+e)^{(3-1)}}{2^{(3-1)}}$$

Thus for *n* balls

$$v'_n = \frac{v_0(1+e)^{(n-1)}}{2^{(n-1)}} \blacktriangleleft$$

(*d*) For $n = 8,\ e = 0.90$

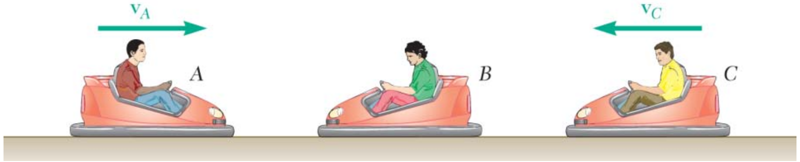
From the answer to part (*c*) with $n = 8$

$$v'_B = \frac{v_0(1+0.9)^{(8-1)}}{2^{(8-1)}} = \frac{v_0(1.9)^7}{(2)^7}$$

$$v'_8 = 0.698v_0 \blacktriangleleft$$

PROBLEM 13.162

At an amusement park there are 200-kg bumper cars *A*, *B*, and *C* that have riders with masses of 40 kg, 60 kg, and 35 kg respectively. Car *A* is moving to the right with a velocity $\mathbf{v}_A = 2$ m/s and car *C* has a velocity $\mathbf{v}_B = 1.5$ m/s to the left, but car *B* is initially at rest. The coefficient of restitution between each car is 0.8. Determine the final velocity of each car, after all impacts, assuming (*a*) cars *A* and *C* hit car *B* at the same time, (*b*) car *A* hits car *B* before car *C* does.



SOLUTION

Assume that each car with its rider may be treated as a particle. The masses are:

$$m_A = 200 + 40 = 240 \text{ kg},$$
$$m_B = 200 + 60 = 260 \text{ kg},$$
$$m_C = 200 + 35 = 235 \text{ kg}.$$

Assume velocities are positive to the right. The initial velocities are:

$$v_A = 2 \text{ m/s} \quad v_B = 0 \quad v_C = -1.5 \text{ m/s}$$

Let v'_A, v'_B, and v'_C be the final velocities.

(*a*) Cars *A* and *C* hit *B* at the same time. Conservation of momentum for all three cars.

$$m_A v_A + m_B v_B + m_C v_C = m_A v'_A + m_B v'_B + m_C v'_C$$
$$(240)(2) + 0 + (235)(-1.5) = 240v'_A + 260v'_B + 235v'_C \qquad (1)$$

Coefficient of restition for cars *A* and *B*.

$$v'_B - v'_A = e(v_A - v_B) = (0.8)(2 - 0) = 1.6 \qquad (2)$$

Coefficient of restitution for cars *B* and *C*.

$$v'_C - v'_B = e(v_B - v_C) = (0.8)[0 - (-1.5)] = 1.2 \qquad (3)$$

Solving Eqs. (1), (2), and (3) simultaneously,

$$v'_A = -1.288 \text{ m/s} \quad v'_B = 0.312 \text{ m/s} \quad v'_C = 1.512 \text{ m/s}$$

$\mathbf{v}'_A = 1.288$ m/s ⟵ ◀

$\mathbf{v}'_B = 0.312$ m/s ⟶ ◀

$\mathbf{v}'_C = 1.512$ m/s ⟶ ◀

(*b*) Car *A* hits car *B* before *C* does.

First impact. Car *A* hits car *B*. Let v'_A and v'_B be the velocities after this impact. Conservation of momentum for cars *A* and *B*.

$$m_A v_A + m_B v_B = m_A v'_A + m_B v'_B$$
$$(240)(2) + 0 = 240 v'_A + 260 v'_B \qquad (4)$$

Coefficient of restitution for cars *A* and *B*.

$$v'_B - v'_A = e(v_A - v_B) = (0.8)(2-0) = 1.6 \qquad (5)$$

Solving Eqs. (4) and (5) simultaneously,

$$v'_A = 0.128 \text{ m/s}, \quad v'_B = 1.728 \text{ m/s}$$

$$\mathbf{v}'_A = 0.128 \text{ m/s} \longrightarrow$$

$$\mathbf{v}'_B = 1.728 \text{ m/s} \longrightarrow$$

Second impact. Cars *B* and *C* hit. Let v''_B and v''_C be the velocities after this impact. Conservation of momentum for cars *B* and *C*.

$$m_B v'_B + m_C v_C = m_B v''_B + m_C v''_C$$

$$(260)(1.728) + (235)(-1.5) = 260 v''_B + 235 v''_C \qquad (6)$$

Coefficient of restitution for cars *B* and *C*.

$$v''_C - v''_B = e(v'_B - v_C) = (0.8)[1.728 - (-1.5)] = 2.5824 \qquad (7)$$

Solving Eqs. (6) and (7) simultaneously,

$$v''_B = -1.03047 \text{ m/s} \quad v''_C = 1.55193 \text{ m/s}$$

$$\mathbf{v}''_B = 1.03047 \text{ m/s} \longleftarrow$$

$$\mathbf{v}''_C = 1.55193 \text{ m/s} \longrightarrow$$

Third impact. Cars *A* and *B* hit again. Let v'''_A and v'''_B be the velocities after this impact. Conservation of momentum for cars *A* and *B*.

$$m_A v'_A + m_B v''_B = m_A v'''_A + m_B v'''_B$$
$$(240)(0.128) + (260)(-1.03047) = 240 v'''_A + 260 v'''_B \qquad (8)$$

Coefficient of restitution for cars *A* and *B*.

$$v'''_B - v'''_A = e(v'_A - v''_B) = (0.8)[0.128 - (-1.03047)] = 0.926776 \qquad (9)$$

Solving Eqs. (8) and (9) simultaneously,

$$v'''_A = -0.95633 \text{ m/s}$$
$$v'''_B = -0.02955 \text{ m/s}$$

$$\mathbf{v}'''_A = 0.95633 \text{ m/s} \longleftarrow$$

$$\mathbf{v}'''_B = 0.02955 \text{ m/s} \longleftarrow$$

PROBLEM 13.162 (Continued)

There are no more impacts. The final velocities are:

$\mathbf{v}_A''' = 0.956 \text{ m/s} \longleftarrow$ ◀

$\mathbf{v}_B''' = 0.0296 \text{ m/s} \longleftarrow$ ◀

$\mathbf{v}_C'' = 1.552 \text{ m/s} \longrightarrow$ ◀

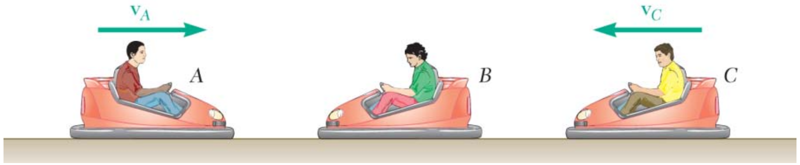
We may check our results by considering conservation of momentum of all three cars over all three impacts.

$$\begin{aligned} m_A v_A + m_B v_B + m_C v_C &= (240)(2) + 0 + (235)(-1.5) \\ &= 127.5 \text{ kg} \cdot \text{m/s} \end{aligned}$$

$$\begin{aligned} m_A v_A''' + m_B v_B''' + m_C v_C'' &= (240)(-0.95633) + (260)(-0.02955) + (235)(1.55193) \\ &= 127.50 \text{ kg} \cdot \text{m/s.} \end{aligned}$$

PROBLEM 13.163

At an amusement park there are 200-kg bumper cars *A*, *B*, and *C* that have riders with masses of 40 kg, 60 kg, and 35 kg respectively. Car *A* is moving to the right with a velocity $\mathbf{v}_A = 2$ m/s when it hits stationary car *B*. The coefficient of restitution between each car is 0.8. Determine the velocity of car *C* so that after car *B* collides with car *C* the velocity of car *B* is zero.



SOLUTION

Assume that each car with its rider may be treated as a particle. The masses are:

$$m_A = 200 + 40 = 240 \text{ kg}$$
$$m_B = 200 + 60 = 260 \text{ kg}$$
$$m_C = 200 + 35 = 235 \text{ kg}$$

Assume velocities are positive to the right. The initial velocities are:

$$v_A = 2 \text{ m/s}, \quad v_B = 0, \quad v_C = ?$$

First impact. Car *A* hits car *B*. Let v_A' and v_B' be the velocities after this impact. Conservation of momentum for cars *A* and *B*.

$$m_A v_A + m_B v_B = m_A v_A' + m_B v_B'$$
$$(240)(2) + 0 = 240 v_A' + 260 v_B' \qquad (1)$$

Coefficient of restitution for cars *A* and *B*.

$$v_B' - v_A' = e(v_A - v_B) = (0.8)(2 - 0) = 1.6 \qquad (2)$$

Solving Eqs. (1) and (2) simultaneously,

$$v_A' = 0.128 \text{ m/s}$$
$$v_B' = 1.728 \text{ m/s}$$

$$\mathbf{v}_A' = 0.128 \text{ m/s} \longrightarrow$$

$$\mathbf{v}_B' = 1.728 \text{ m/s} \longrightarrow$$

Second impact. Cars *B* and *C* hit. Let v_B'' and v_C'' be the velocities after this impact. $v_B'' = 0$. Coefficient of restitution for cars *B* and *C*.

$$v_C'' - v_B'' = e(v_B' - v_C) = (0.8)(1.728 - v_C)$$
$$v_C'' = 1.3824 - 0.8 v_C$$

PROBLEM 13.163 (Continued)

Conservation of momentum for cars *B* and *C*.

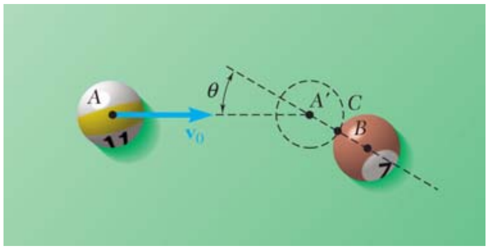
$$m_B v'_B + m_C v_C = m_B v''_B + m_C v''_C$$

$$(260)(1.728) + 235 v_C = (260)(0) + (235)(1.3824 - 0.8 v_C)$$

$$(235)(1.8) v_C = (235)(1.3824) - (260)(1.728)$$

$$v_C = -0.294 \text{ m/s} \qquad \mathbf{v}_C = 0.294 \text{ m/s} \longleftarrow \blacktriangleleft$$

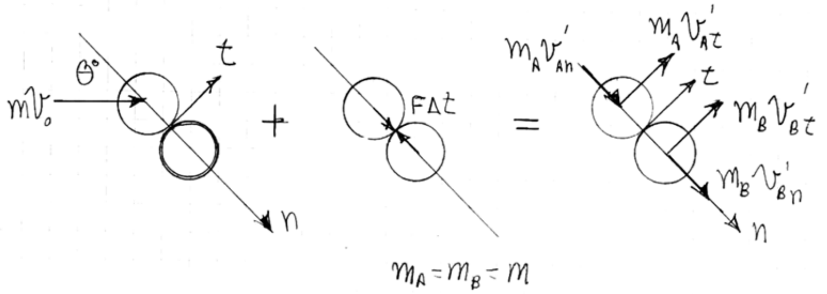
Note: There will be another impact between cars *A* and *B*.



PROBLEM 13.164

Two identical billiard balls can move freely on a horizontal table. Ball *A* has a velocity $\mathbf{v}_0$ as shown and hits ball *B*, which is at rest, at a Point *C* defined by $\theta = 45°$. Knowing that the coefficient of restitution between the two balls is $e = 0.8$ and assuming no friction, determine the velocity of each ball after impact.

SOLUTION



Ball *A*: *t-dir*

$$\cancel{m}v_0 \sin\theta = \cancel{m}v'_{At} \Rightarrow v'_{At} = v_0 \sin\theta$$

Ball *B*: *t-dir*

$$0 = m_B v'_{Bt} \Rightarrow v'_{Bt} = 0$$

Balls *A* + *B*: *n-dir*

$$\cancel{m}v_0 \cos\theta + 0 = \cancel{m}\, v'_{An} + \cancel{m}\, v'_{Bn} \tag{1}$$

Coefficient of restitution

$$v'_{Bn} - v'_{An} = e(v_{An} - v_{Bn})$$

$$v'_{Bn} - v'_{An} = e(v_0 \cos\theta - 0) \tag{2}$$

Solve (1) and (2)

$$v'_{An} = v_0\left(\frac{1-e}{2}\cos\theta\right); \quad v'_{Bn} = v_0\left(\frac{1+e}{2}\right)\cos\theta$$

With numbers

$$e = 0.8; \quad \theta = 45°$$

$$v'_{At} = v_0 \sin 45° = 0.707\, v_0$$

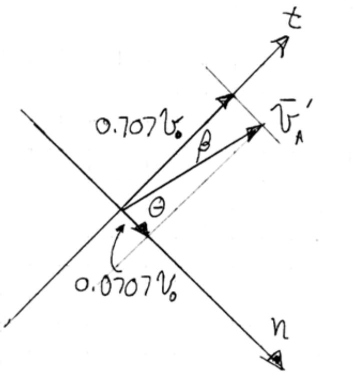
$$v'_{An} = v_0\left(\frac{1-0.8}{2}\cos 45°\right) = 0.0707\ v_0$$

$$v'_{Bt} = 0$$

$$v'_{Bn} = v_0\left(\frac{1+0.8}{2}\right)\cos 45° = 0.6364\, v_0$$

PROBLEM 13.164 (Continued)

(*A*)



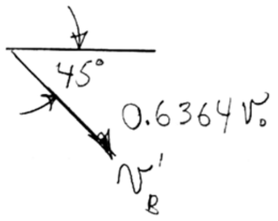
t
0.707v₀
v'_A
β
θ
0.0707v₀
n

$$\left|v''_A\right| = [(0.707\,v_0)^2 + (0.0707 v_0)^2]^{\frac{1}{2}} = 0.711 v_0$$

$$\beta = \tan^{-1}\left(\frac{0.0707}{0.707}\right) = 5.7106°$$

So $\theta = 45 - 5.7106 = 39.3°$

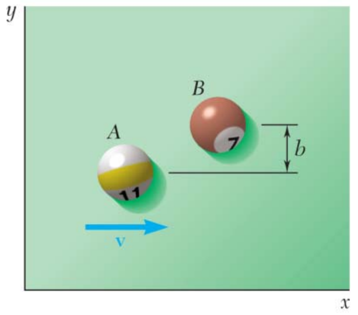
(*B*)



45°
0.6364v₀
v'_B

$\vec{v}'_A = 0.711 v_0$ ∠39.3° ◀

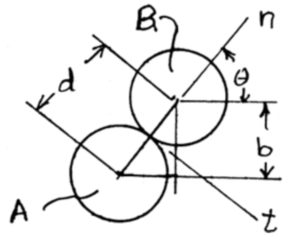
$\vec{v}'_B = 0.636 v_0$ ∠45° ◀



PROBLEM 13.165

Two identical pool balls of 2.37-in. diameter may move freely on a pool table. Ball *B* is at rest and ball *A* has an initial velocity $\mathbf{v} = v_0\mathbf{i}$. (*a*) Knowing that $b = 2$ in. and $e = 0.7$, determine the velocity of each ball after impact. (*b*) Show that if $e = 1$, the final velocities of the balls form a right angle for all values of *b*.

SOLUTION



Geometry at instant of impact.

$$\sin\theta = \frac{b}{d} = \frac{2}{2.37}$$

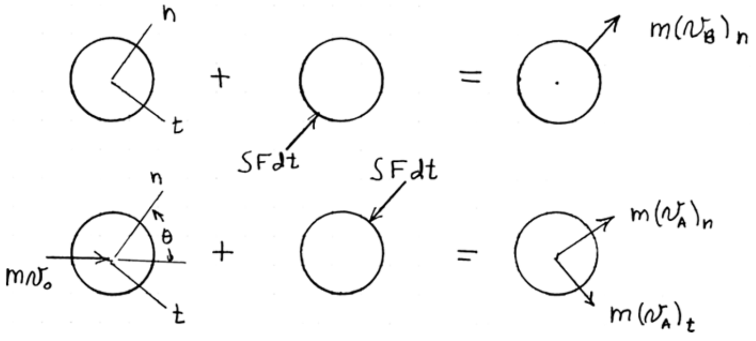
$$\theta = 57.552°$$

Directions *n* and *t* are shown in the figure.

Principle of impulse and momentum.

Ball *B*

Ball *A*



Ball *A*, *t*-direction: $\quad mv_0\sin\theta + 0 = m(v_A)_t \quad (v_A)_t = v_0\sin\theta \quad (1)$

Ball *B*, *t*-direction: $\quad 0 + 0 = m(v_B)_t \quad (v_B)_t = 0 \quad (2)$

Balls *A* and *B*, *n*-direction: $\quad mv_0\cos\theta + 0 = m(v_A)_n + m(v_B)_n$

$$(v_A)_n + (v_B)_n = v_0\cos\theta \quad (3)$$

Coefficient of restitution. $\quad (v_B)_n - (v_A)_n = e[v_0\cos\theta] \quad (4)$

(*a*) $\quad e = 0.7.$ From Eqs. (1) and (2),

$$(v_A)_t = 0.84388v_0 \quad (1)'$$

$$(v_B)_t = 0 \quad (2)'$$

PROBLEM 13.165 (Continued)

From Eqs. (3) and (4),

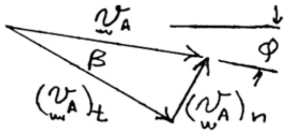
$$(v_A)_n + (v_B)_n = 0.53653v_0 \qquad (3)'$$

$$(v_B)_n - (v_A)_n = (0.7)(0.53653v_0) \qquad (4)'$$

Solving Eqs. (5) and (6) simultaneously,

$$(v_A)_n = 0.08048v_0 \quad (v_B)_n = 0.45605v_0$$

$$\begin{aligned} v_A &= \sqrt{(v_A)_n^2 + (v_A)_t^2} \\ &= \sqrt{(0.08048v_0)^2 + (0.84388v_0^2} \\ &= 0.84771v_0 \end{aligned}$$



$$\tan\beta = \frac{(v_A)_n}{(v_A)_t} = \frac{0.08048v_0}{0.84388v_0} = 0.09537$$

$$\begin{aligned} \beta &= 5.448° \\ \varphi &= 90° - \theta - \beta \\ &= 90° - 57.552° - 5.448° \\ &= 27.000° \end{aligned}$$

$\mathbf{v}_A = 0.848v_0 \searrow 27.0°$ ◀

$\mathbf{v}_B = 0.456v_0 \angle 57.6°$ ◀

(*b*) $e = 1.$ Eqs. (3) and (4) become

$$(v_A)_n + (v_B)_n = v_0 \cos\theta \qquad (3)''$$

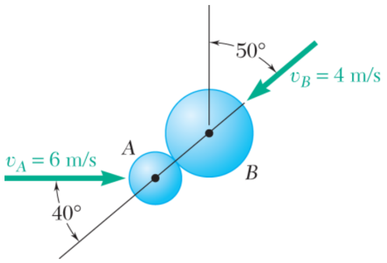
$$(v_B)_n - (v_A)_n = v_0 \cos\theta \qquad (4)''$$

Solving Eqs. $(3)''$ and $(4)''$ simultaneously,

$$(v_A)_n = 0, \quad (v_B)_t = v_0 \cos\theta$$

But $\qquad (v_A)_t = v_0 \sin\theta, \quad \text{and} \quad (v_B)_t = 0$

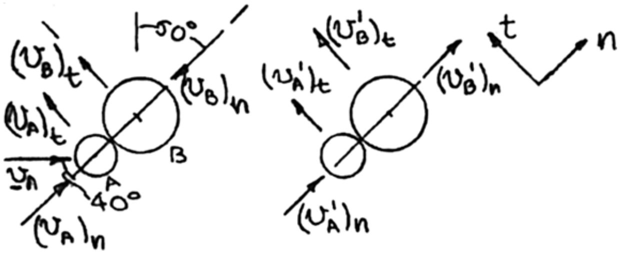
$\mathbf{v}_A$ is in the *t*-direction and $\mathbf{v}_B$ is in the *n*-direction; therefore, the velocity vectors form a right angle.



PROBLEM 13.166

A 600-g ball *A* is moving with a velocity of magnitude 6 m/s when it is hit as shown by a 1-kg ball *B* which has a velocity of magnitude 4 m/s. Knowing that the coefficient of restitution is 0.8 and assuming no friction, determine the velocity of each ball after impact.

SOLUTION



Before After

$$v_A = 6 \text{ m/s}$$
$$(v_A)_n = (6)(\cos 40°) = 4.596 \text{ m/s}$$
$$(v_A)_t = -6(\sin 40°) = -3.857 \text{ m/s}$$
$$v_B = (v_B)_n = -4 \text{ m/s}$$
$$(v_B)_t = 0$$

t-direction:

Total momentum conserved:

$$m_A(v_A)_t + m_B(v_B)_t = m_A(v'_B)_t + m_B(v'_B)_t$$
$$(0.6 \text{ kg})(-3.857 \text{ m/s}) + 0 = (0.6 \text{ kg})(v'_A)_t + (1 \text{ kg})(v'_B)t$$
$$-2.314 \text{ m/s} = 0.6\,(v'_A)_t + (v'_B)_t \qquad (1)$$

Ball *A* alone:

Momentum conserved:

$$m_A(v_A)_t = m_A(v'_A)_t \qquad -3.857 = (v'_A)_t$$
$$(v'_A)_t = -3.857 \text{ m/s} \qquad (2)$$

Replacing $(v'_A)_t$ in (2) in Eq. (1)

$$-2.314 = (0.6)(-3.857) + (v'_B)_t$$
$$-2.314 = -2.314 + (v'_B)_t$$
$$(v'_B)_t = 0$$

PROBLEM 13.166 (Continued)

n-direction:

Relative velocities:

$$[(v_A)_n - (v_B)_n]e = (v'_B)_n - (v'_A)_n$$
$$[(4.596) - (-4)](0.8) = (v'_B)_n - (v'_A)_n$$
$$6.877 = (v'_B)_n - (v'_A)_n \qquad (3)$$

Total momentum conserved:

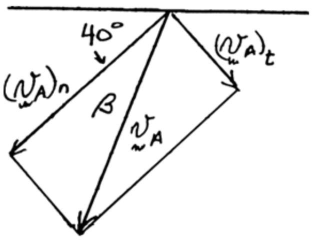
$$m_A(v_A)_n + m_B(v_B)_n = m_A(v'_A)_n + m_B(v'_B)_n$$
$$(0.6\text{ kg})(4.596\text{ m/s}) + (1\text{ kg})(-4\text{ m/s}) = (1\text{ kg})(v'_B)_n + (0.6\text{ kg})(v'_A)_n$$
$$-1.2424 = (v'_B)_n + 0.6(v'_A)_n \qquad (4)$$

Solving Eqs. (4) and (3) simultaneously,

$$(v'_A)_n = 5.075\text{ m/s}$$
$$(v'_B)_n = 1.802\text{ m/s}$$

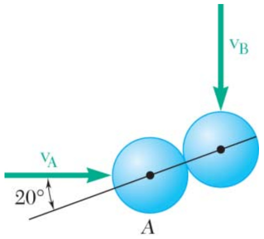
Velocity of A:

$$\tan\beta = \frac{|(v_A)_t|}{|(v_A)_n|} = \frac{3.857}{5.075}$$
$$\beta = 37.2° \qquad \beta + 40° = 77.2°$$
$$v'_A = \sqrt{(3.857)^2 + (5.075)^2} = 6.37\text{ m/s}$$



$\mathbf{v}'_A = 6.37\text{ m/s} \measuredangle 77.2°$ ◀

Velocity of B: $\mathbf{v}'_B = 1.802\text{ m/s} \measuredangle 40°$ ◀

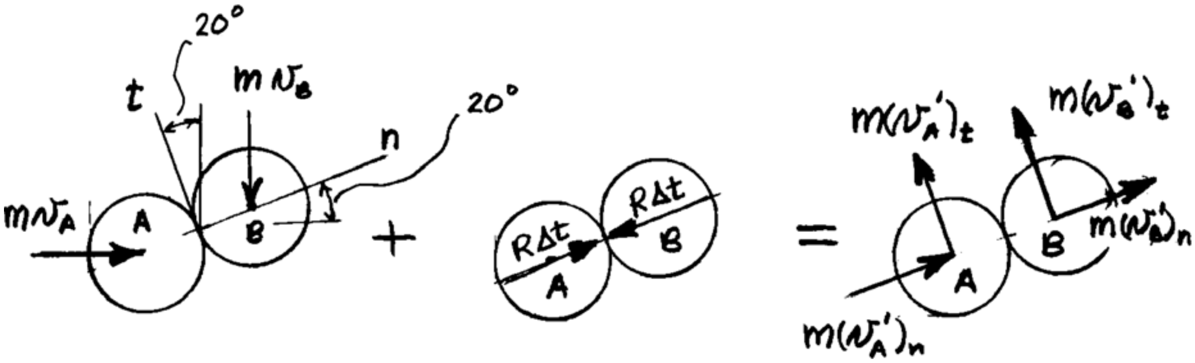


PROBLEM 13.167

Two identical hockey pucks are moving on a hockey rink at the same speed of 3 m/s and in perpendicular directions when they strike each other as shown. Assuming a coefficient of restitution $e = 0.9$, determine the magnitude and direction of the velocity of each puck after impact.

SOLUTION

Use principle of impulse-momentum: $\Sigma m\mathbf{v}_1 + \Sigma \mathbf{Imp}_{1\to 2} = \Sigma m\mathbf{v}_2$



t-direction for puck *A*:

$$-mv_A \sin 20° + 0 = m(v'_A)_t$$
$$(v'_A)_t = v_A \sin 20° = 3\sin 20° = 1.0261 \text{ m/s}$$

t-direction for puck *B*:

$$-mv_B \cos 20° + 0 = m(v'_B)_t$$
$$(v'_B)_t = v_B \cos 20° = -3\cos 20° = -2.8191 \text{ m/s}$$

n-direction for both pucks:

$$mv_A \cos 20° - mv_B \sin 20° = m(v'_A)_n + m(v'_B)_n$$
$$(v'_A)_n + (v'_B)_n = v_A \cos 20° - v_B \sin 20°$$
$$= 3\cos 20° - 3\sin 20° \qquad (1)$$

Coefficient of restitution: $e = 0.9$

$$(v'_B)_n - (v'_A)_n = e[(v_A)_n - (v_B)_n]$$
$$= 0.9[3\cos 20° - (-3)\sin 20°] \qquad (2)$$

Solving Eqs. (1) and (2) simultaneously,

$$(v'_A)_n = -0.8338 \text{ m/s} \qquad (v'_B)_n = 2.6268 \text{ m/s}$$

PROBLEM 13.167 (Continued)

Summary:

$(\mathbf{v}'_A)_n = 0.8338 \text{ m/s} \swarrow 20°$

$(\mathbf{v}'_A)_t = 1.0261 \text{ m/s} \searrow 70°$

$(\mathbf{v}'_B)_n = 2.6268 \text{ m/s} \nearrow 20°$

$(\mathbf{v}'_B)_t = 2.8191 \text{ m/s} \searrow 70°$

$$v_A = \sqrt{(0.8338)^2 + (1.0261)^2} = 1.322 \text{ m/s}$$

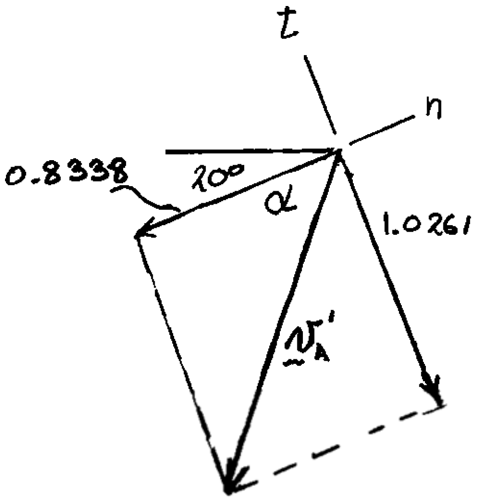
$$\tan\alpha = \frac{1.0261}{0.8338} \qquad \alpha = 50.9° \qquad \alpha + 20° = 70.9°$$

$\mathbf{v}'_A = 1.322 \text{ m/s} \swarrow 70.9°$ ◀

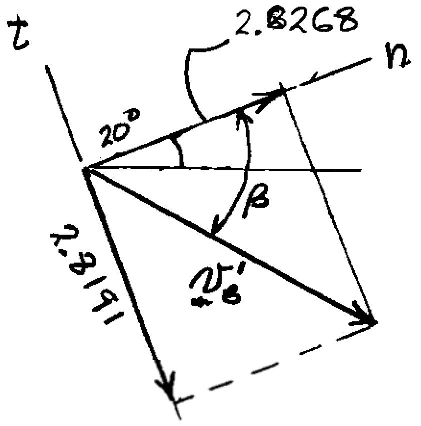
$$v'_B = \sqrt{(2.6268)^2 + (2.8191)^2} = 3.85 \text{ m/s}$$

$$\tan\beta = \frac{2.8191}{2.6268} \qquad \beta = 47.0° \qquad \beta - 20° = 27.0°$$

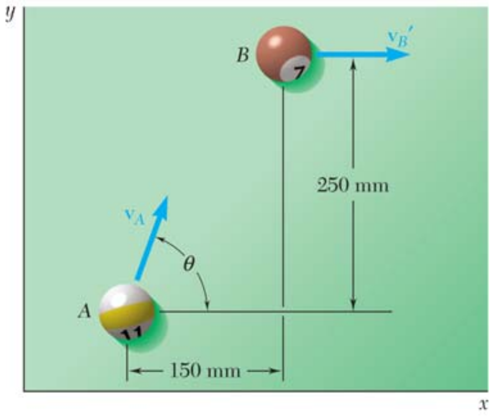
$\mathbf{v}'_B = 3.85 \text{ m/s} \searrow 27.0°$ ◀



Velocity of Puck A



Velocity of Puck B

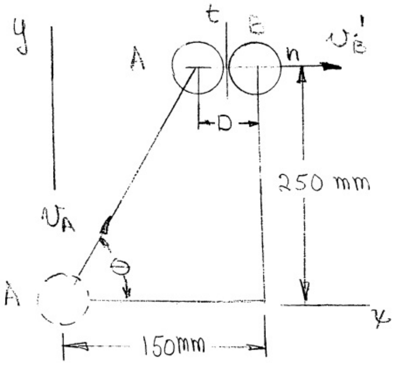


PROBLEM 13.168

The coefficient of restitution is 0.9 between the two 60-mm-diameter billiard balls *A* and *B*. Ball *A* is moving in the direction shown with a velocity of 1 m/s when it strikes ball *B*, which is at rest. Knowing that after impact *B* is moving in the *x* direction, determine (*a*) the angle θ, (*b*) the velocity of *B* after impact.

SOLUTION

(*a*) Since v_B' is in the *x*-direction and (assuming no friction), the common tangent between *A* and *B* at impact must be parallel to the *y*-axis



Thus $$\tan\theta = \frac{250}{150 - D}$$

$$\theta = \tan^{-1}\frac{250}{150 - 60} = 70.20°$$

$$\theta = 70.2° \blacktriangleleft$$

(*b*) Conservation of momentum in *x*(*n*) direction

$$mv_A\cos\theta + m(v_B)_n = m(v_A')_n + mv_B'$$

$$(1)\cos(70.20) + 0 = (v_A')_n + v_B'$$

$$0.3387 = (v_A')_n + (v_B') \qquad (1)$$

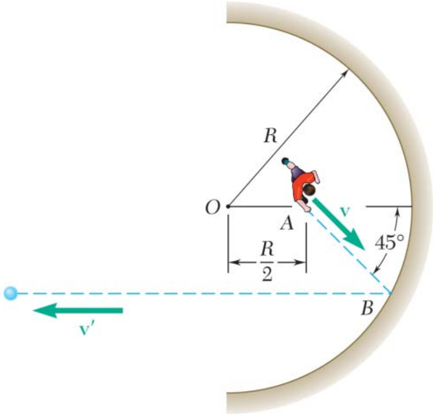
Relative velocities in the *n* direction

$$e = 0.9 \qquad (v_A\cos\theta - (v_B)_n)e = v_B' - (v_A')_n$$

$$(0.3387 - 0)(0.9) = v_B' - (v_A')_n \qquad (2)$$

(1) + (2)

$$2v_B' = 0.3387(1.9) \qquad v_B' = 0.322 \text{ m/s} \blacktriangleleft$$

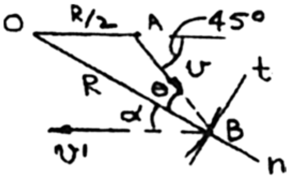


PROBLEM 13.169

A boy located at Point *A* halfway between the center *O* of a semicircular wall and the wall itself throws a ball at the wall in a direction forming an angle of 45° with *OA*. Knowing that after hitting the wall the ball rebounds in a direction parallel to *OA*, determine the coefficient of restitution between the ball and the wall.

SOLUTION

Law of sines:



$$\frac{\sin\theta}{\frac{R}{2}} = \frac{\sin 135^\circ}{R}$$

$$\theta = 20.705^\circ$$

$$\alpha = 45^\circ - 20.705^\circ$$

$$= 24.295^\circ$$

Conservation of momentum for ball in *t*-direction:

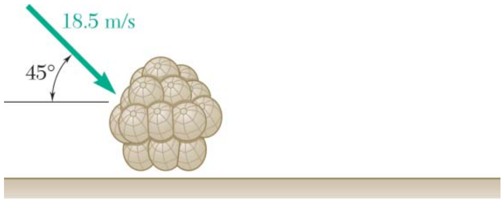
$$-v\sin\theta = -v'\sin\alpha$$

Coefficient of restitution in *n*: $v(\cos\theta)e = v'\cos\alpha$

Dividing, $$\frac{\tan\theta}{e} = \tan\alpha$$

$$e = \frac{\tan 20.705^\circ}{\tan 24.295^\circ}$$

$e = 0.837$ ◀



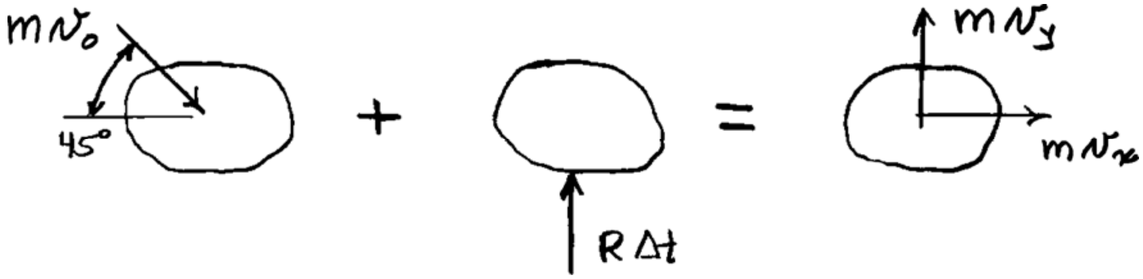
PROBLEM 13.170

The Mars Pathfinder spacecraft used large airbags to cushion its impact with the planet's surface when landing. Assuming the spacecraft had an impact velocity of 18 m/s at an angle of 45° with respect to the horizontal, the coefficient of restitution is 0.85 and neglecting friction, determine (*a*) the height of the first bounce, (*b*) the length of the first bounce. (Acceleration of gravity on the Mars = 3.73 m/s^2.)

SOLUTION

Use impulse-momentum principle.

$$\Sigma m\mathbf{v}_1 + \Sigma \mathbf{Imp}_{1\to 2} = \Sigma m\mathbf{v}_2$$



The horizontal direction (*x* to the right) is the tangential direction and the vertical direction (*y* upward) is the normal direction.

Horizontal components: $mv_0 \sin 45° = 0 = mv_x$

$$v_x = v_0 \sin 45°. \qquad \mathbf{v}_x = 12.728 \text{ m/s} \longrightarrow$$

Vertical components, using coefficient of restitution $e = 0.85$

$$v_y - 0 = e[0 - (-v_0 \cos 45°)]$$

$$v_y = (0.85)(18 \cos 45°) \qquad \mathbf{v}_y = 10.819 \text{ m/s} \uparrow$$

The motion during the first bounce is projectile motion.

Vertical motion: $y = (v_y)_0 t - \frac{1}{2} g t^2$

$$v_y = (v_y)_0 - gt$$

Horizontal motion: $x = v_x t$

PROBLEM 13.170 (Continued)

(*a*) Height of first bounce:

$$v_y = 0: \qquad 0 = (v_y)_0 = gt$$

$$t = \frac{(v_y)_0}{g} = \frac{10.819 \text{ m/s}}{3.73 \text{ m/s}^2} = 2.901 \text{ s}$$

$$y = (10.819)(2.901) - \frac{1}{2}(3.73)(2.901)^2$$

$y = 15.69$ m ◀

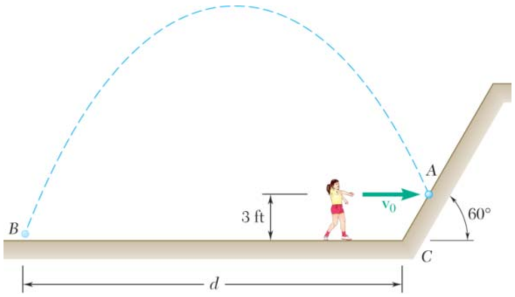
(*b*) Length of first bounce:

$$y = 0: \qquad 10.819t - \frac{1}{2}(3.73)t^2 = 0$$

$$t = 5.801 \text{ s}$$

$$x = (12.728)(5.801)$$

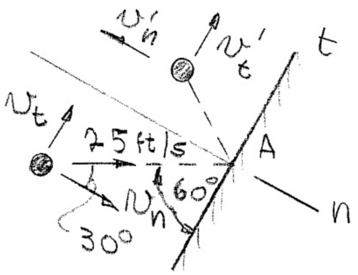
$x = 73.8$ m ◀



PROBLEM 13.171

A girl throws a ball at an inclined wall from a height of 3 ft, hitting the wall at *A* with a horizontal velocity $\mathbf{v}_0$ of magnitude 25 ft/s. Knowing that the coefficient of restitution between the ball and the wall is 0.9 and neglecting friction, determine the distance *d* from the foot of the wall to the Point *B* where the ball will hit the ground after bouncing off the wall.

SOLUTION



Momentum in *t* direction is conserved

$$mv\sin 30° = mv_t'$$

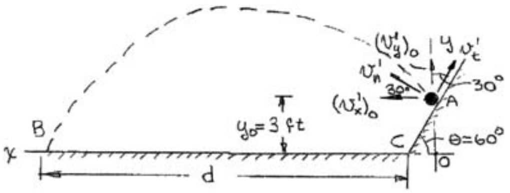
$$(25)(\sin 30°) = v_t'$$

$$v_t' = 12.5 \text{ ft/s}$$

Coefficient of restitution in *n*-direction

$$(v\cos 30°)e = v_n'$$

$$(25)(\cos 30°)(0.9) = v_n' \qquad v_n' = 19.49 \text{ ft/s}$$



Write v' in terms of *x* and *y* components

$$(v_x')_0 = v_n'(\cos 30°) - v_t'(\sin 30°) = 19.49(\cos 30°) - 12.5(\sin 30°)$$
$$= 10.63 \text{ ft/s}$$

$$(v_y')_0 = v_n'(\sin 30°) + v_t'(\cos 30°) = 19.49(\sin 30°) + 12.5(\cos 30°)$$
$$= 20.57 \text{ ft/s}$$

Projectile motion

$$y = y_0 + (v_y')_0 t - \frac{1}{2}gt^2 = 3 \text{ ft} + (20.57 \text{ ft/s})t - (32.2 \text{ ft/s}^2)\frac{t^2}{2}$$

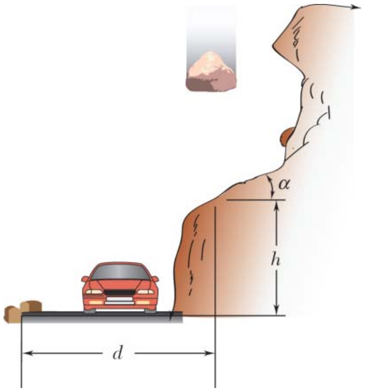
PROBLEM 13.171 (Continued)

At B, $$y = 0 = 3 + 20.57t_B - 16.1t_B^2; \qquad t_B = 1.4098 \text{ s}$$

$$x_B = x_0 + (v'_x)_0 t_B = 0 + 10.63(1.4098); \qquad x_B = 14.986 \text{ ft}$$

$$d = x_B - 3\cot 60^\circ = (14.986 \text{ ft}) - (3 \text{ ft})\cot 60^\circ = 13.254 \text{ ft}$$

$d = 13.25$ ft ◀



PROBLEM 13.172

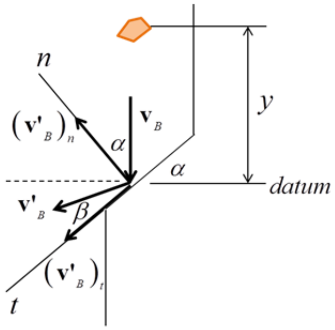
Rockfalls can cause major damage to roads and infrastructure. To design mitigation bridges and barriers, engineers use the coefficient of restitution to model the behavior of the rocks. The rock A falls a distance of 20 m before striking an incline with slope $\alpha = 40^\circ$. Knowing that the coefficient of restitution between A and the incline is 0.2, determine the velocity of the rock after the impact.

SOLUTION

Given:

$y = 20 \text{ m}$
$e = 0.2$
$\alpha = 40^\circ$

Sketch:



Apply Work-Energy to determine speed at impact:

$$\cancel{T_1} + V_{g_1} + \cancel{V_{e_1}} + \cancel{U^{NC}_{1\to3}} = T_2 + \cancel{V_{g_2}} + \cancel{V_{e_2}} \qquad \text{where: } V_{g_1} = mgy \text{ and } T_2 = \frac{1}{2}mv_B^2$$

$$v_B = \sqrt{40g} \text{ m/s}$$

Components in n and t directions:

$$(\mathbf{v}_B)_n = -v_B \cos\alpha$$
$$(\mathbf{v}_B)_t = v_B \sin\alpha$$

Conservation of momentum in the t-direction:

$$(\mathbf{v'}_B)_t = (\mathbf{v}_B)_t = -v_B \sin\alpha$$

n-components using coefficient of restitution:

$$e\big((\mathbf{v}_B)_n - 0\big) = 0 - (\mathbf{v'}_B)_n$$
$$(\mathbf{v'}_B)_n = -e(\mathbf{v}_B)_n$$

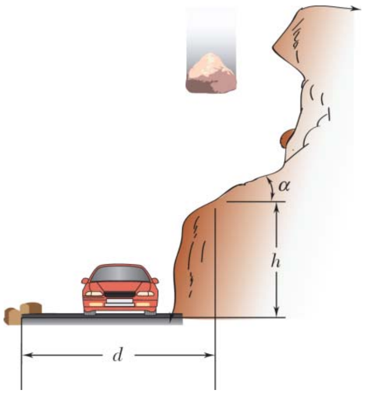
Speed of rock after impact:

$$|\mathbf{v'}_B| = \sqrt{(\mathbf{v'}_B)_t^2 + (\mathbf{v'}_B)_n^2}$$
$$= \sqrt{e^2(\mathbf{v}_B)_n^2 + (\mathbf{v}_B)_t^2}$$
$$= v_B\sqrt{e^2\cos^2\alpha + \sin^2\alpha} = 13.09 \text{ m/s}$$

Direction after impact:

$$\tan\beta = \frac{(\mathbf{v'}_B)_n}{(\mathbf{v'}_B)_t} == \frac{e\cancel{v_B}\cos\alpha}{\cancel{v_B}\sin\alpha} \Rightarrow \beta = 13.4^\circ$$

$$\mathbf{v'}_B = 13.09 \text{ m/s} \swarrow 26.6^\circ \blacktriangleleft$$



PROBLEM 13.173

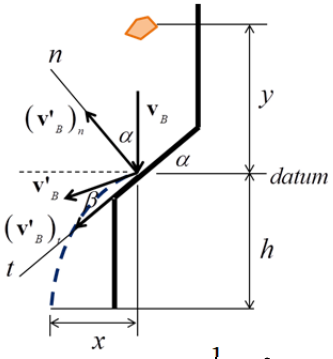
From experimental tests, smaller boulders tend to have a greater coefficient of restitution than larger boulders. The rock *A* falls a distance of 20 meters before striking an incline with slope α = 45°. Knowing that *h*= 30 m and *d*= 20 m, determine if a boulder will land on the road or beyond the road for a coefficient of restitution of (a) e= 0.2, (b) e= 0.1.

SOLUTION

Given:

$y = 20$ m
$h = 30$ m
$d = 20$ m
$\alpha = 45°$

Sketch:



Apply Work-Energy to determine speed of the rock at impact:

$$\cancel{T_1} + V_{g_1} + \cancel{V_{e_1}} + \cancel{U_{1\to3}^{NC}} = T_2 + \cancel{V_{g_2}} + \cancel{V_{e_2}}$$

where: $V_{g_1} = mgy$ and $T_2 = \frac{1}{2}mv_B^2$

$$v_B = \sqrt{40g} = 19.809 \text{ m/s}$$

Components in n and t directions:

$$(\mathbf{v}_B)_n = -v_B \cos\alpha$$
$$(\mathbf{v}_B)_t = v_B \sin\alpha$$

Conservation of momentum in the t-direction:

$$(\mathbf{v}'_B)_t = (\mathbf{v}_B)_t = -v_B \sin\alpha$$

n-components using coefficient of restitution:

$$e\left((\mathbf{v}_B)_n - 0\right) = 0 - (\mathbf{v}'_B)_n$$
$$(\mathbf{v}'_B)_n = -e(\mathbf{v}_B)_n$$

Speed of rock after impact:

$$|\mathbf{v}'_B| = \sqrt{(\mathbf{v}'_B)_t^2 + (\mathbf{v}'_B)_n^2}$$
$$= \sqrt{e^2(\mathbf{v}_B)_n^2 + (\mathbf{v}_B)_t^2}$$
$$= v_B\sqrt{e^2\cos^2\alpha + \sin^2\alpha}$$

Direction after impact:

$$\tan\beta = \frac{(\mathbf{v}'_B)_n}{(\mathbf{v}'_B)_t} == \frac{e\cancel{v_B}\cos\alpha}{\cancel{v_B}\sin\alpha} \Rightarrow \beta = \tan^{-1} e$$

x and *y* components of velocity after impact:

$$(\mathbf{v}'_B)_x = v'_B\cos(\alpha - \beta)$$
$$(\mathbf{v}'_B)_y = -v'_B\sin(\alpha - \beta)$$

PROBLEM 13.173 (Continued)

Projectile Motion in y-dir: $y = y_0 + (v'_B)_y t - \frac{1}{2}gt^2$

$$0 = 30 + (v'_B)_y t - \frac{1}{2}gt^2 \qquad (1)$$

Projectile Motion in x-dir: $x = \cancel{x_0} + (v'_B)_x t \qquad (2)$

(a) For e=0.2:

$|\mathbf{v'}_B| = 14.285$ m/s

$\beta = 11.31°$

$(\mathbf{v'}_B)_x = 11.885$ m/s

$(\mathbf{v'}_B)_y = -7.924$ m/s

Solve (1) for t: $t = 1.7939$ s or ~~$t = -3.4094$ s~~

Solve (2) for x: $x = 21.32$ m $> d$ Rock will land beyond the road◀

(b) For e=0.1:

$|\mathbf{v'}_B| = 14.077$ m/s

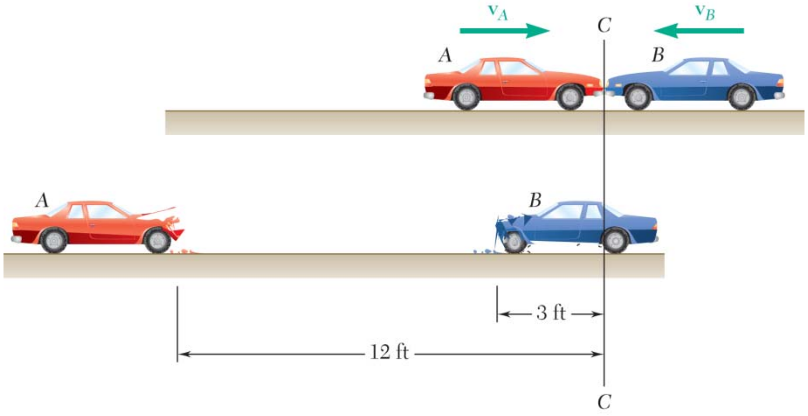
$\beta = 5.711°$

$(\mathbf{v'}_B)_x = 10.894$ m/s

$(\mathbf{v'}_B)_y = -8.914$ m/s

Solve (1) for t: $t = 1.7261$ s or ~~$t = -3.5434$ s~~

Solve (2) for x: $x = 18.81$ m $< d$ Rock will land on the road◀

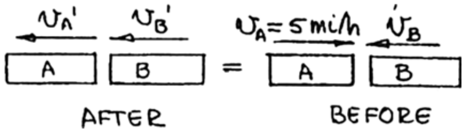


PROBLEM 13.174

Two cars of the same mass run head-on into each other at *C*. After the collision, the cars skid with their brakes locked and come to a stop in the positions shown in the lower part of the figure. Knowing that the speed of car *A* just before impact was 5 mi/h and that the coefficient of kinetic friction between the pavement and the tires of both cars is 0.30, determine (*a*) the speed of car *B* just before impact, (*b*) the effective coefficient of restitution between the two cars.

SOLUTION

(*a*) At *C*:



Conservation of total momentum:

$$m_A = m_B = m$$

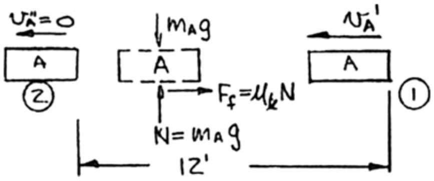
$$5 \text{ mi/h} = 7.333 \text{ ft/s}$$

$$\overset{+}{\longleftarrow} \quad m_A v_A + m_B v_B = m_A v_A' + m_B v_B'$$

$$-7.333 + v_B = v_A' + v_B' \tag{1}$$

Work and energy.

Care *A* (after impact):



$$T_1 = \frac{1}{2} m_A (v_A')^2$$

$$T_2 = 0$$

$$U_{1-2} = F_f (12)$$

$$U_{1-2} = \mu_k m_A g (12 \text{ ft})$$

$$T_1 + U_{1-2} = T_2$$

$$\frac{1}{2} m_A (v_A')^2 - m_k m_A g (12) = 0$$

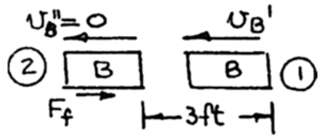
$$(v_A')^2 = (2)(12 \text{ ft})(0.3)(32.2 \text{ ft/s}^2)$$

$$= 231.84 \text{ ft/s}^2$$

$$v_A' = 15.226 \text{ ft/s}$$

PROBLEM 13.174 (Continued)

Car *B* (after impact):



$$T_1 = \frac{1}{2} m_B (v_B')^2$$

$$T_2 = 0$$

$$U_{1-2} = \mu_k\, m_B\, g(3)$$

$$T_1 + U_{1-2} = T_2$$

$$\frac{1}{2} m_B (v_B')^2 - \mu_k m_B g(3)$$

$$v_B'^2 = (2)(3 \text{ ft})(0.3)(32.2 \text{ ft/s}^2)$$

$$(v_B')^2 = 57.96 \text{ ft/s}^2$$

$$v_B' = 7.613 \text{ ft/s}$$

From (1)

$$v_B = 7.333 + v_A' + v_B'$$

$$= 7.333 + 15.226 + 7.613$$

$$v_B = 30.2 \text{ ft/s} = 20.6 \text{ mi/h} \blacktriangleleft$$

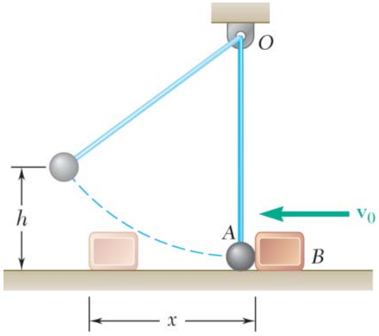
(*b*) Relative velocities:

$$\overset{+}{\longleftarrow} \quad (-v_A - v_B)e = v_B' - v_A'$$

$$(-7.333 - 30.2)e = 7.613 - 15.226$$

$$e = \frac{-(7.613)}{-(37.53)} = 0.2028$$

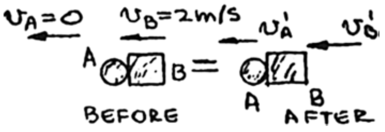
$$e = 0.203 \blacktriangleleft$$



PROBLEM 13.175

A 1-kg block B is moving with a velocity $\mathbf{v}_0$ of magnitude $v_0 = 2$ m/s as it hits the 0.5-kg sphere A, which is at rest and hanging from a cord attached at O. Knowing that $\mu_k = 0.6$ between the block and the horizontal surface and $e = 0.8$ between the block and the sphere, determine after impact (*a*) the maximum height h reached by the sphere, (*b*) the distance x traveled by the block.

SOLUTION



Velocities just after impact

Total momentum in the horizontal direction is conserved:

$$m_A v_A + m_B v_B = m_A v_A' + m_B v_B'$$

$$0 + (1\text{ kg})(2\text{ m/s}) = (0.5\text{ kg})(v_A') + (1\text{ kg})(v_B')$$

$$4 = v_A' + 2v_B' \qquad (1)$$

Relative velocities:

$$(v_A - v_B)e = (v_B' - v_A')$$

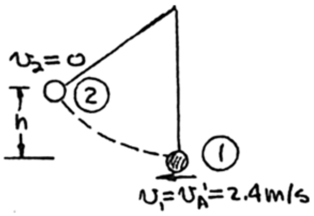
$$(0-2)(0.8) = v_B' - v_A'$$

$$-1.6 = v_B' - v_A' \qquad (2)$$

Solving Eqs. (1) and (2) simultaneously:

$$v_B' = 0.8\text{ m/s}$$

$$v_A' = 2.4\text{ m/s}$$



(*a*) Conservation of energy:

$$T_1 = \frac{1}{2}m_A v_1^2 \qquad V_1 = 0$$

$$T_1 = \frac{1}{2}m_A(2.4\text{ m/s})^2 = 2.88\,m_A$$

$$T_2 = 0$$

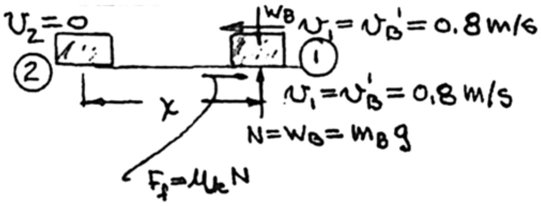
$$V_2 = m_A gh$$

$$T_1 + V_1 = T_2 + V_2 \qquad 2.88\cancel{m}_A + 0 = 0 + \cancel{m}_A(9.81)h$$

$h = 0.294$ m ◀

PROBLEM 13.175 (Continued)

(*b*) Work and energy:



$v_2 = 0$
②
W_B
$v_1 = v_B' = 0.8$ m/s
①
x
$v_1 = v_B' = 0.8$ m/s
$N = W_B = m_B g$
$F_f = \mu_k N$

$$T_1 = \frac{1}{2} m_B v_1^2 = \frac{1}{2} m_B (0.8 \text{ m/s})^2 = 0.32 m_B \qquad T_2 = 0$$

$$U_{1-2} = -F_f x = -\mu_k N x = -\mu_x m_B g x = -(0.6)(m_B)(9.81)x$$

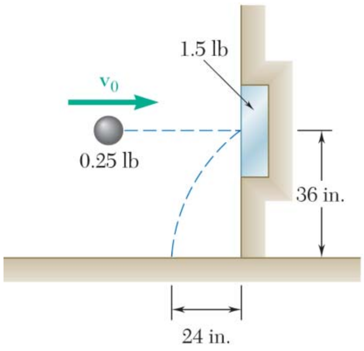
$$U_{1-2} = -5.886 m_B x$$

$$T_1 + U_{1-2} = T_2: \qquad 0.32 m_B - 5.886 m_B x = 0$$

$$x = 0.0544 \text{ m} \qquad\qquad x = 54.4 \text{ mm} \blacktriangleleft$$

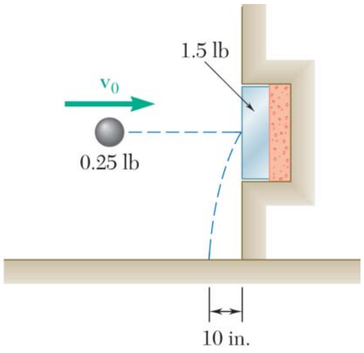
PROBLEM 13.176

A 0.25-lb ball thrown with a horizontal velocity $\mathbf{v}_0$ strikes a 1.5-lb plate attached to a vertical wall at a height of 36 in. above the ground. It is observed that after rebounding, the ball hits the ground at a distance of 24 in. from the wall when the plate is rigidly attached to the wall (Figure 1) and at a distance of 10 in. when a foam-rubber mat is placed between the plate and the wall (Figure 2). Determine (*a*) the coefficient of restitution *e* between the ball and the plate, (*b*) the initial velocity $\mathbf{v}_0$ of the ball.



1.5 lb
$\mathbf{v}_0$
0.25 lb
36 in.
24 in.

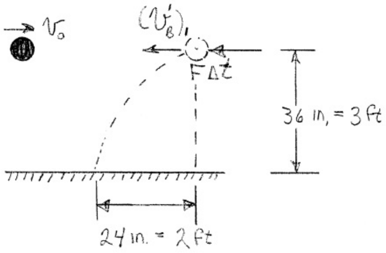
(1)



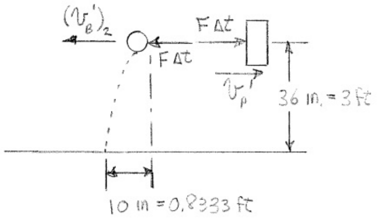
1.5 lb
$\mathbf{v}_0$
0.25 lb
10 in.

(2)

SOLUTION



v_0
$(v_B')_1$
$F\Delta t$
36 in. = 3 ft
24 in. = 2 ft



$(v_B')_2$
$F\Delta t$
$F\Delta t$
v_P'
36 in. = 3 ft
10 in = 0.8333 ft

(*a*) Figure (1), ball alone relative velocities

$$v_0 e = (v_B')_1$$

Projectile motion

$$t = \text{time for the ball to hit ground}$$

$$2\text{ ft} = v_0 e t \qquad (1)$$

Figure (2), ball and plate relative velocities

$$(v_B - v_A)e = v_P' + (v_B')_2$$

$$v_B = v_0, \qquad v_P = 0$$

$$v_0 e = v_P' + (v_B')_2 \qquad (2)$$

Conservation of momentum

$$\xrightarrow{+} m_B v_B + m_P v_P = m_B v_B' + m_P v_P'$$

$$\frac{0.25}{g} v_0 + 0 = \frac{0.25}{g}(-v_B')_2 + \frac{1.5}{g} v_P'$$

$$0.25v_0 = -0.25(v'_B)_2 + 1.5v'_p \Rightarrow v_0 = -(v'_B)_2 - 6v'_p \qquad (3)$$

Solving (2) and (3) for $(v'_B)_2$, $\qquad (v'_B)_2 = \frac{(6e-1)}{7}v_0$

Projectile motion

$$0.8333 = \frac{(6e-1)}{7}v_0 t \qquad (4)$$

Dividing Equation (4) by Equation (1)

$$\frac{0.8333}{2} = \frac{6e-1}{7e};\ 2.91655e = 6e - 1$$

$e = 0.324$ ◀

(*b*) From Figure (1)

Projectile motion, $\qquad h = \frac{1}{2}gt^2;\ 3 = \frac{1}{2}(32.2)t^2$

$$6 = 32.2t^2 \qquad (5)$$

From Equation (1),

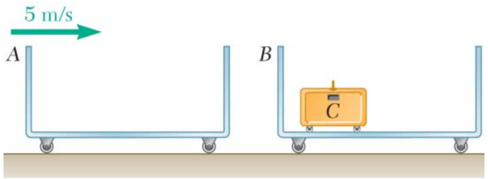
$$2 = v_0 e t \Rightarrow t = \frac{2}{0.324v_0} = \frac{6.1728}{v_0}$$

Using Equation (5)

$$6 = 32.2\left(\frac{6.1728}{v_0}\right)^2 \Rightarrow 6v_0^2 = 1226.947$$

$$v_0^2 = 204.49$$

$v_0 = 14.30$ ft/s ◀



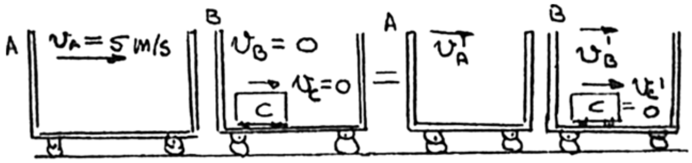
PROBLEM 13.177

After having been pushed by an airline employee, an empty 40-kg luggage carrier *A* hits with a velocity of 5 m/s an identical carrier *B* containing a 15-kg suitcase equipped with rollers. The impact causes the suitcase to roll into the left wall of carrier *B*. Knowing that the coefficient of restitution between the two carriers is 0.80 and that the coefficient of restitution between the suitcase and the wall of carrier *B* is 0.30, determine (*a*) the velocity of carrier *B* after the suitcase hits its wall for the first time, (*b*) the total energy lost in that impact.

SOLUTION

(*a*) Impact between *A* and *B*:

Total momentum conserved:



$$m_A v_A + m_B v_B = m_A v_A' + m_B v_B' \qquad m_A = m_B = 40 \text{ kg}$$

$$\xrightarrow{+} 5 \text{ m/s} + 0 = v_A' + v_B' \tag{1}$$

Relative velocities:

$$(v_A - v_B)e_{AB} = v_B' - v_A'$$

$$(5 - 0)(0.80) = v_B' - v_A' \tag{2}$$

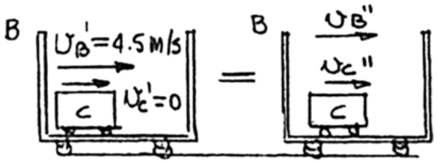
Adding Eqs. (1) and (2)

$$(5 \text{ m/s})(1 + 0.80) = 2v_B'$$

$$v_B' = 4.5 \text{ m/s} \longrightarrow$$

Impact between *B* and *C* (after *A* hits *B*)

Total momentum conserved:



$$\xrightarrow{+} m_B v_B' + m_C v_C' = m_B v_B'' + m_C v_C''$$

$$(40 \text{ kg})(4.5 \text{ m/s}) + 0 = (40 \text{ kg})\, v_B'' + (15 \text{ kg})\, v_C''$$

$$4.5 = v_B'' + 0.375 v_C'' \tag{3}$$

Relative velocities:

$$(v_B' - v_C')\, e_{BC} = v_C'' - v_B''$$

$$(4.5 - 0)(0.30) = v_C'' - v_B'' \tag{4}$$

Adding Eqs. (4) and (3)

$$(4.5)(1+0.3)=(1.375)v_C''$$

$$v_C''=4.2545\text{ m/s}$$

$$v_B''=4.5-0.375(4.2545)\,v_B''=2.90\text{ m/s} \qquad v_B'=2.90\text{ m/s} \blacktriangleleft$$

(*b*)

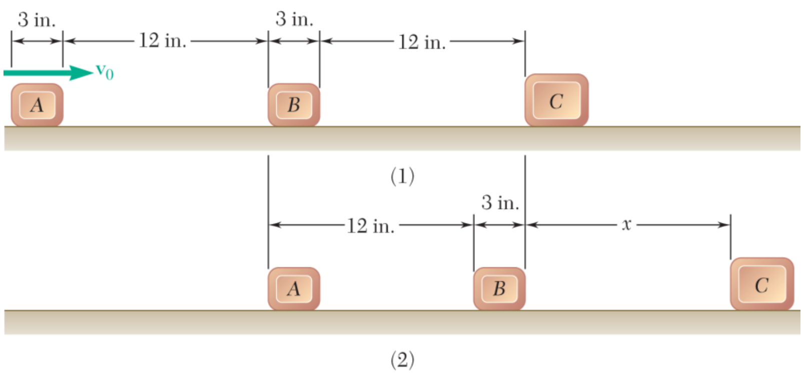
$$\Delta T_L=(T_B'+T_C')-(T_B''+T_C'')$$

$$T_B'=\frac{1}{2}m_B(v_B')^2=\left(\frac{40}{2}\text{ kg}\right)(4.5\text{ m/s})^2=405\text{ J}$$

$$T_C'=0 \qquad T_B''=\frac{1}{2}m_B(v_B'')^2=\left(\frac{40}{2}\text{ kg}\right)(2.90)^2=168.72\text{ J}$$

$$T_C''=\frac{1}{2}m_C(v_C'')^2=\left(\frac{15}{2}\text{ kg}\right)(4.2545\text{ m/s})^2=135.76\text{ J}$$

$$\Delta T_L=(405+0)-(168.72+135.76)=100.5\text{ J} \qquad \Delta T_L=100.5\text{ J} \blacktriangleleft$$



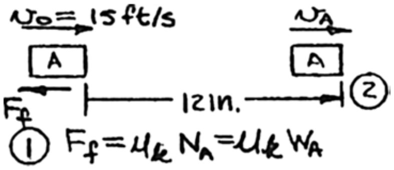
PROBLEM 13.178

Blocks *A* and *B* each weigh 0.8 lb and block *C* weighs 2.4 lb. The coefficient of friction between the blocks and the plane is $\mu_k = 0.30$. Initially block *A* is moving at a speed $v_0 = 15$ ft/s and blocks *B* and *C* are at rest (Fig. 1). After *A* strikes *B* and *B* strikes *C*, all three blocks come to a stop in the positions shown (Fig. 2). Determine (*a*) the coefficients of restitution between *A* and *B* and between *B* and *C*, (*b*) the displacement *x* of block *C*.

SOLUTION

(*a*) Work and energy

Velocity of A just before impact with *B*:



$$T_1 = \frac{1}{2}\frac{W_A}{g}v_0^2 \qquad T_2 = \frac{1}{2}\frac{W_A}{g}\left(v_A^2\right)_2$$

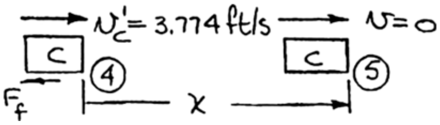
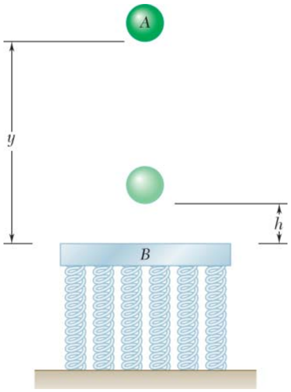
$$T_4 = \frac{1}{2}\frac{W_C}{g}(v_C)^2 \qquad T_5 = 0 \qquad U_{4-5} = -\mu_k W_C(x)$$



$$T_4 + U_{4-5} = T_5 \qquad \frac{1}{2}\frac{W_C}{g}(3.774)^2 - (0.3)W_C(x) = 0$$

$$x = \frac{(3.774)^2}{2(32.2)(0.3)} = 0.737 \text{ ft}$$

$x = 8.84$ in. ◀



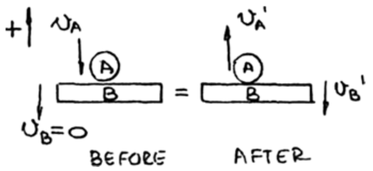
PROBLEM 13.179

A 5 kg sphere is dropped from a height *y*=2 m to test newly designed spring floors used in gymnastics. The mass of the floor section is 10 kg, and the effective stiffness of the floor is *k*= 120 kN/m. Knowing that the coefficient of restitution between the ball and the platform is 0.6, determine *(a)* the height *h* reached by the sphere after rebound, *(b)* the maximum force in the springs.

SOLUTION

Given:
$m_A = 5$ kg
$m_B = 10$ kg
$y = 2$ m
$e = 0.6$
$k = 120$ kN/m

Sketch before/after impact:



Apply Work-Energy to determine speed of the sphere just before impact:

$$\cancel{T_1} + V_{g_1} + \cancel{V_{e_1}} + \cancel{U_{1\to2}^{NC}} = T_2 + \cancel{V_{g_2}} + \cancel{V_{e_2}}$$

where: $V_{g_1} = m_A g y$ and $T_2 = \frac{1}{2} m_A v_A^2$

$$v_A = \sqrt{2gy} = 6.264 \text{ m/s} \downarrow$$

Conservation of momentum in the y-direction: $m_A v_A + m_B \cancel{v_B} = m_A v'_A + m_B v'_B$

Dividing by m_A with ($m_B/m_A = 2$): $-6.264 = v'_A + 2v'_B$ (1)

Coefficient of restitution: $v'_B - v'_A = e\left(v_A - \cancel{v_B}\right)$ (2)

$$= -6.264e$$

Solving Eqs. (1) and (2) simultaneously yields:
$v'_A = 0.4176$ m/s
$v'_B = -3.341$ m/s

(a) Apply Work-Energy to sphere A to determine height it rises:

$$T_1 + \cancel{V_{g_1}} + \cancel{V_{e_1}} + \cancel{U_{1\to2}^{NC}} = \cancel{T_2} + V_{g_2} + \cancel{V_{e_2}}$$

where: $T_1 = \frac{1}{2} m_A v'^2_A$ and $V_{g_2} = m_A g h$

$$h = \frac{v'^2_A}{2g} \text{ m/s}$$

$h = 8.89$ mm ◀

(b) Let δ_0 be the initial compression of the spring and h_B be the additional compression of the spring after impact. In the initial equilibrium state: $+\uparrow \ \Sigma F_y = 0: \ k\delta_0 - W_B = 0$ or $k\delta_0 = m_B g$

Apply Work-Energy to determine maximum deflection of the springs (when the plate reaches its lowest point and the speed is zero):

PROBLEM 13.179 (Continued)

$T_1 + V_{g_1} + V_{e_1} + \cancel{U^{NC}_{1\to 2}} = \cancel{T_2} + V_{g_2} + V_{e_2}$ where: $T_1 = \frac{1}{2} m_B v'^2_B,\ V_{g_1} = -m_B g \delta_0,\ V_{e_1} = \frac{1}{2} k \delta_0^2$

$V_{g_2} = -m_B g \left(\delta_0 + h_B\right),\ V_{e_2} = \frac{1}{2} k \left(\delta_0 + h_B\right)^2$

$$\frac{1}{2} m_B v'^2_B - m_B g \delta_0 + \frac{1}{2} k \delta_0^2 = -m_B g \left(\delta_0 + h_B\right) + \frac{1}{2} k \delta_0^2 + k \delta_0 h_B + \frac{1}{2} k h_B^2$$

Simplify: $\frac{1}{2} m_B v'^2_B = -m_B g h_B + k \delta_0 h_B + \frac{1}{2} k h_B^2$

Substitute $k\delta_0 = m_B g$: $\cancel{\frac{1}{2}} m_B v'^2_B = \cancel{-m_B g h_B} + \cancel{m_B g h_B} + \cancel{\frac{1}{2}} k h_B^2$

Put in known values:

$$120000 h_B^2 - 111.616 = 0$$

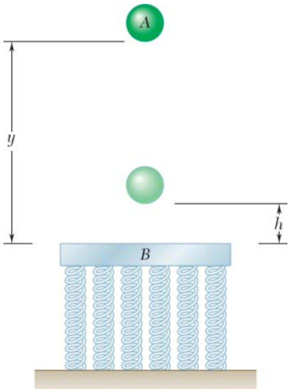
Solving for h_B: $h_B = 0.0305 \text{ m}$

Maximum force in spring $F = k\left(\delta_0 + h_B\right)$

$= k\delta_0 + k h_B$

$= m_B g + k h_B$

$F_{\max} = 3758 \text{ N}$ ◀



PROBLEM 13.180

A 5 kg sphere is dropped from a height y=3 m to test a new spring floor used in gymnastics. The mass of the floor section B is 12 kg, and the sphere bounces back upwards a distance of 44 mm. Knowing that the maximum deflection of the floor section is 33 mm from its equilibrium position, determine *(a)* the coefficient of restitution between the sphere and the floor, *(b)* the effective spring constant k of the floor section.

SOLUTION

Given:

$m_A = 5$ kg

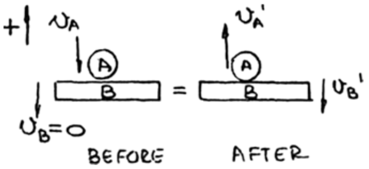
$m_B = 12$ kg

$y = 3$ m

$h = 44$ mm

$s_{\max} = 33$ mm

Sketch before/after impact:



Apply Work-Energy to determine speed of the sphere just before impact:

$$\cancel{T_1} + V_{g_1} + \cancel{V_{e_1}} + \cancel{U_{1\to 2}^{NC}} = T_2 + \cancel{V_{g_2}} + \cancel{V_{e_2}} \qquad \text{where: } V_{g_1} = m_A g y \text{ and } T_2 = \frac{1}{2} m_A v_A^2$$

$$v_A = \sqrt{2gy} = 7.672 \text{ m/s} \downarrow \text{ or } v_A - 7.672 \text{ m/s}$$

Apply Work Energy to determine the speed of the sphere just after impact:

$$T_2 + \cancel{V_{g_1}} + \cancel{V_{e_1}} + \cancel{U_{2\to 3}^{NC}} = \cancel{T_3} + V_{g_3} + \cancel{V_{e_3}} \qquad \text{where: } T_2 = \frac{1}{2} m_A v'^2_A \text{ and } V_{g_3} = m_A g h$$

$$v'_A = \sqrt{2gh} = 0.9291 \text{ m/s} \uparrow$$

(a) Conversation of momentum in the y-direction: $m_A v_A + m_B \cancel{v_B} = m_A v'_A + m_B v'_B$

Put in known values and solve:

$$v'_B = \frac{m_A}{m_B}\left(v_A - v'_A\right)$$
$$= -3.584 \text{ m/s}$$

Coefficient of restitution:

$$v'_B - v'_A = e\left(v_A - \cancel{v_B}\right)$$
$$e = \frac{v'_B - v'_A}{v_A}$$

Put in known values and solve: $e = 0.588$ ◀

(b) Let δ_0 be the initial compression of the spring and $s_{\max}$ be the additional compression of the spring after impact. In the initial equilibrium state: $+\uparrow\ \Sigma F_y = 0$: $k\delta_0 - W_B = 0$ or $\delta_0 = \frac{m_B g}{k}$

PROBLEM 13.180 (Continued)

Apply Work-Energy to determine the stiffness of the springs (when the plate reaches its lowest point and the speed is zero). Take the equilibrium position as the datum.

$$T_1 + \cancel{V_{g_1}} + V_{e_1} + \cancel{U_{1\to 2}^{NC}} = \cancel{T_2} + V_{g_2} + V_{e_2} \qquad \text{where: } T_1 = \frac{1}{2}m_B v'^2_B,\ V_{e_1} = \frac{1}{2}k\delta_0^2$$

$$V_{g_2} = -m_B g\left(s_{\max}\right),\ V_{e_2} = \frac{1}{2}k\left(s_{\max}\right)^2$$

Substitute $\delta_0 = \dfrac{m_B g}{k}$:

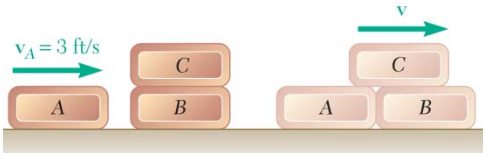
$$\frac{1}{2}m_B v'^2_B + \frac{1}{2}k\left(\frac{m_B g}{k}\right)^2 = -m_B g s_{\max} + \frac{1}{2}k\left(s_{\max}\right)^2$$

$$m_B v'^2_B k + \left(m_B g\right)^2 = -2m_B g\left(s_{\max}\right)k + k^2\left(s_{\max}\right)^2$$

$$k^2\left(s_{\max}\right)^2 - \left(m_B v'^2_B + 2m_B g s_{\max}\right)k - \left(m_B g\right)^2 = 0$$

Put in known values and solve for k:

$k = 148.7$ kN/m or ~~$k = -85.5$ N/m~~ $\qquad k = 148.7\,\text{kN/m}$ ◀



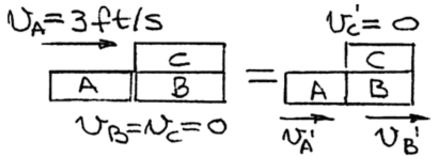
PROBLEM 13.181

The three blocks shown are identical. Blocks *B* and *C* are at rest when block *B* is hit by block *A*, which is moving with a velocity $\mathbf{v}_A$ of 3 ft/s. After the impact, which is assumed to be perfectly plastic $(e = 0)$, the velocity of blocks *A* and *B* decreases due to friction, while block *C* picks up speed, until all three blocks are moving with the same velocity **v**. Knowing that the coefficient of kinetic friction between all surfaces is $\mu_k = 0.20$, determine (*a*) the time required for the three blocks to reach the same velocity, (*b*) the total distance traveled by each block during that time.

SOLUTION

(*a*) Impact between *A* and *B*, conservation of momentum

$$mv_A + mv_B + mv_C = mv'_A + mv'_B + mv'_C$$



$$3 + 0 = v'_A + v'_B + 0$$

Relative velocities $(e = 0)$

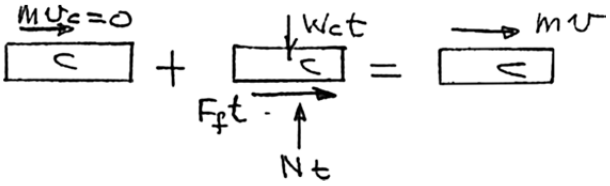
$$(v_A - v_B)e = v'_B - v'_A \qquad 3 = 2v'_B$$

$$0 = v'_B - v'_A \qquad v'_B = 1.5 \text{ ft/s}$$

$$v'_A = v'_B$$

$v =$ Final (common) velocity

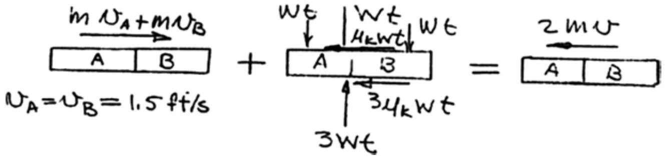
Block *C*: Impulse and momentum



$$\xrightarrow{+} W_C v_C + F_f t = \frac{W_C}{g} v \qquad F_f = \mu_k W_C$$

$$0 + (0.2)t = \frac{v}{g} \qquad v = (0.2)gt \qquad (1)$$

Blocks *A* and *B*: Impulse and momentum



$m v_A + m v_B$
A

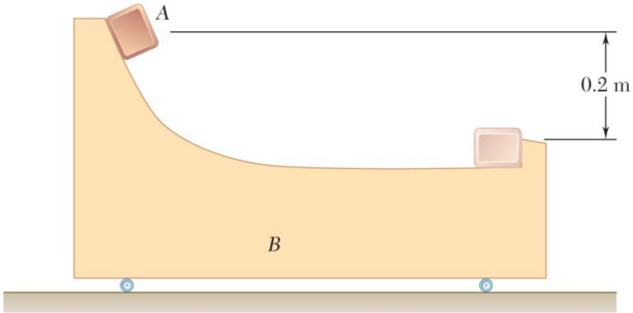
$$U_{1-2} = -4\mu_k W g x_A = -0.8 W g x_A$$

$$T_1 + U_{1-2} = T_2$$

$$2.25W - 4(0.2)W(32.2)x_A = 0.25W$$

$$x_A = 0.07764\text{ ft} \qquad x_A = 0.0776\text{ ft} \blacktriangleleft$$



PROBLEM 13.182

Block A is released from rest and slides down the frictionless surface of B until it hits a bumper on the right end of B. Block A has a mass of 10 kg and object B has a mass of 30 kg and B can roll freely on the ground. Determine the velocities of A and B immediately after impact when (a) $e = 0$, (b) $e = 0.7$.

SOLUTION

Let the x-direction be positive to the right and the y-direction vertically upward.

Let $(v_A)_x$, $(v_A)_y$, $(v_A)_x$ and $(v_B)_y$ be velocity components just before impact and $(v'_A)_x, (v'_A)'_y, (v'_B)_x$, and $(v'_B)_y$ those just after impact. By inspection,

$$(v_A)_y = (v_B)_y = (v'_A)_y = (v'_B)_y = 0$$

Conservation of momentum for x-direction:

While block is sliding down: $$0 + 0 = m_A(v_A)_x + m_B(v_B)_x \qquad (v_B)_x = -\beta(v_A)_x \tag{1}$$

Impact: $$0 + 0 = m_A(v'_A)_x + m_B(v'_B)_x \qquad (v'_B)_x = -\beta(v'_A)_x \tag{2}$$

where $$\beta = m_A/m_B$$

Conservation of energy during frictionless sliding:

Initial potential energies: $m_A gh$ for A, 0 for B.

Potential energy just before impact: $V_1 = 0$

Initial kinetic energy: $T_0 = 0$ (rest)

Kinetic energy just before impact: $$T_1 = \frac{1}{2}m_A v_A^2 + \frac{1}{2}m_B v_B^2$$

$$T_0 + V_0 = T_1 + V_1$$

$$m_A gh = \frac{1}{2}m_A v_A^2 + \frac{1}{2}m_B v_B^2 = \frac{1}{2}(m_A + m_B\beta^2)v_A^2$$

$$= \frac{1}{2}m_A(1+\beta)v_A^2$$

$$v_A^2 = (v_A)_x^2 = \frac{2gh}{1+\beta} \qquad v_A = \sqrt{\frac{2gh}{1+\beta}} \tag{3}$$

PROBLEM 13.182 (Continued)

Velocities just before impact: $\mathbf{v}_A = \sqrt{\dfrac{2gh}{1+\beta}} \longrightarrow$

$$\mathbf{v}_B = \beta\sqrt{\frac{2gh}{1+\beta}} \longleftarrow$$

Analysis of impact. Use Eq. (2) together with coefficient of restitution.

$$(v'_B)_x - (v'_A)_x = e[(v_A)_x - (v_B)_x]$$
$$-\beta(v'_A)_x - (v'_A)_x = e[(v_A)_x + \beta(v_A)_x]$$
$$(v'_A)_x = -e(v_A)_x \qquad (4)$$

Data: $m_A = 10 \text{ kg}$

$m_B = 30 \text{ kg}$

$h = 0.2 \text{ m}$

$g = 9.81 \text{ m/s}^2$

$$\beta = \frac{10\,\text{kg}}{30\,\text{kg}} = 0.33333$$

From Eq. (3),
$$v_A = \sqrt{\frac{(2)(9.81)(0.2)}{1.33333}} = 1.71552 \text{ m/s}$$

(*a*) $e = 0$: $(v'_A)_x = 0 \qquad (v'_B)_x = 0$

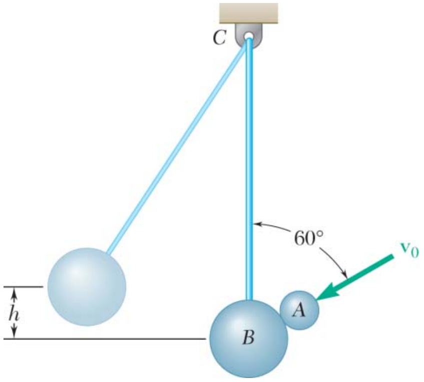
$\mathbf{v}'_A = 0$ ◀

$\mathbf{v}'_B = 0$ ◀

(*b*) $e = 0.7$:
$$(v'_A)_x = -(0.7)(1.71552) = -1.20086 \text{ m/s}$$
$$(v'_B)_x = -(0.33333)(1.20086) = 0.40029 \text{ m/s}$$

$\mathbf{v}'_A = 1.201 \text{ m/s} \longleftarrow$ ◀

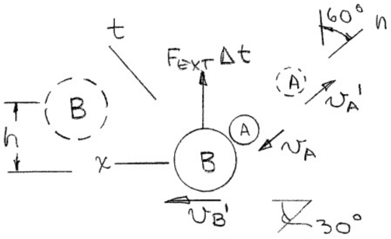
$\mathbf{v}'_B = 0.400 \text{ m/s} \longrightarrow$ ◀



PROBLEM 13.183

A 340-g ball *B* is hanging from an inextensible cord attached to a support *C*. A 170-g ball *A* strikes *B* with a velocity $\mathbf{v}_0$ of magnitude 1.5 m/s at an angle of 60° with the vertical. Assuming perfectly elastic impact ($e = 1$) and no friction, determine the height *h* reached by ball *B*.

SOLUTION

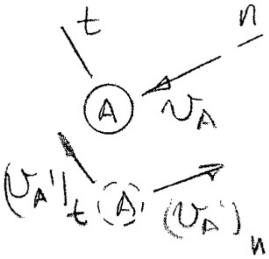


Ball *A* alone

Momentum in *t*-direction conserved

$$m_A(v_A)_t = m_A(v'_A)_t$$

$$(v_A)_t = 0 = (v'_A)_t$$



Thus $\quad (v'_A)_n = v'_A \nearrow 60^\circ$

Total momentum in the *x*-direction is conserved.

$$m_A v_A \sin 60^\circ + m_B(v_B)_x = m_A(-v'_A)\sin 60 + m_B v'_B$$

$$v_A = v_0 = 1.5 \text{ m/s} \qquad (v_B)_x = 0$$

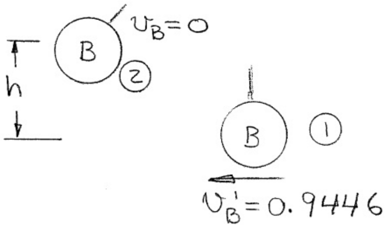
$$0.17(1.5)(\sin 60^\circ) + 0 = -(0.17)(v'_A)(\sin 60^\circ) + (0.34)v'_B$$

$$0.2208 = -0.1472v'_A + 0.34v'_B \qquad (1)$$

Relative velocity in the *n*-direction

$$[-v_A - (v_B)_n]e = -v'_B \cos 30^\circ - v'_A;$$

$$(-1.5 - 0)(1) = -0.866v'_B - v'_A \qquad (2)$$



Solving Equations (1) *and* (2) simultaneously

$$v'_B = 0.9446 \text{ m/s}, \; v'_A = 0.6820 \text{ m/s}$$

Conservation of energy ball *B*

$$T_1 = \frac{1}{2}m_B(v'_B)^2$$

$$T_1 = \frac{1}{2}\frac{W_B}{g}(3.0232)^2 \qquad T_2 = 0$$

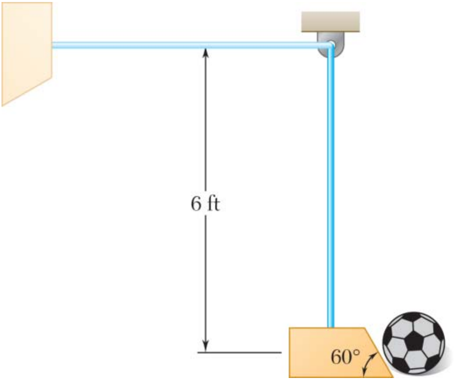
PROBLEM 13.183 (Continued)

$$V_1 = 0 \qquad V_2 = W_B h$$

$$T_1 + V_1 = T_2 + V_2;\ \frac{1}{2}\frac{\cancel{W}_B}{g}(0.9446)^2 = 0 + \cancel{W}_B h;$$

$$h = \frac{(0.9446)^2}{(2)(9.81)} = 0.0455 \text{ m}$$

$h = 45.5$ mm ◀



PROBLEM 13.184

A test machine that kicks soccer balls has a 5-lb simulated foot attached to the end of a 6-ft long pendulum arm of negligible mass. Knowing that the arm is released from the horizontal position and that the coefficient of restitution between the foot and the 1 lb ball is 0.8, determine the exit velocity of the ball (a) if the ball is stationary, (b) if the ball is struck when it is rolling towards the foot with a velocity of 10 ft/s.

SOLUTION

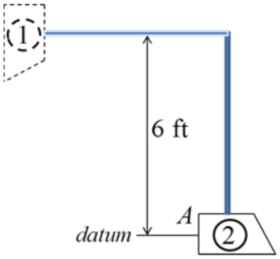
Given: $m_A = 5/32.2$ slugs

$m_B = 1/32.2$ slugs

$l = 6$ ft

$e = 0.8$

Pendulum in two positions:



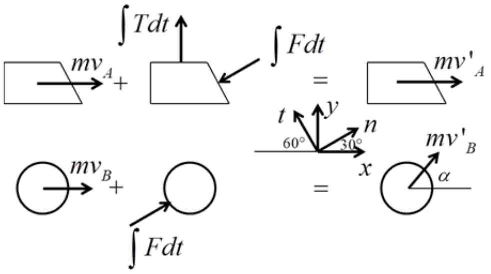
Apply Work-Energy to determine speed of foot before impact:

$$\cancel{T_1} + V_{g_1} + \cancel{V_{e_1}} + \cancel{U_{1\to 2}^{NC}} = T_2 + \cancel{V_{g_2}} + \cancel{V_{e_2}}$$

where: $V_{g_1} = m_A g l$ and $T_2 = \frac{1}{2} m_A v_A^2$

$$v_A = \sqrt{2gl} = 19.66 \text{ ft/s} \rightarrow \text{m/s}$$

Impulse momentum diagrams for ball and foot:



Conservation of momentum of the ball in the t-direction:

$$(v'_B)_t = (v_B)_t$$
$$= -v_B \cos 60° \quad (1)$$

Conservation of momentum of the systems in the x-direction:

$$m_A (v_A)_x + m_B (v_B)_x = m_A (v'_A)_x + m_B (v'_B)_x$$

where:

$$(v_A)_x = v_A$$
$$(v_B)_x = v_B$$
$$(v'_A)_x = v'_A$$
$$(v'_B)_x = (v'_B)_n \sin 60° - (v'_B)_t \cos 60°$$

therefore:

$$m_A v_A + m_B v_B = m_A v'_A + m_B \left[(v'_B)_n \sin 60° + v_B \cos^2 60° \right] \quad (2)$$

PROBLEM 13.184 (Continued)

Coefficient of Restitution: $\left(v'_B\right)_n - \left(v'_A\right)_n = e\left[\left(v_A\right)_n - \left(v_B\right)_n\right]$

where:

$$\left(v'_A\right)_n = v'_A \sin 60°$$
$$\left(v_A\right)_n = v_A \sin 60°$$
$$\left(v_B\right)_n = v_B \sin 60°$$

therefore: $\left(v'_B\right)_n - v'_A \sin 60° = e\left(v_A \sin 60° - v_B \sin 60°\right)$ (3)

Solving equations (2) and (3)

$$\left(v'_B\right)_n = \frac{\left[m_A v_A\left(1+e\right) - e m_A v_B + m_B v_B\left(1-\cos^2 60°\right)\right]\sin 60°}{m_A + m_B \sin^2 60°} \qquad (4)$$

$$v'_B = \sqrt{\left(v'_B\right)_t^2 + \left(v'_B\right)_n^2} \qquad (5)$$

$$\alpha = 30° + \tan^{-1}\left(\frac{\left(v'_B\right)_t}{\left(v'_B\right)_n}\right) \qquad (6)$$

(a) Evaluating equations (1), (4) for $v_B = 0$

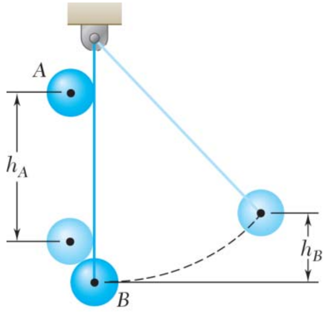
$$\left(v'_B\right)_t = 0$$
$$\left(v'_B\right)_n = 26.65 \text{ ft/s}$$

Using equations (5) and (6) yields: 26.65 ft/s ∠ 30° ◀

(b) Evaluating equations (1), (4) for $v_B = -10$ ft/s

$$\left(v'_B\right)_t = 5 \text{ ft/s}$$
$$\left(v'_B\right)_n = 31.54 \text{ ft/s}$$

Using equations (5) and (6) yields: 31.93 ft/s ∠ 39.0° ◀



PROBLEM 13.185

Ball *B* is hanging from an inextensible cord. An identical ball *A* is released from rest when it is just touching the cord and drops through the vertical distance $h_A = 8$ in. before striking ball *B*. Assuming $e = 0.9$ and no friction, determine the resulting maximum vertical displacement h_B of ball *B*.

SOLUTION

Ball *A* falls

$$T_1 = 0 \quad V_2 = 0$$

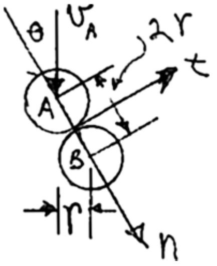
$$T_1 + V_1 = T_2 + V_2 \qquad \text{(Put datum at 2)}$$

$$h = 8 \text{ in.} = 0.66667 \text{ ft}$$

$$mgh = \frac{1}{2} m v_A^2$$

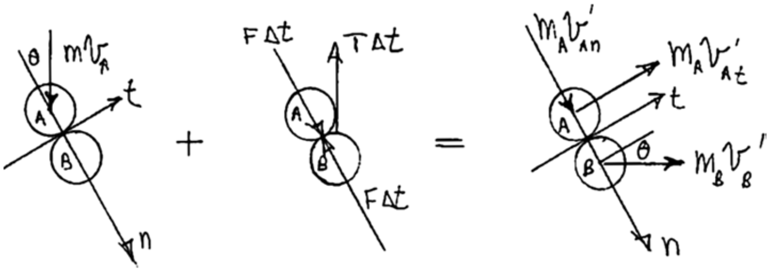
$$v_A = \sqrt{2gh} = \sqrt{(2)(32.2)(0.66667)} = 6.5524 \text{ ft/s}$$

Impact



$$\theta = \sin^{-1} \frac{r}{2r} = 30°$$

Impulse-Momentum



Unknowns: v'_B, v'_{At}, v'_{An}

x-dir ⟶

$$0 + 0 = m_B v'_B + m_A v'_{An} \sin 30° + m_A v'_{At} \cos 30° \qquad (1)$$

Noting that $m_A = m_B$ and dividing by m_A

$$v'_B + v'_{An} \sin 30° + v'_{At} \cos 30° = 0 \qquad (1)$$

Ball *A* alone:

Momentum in *t*-direction:

$$-m_A v_A \sin 30° + 0 = m_A v_{At}$$

$$v'_{At} = -v_A \sin 30° = -6.5524 \sin 30° = -3.2762 \text{ ft/s} \qquad (2)$$

Coefficient of restitution:

$$v'_{Bn} - v'_{An} = e(v_{An} - v_{en})$$

$$v'_B \sin 30° - v'_{An} = 0.9(v_A \cos 30° - 0) \qquad (3)$$

With known value for v_{At}, Eqs. (1) and (3) become

$$v'_B + v'_{An} \sin 30° = 3.2762 \cos 30°$$
$$v'_B \sin 30° - v'_{An} = (0.9)(6.5524) \cos 30°$$

Solving the two equations simultaneously,

$$v'_B = 4.31265 \text{ ft/s}$$
$$v'_{An} = -2.9508 \text{ ft/s}$$

After the impact, ball *B* swings upward. Using *B* as a free body

$$T' + V' = T_B + V_B$$

where $T' = \frac{1}{2} m_B (v'_B)^2,$

$V' = 0,$

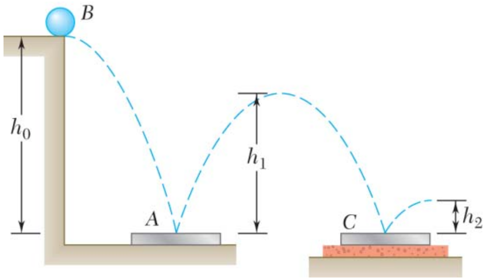
$T_B = 0$

and $V_B = m_B g h_B$

$$\frac{1}{2} m_B (v'_B)^2 = m_B g h_B$$

$$h_B = \frac{1}{2} \frac{(v'_B)^2}{g}$$
$$= \frac{1}{2} \frac{(4.31265)^2}{32.2}$$
$$= 0.2888 \text{ ft}$$

$h_B = 3.47$ in. ◀

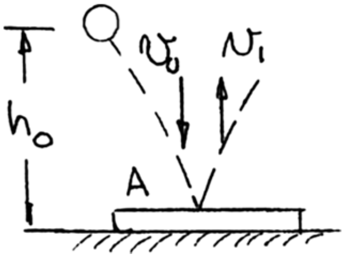


PROBLEM 13.186

A 70 g ball B dropped from a height $h_0 = 1.5$ m reaches a height $h_2 = 0.25$ m after bouncing twice from identical 210-g plates. Plate A rests directly on hard ground, while plate C rests on a foam-rubber mat. Determine (*a*) the coefficient of restitution between the ball and the plates, (*b*) the height h_1 of the ball's first bounce.

SOLUTION

(*a*) Plate on hard ground (first rebound):



Conservation of energy:

$$\cancel{\frac{1}{2} m_B v_y^2} + \frac{1}{2} m_B v_0^2 = m_B g h_0 + \cancel{\frac{1}{2} m_B v_x^2}$$

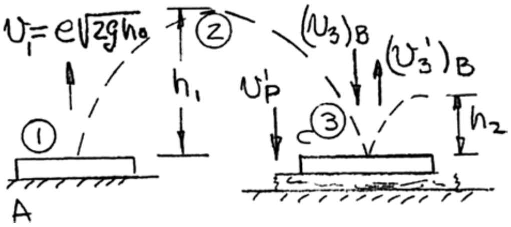
$$v_0 = \sqrt{2 g h_0}$$

Relative velocities., *n*-direction:

$$v_0 e = v_1 \qquad v_1 = e\sqrt{2 g h_0}$$

t-direction $\qquad v'_{Bx} = v_{Bx}$

Plate on foam rubber support at *C*.



Conservation of energy:

Points ① and ③: $\qquad V_1 = V_3 = 0$

$$\cancel{\frac{1}{2} m_B (v'_{Bx})^2} \times \frac{1}{2} m_B v_1^2 = \frac{1}{2} m_B (v_3)_B^2 + \cancel{\frac{1}{2} m_B (v'_{Bx})^2}$$

$$(v_3)_B = e\sqrt{2 g h_0}$$

Conservation of momentum:

$\uparrow +$ At ③: $\qquad m_B(-v_3)_B + m_P v_P = m_B (v'_3)_B - m_P v'_P$

$$\frac{m_P}{m_B} = \frac{210}{70} = 3 \qquad -e\sqrt{2 g h_0} = (v'_3)_B - 3 v'_P \tag{1}$$

PROBLEM 13.186 (Continued)

Relative velocities:

$$[(-v_3)_B - (v_P)]e = -v'_P - (v'_3)_B$$

$$e^2\sqrt{2gh_0} + 0 = v'_P + (v'_3)_B \qquad (2)$$

Multiplying (2) by 3 and adding to (1)

$$4(v'_3)_B = \sqrt{2gh_0}\,(3e^2 - e)$$

Conservation of energy at ③, $(v'_3)_B = \sqrt{2gh_2}$

Thus, $4\sqrt{2gh_2} = \sqrt{2gh_0}\,(3e^2 - e)$

$$3e^2 - e = 4\sqrt{\frac{h_2}{h_0}} = 4\sqrt{\frac{0.25}{1.5}} = 1.63299$$

$$3e^2 - e - 1.633 = 0 \qquad e = 0.923 \blacktriangleleft$$

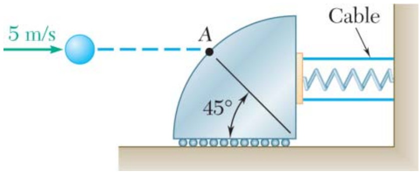
(*b*) Points ① and ②:

Conservation of energy.

$$\cancel{\frac{1}{2}m_B(v'_{Bx})^2} + \frac{1}{2}m_B v_1^2 = \cancel{\frac{1}{2}m_B(v'_{Bx})^2}; \quad \frac{1}{2}e^2(2gh_0) = gh_1$$

$$h_1 = e^2 h_0 = (0.923)^2(1.5)$$

$$h_1 = 1.278 \text{ m} \blacktriangleleft$$

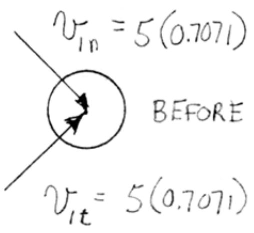


5 m/s
A
Cable
45°

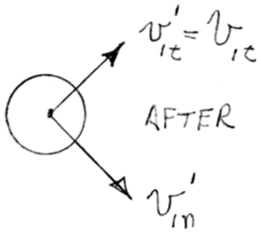
PROBLEM 13.187

A 2-kg sphere moving to the right with a velocity of 5 m/s strikes at *A* the surface of a 9-kg quarter cylinder which is initially at rest and in contact with a spring of constant 20 kN/m. The spring is held by cables so that it is initially compressed 50 mm. Neglecting friction and knowing that the coefficient of restitution is 0.6, determine (*a*) the velocity of the sphere immediately after impact, (*b*) the maximum compressive force in the spring.

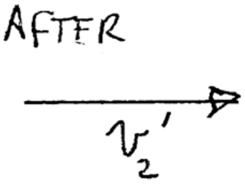
SOLUTION



$v_{1n} = 5(0.7071)$
BEFORE
$v_{1t} = 5(0.7071)$



$v'_{1t} = v_{1t}$
AFTER
v'_{1n}



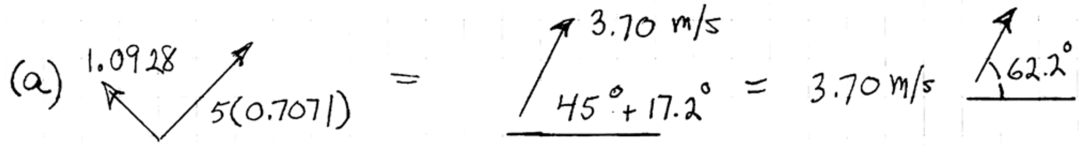
Momentum: $+\searrow \; mv_{1n} + 0 = mv'_{1n} + Mv'_2(0.7071)$

$$(2\text{ kg})(5\text{ m/s})(0.7071) = 2\text{ kg}\; v'_{1n} + 9\text{ kg}\; v'_2(0.7071)$$

Restitution: $v'_2(0.7071) - v'_{1n} = 0.6\,v_{1n} = 0.6(5)(0.7071)$

Solve for $v'_2 = \left(\frac{16}{11}\right)$ m/s, $\quad v'_{1n} = -\left(\frac{17}{11}\right)(0.7071)$

$$v'_{1n} = -1.092801\text{ m/s}$$



(a)
1.0928
5(0.7071)
=
3.70 m/s
45° + 17.2°
=
3.70 m/s
62.2°

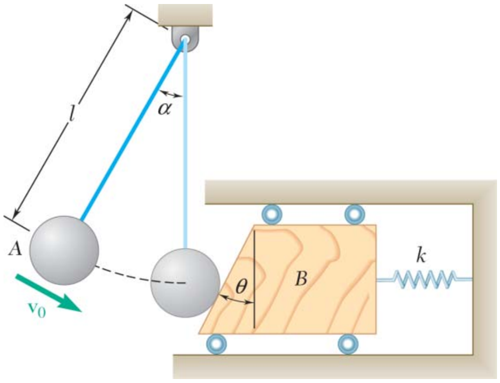
◀

(*b*) Conservation of energy – cylinder + spring:

$$\frac{1}{2}kx_0^2 + \frac{1}{2}M(v'_2)^2 = \frac{1}{2}kx_2^2$$

$$\frac{20{,}000}{2}(0.05)^2 + \frac{1}{2}(9)\left(\frac{16}{11}\right)^2 = \frac{20{,}000}{2}x_2^2 = 34.52$$

$x_2 = 0.05875$ m, $\quad F = kx_2 = 20{,}000\,\frac{\text{N}}{\text{m}}(0.0587\text{ m}) = 1175\text{ N}$ ◀



PROBLEM 13.188

When the rope is at an angle of $\alpha = 30°$ the 1-lb sphere A has a speed $v_0 = 4$ ft/s. The coefficient of restitution between A and the 2-lb wedge B is 0.7 and the length of rope $l = 2.6$ ft. The spring constant has a value of 2 lb/in. and $\theta = 20°$. Determine (*a*) the velocities of A and B immediately after the impact, (*b*) the maximum deflection of the spring assuming A does not strike B again before this point.

SOLUTION

Masses: $m_A = (1/32.2)\ \text{lb}\cdot\text{s}^2/\text{ft} \qquad m_B = (2/32.2)\ \text{lb}\cdot\text{s}^2/\text{ft}$

Analysis of sphere A as it swings down:

Initial state: $\alpha = 30°, \quad h_0 = l(1-\cos\alpha) = (2.6)(1-\cos 30°) = 0.34833\ \text{ft}$

$$V_0 = m_A g h_0 = (1)(0.34833) = 0.34833\ \text{lb}\cdot\text{ft}$$

$$T_0 = \frac{1}{2}m_A v_0^2 = \frac{1}{2}\left(\frac{1.0}{32.2}\right)(4)^2 = 0.24845\ \text{lb}\cdot\text{ft}$$

Just before impact: $\alpha = 0, \quad h_1 = 0, \quad V_1 = 0$

$$T_1 = \frac{1}{2}m_A v_A^2 = \frac{1}{2}\left(\frac{1.0}{32.2}\right)v_A^2 = \left(\frac{1.0}{64.4}\right)v_A^2$$

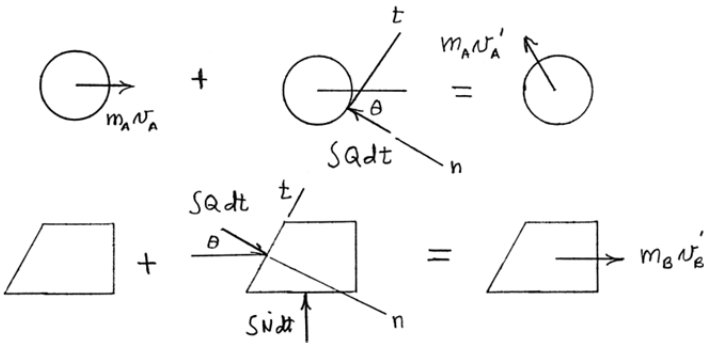
Conservation of energy: $T_0 + V_0 = T_1 + V_1$

$$0.24845 + 0.34833 = \frac{1}{64.4}v_A^2 + 0$$

$$v_A^2 = 38.433\ \text{ft}^2/\text{s}^2$$

$$\mathbf{v}_A = 6.1994\ \text{ft/s} \longrightarrow$$

Analysis of the impact. Use conservation of momentum together with the coefficient of restitution. $e = 0.7$.



Note that the rope does not apply an impulse since it becomes slack.

PROBLEM 13.188 (Continued)

Sphere A: Momentum in t-direction:

$$m_A v_A \sin\theta + 0 = m_A (v'_A)_t$$
$$(v'_A)_t = v_A \sin\theta = 6.1994 \sin 20^\circ = 2.1203 \text{ m/s}$$
$$(\mathbf{v}_A)_t = 2.1203 \text{ m/s} \ \angle 70^\circ$$

Both A and B: Momentum in x-direction:

$$m_A v_A + 0 = m_A (v'_A)_n \cos\theta + m_A (v'_A)_t \sin\theta + m_B v'_B$$
$$(1/32.2)(6.1994) = (1/32.2)(v_A)_n \cos 20^\circ + (1/32.2)(2.120323)\sin 20^\circ + (2/32.2)v'_B$$
$$(1/32.2)(v'_A)_n \cos 20^\circ + (2/32.2)v'_B = 0.17001 \qquad (1)$$

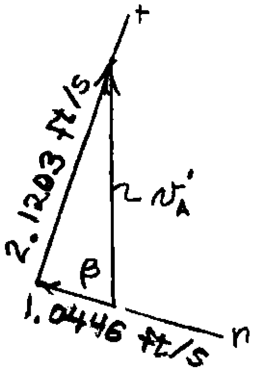
Coefficient of restitution:

$$(v'_B)_n - (v'_A)_n = e[(v_A)_n - (v_B)_n]$$
$$v'_B \cos\theta - (v'_A)_n = e[v_A \cos\theta - 0]$$
$$v'_B \cos 20^\circ - (v'_A)_n = (0.7)(6.1994)\cos 20^\circ \qquad (2)$$

Solving Eqs. (1) and (2) simultaneously for $(v'_A)_n$ and v'_B,

$$(v'_A)_n = -1.0446 \text{ ft/s}$$
$$v'_B = 3.2279 \text{ ft/s}$$

Resolve $\mathbf{v}_A$ into horizontal and vertical components.



$$\tan\beta = \frac{(v'_A)_t}{-(v'_A)_n} = \frac{2.1203}{1.0446}$$
$$\beta = 63.77^\circ \qquad \beta + 20^\circ = 83.8^\circ$$
$$v'_A = \sqrt{(2.1203)^2 + (1.0446)^2} = 2.3637 \text{ ft/s}$$

(*a*) *Velocities immediately after impact.* $\mathbf{v}'_A = 2.36 \text{ ft/s} \searrow 83.8^\circ$ ◀

$\mathbf{v}'_B = 3.23 \text{ ft/s} \longrightarrow$ ◀

(*b*) *Maximum deflection of wedge B.*

Use conservation of energy: $T_{B1} + V_{B1} = T_{B2} + V_{B2}$

$$T_{B1} = \frac{1}{2} m_B v_B^2$$
$$V_{B1} = 0$$
$$T_{B2} = 0$$
$$V_{B2} = \frac{1}{2} k (\Delta x)^2$$

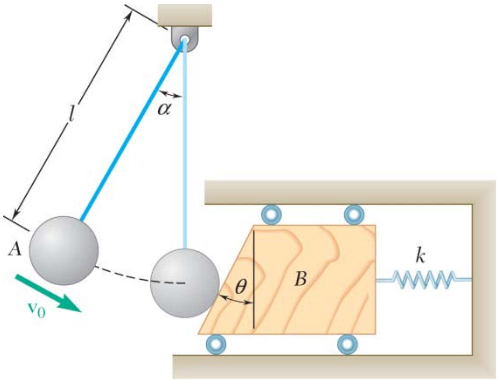
PROBLEM 13.188 (Continued)

The maximum deflection will occur when the block comes to rest (ie, no kinetic energy)

$$\frac{1}{2}m_B v_B^2 = \frac{1}{2}k(\Delta x)^2$$

$$(\Delta x)^2 = \frac{m_B v_B^2}{k} = \frac{\left(\frac{2\text{ lb}}{32.2\text{ ft/s}^2}\right)(3.2279\text{ ft/s})^2}{2\text{ lb/in }(12\text{ in/ft})}$$

$$(\Delta x) = 0.1642118\text{ ft} \qquad (\Delta x) = 1.971\text{ in.} \blacktriangleleft$$



PROBLEM 13.189

When the rope is at an angle of $\alpha = 30°$ the 1-kg sphere A has a speed $v_0 = 0.6$ m/s. The coefficient of restitution between A and the 2-kg wedge B is 0.8 and the length of rope $l = 0.9$ m The spring constant has a value of 1500 N/m and $\theta = 20°$. Determine, (*a*) the velocities of A and B immediately after the impact (*b*) the maximum deflection of the spring assuming A does not strike B again before this point.

SOLUTION

Masses: $m_A = 1$ kg

$m_B = 2$ kg

Analysis of sphere *A* as it swings down:

Initial state: $\alpha = 30°, \quad h_0 = l(1-\cos\alpha) = (0.9)(1-\cos 30°) = 0.12058$ m

$$V_0 = m_A g h_0 = (1)(9.81)(0.12058) = 1.1829 \text{ N}\cdot\text{m}$$

$$T_0 = \frac{1}{2}mv_0^2 = \frac{1}{2}(1)(0.6)^2 = 0.180 \text{ N}\cdot\text{m}$$

Just before impact: $\alpha = 0, \quad h_1 = 0, \quad V_1 = 0$

$$T_1 = \frac{1}{2}m_A v_A^2 = \frac{1}{2}(1)v_A^2 = 0.5v_A^2$$

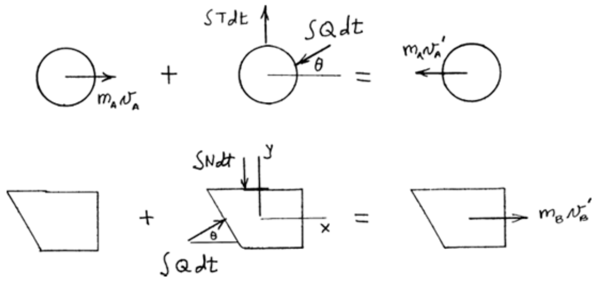
Conservation of energy: $T_0 + V_0 = T_1 + V_1$

$$0.180 + 1.1829 = 0.5v_A^2 + 0$$

$$v_A^2 = 2.7257 \text{ m}^2/\text{s}^2$$

$$\mathbf{v}_A = 1.6510 \text{ m/s} \longrightarrow$$

Analysis of the impact: Use conservation of momentum together with the coefficient of restitution. $e = 0.8$.



Note that the ball rebounds horizontally and that an impulse $\int T dt$ is applied by the rope. Also, an impulse $\int N dt$ is applied to B through its supports.

Both A and B:

Momentum in x-direction:

$$m_A(v_A)_x + 0 = m_A(v'_A)_x + m_B(v'_B)_x$$

$$(1)(1.6510) = (1)(v'_A)_x + (2)(v'_B)_x \qquad (1)$$

Coefficient of restitution: $(v_A)_n = (v_A)_x \cos\theta$

$$(v_B)_n = 0, \quad (v'_A)_n = (v'_A)_x \cos\theta, \quad (v'_B)_x \cos 30°$$

$$(v'_B)_n - (v'_A)_n = e[(v_A)_n - (v_B)_n]$$

$$(v'_B)_x \cos\theta - (v'_A)_x \cos\theta = e[(v_A)_x \cos\theta]$$

Dividing by $\cos\theta$ and applying $e = 0.8$ gives

$$(v'_B)_x - (v'_A)_x = (0.8)(1.6510) \qquad (2)$$

Solving Eqs. (1) and (2) simultaneously,

$$(v'_A)_x = -0.33020 \text{ m/s}$$

$$(v'_B)_x = 0.99059 \text{ m/s}$$

$\mathbf{v}'_A = 0.330$ m/s ← ◀

(*a*) *Velocities immediately after impact.* $\mathbf{v}'_B = 0.991$ m/s → ◀

(*b*) Maximum deflection of wedge B.

Use conservation of energy: $T_{B1} + V_{B1} = T_{B2} + V_{B2}$

$$T_{B1} = \frac{1}{2} m_B v_B^2$$

$$V_{B1} = 0$$

$$T_{B2} = 0$$

$$V_{B2} = \frac{1}{2} k(\Delta x)^2$$

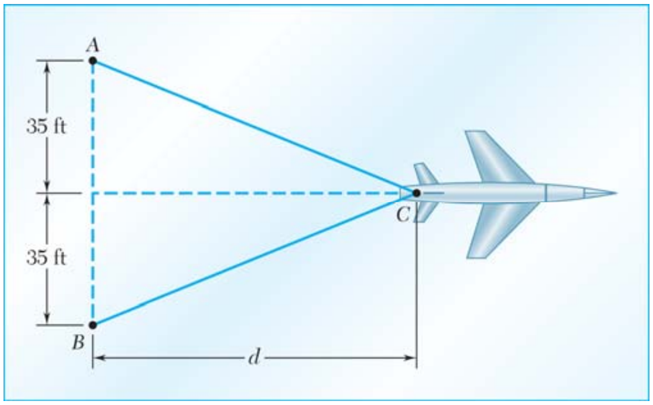
The maximum deflection will occur when the block comes to rest (ie, no kinetic energy)

$$\frac{1}{2} m_B v_B^2 = \frac{1}{2} k(\Delta x)^2$$

$$(\Delta x)^2 = \frac{m_B v_B^2}{k} = \frac{(2)(0.99059 \text{ m/s})^2}{1500 \text{ N/m})}$$

$$(\Delta x) = 0.0362 \text{ m}$$

$\Delta x = 36.2$ mm ◀

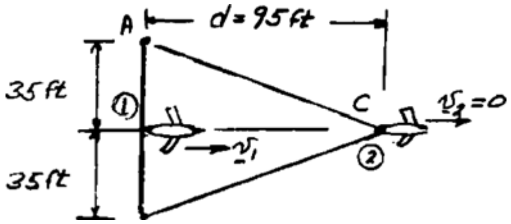


PROBLEM 13.190

A 32,000-lb airplane lands on an aircraft carrier and is caught by an arresting cable. The cable is inextensible and is paid out at A and B from mechanisms located below dock and consisting of pistons moving in long oil-filled cylinders. Knowing that the piston-cylinder system maintains a constant tension of 85 kips in the cable during the entire landing, determine the landing speed of the airplane if it travels a distance $d = 95$ ft after being caught by the cable.

SOLUTION

Mass of airplaine: $m = \frac{W}{g} = \frac{32000 \text{ lb}}{32.2 \text{ ft/s}^2} = 993.79 \text{ lb}\cdot\text{s}^2/\text{ft}$



Work of arresting cable force.

$$Q = 85 \text{ kips} = 85000 \text{ lb.}$$

As the cable is pulled out, the cable tension acts paralled to the cable at the airplane hook. For a small displacement

$$\Delta U = -Q(\Delta l_{AC}) - Q(\Delta l_{BC})$$

Since Q is constant,

$$U_{1\to2} = -Q\left[\overline{AC} + \overline{BC} - \overline{AB}\right]$$

For $d = 95$ ft, $\overline{AC} = \overline{BC} = \sqrt{(35)^2 + (95)^2} = 101.24$ ft

$$U_{1\to2} = -(85000)(101.24 + 101.24 - 70) = -11.261 \text{ ft}\cdot\text{lb}$$

Principle of work and energy: $T_1 + U_{1\to2} = T_2$

$$\frac{1}{2}mv_1^2 + U_{1\to2} = \frac{1}{2}mv_2^2$$

Since $v_2 = 0$, we get

$$v_1^2 = -\frac{2U_{1\to2}}{m} = -\frac{(2)(-11.261)}{993.79} = 22.663\times10^3 \text{ ft}^2/\text{s}^2$$

Initial speed: $v_1 = 150.54$ ft/s $\quad v_1 = 102.6$ mi/h ◀

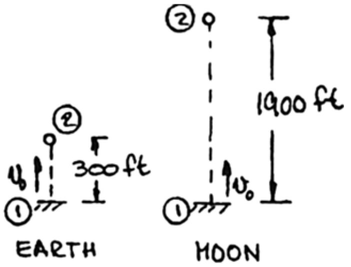
PROBLEM 13.191

A 2-oz pellet shot vertically from a spring-loaded pistol on the surface of the earth rises to a height of 300 ft. The same pellet shot from the same pistol on the surface of the moon rises to a height of 1900 ft. Determine the energy dissipated by aerodynamic drag when the pellet is shot on the surface of the earth. (The acceleration of gravity on the surface of the moon is 0.165 times that on the surface of the earth.)

SOLUTION

Since the pellet is shot from the same pistol the initial velocity v_0 is the same on the moon and on the earth.

Work and energy.



Earth: $$T_1 = \frac{1}{2}mv_0^2$$

$$U_{1-2} = -mg_E(300\text{ ft}) - E_L$$

$(E_L =$ Loss of energy due to drag$)$

Moon: $$T_1 = \frac{1}{2}mv_0^2 \qquad T_2 = 0$$

$$U_{1-2} = -mg_M(1900) \qquad T_1 - 300mg_E - E_L = 0 \tag{1}$$

$$T_2 = 0$$

$$T_1 - 1900mg_M = 0 \tag{2}$$

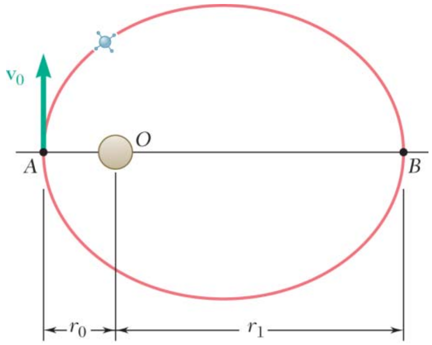
Subtracting (1) from (2) $$-1900mg_M + 300mg_E + E_L = 0$$

$$g_M = 0.165g_E$$

$$m = \frac{(2/16)}{g_E}$$

$$E_L = (1900)\frac{(2/16)}{g_E}(0.165g_E) - 300\frac{(2/16)}{g_E}g_E$$

$E_L = 1.688\text{ ft}\cdot\text{lb}$ ◀



PROBLEM 13.192

A satellite describes an elliptic orbit about a planet of mass *M*. The minimum and maximum values of the distance *r* from the satellite to the center of the planet are, respectively, r_0 and r_1. Use the principles of conservation of energy and conservation of angular momentum to derive the relation

$$\frac{1}{r_0}+\frac{1}{r_1}=\frac{2GM}{h^2}$$

where *h* is the angular momentum per unit mass of the satellite and *G* is the constant of gravitation.

SOLUTION

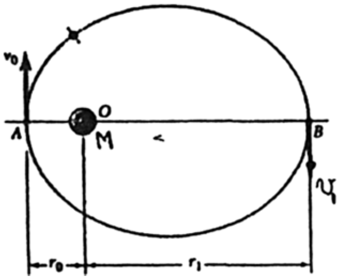
Angular momentum:

$$h = r_0, \quad v_0 = r_1 v_1$$

$$b = r_0 v_0 = r_1 v_1$$

$$v_0 = \frac{h}{r_0} \quad v_1 = \frac{h}{r_1} \tag{1}$$

Conservation of energy:



$$T_A = \frac{1}{2}mv_0^2$$

$$V_A = -\frac{GMm}{r_0}$$

$$T_B = \frac{1}{2}mv_1^2$$

$$V_B = -\frac{GMm}{r_1}$$

$$T_A + V_A = T_B + V_B$$

$$\frac{1}{2}mv_0^2 - \frac{GMm}{r_0} = \frac{1}{2}mv_1^2 - \frac{GMm}{r_1}$$

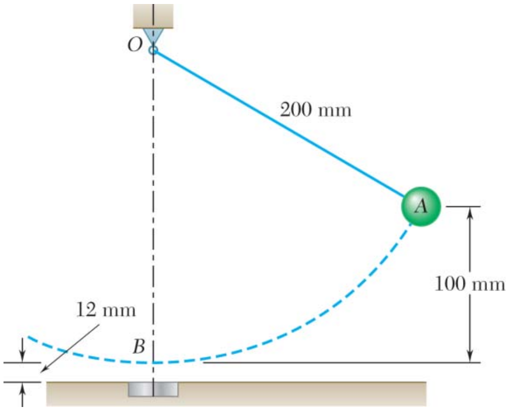
$$v_0^2 - v_1^2 = 2GM\left[\frac{1}{r_0}-\frac{1}{r_1}\right] = 2GM\left[\frac{r_1-r_0}{r_1r_0}\right]$$

Substituting for v_0 and v_1 from Eq. (1)

$$h^2\left[\frac{1}{r_0^2}-\frac{1}{r_1^2}\right] = 2GM\left[\frac{r_1-r_0}{r_1r_0}\right]$$

$$h^2\left[\frac{r_1^2-r_0^2}{r_1^2r_0^2}\right] = \frac{h^2}{r_1^2r_0^2}(r_1-r_0)(r_1+r_0) = 2GM\left[\frac{r_1-r_0}{r_1r_0}\right]$$

$$h^2\left(\frac{1}{r_0}+\frac{1}{r_1}\right) = 2GM \qquad \left(\frac{1}{r_0}+\frac{1}{r_1}\right) = \frac{2GM}{h^2} \quad \text{Q.E.D.}$$



PROBLEM 13.193

A 60-g steel sphere attached to a 200-mm cord can swing about Point *O* in a vertical plane. It is subjected to its own weight and to a force **F** exerted by a small magnet embedded in the ground. The magnitude of that force expressed in newtons is $F = 3000/r^2$ where r is the distance from the magnet to the sphere expressed in millimeters. Knowing that the sphere is released from rest at *A*, determine its speed as it passes through Point *B*.

SOLUTION

Mass and weight:

$$m = 0.060 \text{ kg}$$

$$W = mg = (0.060)(9.81) = 0.5886 \text{ N}$$

Gravitational potential energy:

$$V_g = Wh$$

where *h* is the elevation above level at *B*.

Potential energy of magnetic force:

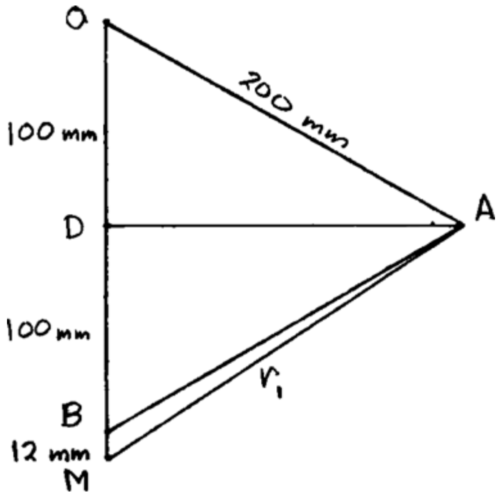
$$F = \frac{3000}{r^2} = -\frac{dV}{dr} \quad (F, \text{ in newtons, } r \text{ in mm})$$

$$V_m = -\int_{\infty}^{r} \frac{3000}{r^2} = \frac{3000}{r} \text{ N} \cdot \text{mm}$$

Use conservation of energy:

$$T_1 + V_1 = T_2 + V_2$$

Position 1: (Rest at *A*.)



$$v_1 = 0 \qquad T_1 = 0$$

$$h_1 = 100 \text{ mm}$$

$$(V_g)_1 = (0.5886 \text{ N})(100 \text{ mm}) = 58.86 \text{ N} \cdot \text{mm}$$

From the figure, $\overline{AD}^2 = 200^2 - 100^2 \text{ (mm}^2)$

$$\overline{MD} = 100 + 12 = 112 \text{ mm}$$

$$r_1^2 = \overline{AD}^2 + \overline{MD}^2$$

$$= 200^2 - 100^2 + 112^2$$

$$= 42544 \text{ mm}^2$$

$$r_1 = 206.26 \text{ mm}$$

$$(V_r)_1 = -\frac{3000}{r_1} = -14.545 \text{ N} \cdot \text{mm}$$

$$V_1 = 58.86 - 14.545 = 44.3015 \text{ N} \cdot \text{mm} = 44.315 \times 10^{-3} \text{ N} \cdot \text{m}$$

PROBLEM 13.193 (Continued)

Position 2. (Sphere at Point *B*.)

$$T_2 = \frac{1}{2}mv_2^2 = \frac{1}{2}(0.060)v_2^2 = 0.030\ v_2^2$$

$$(V_g)_2 = 0 \qquad \text{(since } h_2 = 0\text{)}$$

$$r_2 = \overline{MB} = 12\ \text{mm} \qquad \text{(See figure.)}$$

$$(V_m)_2 = -\frac{3000}{12} = -250\ \text{N}\cdot\text{mm} = -250\times10^{-3}\ \text{N}\cdot\text{mm}$$

$$T_1 + V_1 = T_2 + V_2$$

$$0 + 44.315\times10^{-3} = 0.030v_2^2 - 250\times10^{-3}$$

$$v_2^2 = 9.8105\ \text{m}^2/\text{s}^2 \qquad v_2 = 3.13\ \text{m/s}\ ◀$$

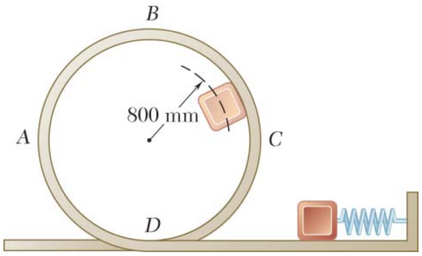
$$(v'_A)_x = 5.3606 \text{ ft/s}$$

From equation (2) $\quad 15 = 2.5(5.3606) + 6(v'_A)_y$

$$(v'_A)_y = 0.2664 \text{ ft/s}$$

$$e = \frac{6.9498 - 5.3606 + 0.2664\left(\frac{2.5}{6}\right)}{6} = 0.2834$$

$e = 0.283$ ◀

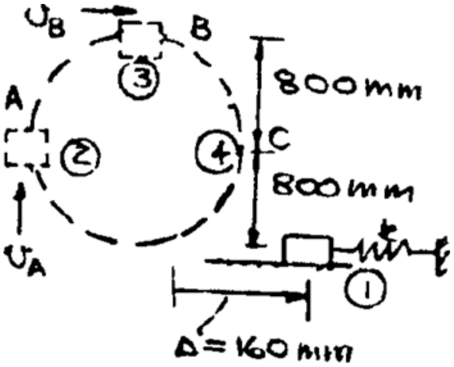


PROBLEM 13.195

A 300-g block is released from rest after a spring of constant $k = 600$ N/m has been compressed 160 mm. Determine the force exerted by the loop *ABCD* on the block as the block passes through (*a*) Point *A*, (*b*) Point *B*, (*c*) Point *C*. Assume no friction.

SOLUTION

Conservation of energy to determine speeds at locations *A*, *B*, and *C*.



Mass: $m = 0.300$ kg

Initial compression in spring: $x_1 = 0.160$ m

Place datum for gravitational potential energy at position 1.

Position 1: $v_1 = 0 \qquad T_1 = \frac{1}{2}mv_1^2 = 0$

$$V_1 = \frac{1}{2}kx_1^2 = \frac{1}{2}(600 \text{ N/m})(0.160 \text{ m})^2 = 7.68 \text{ J}$$

Position 2: $T_2 = \frac{1}{2}mv_A^2 = \frac{1}{2}(0.3)v_A^2 = 0.15v_A^2$

$$V_2 = mgh_2 = (0.3 \text{ kg})(9.81 \text{ m/s}^2)(0.800 \text{ m}) = 2.3544 \text{ J}$$

$$T_1 + V_1 = T_2 + V_2: \quad 0 + 7.68 = 0.15v_A^2 + 2.3544$$

$$v_A^2 = 35.504 \text{ m}^2/\text{s}^2$$

Position 3: $T_3 = \frac{1}{2}mv_B^2 = \frac{1}{2}(0.3)v_B^2 = 0.15v_B^2$

$$V_3 = mgh_3 = (0.3 \text{ kg})(9.81 \text{ m/s}^2)(1.600 \text{ m}) = 4.7088 \text{ J}$$

$$T_1 + V_1 = T_3 + V_3: \quad 0 + 7.68 = 0.15v_B^2 + 4.7088$$

$$v_B^2 = 19.808 \text{ m}^2/\text{s}^2$$

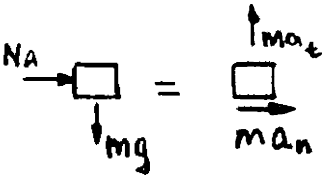
Position 4: $T_2 = \frac{1}{2}mv_C^2 = \frac{1}{2}(0.3)v_C^2 = 0.15v_C^2$

$$V_4 = mgh_4 = (0.3 \text{ kg})(9.81 \text{ m/s})(0.800 \text{ m}) = 2.3544 \text{ J}$$

$$T_1 + V_1 = T_4 + V_4: \quad 0 + 7.68 = 0.15v_C^2 + 2.3544$$

$$v_C^2 = 35.504 \text{ m}^2/\text{s}^2$$

(*a*) Newton's second law at *A*:



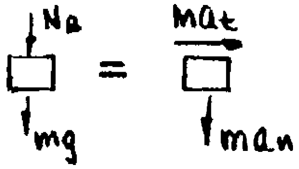
$$a_n = \frac{v_A^2}{\rho} = \frac{35.504\ \text{m}^2/\text{s}^2}{0.800\ \text{m}} = 44.38\ \text{m/s}^2$$

$$\mathbf{a}_n = 44.38\ \text{m/s}^2 \longrightarrow$$

$$\xrightarrow{+} \Sigma F = ma_n: \quad N_A = ma_n$$

$$N_A = (0.3\ \text{kg})(44.38\ \text{m/s}^2) \qquad \mathbf{N}_A = 13.31\ \text{N} \longrightarrow \blacktriangleleft$$

(*b*) Newton's second law at *B*:



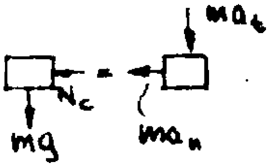
$$a_n = \frac{v_B^2}{\rho} = \frac{19.808\ \text{m}^2/\text{s}^2}{0.800\ \text{m}} = 24.76\ \text{m/s}^2$$

$$\mathbf{a}_n = 24.76\ \text{m/s}^2 \downarrow$$

$$+\!\downarrow \Sigma F = ma_n: \quad N_B = mg = ma_n$$

$$N_B = m(a_n - g) = (0.3\ \text{kg})(24.76\ \text{m/s}^2 - 9.81\ \text{m/s}^2) \qquad \mathbf{N}_B = 4.49\ \text{N} \downarrow \blacktriangleleft$$

(*c*) Newton's second law at *C*:

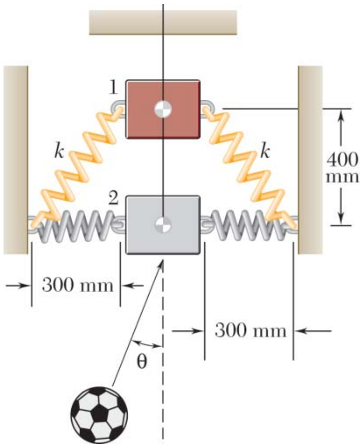


$$a_n = \frac{v_C^2}{\rho} = \frac{35.504\ \text{m}^2/\text{s}^2}{0.800\ \text{m}} = 44.38\ \text{m/s}^2$$

$$\mathbf{a}_n = 44.38\ \text{m/s}^2 \longleftarrow$$

$$\xleftarrow{+} \Sigma F = ma_n: \quad N_C = ma_n$$

$$N_C = (0.3\ \text{kg})(44.38\ \text{m/s}^2) \qquad \mathbf{N}_C = 13.31\ \text{N} \longleftarrow \blacktriangleleft$$



PROBLEM 13.196

A soccer kicking machine has a 5 lb “simulated foot” attached to A “kicking” attachment goes on the front of a wheelchair, allowing athletes with mobility impairments to play soccer. The athletes load up the spring shown through a ratchet mechanism that pulls the 2 kg “foot” back to the position 1. They then release the “foot” to impact the 0.45 kg soccer ball, which is rolling towards the “foot” with a speed of 2 m/s at an angle $\theta = 30^{\circ}$ as shown. The impact occurs with a coefficient of restitution $e = 0.75$ when the foot is at position 2, where the spring is unstretched. Knowing that the effective friction coefficient during rolling is $\mu_k = 0.1$, determine *(a)* the necessary spring coefficient to make the ball roll 30 meters, *(b)* the direction the ball will travel after it is kicked.

SOLUTION

Given: $m_A = 2 \text{ kg}, m_B = 0.45 \text{ kg}, v_B = 2 \text{ m/s}, e = 0.75, \mu_k = 0.1, s_2 = 0$

Conservation of momentum of the ball in the t-direction:

$$(v'_B)_t = (v_B)_t$$
$$= -v_B \sin 30^{\circ}$$
$$= 1 \text{ m/s}$$

Apply Work-Energy to the ball after impact to when it comes to rest:

$$T_1 + \cancel{V_{g_1}} + \cancel{V_{e_1}} + U_{1\to 2}^{NC} = \cancel{T_2} + \cancel{V_{g_2}} + \cancel{V_{e_2}} \qquad \text{where:} \qquad T_2 = \frac{1}{2} m_B v'^2_B$$

$$U_{1\to 2}^{NC} = \mu_k m_B g(30)$$

Therefore:

$$\frac{1}{2}\cancel{m_B} v'^2_B - \mu_k \cancel{m_B} g(30) = 0$$

$$v'_B = 7.672 \text{ m/s}$$

Find $(v'_B)_n$ using:

$$v'_B = \sqrt{(v'_B)_n^2 + (v'_B)_t^2}$$

$$(v'_B)_n = \sqrt{v'^2_B - (v'_B)_t^2}$$

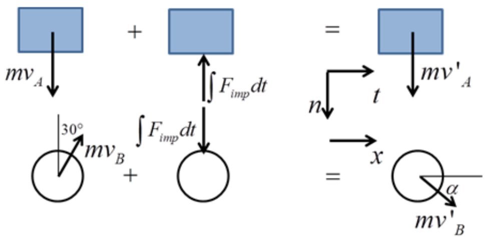
$$= 7.607 \text{ m/s} \downarrow$$

Conservation of momentum of the systems in the n-direction foot:

$$m_A(v_A)_n + m_B(v_B)_n = m_A(v'_A)_n + m_B(v'_B)_n$$

$$(v'_A)_n = \frac{1}{m_A}\left[m_A(v_A)_n + m_B(v_B)_n - m_B(v'_B)_n\right] \qquad (1)$$

Impulse momentum diagrams for ball and



Coefficient of Restitution:

$$(v'_B)_n - (v'_A)_n = e\left[(v_A)_n - (v_B)_n\right] \qquad (2)$$

PROBLEM 13.196 (Continued)

Sub (1) into (2) and solve for $(v_A)_n$:

$$(v'_B)_n - \frac{1}{m_A}\left[m_A(v_A)_n + m_B(v_B)_n - m_B(v'_B)_n\right] = e\left[(v_A)_n - (v_B)_n\right]$$

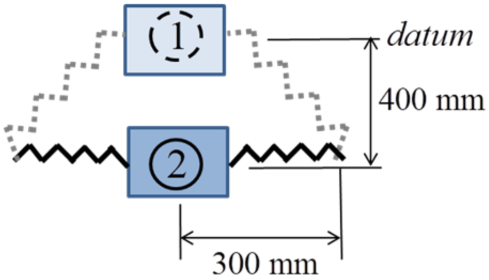
$$(v_A)_n = \frac{(m_A+m_B)(v'_B)_n - m_B(v_B)_n + em_A(v_B)_n}{m_A(e+1)}$$

Sub in known quantities: $$(v_A)_n = \frac{(2+0.45)(7.607) - 0.45(-1.732) + 0.75(2)(-1.732)}{2(0.75+1)}$$

$$= 4.805 \text{ m/s}$$

(a) Apply Work-Energy to determine speed of foot before impact:

“Foot in two positions:



$$\cancel{T_1} + \cancel{V_{g_1}} + V_{e_1} + \cancel{U^{NC}_{1\to 2}} = T_2 + \cancel{V_{g_2}} + \cancel{V_{e_2}}$$

where: $V_{e_1} = 2\left(\frac{1}{2}ks_1^2\right)$, and $T_2 = \frac{1}{2}m_A(v_A)_n^2$

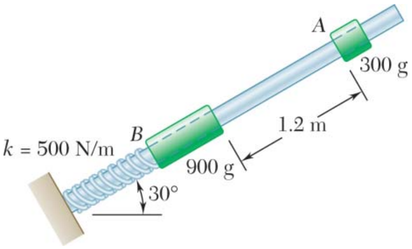
$$s_1 = \sqrt{0.4^2 + 0.3^2} - 0.3$$
$$= 0.2 \text{ m}$$

Therefore: $$k = \frac{m_A(v_A)_n^2}{2s_1^2}$$
$$= \frac{2(4.805)^2}{2(0.2)^2}$$

$k = 577.3$ N/m ◀

(b) Direction of the ball: $$\tan\alpha = \frac{(v'_B)_n}{(v'_B)_t}$$
$$= \frac{7.607}{1}$$

$\alpha = 82.5°$ ◀

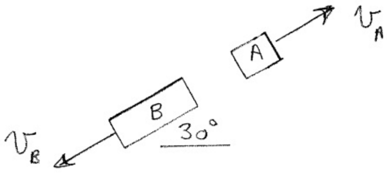


PROBLEM 13.197

A 300-g collar *A* is released from rest, slides down a frictionless rod, and strikes a 900-g collar *B* which is at rest and supported by a spring of constant 500 N/m. Knowing that the coefficient of restitution between the two collars is 0.9, determine (*a*) the maximum distance collar *A* moves up the rod after impact, (*b*) the maximum distance collar *B* moves down the rod after impact.

SOLUTION

After impact



Velocity of *A* just before impact, v_0

$$v_0 = \sqrt{2gh} = \sqrt{2(9.81\text{ m/s}^2)(1.2\text{ m})\sin 30^\circ}$$

$$= \sqrt{2(9.81)(1.2)(0.5)} = 3.431\text{ m/s}$$

Conservation of momentum

$$\overset{+}{\swarrow}_{30^\circ}\ m_A v_0 = m_B v_B - m_A v_A: \quad 0.3v_0 = 0.9v_B - 0.3v_A \quad (1)$$

Restitution

$$(v_A + v_B) = e(v_0 + 0) = 0.9v_0\,(2)$$

Substituting for v_B from (2) in (1)

$$0.3v_0 = 0.9(0.9v_0 - v_A) - 0.3v_A \qquad 1.2v_A = 0.51v_0$$

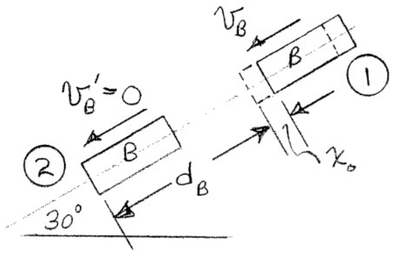
$$v_A = 1.4582\text{ m/s}, \ v_B = 1.6297\text{ m/s}$$

(*a*) *A* moves up the distance *d* where:

$$\frac{1}{2}\cancel{m_A}v_A^2 = \cancel{m_A}gd\sin 30^\circ; \quad \frac{1}{2}(1.4582\text{ m/s})^2 = (9.81\text{ m/s}^2)d(0.5)$$

$$\nearrow_{30^\circ}\ d_A = 0.21675\text{ m} = 217\text{ mm} \blacktriangleleft$$

(*b*) Static deflection = x_0, *B* moves down $\overset{d_B}{\swarrow}_{30^\circ}$



Conservation of energy (1) to (2)

Position (1) – spring deflected, x_0

$$kx_0 = m_B g\sin 30^\circ$$

$$T_1 + V_1 = T_2 + V_2: \quad T_1 = \frac{1}{2}m_B v_B^2, \ T_2 = 0$$

PROBLEM 13.197 (Continued)

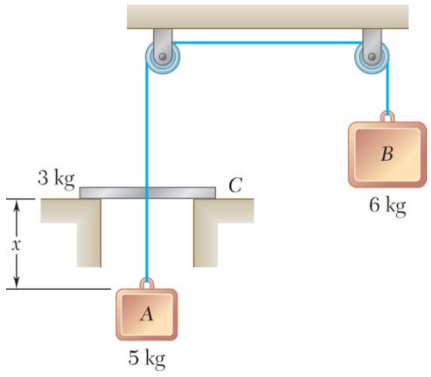
$$V_1 = V_e + V_g = \frac{1}{2}kx_0^2 + m_B g d_B \sin 30°$$

$$V_2 = V_e' + V_g' = \int_0^{x_0 + d_B} kx dx = \frac{1}{2}k\left(d_B^2 + 2d_B x_0 + x_0^2\right)$$

$$\frac{1}{2}kx_0^2 + mgd_B \sin 30° + \frac{1}{2}m_B v_B^2 = \frac{1}{2}k\left(d_B^2 + 2d_B x_0 + x_0^2\right) + 0 + 0$$

$$\therefore \quad kd_B^2 = m_B v_B^2; \qquad 500d_B^2 = 0.9(1.6297)^2 \qquad d_B = 0.0691 \text{ m}$$

$$d_B = 69.1 \text{ mm} \blacktriangleleft$$



PROBLEM 13.198

Blocks *A* and *B* are connected by a cord which passes over pulleys and through a collar *C*. The system is released from rest when $x = 1.7$ m. As block *A* rises, it strikes collar *C* with perfectly plastic impact ($e = 0$). After impact, the two blocks and the collar keep moving until they come to a stop and reverse their motion. As *A* and *C* move down, *C* hits the ledge and blocks *A* and *B* keep moving until they come to another stop. Determine (*a*) the velocity of the blocks and collar immediately after *A* hits *C*, (*b*) the distance the blocks and collar move after the impact before coming to a stop, (*c*) the value of *x* at the end of one compete cycle.

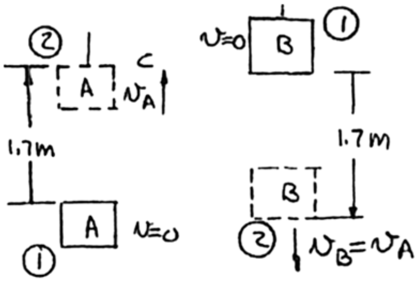
SOLUTION

(*a*) Velocity of *A* just before it hits *C*:

Conservations of energy:

Datum at ①:

Position ①:



$$(v_A)_1 = (v_B)_1 = 0$$
$$T_1 = 0$$
$$V_1 = 0$$

Position ②:

$$T_2 = \frac{1}{2}m_A(v_A)^2 + \frac{1}{2}m_B v_B^2$$
$$v_A = v_B \quad \text{(kinematics)}$$
$$T_2 = \frac{1}{2}(5+6)v_A^2 = \frac{11}{2}v_A^2$$
$$V_2 = m_A g(1.7) - m_B g(1.7)$$
$$= (5-6)(g)(1.7)$$
$$V_2 = -1.7g$$

$$T_1 + V_1 = T_2 + V_2$$
$$0 + 0 = \frac{11}{2}v_A^2 - 1.7g$$
$$v_A^2 = \left(\frac{3.4}{11}\right)(9.81)$$
$$= 3.032 \text{ m}^2/\text{s}^2$$
$$v_A = 1.741 \text{ m/s}$$

PROBLEM 13.198 (Continued)

$$T_2 = \frac{1}{2}(m_A + m_B + m_C)(v_A')$$

$$T_2 = \left(\frac{14}{2}\right)(1.3681)^2$$

$$T_2 = 13.103 \text{ J}$$

$$V_2 = 0$$

PROBLEM 13.198 (Continued)

Position ③:

$T_3 = 0$

$$V_3 = (m_A + m_C)gd - m_B gd$$
$$V_3 = (8-6)gd = 2gd$$

$T_2 + V_2 = T_3 + V_3$

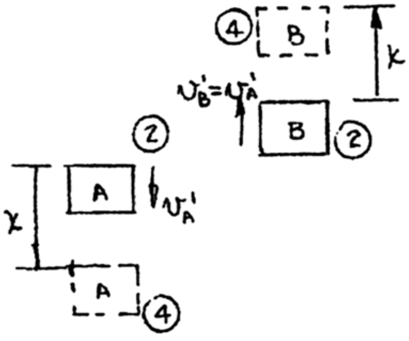
$$13.103 + 0 = 0 + 2gd$$

$$d = (13.103)/(2)(9.81) = 0.6679 \text{ m} \qquad d = 0.668 \text{ m} \blacktriangleleft$$

(*c*) As the system returns to position ② after stopping in position ③, energy is conserved, and the velocities of *A*, *B*, and *C* before the collar at *C* is removed are the same as they were in Part (*a*) above with the directions reversed. Thus, $v'_A = v'_C = v'_B = 1.3679$ m/s. After the collar *C* is removed, the velocities of *A* and *B* remain the same since there is no impulsive force acting on either.

Conversation of energy:

Datum at ②:



$$T_2 = \frac{1}{2}(m_A + m_B)(v'_A)^2$$
$$T_2 = \frac{1}{2}(5+6)(1.3679)^2$$
$$T_2 = 10.291 \text{ J}$$

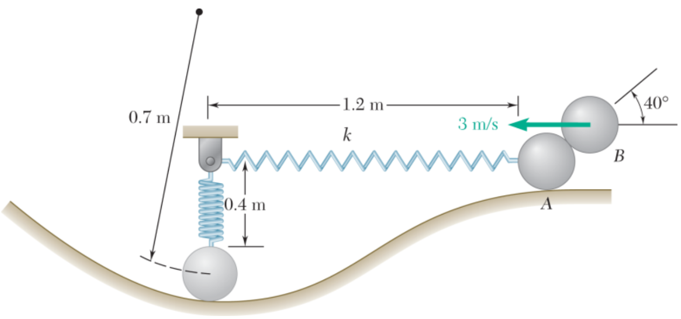
$V_2 = 0$

$$T_4 = 0 \quad V_4 = m_B gx - m_A gx$$
$$V_4 = (6-5)gx$$

$T_2 + V_2 = T_4 + V_4$

$$10.291 + 0 = (1)(9.81)x$$

$$x = 1.049 \text{ m} \blacktriangleleft$$



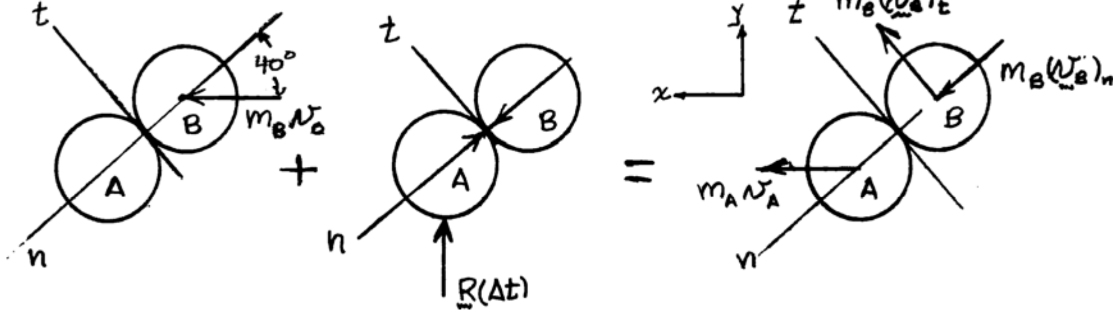
PROBLEM 13.199

A 2-kg ball *B* is traveling horizontally at 10 m/s when it strikes 2-kg ball *A*. Ball *A* is initially at rest and is attached to a spring with constant 100 N/m and an unstretched length of 1.2 m. Knowing the coefficient of restitution between *A* and *B* is 0.8 and friction between all surfaces is negligible, determine the normal force between *A* and the ground when it is at the bottom of the hill.

SOLUTION

Ball *B* impacts on ball *A*. Use the principle of impulse and momentum.

$$\Sigma m\mathbf{v}_1 + \Sigma \mathbf{Imp}_{1\to 2} = \Sigma m\mathbf{v}_2$$



Velocity components: $v_0 = 10$ m/s

$$(v_0)_x = v_0 \quad (v_0)_n = v_0 \cos 40° \quad (v_0)_t = v_0 \sin 40°$$

$$(v_A)_x = v_A \quad (v_A)_n = v_A \cos 40°$$

$$(v_B)_x = (v_B)_n \cos 40° + (v_B)_t \sin 40°$$

Impulse-momentum for ball *B* alone.

t-direction:

$$m_B(v_0)_t = m_B(v_B)_t$$

$$(v_B)_t = (v_0)_t = 10\sin 40° = 6.4279 \text{ m/s} \qquad (1)$$

Impulse-momentum for balls *A* and *B*.

x-direction ←

$$m_B v_0 + 0 = m_A v_A + m_B(v_B)_x + m_B(v_B)_t$$

$$(2)(10) + 0 = 2v_A + 2[(v_B)_n \cos 40° + 6.4279\sin 40°]$$

$$2v_A + 2(v_B)_n \cos 40° = 11.7365 \qquad (1)$$

Coefficient of restitution. $(e = 0.8)$

$$(v_B)_n = (v_A)_n = e[0 - (v_0)_n]$$

$$(v_B)_n - v_A \cos 40° = -(0.8)(10)\cos 40° \qquad (2)$$

Solving Eqs. (1) and (2) simultaneously,

$$v_A = 6.6566 \text{ m/s} \qquad (v_B)_n = -1.0291 \text{ m/s}$$

As ball *A* moves from the impact location to the lowest point on the path, the spring compresses and the elevation decreases. Since friction is negligible, energy is conserved.

$$T_1 + V_1 = T_2 + V_2$$

$$\frac{1}{2}m_A v_A^2 + (V_e)_1 + (V_g)_1 = \frac{1}{2}m_A v_2^2 + (V_e)_2 + (V_g)_2$$

Position 1: (Just after impact.)

$$T_1 = \frac{1}{2}m_A v_A^2 = \frac{1}{2}(2)(6.6566)^2 = 44.3101 \text{ J}$$

$$(V_e)_1 = 0 \quad \text{(The spring is unstretched.)}$$

$$(V_g)_1 = 0 \quad \text{(Datum)}$$

Position 2: (Lowest point on path.)

$$T_2 = \frac{1}{2}m_A v_2^2 = \frac{1}{2}(2)v_2^2 = v_2^2$$

For the spring, $x_2 = l_2 - l_0 = 0.4 \text{ m} - 1.2 \text{ m} = 0.8 \text{ m}$

$$F_e = kx_2 = (100)(0.8) = 80 \text{ N}$$

$$(V_2)_e = \frac{1}{2}kx_2^2 = \frac{1}{2}(100)(0.8)^2 = 32 \text{ J}$$

Elevation above datum: $h_2 = -0.4 \text{ m}$

$$(V_2)_g = m_A g\, h_2 = (2)(9.81)(-0.4) = -7.848$$

Conservation of energy:

$$44.310 + 0 + 0 = v_2^2 + 32 - 7.848$$

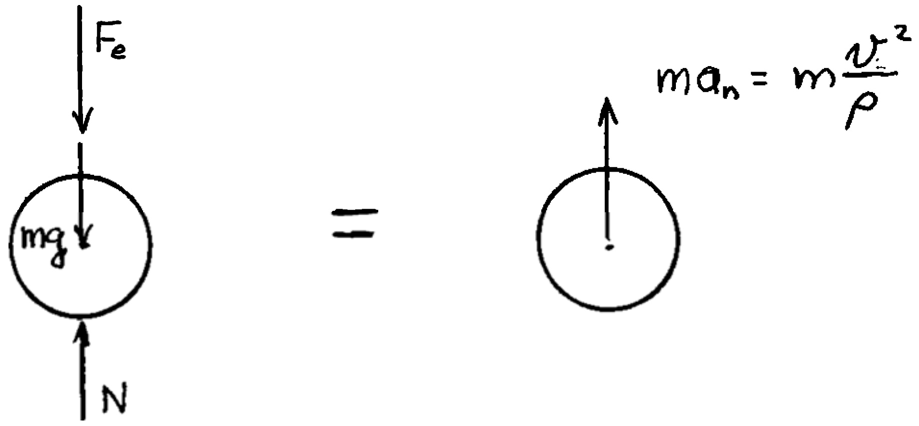
$$v_2^2 = 20.158 \text{ m}^2/\text{s}^2 \qquad v_2 = 4.489 \text{ m/s}$$

Normal acceleration at lowest point on path:

$$a_n = \frac{v_2^2}{\rho} = \frac{20.158}{0.7} = 28.798 \text{ m/s}^2 \qquad \mathbf{a}_n = 28.8 \text{ m/s}^2 \uparrow$$

PROBLEM 13.199 (Continued)

Apply Newton's second law to the ball.



F_e
mg
N
=
$ma_n = m\frac{v^2}{\rho}$

$$+\uparrow \Sigma F = ma_n: N - mg - F_e = ma_n$$

$$N = mg + F_e + ma_n$$

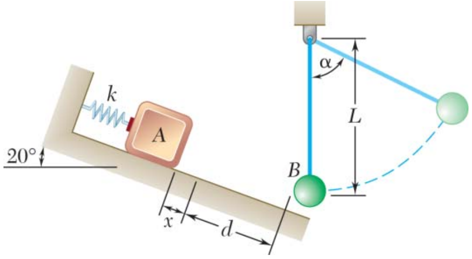
$N = 157.2$ N ◀



PROBLEM 13.200

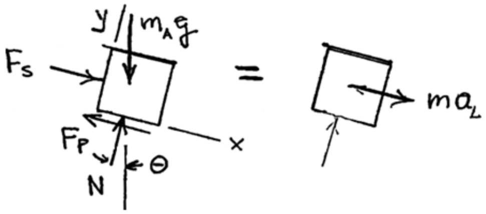
A 2-kg block A is pushed up against a spring compressing it a distance x. The block is then released from rest and slides down the 20° incline until it strikes a 1-kg sphere B which is suspended from a 1 m inextensible rope. The spring constant $k = 800$ N/m, the coefficient of friction between A and the ground is 0.2, the distance A slides from the unstretched length of the spring $d = 1.5$ m and the coefficient of restitution between A and B is 0.8. Knowing the tension in the rope is 20 N when $\alpha = 30°$, determine initial compression x of the spring.

SOLUTION

Data: $m_A = 2\text{ kg}, \quad m_B = 1\text{ kg}, \quad k = 800\text{ N/m}, \; d = 1.5\text{ m}, \; T = 20\text{ N}$

$\mu_k = 0.2, \quad e = 0.8, \quad \theta = 20°, \quad \alpha = 30°, \quad l = 1.0\text{ m}$

Block slides down the incline:



$$+\nearrow \; \Sigma F_y = 0$$

$$N - m_A g\cos\theta = 0$$

$$\begin{aligned} N &= m_A g\cos\theta \\ &= (2)(9.81)\cos 20° \\ &= 18.4368\text{ N} \\ F_f &= \mu_k N = (0.2)(18.4368) \\ &= 3.6874\text{ N} \end{aligned}$$

Use work and energy. Datum for V_g is the impact point near B.

$$T_1 = 0, \quad (V_1)_e = \frac{1}{2}kx^2 = \frac{1}{2}(800)x^2 = 400x^2\text{ J}$$

$$(V_1)_g = m_A g h_1 = m_A g(x+d)\sin\theta = (2)(9.81)(x+1.5)\sin 20° = 6.7104(x+1.5)\text{ J}$$

$$U_{1\to 2} = -F_f(x+d) = -(3.6874)(x+1.5)\text{ J}$$

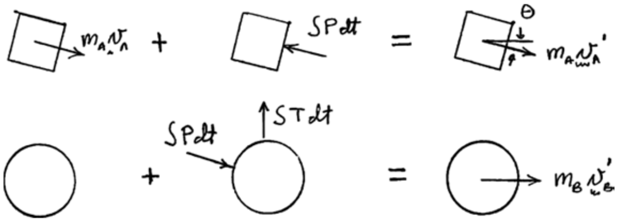
$$T_2 = \frac{1}{2}m_A v_A^2 = \frac{1}{2}(1)(v_A^2) = 1.000\,v_A^2 \qquad V_2 = 0$$

$$T_1 + V_1 + U_{1\to 2} = T_2 + V_2: \quad 0 + 400x^2 + 6.7104(x+1.5) - (3.6874)(x+1.5) = 1.000\,v_A^2 + 0$$

$$400x^2 + 3.0231x + 4.5346 = v_A^2 \qquad (1)$$

PROBLEM 13.200 (Continued)

Impact: Conservation of momentum.



Both A and B, horizontal components $\xrightarrow{+}$:

$$m_A v_A \cos\theta + 0 = m_A v_A' \cos\theta + m_B v_B'$$

$$2v_A \cos 20° = 2v_A' \cos 20° + v_B' \tag{2}$$

Relative velocities:

$$(v_B')_n - (v_A')_n = e[(v_A)_n - (v_B)_n]$$

$$v_B' \cos\theta - v_A' = e[v_A - 0]$$

$$v_B' \cos 20° - v_A' = (0.8)v_A \tag{3}$$

Solving Eqs. (2) and (3) simultaneously,

$$v_B' = \frac{3.6\cos 20°}{2\cos^2 20° + 1} v_A \tag{4}$$

$$= 1.2230 v_A$$

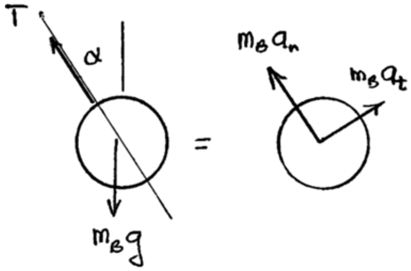
$$T_1 = \frac{1}{2} m_B (v_B')^2 \quad V_1 = 0$$

$$T_2 = \frac{1}{2} m_B v_2^2 \qquad V_2 = m_B g h_2 = m_B g l (1 - \cos\alpha)$$

$$T_1 + V_1 = T_2 + V_2: \quad \frac{1}{2} m_B (v_B')^2 + 0 = \frac{1}{2} m_B v_2^2 + m_B g(1 - \cos)$$

$$v_2^2 = (1.2230 v_A)^2 - 2gl(1 - \cos\alpha)$$

Tension in the rope: $\rho = 1.00\text{ m}$



$$a_n = \frac{v_2^2}{\rho} = (1.2230 v_A)^2 - 2gl(1 - \cos\alpha)$$

$$+\nwarrow \Sigma F_n = m_B a_n:$$

$$T - m_B g \cos\alpha = m_B a_n$$

$$T = m_B (a_n + g\cos\alpha)$$

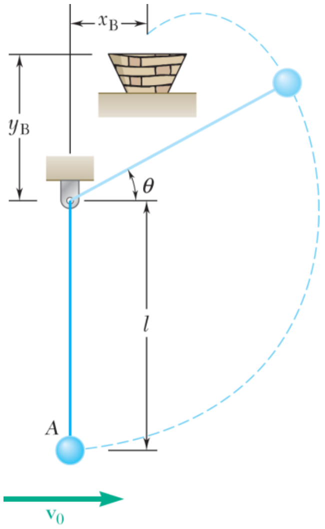
$$T = m_B ((1.2230 v_A)^2 - 2gl(1 - \cos\alpha) + g\cos\alpha)$$

$$20 = (1.0)((1.2230 v_A)^2 - 2(9.81)(1)(1 - \cos 30°) + 9.81\cos 30°) \tag{5}$$

Solving (5) $\qquad v_A = 3.0739\text{ m/s}$ $\qquad$ (6)

Sub (6) into (1) $\qquad 400x^2 + 3.0231x - 4.9141 = 0$

Solve for x: $\qquad x = 0.107\text{ m}$ ◀



PROBLEM 13.201*

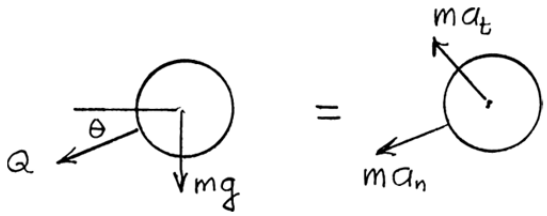
The 2-lb ball at A is suspended by an inextensible cord and given an initial horizontal velocity of $\mathbf{v}_0$. If $l = 2$ ft, $x_B = 0.3$ ft and $y_B = 0.4$ ft determine the initial velocity $\mathbf{v}$ so that the ball will enter in the basket. *Hint*: use a computer to solve the resulting set of equations.

SOLUTION

Let position 1 be at A. $\quad v_1 = v_0$

Let position 2 be the point described by the angle θ where the path of the ball changes from circular to parabolic. At position 2 the tension Q in the cord is zero.

Relationship between v_2 and θ based on $Q = 0$. Draw the free body diagram.



$$+\swarrow \Sigma F = 0: \quad Q + mg\sin\theta = ma_n = \frac{mv_2^2}{\ell}$$

With $Q = 0$,
$$v_2^2 = g\ell\sin\theta \quad \text{or} \quad v_2 = \sqrt{g\ell\sin\theta} \tag{1}$$

Relationship among $v_0, v_2,$ and θ based on conservation of energy.

$$T_1 + V_1 = T_2 + V_2$$

$$\frac{1}{2}mv_0^2 - mg\ell = \frac{1}{2}mv_2^2 + mg\ell\sin\theta$$

$$v_0^2 = v_2^2 + 2g\ell(1 + \sin\theta) \tag{2}$$

PROBLEM 13.201* (Continued)

x and *y* coordinates at position 2:

$$x_2 = \ell \cos\theta \tag{3}$$

$$y_2 = \ell \sin\theta \tag{4}$$

Let t_2 be the time when the ball is in position 2.

Motion on the parabolic path. The horizontal motion is

$$\dot{x} = -v_2 \sin\theta$$

$$x = x_2 - (v_2 \sin\theta)(t - t_2) \tag{5}$$

At Point *B*, $x = x_B$ and $t = t_B$. From Eq. (5),

$$(t_B - t_2) = \frac{\ell \cos\theta - x_B}{v_\theta \sin\theta} \tag{6}$$

Vertical motion: $\dot{y} = v_2 \cos\theta - g(t - t_2)$

$$y = y_2 + (v_2 \cos\theta)(t - t_2) - \frac{1}{2} g(t - t_2)^2$$

At Point *B*,

$$y_B = \ell \sin\theta + (v_2 \cos\theta)(t_B - t_2) - \frac{1}{2} g(t_B - t_2)^2 \tag{7}$$

Data: $\ell = 2 \text{ ft}, \quad x_B = 0.3 \text{ ft}, \quad y_B = 0.4 \text{ ft}, \quad g = 32.2 \text{ ft/s}^2$

With the numerical data,

Eq. (1) becomes $$v_2 = \sqrt{64.4 \sin\theta} \tag{1$'$}$$

Eq. (6) becomes $$t_B - t_2 = \frac{2\cos\theta - 0.3}{v_2 \sin\theta} \tag{6$'$}$$

Eq. (7) becomes $$y_B = 2\sin\theta + (v_2 \cos\theta)(t_B - t_2) - 16.1(t_B - t_2)^2 \tag{7$'$}$$

Method of solution. From a trial value of θ, calculate v_2 from Eq. (1)′, $t_B - t_2$ from Eq. (6)′, and y_B from Eq. (7)′. Repeat until $y_B = 0.4$ ft as required.

Try $\theta = 30°$. $$v_2 = \sqrt{64.4 \sin 30°} = 5.6745 \text{ ft/s}$$

$$t_B - t_2 = \frac{2\cos 30° - 0.3}{5.6745 \sin 30°} = 0.50473 \text{s}$$

$$y_B = 2\sin 30° + (5.6745 \cos 30°)(0.50473) - (16.1)(0.50473)^2$$
$$= -0.62116 \text{ ft}$$

PROBLEM 13.201* (Continued)

Try $\theta = 45°$.

$$v_2 = \sqrt{64.4 \sin 45°} = 6.7482$$

$$t_B - t_2 = \frac{2\cos 45° - 0.3}{6.7482 \sin 45°} = 0.23351 \text{ s}$$

$$y_B = 2\sin 45° + (6.7482 \cos 45°)(0.23351) - (16.1)(0.23351)^2$$
$$= 1.65060 \text{ ft}$$

Try $\theta = 37.5°$.

$$v_2 = \sqrt{64.4 \sin 37.5°} = 6.2613 \text{ ft/s}$$

$$t_B - t_2 = \frac{2\cos 37.5° - 0.3}{6.2613 \sin 37.5°} = 0.33757 \text{ s}$$

$$y_B = 2\sin 37.5° + (6.2613 \cos 37.5°)(0.33757) - (16.1)(0.33757)^2$$
$$= 1.05972 \text{ ft}$$

Let $u = \theta - 30°$. The following sets of data points have be determined:

$$(u, y_B) = (0°, -0.62114 \text{ ft}), (7.5°, 1.05972 \text{ ft}), (15°, 1.65060 \text{ ft})$$

The quadratic curve fit of this data gives

$$y_B = -0.62114 + 0.29678\,u - 0.009688711\,u^2$$

Setting $y_B = 0.4$ ft gives the quadratic equation

$$-0.009688711\,u^2 + 0.29678\,u - 1.02114 = 0$$

Solving for u, $u = 3.95°$ and $26.68°$

Rejecting the second value gives $\theta = 30° + u = 33.95°$.

Try $\theta = 33.95°$.

$$v_2 = \sqrt{64.4 \sin 33.95°} = 5.997 \text{ ft/s}$$

$$t_B - t_2 = \frac{2\cos 33.95° - 0.3}{5.9971 \sin 33.95°} = 0.40578 \text{ s}$$

$$y_B = 2\sin 33.95° + (5.997 \cos 33.95°)(0.40578) - (16.1)(0.40578)^2$$
$$= 0.48462 \text{ ft}$$

The new quadratic curve-fit is based on the data points

$$(u, y_B) = (0°, -0.62114 \text{ ft}), (3.95°, 0.48462 \text{ ft}), (7.5°, 1.05972 \text{ ft}).$$

The quadratic curve fit of this data is

$$y_B = -0.62114 + 0.342053907\,u - 0.015725232\,u^2$$

Setting $y_B = 0.4$ ft gives

$$-0.015725232\,u^2 + 0.342053907\,u - 1.02114 = 0$$

PROBLEM 13.201* (Continued)

Solving for u,

$$u = 3.572° \qquad \theta = 30° + 3.572° = 33.572°$$

Try $\theta = 33.572°$. $\quad v_2 = \sqrt{64.4 \sin 33.572°} = 5.9676 \text{ ft/s}$

$$t_B - t_2 = \frac{2 \cos 33.572° - 0.3}{5.9676 \sin 33.572°} = 0.41406 \text{ s}$$

$$y_B = 2 \sin 33.572° + (5.9676 \cos 33.572°)(0.41406) - (16.1)(0.41406)^2$$
$$= 0.40445 \text{ ft}$$

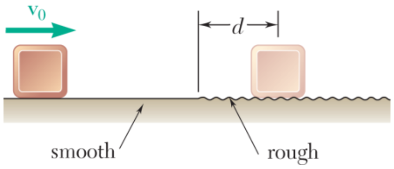
which is close enough to 0.4 ft.

Substituting $\theta = 33.572°$ and $v_2 = 5.9676$ ft/s into Eq. (2) along with other data gives

$$v_0^2 = (5.9676)^2 + (2)(32.2)(2)(1 + \sin 33.572°) = 235.64 \text{ ft}^2/\text{s}^2$$

$$\mathbf{v}_0 = 15.35 \text{ ft/s} \longrightarrow \blacktriangleleft$$

PROBLEM 13.CQ1



Block A is traveling with a speed v_0 on a smooth surface when the surface suddenly becomes rough with a coefficient of friction of μ causing the block to stop after a distance d. If block A were traveling twice as fast, that is, at a speed $2v_0$, how far will it travel on the rough surface before stopping?

(*a*) $d/2$

(*b*) d

(*c*) $\sqrt{2}d$

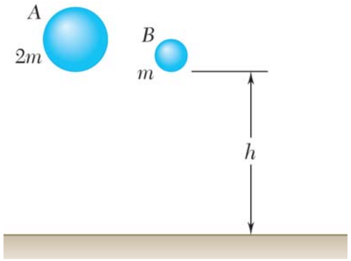
(*d*) $2d$

(*e*) $4d$

SOLUTION

If the block were traveling twice as fast, its kinetic energy would be 4x as much ($T = \frac{1}{2}mv^2$). The work done by friction to stop the block is $U = Fd$. This work must equal the amount of kinetic energy before the block hits the rough patch. Since the kinetic energy is 4x as much it will take 4x the distance to stop.

Answer: (*e*)



PROBLEM 13.CQ2

Two small balls *A* and *B* with masses 2*m* and *m* respectively are released from rest at a height *h* above the ground. Neglecting air resistance, which of the following statements are true when the two balls hit the ground?

(*a*) The kinetic energy of *A* is the same as the kinetic energy of *B*.

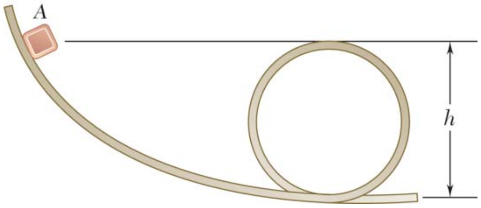
(*b*) The kinetic energy of *A* is half the kinetic energy of *B*.

(*c*) The kinetic energy of *A* is twice the kinetic energy of *B*.

(*d*) The kinetic energy of *A* is four times the kinetic energy of *B*.

SOLUTION

Since each ball accelerates due to gravity at the same rate, they have the same speed when they hit the ground. Since kinetic energy, $T = \frac{1}{2}mv^2$, and ball *A* has twice the mass as ball *B*, then A will have twice the kinetic energy. Answer: (*c*)



PROBLEM 13.CQ3

Block *A* is released from rest and slides down the frictionless ramp to the loop. The maximum height *h* of the loop is the same as the initial height of the block. Will *A* make it completely around the loop without losing contact with the track?

(*a*) Yes

(*b*) No

(*c*) need more information

SOLUTION

Answer: (*b*) In order for *A* to not maintain contact with the track, the normal force must remain greater than zero, which requires a non-zero speed at the top of the loop.

PROBLEM 13.CQ4

A large insect impacts the front windshield of a sports car traveling down a road. Which of the following statements is true during the collision?

(*a*) The car exerts a greater force on the insect than the insect exerts on the car.

(*b*) The insect exerts a greater force on the car than the car exerts on the insect.

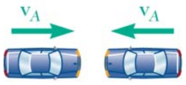
(*c*) The car exerts a force on the insect, but the insect does not exert a force on the car.

(*d*) The car exerts the same force on the insect as the insect exerts on the car.

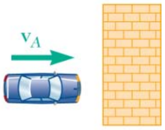
(*e*) Neither exerts a force on the other; the insect gets smashed simply because it gets in the way of the car.

SOLUTION

Newton’s third law states that when a body exerts a force on a second body, the second body exerts a force equal in magnitude and opposite in direction on the first body. Therefore the answer is: (*d*)



Case 1



Case 2

PROBLEM 13.CQ5

The expected damages associated with two types of perfectly plastic collisions are to be compared. In the first case, two identical cars traveling at the same speed impact each other head on. In the second case, the car impacts a massive concrete wall. In which case would you expect the car to be more damaged?

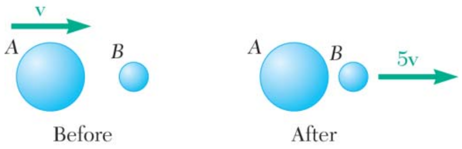
(*a*) Case 1

(*b*) Case 2

(*c*) The same damage in each case

SOLUTION

In both cases the car will come to a complete stop, so the applied impulse will be the same. With the same impulse, the same damage should occur. Answer: (*c*)



PROBLEM 13.CQ6

A 5 kg ball *A* strikes a 1 kg ball *B* that is initially at rest. Is it possible that after the impact *A* is not moving and *B* has a speed of 5*v*?

(*a*) Yes

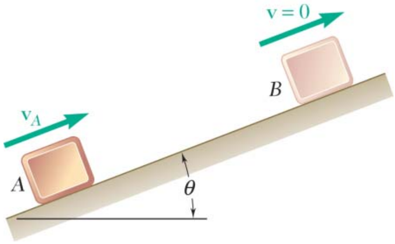
(*b*) No

Explain your answer.

SOLUTION

Answer: (*b*) No.

Conservation of momentum is satisfied, but the coefficient of restitution equation is not. The coefficient of restitution must be less than 1.



PROBLEM 13.F1

The initial velocity of the block in position *A* is 30 ft/s. The coefficient of kinetic friction between the block and the plane is $\mu_k = 0.30$. Draw impulse-momentum diagrams that could be used to determine the time it takes for the block to reach *B* with zero velocity, if $\theta = 20°$.

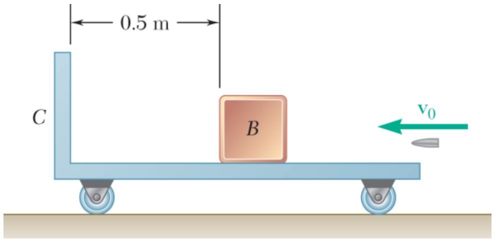
CHAPTER 14



PROBLEM 14.1

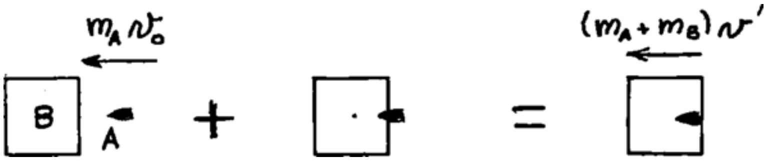
A 30-g bullet is fired with a horizontal velocity of 450 m/s and becomes embedded in block *B* which has a mass of 3 kg. After the impact, block *B* slides on 30-kg carrier *C* until it impacts the end of the carrier. Knowing the impact between *B* and *C* is perfectly plastic and the coefficient of kinetic friction between *B* and *C* is 0.2, determine (*a*) the velocity of the bullet and *B* after the first impact, (*b*) the final velocity of the carrier.

SOLUTION

For convenience, label the bullet as particle *A* of the system of three particles *A*, *B*, and *C*.

(*a*) *Impact between A and B*: Use conservation of linear momentum of *A* and *B*. Assume that the time period is so short that any impulse due to the friction force between *B* and *C* may be neglected.

$$\Sigma m\bar{\mathbf{v}}_1 + \Sigma \mathbf{Imp}_{1\rightarrow 2} = \Sigma m\bar{\mathbf{v}}_2$$



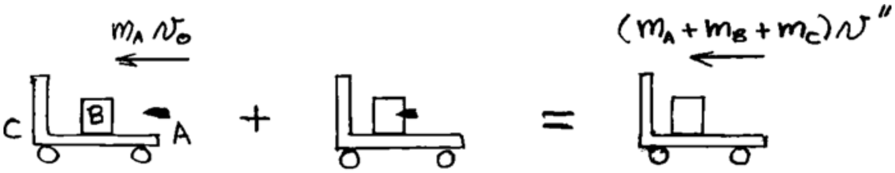
Components $\longleftarrow$: $\quad m_A v_0 + 0 = (m_A + m_B)v'$

$$v' = \frac{m_A v_0}{m_A + m_B} = \frac{(30\times 10^{-3}\text{ kg})(450\text{ m/s})}{(30\times 10^{-3}\text{ kg} + 3\text{ kg}} = 4.4554\text{ m/s}$$

$\mathbf{v}' = 4.46\text{ m/s} \longleftarrow$ ◀

(*b*) *Final velocity of the carrier*: Particles *A*, *B*, and *C* have the same velocity v'' to the left. Use conservation of linear momentum of all three particles. The friction forces between *B* and *C* are internal forces. Neglect friction at the wheels of the carrier.

$$\Sigma m\bar{\mathbf{v}}_2 + \Sigma \mathbf{Imp}_{2\rightarrow 3} = \Sigma m\bar{\mathbf{v}}_3$$

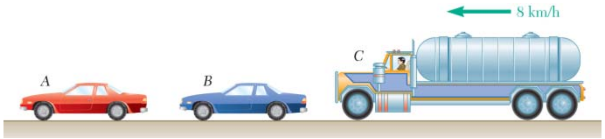


Components $\longleftarrow$: $\quad (m_A + m_B)v' + 0 = (m_A + m_B + m_C)v$

$$v'' = \frac{(m_A + m_B)v'}{m_A + m_B + m_C} = \frac{m_A v_0}{m_A + m_B + m_C}$$

$$= \frac{(30\times 10^{-3}\text{ kg})(450\text{ m/s})}{30\times 10^{-3}\text{ kg} + 3\text{ kg} + 30\text{ kg}} = 0.4087\text{ m/s}$$

$\mathbf{v}'' = 0.409\text{ m/s} \longleftarrow$ ◀



PROBLEM 14.2

Two identical 1350-kg automobiles *A* and *B* are at rest with their brakes released when *B* is struck by a 5400-kg truck *C* which is moving to the left at 8 km/h. A second collision then occurs when *B* strikes *A*. Assuming the first collision is perfectly plastic and the second collision is perfectly elastic, determine the velocities of the three vehicles just after the second collision.

SOLUTION

Given: $m_A = m_B = 1350$ kg and $m_C = 5400$ kg.

Let v_A, v_B, and v_C be the sought after final velocities, positive to the left.

Initial velocities: $(v_A)_0 = (v_B)_0 = 0, \; (v_C)_0 = 8 \text{ km/h} = 2.2222 \text{ m/s}$

First collision. Truck C strikes car B. Plastic impact: $e = 0$

Let $(v_{BC})_0$ be the common velocity of B and C after impact.

Conservation of momentum for B and C:

$$(m_B + m_C)v_{BC} = m_B(v_B)_0 + m_C(v_C)_0$$

$$6750\, v_{BC} = 0 + (5400)(2.2222) \qquad v_{BC} = 1.77778 \text{ m/s}$$

Second collision. Car-truck BC strikes car A.

Elastic impact. $e = 1$

$$v_A - v_{BC} = -e\left[(v_A)_0 - (v_{BC})_0\right] = -1.77778 \text{ m/s} \qquad (1)$$

Conservation of momentum for A, B, and C.

$$m_A v_A + (m_B + m_C)(v_{BC}) = m_A(v_A)_0 + (m_B + m_C)(v_{BC})_0$$

$$1350\, v_A + 6750\, v_{BC} = 0 + (6750)(1.77778) \qquad (2)$$

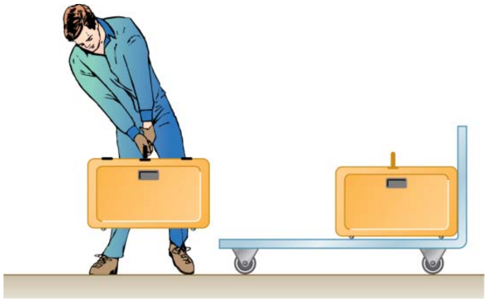
Solving (1) and (2) simultaneously for v_A and v_{BC},

$$v_A = 2.9630 \text{ m/s}, \quad v_{BC} = 1.18519 \text{ m/s} = v_B = v_C$$

$\mathbf{v}_A = 10.67$ km/h ← ◀

$\mathbf{v}_B = 4.27$ km/h ← ◀

$\mathbf{v}_C = 4.27$ km/h ← ◀



PROBLEM 14.3

An airline employee tosses two suitcases, of weight 30 lb and 40 lb, respectively, onto a 50-lb baggage carrier in rapid succession. Knowing that the carrier is initially at rest and that the employee imparts a 9-ft/s horizontal velocity to the 30-lb suitcase and a 6-ft/s horizontal velocity to the 40-lb suitcase, determine the final velocity of the baggage carrier if the first suitcase tossed onto the carrier is (*a*) the 30-lb suitcase, (*b*) the 40-lb suitcase.

SOLUTION

The weights are $W_A = 30$ lb, $W_B = 40$ lb, and $W_C = 50$ lb.

Initial velocities: $(v_A)_0 = 9 \text{ ft/s} \longrightarrow,\quad (v_B)_0 = 6 \text{ ft/s} \longrightarrow,\quad$ and $\quad (v_C)_0 = 0.$

There are no horizontal external forces acting during the impacts, and the baggage carrier is free to coast between the impacts.

(*a*) *Suitcase A is thrown first.*

Let v_1 be the common velocity of suitcase *A* and the carrier after the first impact and v_2 be the common velocity of the two suitcases and the carrier after the second impact.

Initial momenta: $\dfrac{W_A}{g}(v_A)_0,\quad \dfrac{W_B}{g}(v_B)_0,\quad$ and $\quad 0.$

Suitcase *A* impacts carrier. Conservation of momentum:

$$\frac{W_A}{g}(v_A)_0 + 0 = \frac{W_A + W_C}{g}v_1 \qquad v_1 = \frac{W_A(v_A)_0}{W_A + W_C} = \frac{(30)(9)}{80} = 3.375 \text{ ft/s}$$

Suitcase *B* impacts on suitcase *A* and carrier. Conservation of momentum:

$$\frac{W_B}{g}(v_B)_0 + \frac{W_A + W_C}{g}v_1 = \frac{W_A + W_B + W_C}{g}v_2$$

$$v_2 = \frac{W_B(v_B)_0 + (W_A + W_C)v_1}{W_A + W_B + W_C} = \frac{(40)(6) + (80)(3.375)}{120} = 4.25 \text{ ft/s} \qquad \mathbf{v}_2 = 4.25 \text{ ft/s} \longrightarrow \blacktriangleleft$$

(*b*) *Suitcase B is thrown first.*

Let v_3 be the common velocity of suitcase *B* and the carrier after the first impact and v_4 be the common velocity of all after the second impact.

Suitcase *B* impacts the carrier. Conservation of momentum:

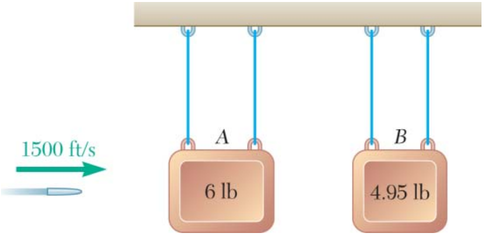
$$\frac{W_B}{g}(v_B)_0 + 0 = \frac{W_B + W_C}{g}v_3 \qquad v_3 = \frac{W_B(v_B)_0}{W_B + W_C} = \frac{(40)(6)}{90} = 2.6667 \text{ ft/s}$$

PROBLEM 14.3 (Continued)

Suitcase *A* impacts on suitcase *B* and carrier. Conservation of momentum:

$$\frac{W_A}{g}(v_A)_0 + \frac{W_B + W_C}{g} v_3 = \frac{W_A + W_B + W_C}{g} v_4$$

$$v_4 = \frac{W_A(v_A)_0 + (W_B + W_C)v_3}{W_A + W_B + W_C} = \frac{(30)(9) + (90)(2.6667)}{120} = 4.25 \text{ ft/s} \qquad \mathbf{v}_4 = 4.25 \text{ ft/s} \longrightarrow \blacktriangleleft$$



PROBLEM 14.4

A bullet is fired with a horizontal velocity of 1500 ft/s through a 6-lb block *A* and becomes embedded in a 4.95-lb block *B*. Knowing that blocks *A* and *B* start moving with velocities of 5 ft/s and 9 ft/s, respectively, determine (*a*) the weight of the bullet, (*b*) its velocity as it travels from block *A* to block *B*.

SOLUTION

The masses are m for the bullet and m_A and m_B for the blocks.

(*a*) The bullet passes through block *A* and embeds in block *B*. Momentum is conserved.

Initial momentum: $mv_0 + m_A(0) + m_B(0) = mv_0$

Final momentum: $mv_B + m_A v_A + m_B v_B$

Equating, $mv_0 = mv_B + m_A v_A + m_B v_B$

$$m = \frac{m_A v_A + m_B v_B}{v_0 - v_B} = \frac{(6)(5) + (4.95)(9)}{1500 - 9} = 0.0500 \text{ lb}$$

$m = 0.800$ oz ◀

(*b*) The bullet passes through block *A*. Momentum is conserved.

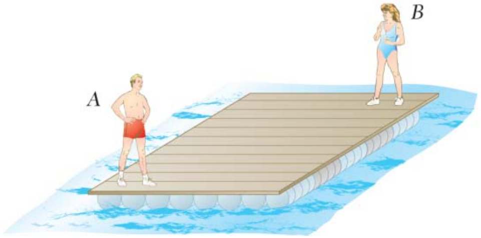
Initial momentum: $mv_0 + m_A(0) = mv_0$

Final momentum: $mv_1 + m_A v_A$

Equating, $mv_0 = mv_1 + m_A v_A$

$$v_1 = \frac{mv_0 - m_A v_A}{m} = \frac{(0.0500)(1500) - (6)(5)}{0.0500} = 900 \text{ ft/s}$$

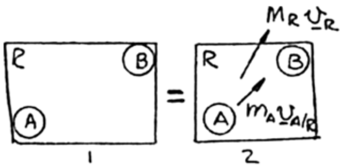
$\mathbf{v}_1 = 900 \text{ ft/s} \longrightarrow$ ◀



PROBLEM 14.5

Two swimmers *A* and *B*, of weight 190 lb and 125 lb, respectively, are at diagonally opposite corners of a floating raft when they realize that the raft has broken away from its anchor. Swimmer *A* immediately starts walking toward *B* at a speed of 2 ft/s relative to the raft. Knowing that the raft weighs 300 lb, determine (*a*) the speed of the raft if *B* does not move, (*b*) the speed with which *B* must walk toward *A* if the raft is not to move.

SOLUTION



(*a*) The system consists of *A* and *B* and the raft *R*.

Momentum is conserved.

$$(\Sigma m\mathbf{v})_1 = (\Sigma m\mathbf{v})_2$$

$$0 = m_A\mathbf{v}_A + m_B\mathbf{v}_B + m_R\mathbf{v}_R \qquad (1)$$

$$\mathbf{v}_A = \mathbf{v}_{A/R} + \mathbf{v}_R \qquad \mathbf{v}_B - \mathbf{v}_{B/R} + \mathbf{v}_R \qquad v_{B/R} = 0$$

$$\mathbf{v}_A = 2\text{ ft/s}\overset{B}{\underset{A}{\nearrow}} + \mathbf{v}_R \qquad \mathbf{v}_B = \mathbf{v}_R$$

$$0 = m_A[2\overset{B}{\underset{A}{\nearrow}} + \mathbf{v}_R] + m_B\mathbf{v}_R + m_R\mathbf{v}_e$$

$$\mathbf{v}_R = \frac{-2m_A}{(m_A + m_B + m_R)} = \frac{-(2\text{ ft/s})(190\text{ lb})}{(190\text{ lb} + 125\text{ lb} + 300\text{ lb})}$$

$v_R = 0.618$ ft/s ◀

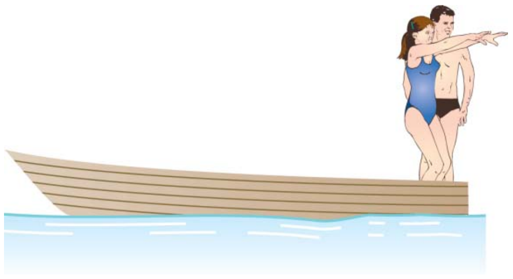
(*b*) From Eq. (1),

$$0 = m_A v_A + m_B v_B + 0 \qquad (v_R = 0)$$

$$v_B = -\frac{m_A v_A}{m_B} \qquad v_A = v_{A/R} + \cancel{v}_R^{\,0} = 2\text{ ft/s}$$

$$v_B = -\frac{(2\text{ ft/s})(190\text{ lb})}{(125\text{ lb})} = 3.04\text{ ft/s}$$

$v_B = 3.04$ ft/s ◀



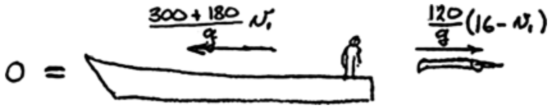
PROBLEM 14.6

A 180-lb man and a 120-lb woman stand side by side at the same end of a 300-lb boat, ready to dive, each with a 16-ft/s velocity relative to the boat. Determine the velocity of the boat after they have both dived, if (*a*) the woman dives first, (*b*) the man dives first.

SOLUTION

(*a*) Woman dives first.

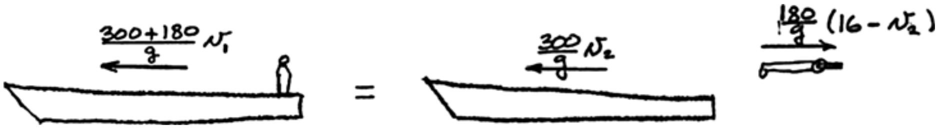
Conservation of momentum:



$$\frac{120}{g}(16 - v_1) - \frac{300+180}{g} v_1 = 0$$

$$v_1 = \frac{(120)(16)}{600} = 3.20 \text{ ft/s} \longleftarrow$$

Man dives next. Conservation of momentum:



$$-\frac{300+180}{g} v_1 = -\frac{300}{g} v_2 + \frac{180}{g}(16 - v_2)$$

$$v_2 = \frac{480 v_1 + (180)(16)}{480} = 9.20 \text{ ft/s}$$

$\mathbf{v}_2 = 9.20$ ft/s ⟵ ◀

(*b*) Man dives first.

Conservation of momentum:

$$\frac{180}{g}(16 - v_1') - \frac{300+120}{g} v_1' = 0$$

$$v_1' = \frac{(180)(16)}{600} = 4.80 \text{ ft/s}$$

Woman dives next. Conservation of momentum:

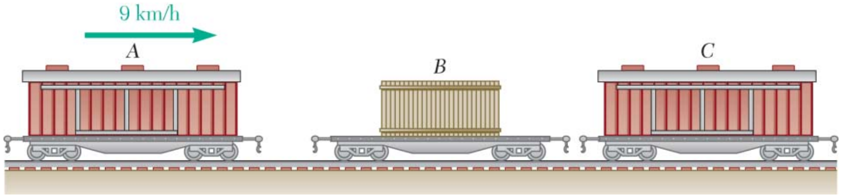
$$-\frac{300+120}{g} v_1' = -\frac{300}{g} v_2' + \frac{120}{g}(16 - v_2')$$

$$v_2' = \frac{420 v_1' + (120)(16)}{420} = 9.37 \text{ ft/s}$$

$\mathbf{v}_2' = 9.37$ ft/s ⟵ ◀

PROBLEM 14.7

A 40-Mg boxcar *A* is moving in a railroad switchyard with a velocity of 9 km/h toward cars *B* and *C*, which are both at rest with their brakes off at a short distance from each other. Car *B* is a 25-Mg flatcar supporting a 30-Mg container, and car *C* is a 35-Mg boxcar. As the cars hit each other they get automatically and tightly coupled. Determine the velocity of car *A* immediately after each of the two couplings, assuming that the container (*a*) does not slide on the flatcar, (*b*) slides after the first coupling but hits a stop before the second coupling occurs, (*c*) slides and hits the stop only after the second coupling has occurred.



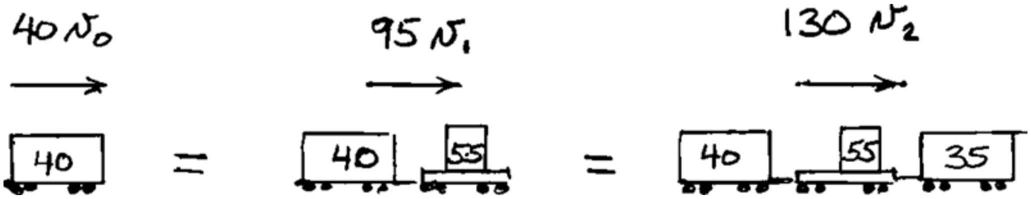
SOLUTION

Each term of the conservation of momentum equation is mass times velocity. As long as the same units are used in all terms, any unit may be used for mass and for velocity. We use Mg for mass and km/h for velocity and apply conservation of momentum.

Note: Only moving masses are shown in the diagrams.

Initial momentum: $m_A v_0 = (40)(9) = 360$

(*a*) Container does not slide

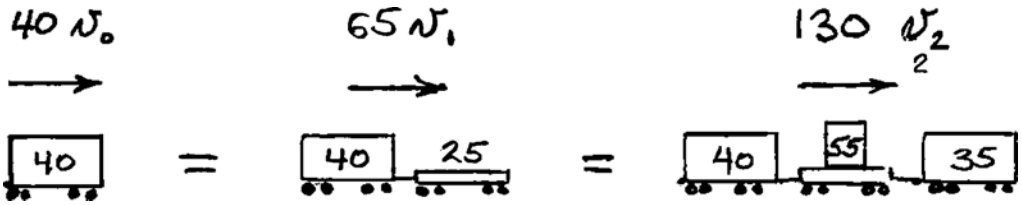


$360 = 95v_1 = 130v_2$

$\mathbf{v}_1 = 3.79$ km/h → ◀

$\mathbf{v}_2 = 2.77$ km/h → ◀

(*b*) Container slides after 1st coupling, stops before 2nd



$360 = 65v_1 = 130v_2$

$\mathbf{v}_1 = 5.54$ km/h → ◀

$\mathbf{v}_2 = 2.77$ km/h → ◀

PROBLEM 14.7 (Continued)

(*c*) Container slides and stops only after 2nd coupling

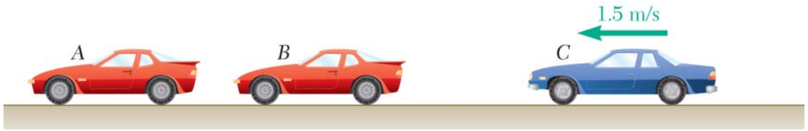
PROBLEM 14.8

Two identical cars *A* and *B* are at rest on a loading dock with brakes released. Car *C*, of a slightly different style but of the same weight, has been pushed by dockworkers and hits car *B* with a velocity of 1.5 m/s. Knowing that the coefficient of restitution is 0.8 between *B* and *C* and 0.5 between *A* and *B*, determine the velocity of each car after all collisions have taken place.

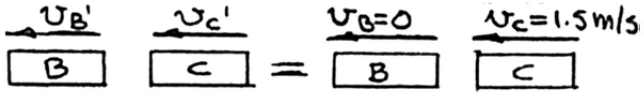


SOLUTION

$$m_A = m_B = m_C = m$$

Collision between *B* and *C*:

The total momentum is conserved:



$$\overset{+}{\leftarrow} \quad mv_B' + mv_C' = mv_B + mv_C$$

$$v_B' + v_C' = 0 + 1.5 \qquad (1)$$

Relative velocities:

$$(v_B - v_C)(e_{BC}) = (v_C' - v_B')$$
$$(-1.5)(0.8) = (v_C' - v_B')$$
$$-1.2 = v_C' - v_B' \qquad (2)$$

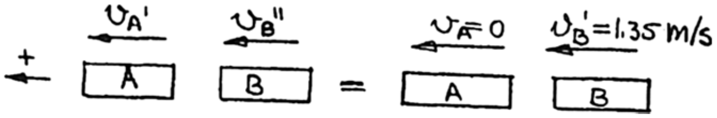
Solving (1) and (2) simultaneously,

$$v_B' = 1.35 \text{ m/s}$$
$$v_C' = 0.15 \text{ m/s}$$

$\mathbf{v}_C' = 0.150 \text{ m/s} \leftarrow$ ◀

Since $v_B' > v_C'$, car *B* collides with car *A*.

Collision between *A* and *B*:



$$mv_A' + mv_B'' = mv_A + mv_B'$$

$$v_A' + v_B'' = 0 + 1.35 \qquad (3)$$

PROBLEM 14.8 (Continued)

Relative velocities:

$$(v_A - v'_B)e_{AB} = (v''_B - v'_A)$$
$$(0 - 1.35)(0.5) = v''_B - v'_A$$
$$v'_A - v''_B = 0.675 \qquad (4)$$

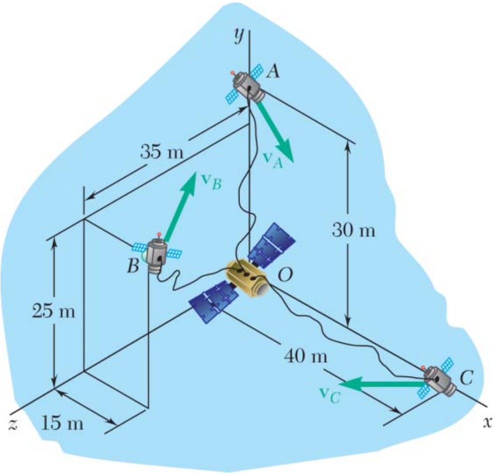
Solving (3) and (4) simultaneously,

$$2v'_A = 1.35 + 0.675$$

$$\mathbf{v}'_A = 1.013 \text{ m/s} \longleftarrow \blacktriangleleft$$

$$\mathbf{v}''_B = 0.338 \text{ m/s} \longleftarrow \blacktriangleleft$$

Since $v'_C < v''_B < v'_A$, there are no further collisions.



PROBLEM 14.9

A 20-kg base satellite deploys three sub-satellites, each which has its own thrust capabilities, to perform research on tether propulsion. The weights of sub-satellite *A*, *B*, and *C* are 4 kg, 6 kg, and 8 kg, respectively, and their velocities expressed in m/s are given by $\mathbf{v_A} = 4\mathbf{i} - 2\mathbf{j} + 2\mathbf{k}$, $\mathbf{v_B} = \mathbf{i} + 4\mathbf{j}$, $\mathbf{v_C} = 2\mathbf{i} + 2\mathbf{j} + 4\mathbf{k}$. At the instant shown, what is the angular momentum $\mathbf{H_O}$ of the system about the base satellite?

SOLUTION

Given: $m_A = 4\text{ kg},\ m_B = 6\text{ kg},\ m_C = 8\text{ kg}$

$\mathbf{v}_\text{A} = 4\mathbf{i} - 2\mathbf{j} + 2\mathbf{k}\text{ m/s},\ \mathbf{v}_\text{B} = \mathbf{i} + 4\mathbf{j}\text{ m/s},\ \mathbf{v}_\text{C} = 2\mathbf{i} + 2\mathbf{j} + 4\mathbf{k}\text{ m/s}$

Linear momentum of each particle expressed in kg·m/s :

$$m_A\mathbf{v}_A = 16.0\mathbf{i} - 8.0\mathbf{j} + 8.0\mathbf{k}$$
$$m_B\mathbf{v}_B = 6.0\mathbf{i} + 24.0\mathbf{j} + 0\mathbf{k}$$
$$m_C\mathbf{v}_C = 16.0\mathbf{i} + 16.0\mathbf{j} + 32.0\mathbf{k}$$

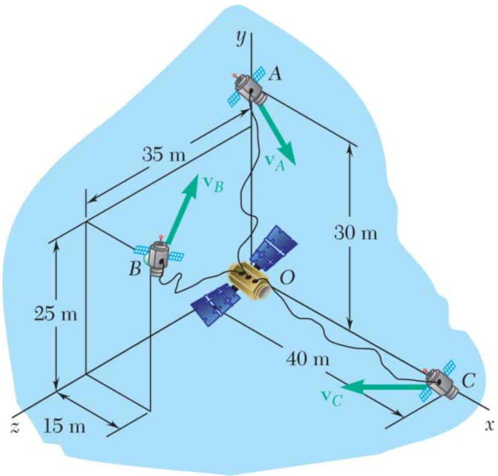
Position Vectors from point O to each satellite in meters:

$$\mathbf{r}_A = 30\mathbf{j}$$
$$\mathbf{r}_B = 15\mathbf{i} + 25\mathbf{j} + 35\mathbf{k}$$
$$\mathbf{r}_C = 40\mathbf{i}$$

Angular Momentum about O, $\text{kg}\cdot\text{m}^2/\text{s}$:

$$\mathbf{H}_O = \mathbf{r}_A \times (m_A\mathbf{v}_A) + \mathbf{r}_B \times (m_B\mathbf{v}_B) + \mathbf{r}_C \times (m_C\mathbf{v}_C)$$
$$= \begin{vmatrix} \mathbf{i} & \mathbf{j} & \mathbf{k} \\ 0 & 30 & 0 \\ 16.0 & -8.0 & 8.0 \end{vmatrix} + \begin{vmatrix} \mathbf{i} & \mathbf{j} & \mathbf{k} \\ 15 & 25 & 35 \\ 6.0 & 24.0 & 0 \end{vmatrix} + \begin{vmatrix} \mathbf{i} & \mathbf{j} & \mathbf{k} \\ 40 & 0 & 0 \\ 16.0 & 16.0 & 32.0 \end{vmatrix}$$
$$= (240.0\mathbf{i} - 480.0\mathbf{k}) + (-840.0\mathbf{i} + 210.0\mathbf{j} + 210.0\mathbf{k}) + (-1280.0\mathbf{j} + 640.0\mathbf{k})$$
$$= -600.0\mathbf{i} - 1070.0\mathbf{j} + 370.0\mathbf{k}$$

$$\mathbf{H}_O = -(600\text{ kg}\cdot\text{m}^2/\text{s})\mathbf{i} - (1070.0\text{ kg}\cdot\text{m}^2/\text{s})\mathbf{j} + (370.0\text{ kg}\cdot\text{m}^2/\text{s})\mathbf{k}\ \blacktriangleleft$$



PROBLEM 14.10

For the satellite system of Prob. 14.9, assuming that the velocity of the base satellite is zero, determine (*a*) the position vector **r** of the mass center *G* of the system, (*b*) the linear momentum $m\bar{\mathbf{v}}$ of the system, (*c*) the angular momentum $\mathbf{H}_G$ of the system about *G*. Also, verify that the answers to this problem and to Prob. 14.9 satisfy the equation given in Prob. 14.27.

PROBLEM 14.9 A 20-kg base satellite deploys three sub-satellites, each which has its own thrust capabilities, to perform research on tether propulsion. The weights of sub-satellite *A*, *B*, and *C* are 4 kg, 6 kg, and 8 kg, respectively, and their velocities expressed in m/s are given by $\mathbf{v_A} = 4\mathbf{i} - 2\mathbf{j} + 2\mathbf{k}$, $\mathbf{v_B} = \mathbf{i} + 4\mathbf{j}$, $\mathbf{v_C} = 2\mathbf{i} + 2\mathbf{j} + 4\mathbf{k}$. At the instant shown, what is the angular momentum $\mathbf{H_O}$ of the system about the base satellite?

SOLUTION

Given: $m_A = 4\text{ kg}$, $m_B = 6\text{ kg}$, $m_C = 8\text{ kg}$

$\mathbf{v}_\text{A} = 4\mathbf{i} - 2\mathbf{j} + 2\mathbf{k}\text{ m/s}$, $\mathbf{v}_\text{B} = 1\mathbf{i} + 4\mathbf{j}\text{ m/s}$, $\mathbf{v}_\text{C} = 2\mathbf{i} + 2\mathbf{j} + 4\mathbf{k}\text{ m/s}$

$\mathbf{r}_A = 30\mathbf{j}\text{ m}$, $\mathbf{r}_B = 15\mathbf{i} + 25\mathbf{j} + 35\mathbf{k}\text{ m}$, $\mathbf{r}_C = 40\mathbf{i}\text{ m}$

(*a*) The mass center must satisfy:

$$\bar{\mathbf{r}} = \frac{\sum_{i=1}^{n} m_i \mathbf{r}_i}{\sum_{i=1}^{n} m_i}$$

$$\bar{\mathbf{r}} = \frac{m_A\mathbf{r}_A + m_B\mathbf{r}_B + m_C\mathbf{r}_C}{(m_A + m_B + m_C)}$$

$$\bar{\mathbf{r}} = \frac{(4)(30\mathbf{j}) + (6)(15\mathbf{i} + 25\mathbf{j} + 35\mathbf{k}) + (8)(40\mathbf{i})}{18}$$

$$\bar{\mathbf{r}} = 22.778\mathbf{i} + 15.000\mathbf{j} + 11.667\mathbf{k}\text{ m} \blacktriangleleft$$

(*b*) Linear momentum of the system:

$$m\bar{\mathbf{v}} = m_A\mathbf{v}_A + m_B\mathbf{v}_B + m_C\mathbf{v}_C$$

$$= 16.0\mathbf{i} - 8.0\mathbf{j} + 8.0\mathbf{k} + 6.0\mathbf{i} + 24.0\mathbf{j} + 0\mathbf{k} + 16.0\mathbf{i} + 16.0\mathbf{j} + 32.0\mathbf{k}$$

$$m\bar{\mathbf{v}} = (38.0\text{ kg}\cdot\text{m/s})\mathbf{i} + (32.0\text{ kg}\cdot\text{m/s})\mathbf{j} + (40.0\text{ kg}\cdot\text{m/s})\mathbf{k} \blacktriangleleft$$

(*c*) Angular Momentum about the mass center, G:

$$\mathbf{H}_\text{G} = \sum_{i=1}^{n} \mathbf{r}_i' \times m_i \mathbf{v}_i$$

PROBLEM 14.10 (Continued)

where: $$\mathbf{r}'_A = \mathbf{r}_A - \overline{\mathbf{r}} = -22.778\mathbf{i} + 15.000\mathbf{j} - 11.667\mathbf{k} \text{ ft}$$
$$\mathbf{r}'_B = \mathbf{r}_B - \overline{\mathbf{r}} = -7.778\mathbf{i} + 10.000\mathbf{j} + 23.333\mathbf{k} \text{ ft}$$
$$\mathbf{r}'_C = \mathbf{r}_C - \overline{\mathbf{r}} = 17.222\mathbf{i} - 15.000\mathbf{j} - 11.667\mathbf{k} \text{ ft}$$

$$\mathbf{H}_G = \mathbf{r}'_A \times m_A\mathbf{v}_A + \mathbf{r}'_B \times m_B\mathbf{v}_B + \mathbf{r}'_C \times m_C\mathbf{v}_C$$
$$= \begin{vmatrix} \mathbf{i} & \mathbf{j} & \mathbf{k} \\ -22.778 & 15.000 & -11.667 \\ 16.0 & -8.0 & 8.0 \end{vmatrix} + \begin{vmatrix} \mathbf{i} & \mathbf{j} & \mathbf{k} \\ -7.778 & 10.000 & 23.333 \\ 6.0 & 24.0 & 0 \end{vmatrix} + \begin{vmatrix} \mathbf{i} & \mathbf{j} & \mathbf{k} \\ 17.222 & -15.000 & -11.667 \\ 16.0 & 16.0 & 32.0 \end{vmatrix}$$
$$= (26.667\mathbf{i} - 4.444\mathbf{j} - 57.778\mathbf{k}) + (-560.0\mathbf{i} + 140.0\mathbf{j} - 246.667\mathbf{k}) + (-293.333\mathbf{i} - 737.778\mathbf{j} + 515.556\mathbf{k})$$

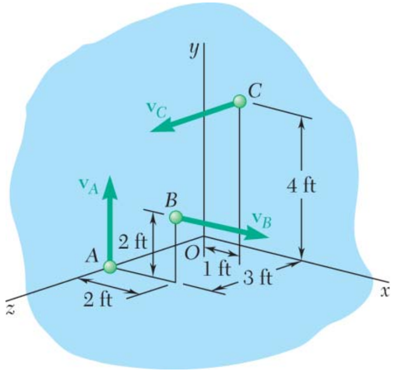
From Prob. 14.27 show that: $\mathbf{H}_O = \mathbf{H}_G + \overline{\mathbf{r}} \times m\overline{\mathbf{v}}$

$$\overline{\mathbf{r}} \times m\overline{\mathbf{v}} = \begin{vmatrix} \mathbf{i} & \mathbf{j} & \mathbf{k} \\ 22.778 & 15.000 & 11.667 \\ 38.0 & 32.0 & 40.0 \end{vmatrix}$$
$$= 226.667\mathbf{i} - 467.778\mathbf{j} + 158.889\mathbf{k} \quad \text{kg}\cdot\text{m}^2/\text{s}$$

$$\mathbf{H}_G + \overline{\mathbf{r}} \times m\overline{\mathbf{v}} = -600.0\mathbf{i} - 1070.0\mathbf{j} + 370.0\mathbf{k} \quad \text{kg}\cdot\text{m}^2/\text{s}$$

This is the identical answer to Problem 14.9.



PROBLEM 14.11

A system consists of three identical 19.32-lb particles *A, B,* and *C.* The velocities of the particles are, respectively, $\mathbf{v}_A = v_A\mathbf{j}$, $\mathbf{v}_B = v_B\mathbf{i}$, and $\mathbf{v}_C = v_C\mathbf{k}$. Knowing that the angular momentum of the system about *O*, expressed in $\text{ft}\cdot\text{lb}\cdot\text{s}$ is $\mathbf{H}_O = -1.2\mathbf{k}$, determine (*a*) the velocities of the particles, (*b*) the angular momentum of the system about its mass center *G*.

SOLUTION

The masses are $m_A = m_B = m_C = \dfrac{19.32}{32.2} = 0.6\ \text{lb}\cdot\text{s}^2/\text{ft}$.

Position vectors (ft): $\mathbf{r}_A = 3\mathbf{k}, \qquad \mathbf{r}_B = 2\mathbf{i} + 2\mathbf{j} + 3\mathbf{k}, \qquad \mathbf{r}_C = \mathbf{i} + 4\mathbf{j}$

In units of $\text{ft}\cdot\text{lb}\cdot\text{s}$, $\quad \mathbf{H}_O = \mathbf{r}_A \times (m_A\mathbf{v}_A) + \mathbf{r}_B \times (m_B\mathbf{v}_B) + \mathbf{r}_C \times (m_C\mathbf{v}_C)$

$$= \begin{vmatrix} \mathbf{i} & \mathbf{j} & \mathbf{k} \\ 0 & 0 & 3 \\ 0 & (0.6v_A) & 0 \end{vmatrix} + \begin{vmatrix} \mathbf{i} & \mathbf{j} & \mathbf{k} \\ 2 & 2 & 3 \\ (0.6v_B) & 0 & 0 \end{vmatrix} + \begin{vmatrix} \mathbf{i} & \mathbf{j} & \mathbf{k} \\ 1 & 4 & 0 \\ 0 & 0 & (0.6v_C) \end{vmatrix}$$

$$= (-1.8v_A\mathbf{i}) + (1.8v_B\mathbf{j} - 1.2v_B\mathbf{k}) + (2.4v_C\mathbf{i} - 0.6v_C\mathbf{j})$$

$$= (-1.8v_A + 2.4v_C)\mathbf{i} + (1.8v_B - 0.6v_C)\mathbf{j} + (-1.2v_B)\mathbf{k}$$

But, $\mathbf{H}_O$ is given as $-1.2\mathbf{k}\ \text{ft}\cdot\text{lb}\cdot\text{s}$.

Equating the two expressions for $\mathbf{H}_O$ and resolving into components,

$$\mathbf{i}: \quad -1.8v_A + 2.4v_C = 0 \qquad (1)$$

$$\mathbf{j}: \quad 1.8v_B - 0.6v_C = 0 \qquad (2)$$

$$\mathbf{k}: \quad -1.2v_B = -1.2 \qquad (3)$$

(*a*) Solving, $\quad v_A = 4\ \text{ft/s} \qquad \mathbf{v}_A = (4.00\ \text{ft/s})\mathbf{j}$ ◀

$v_B = 1\ \text{ft/s} \qquad \mathbf{v}_B = (1.000\ \text{ft/s})\mathbf{i}$ ◀

$v_C = 3\ \text{ft/s} \qquad \mathbf{v}_C = (3.00\ \text{ft/s})\mathbf{k}$ ◀

Coordinates of mass center *G* in ft.

$$\bar{\mathbf{r}} = \frac{m_A\mathbf{r}_A + m_B\mathbf{r}_B + m_C\mathbf{r}_C}{m_A + m_B + m_C}$$

$$= \frac{(0.6)(3\mathbf{k}) + (0.6)(2\mathbf{i} + 2\mathbf{j} + 3\mathbf{k}) + (0.6)(\mathbf{i} + 4\mathbf{j})}{1.8}$$

$$= \mathbf{i} + 2\mathbf{j} + 2\mathbf{k}$$

PROBLEM 14.11 (Continued)

Position vectors relative to the mass center in ft.

$$\mathbf{r}'_A = \mathbf{r}_A - \overline{\mathbf{r}} = (3\mathbf{k}) - (\mathbf{i} + 2\mathbf{j} + 2\mathbf{k}) = -\mathbf{i} - 2\mathbf{j} + \mathbf{k}$$

$$\mathbf{r}'_B = \mathbf{r}_B - \overline{\mathbf{r}} = (2\mathbf{i} + 2\mathbf{j} + 3\mathbf{k}) - (\mathbf{i} + 2\mathbf{j} + 2\mathbf{k}) = \mathbf{i} + \mathbf{k}$$

$$\mathbf{r}'_C = \mathbf{r}_C - \overline{\mathbf{r}} = (\mathbf{i} + 4\mathbf{j}) - (\mathbf{i} + 2\mathbf{j} + 2\mathbf{k}) = 2\mathbf{j} - 2\mathbf{k}$$

$$m_A\mathbf{v}_A = (0.6)(4\mathbf{j}) = (2.4\text{ lb}\cdot\text{s})\mathbf{j}$$

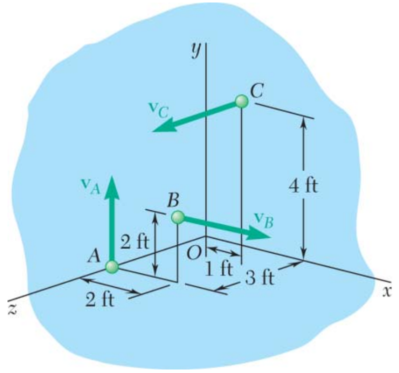
$$m_B\mathbf{v}_B = (0.6)(\mathbf{i}) = (0.6\text{ lb}\cdot\text{s})\mathbf{i}$$

$$m_C\mathbf{v}_C = (0.6)(3\mathbf{k}) = (1.8\text{ lb}\cdot\text{s})\mathbf{k}$$

(*b*)

$$\begin{aligned}\mathbf{H}_G &= \mathbf{r}'_A \times (m_A\mathbf{v}_A) + \mathbf{r}'_B \times (m_B\mathbf{v}_B) + \mathbf{r}'_C \times (m_C\mathbf{v}_C)\\ &= (-\mathbf{i} - 2\mathbf{j} + \mathbf{k}) \times (2.4\mathbf{j}) + (\mathbf{i} + \mathbf{k}) \times (0.6\mathbf{i}) + (2\mathbf{j} - 2\mathbf{k}) \times (1.8\mathbf{k})\\ &= (-2.4\mathbf{i} - 2.4\mathbf{k}) + (0.6\mathbf{j}) + (3.6\mathbf{i}) = 1.2\mathbf{i} + 0.6\mathbf{j} - 2.4\mathbf{k}\end{aligned}$$

$$\mathbf{H}_G = (1.20\text{ ft}\cdot\text{lb}\cdot\text{s})\mathbf{i} + (0.60\text{ ft}\cdot\text{lb}\cdot\text{s})\mathbf{j} - (2.40\text{ ft}\cdot\text{lb}\cdot\text{s})\mathbf{k} \blacktriangleleft$$



PROBLEM 14.12

A system consists of three identical 19.32-lb particles *A, B,* and *C.* The velocities of the particles are, respectively, $\mathbf{v}_A = v_A\mathbf{j}$, $\mathbf{v}_B = v_B\mathbf{i}$, and $\mathbf{v}_C = v_C\mathbf{k}$, and the magnitude of the linear momentum **L** of the system is 9 lb·s. Knowing that $\mathbf{H}_G = \mathbf{H}_O$, where $\mathbf{H}_G$ is the angular momentum of the system about its mass center *G* and $\mathbf{H}_O$ is the angular momentum of the system about *O*, determine (*a*) the velocities of the particles, (*b*) the angular momentum of the system about *O.*

SOLUTION

The masses are $m_A = m_B = m_C = \dfrac{19.32}{32.2} = 0.6\text{ lb}\cdot\text{s}^2/\text{ft}.$

Position vectors (ft): $\mathbf{r}_A = 3\mathbf{k}, \qquad \mathbf{r}_B = 2\mathbf{i} + 2\mathbf{j} + 3\mathbf{k}, \qquad \mathbf{r}_C = \mathbf{i} + 4\mathbf{j}$

Coordinates of mass center *G* expressed in ft.

$$\begin{aligned}\overline{\mathbf{r}} &= \frac{m_A\mathbf{r}_A + m_B\mathbf{r}_B + m_C\mathbf{r}_C}{m_A + m_B + m_C}\\ &= \frac{(0.6)(3\mathbf{k}) + (0.6)(2\mathbf{i} + 2\mathbf{j} + 3\mathbf{k}) + (0.6)(\mathbf{i} + 4\mathbf{j})}{1.8}\\ &= \mathbf{i} + 2\mathbf{j} + 2\mathbf{k}\end{aligned}$$

Position vectors relative to the mass center expressed in ft.

$$\begin{aligned}\mathbf{r}'_A &= \mathbf{r}_A - \overline{\mathbf{r}} = (3\mathbf{k}) - (\mathbf{i} + 2\mathbf{j} + 2\mathbf{k}) = -\mathbf{i} - 2\mathbf{j} + \mathbf{k}\\ \mathbf{r}'_B &= \mathbf{r}_B - \overline{\mathbf{r}} = (2\mathbf{i} + 2\mathbf{j} + 3\mathbf{k}) - (\mathbf{i} + 2\mathbf{j} + 2\mathbf{k}) = \mathbf{i} + \mathbf{k}\\ \mathbf{r}'_C &= \mathbf{r}_C - \overline{\mathbf{r}} = (\mathbf{i} + 4\mathbf{j}) - (\mathbf{i} + 2\mathbf{j} + 2\mathbf{k}) = 2\mathbf{j} - 2\mathbf{k}\end{aligned}$$

Angular momenta.

$$\begin{aligned}\mathbf{H}_O &= \mathbf{r}_A \times (m_A\mathbf{v}_A) + \mathbf{r}_B \times (m_B\mathbf{v}_B) + \mathbf{r}_C \times (m_C\mathbf{v}_C)\\ \mathbf{H}_G &= \mathbf{r}'_A \times (m_A\mathbf{v}_A) + \mathbf{r}'_B \times (m_B\mathbf{v}_B) + \mathbf{r}'_C \times (m_C\mathbf{v}_C)\end{aligned}$$

Subtracting,

$$\mathbf{H}_O - \mathbf{H}_G = (\mathbf{r}_A - \mathbf{r}'_A) \times (m_A\mathbf{v}_A) + (\mathbf{r}_B - \mathbf{r}'_B) \times m_B\mathbf{v}_B + (\mathbf{r}_C - \mathbf{r}'_C) \times m_C\mathbf{v}_C$$

$$\begin{aligned}0 &= \overline{\mathbf{r}} \times (m_A\mathbf{v}_A) + \overline{\mathbf{r}} \times (m_B\mathbf{v}_B) + \overline{\mathbf{r}} \times (m_C\mathbf{v}_C)\\ &= \overline{\mathbf{r}} \times (m_A\mathbf{v}_A + m_B\mathbf{v}_B + m_C\mathbf{v}_C) = \overline{\mathbf{r}} \times \mathbf{L}\end{aligned}$$

L is parallel to $\overline{\mathbf{r}}$. $\qquad \mathbf{L} = \lambda\overline{\mathbf{r}} \qquad \mathbf{L}\cdot\mathbf{L} = \lambda^2\overline{\mathbf{r}}\cdot\overline{\mathbf{r}}$

$$\lambda^2 = \frac{\mathbf{L}\cdot\mathbf{L}}{\overline{\mathbf{r}}\cdot\overline{\mathbf{r}}} = \frac{(9)^2}{(3)^2} = 3^2, \qquad \lambda = \pm 3\text{ lb}\cdot\text{s/ft}$$

PROBLEM 14.12 (Continued)

$$m_A\mathbf{v}_A + m_B\mathbf{v}_B + m_C\mathbf{v}_C = \lambda\overline{\mathbf{r}}$$

$$(0.6)(v_A\mathbf{j}) + (0.6)(v_B\mathbf{i}) + (0.6)(v_C\mathbf{k}) = \pm 3(\mathbf{i} + 2\mathbf{j} + 2\mathbf{k})$$

(*a*) Resolve into components and solve for v_A, v_B, and v_C.

$$v_A = 10 \text{ ft/s} \qquad \mathbf{v}_A = (10.00 \text{ ft/s})\mathbf{j} \blacktriangleleft$$

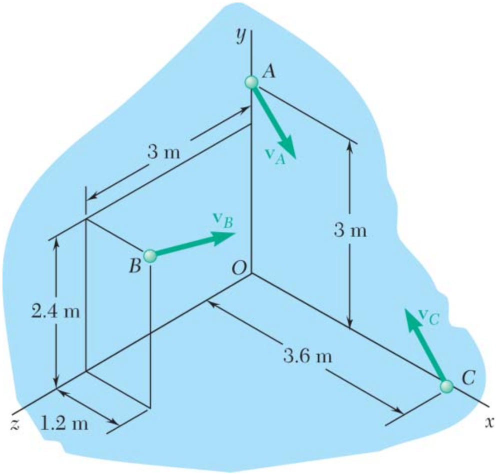
$$v_B = 5 \text{ ft/s} \qquad \mathbf{v}_B = (5.00 \text{ ft/s})\mathbf{i} \blacktriangleleft$$

$$v_C = 10 \text{ ft/s} \qquad \mathbf{v}_C = (10.00 \text{ ft/s})\mathbf{k} \blacktriangleleft$$

(*b*) Angular momentum about *O* expressed in ft·lb·s.

$$\begin{aligned}
\mathbf{H}_O &= \mathbf{r}_A \times (m_A\mathbf{v}_A) + \mathbf{r}_B \times (m_B\mathbf{v}_B) + \mathbf{r}_C \times (m_C\mathbf{v}_C) \\
&= \begin{vmatrix} \mathbf{i} & \mathbf{j} & \mathbf{k} \\ 0 & 0 & 3 \\ 0 & (0.6v_A) & 0 \end{vmatrix} + \begin{vmatrix} \mathbf{i} & \mathbf{j} & \mathbf{k} \\ 2 & 2 & 3 \\ (0.6v_B) & 0 & 0 \end{vmatrix} + \begin{vmatrix} \mathbf{i} & \mathbf{j} & \mathbf{k} \\ 1 & 4 & 0 \\ 0 & 0 & (0.6v_C) \end{vmatrix} \\
&= (-1.8v_A\mathbf{i}) + (1.8v_B\mathbf{j} - 1.2v_B\mathbf{k}) + (2.4v_C\mathbf{i} - 0.6v_C\mathbf{j}) \\
&= (-1.8v_A + 2.4v_C)\mathbf{i} + (1.8v_B - 0.6v_C)\mathbf{j} + (-1.2v_B)\mathbf{k} \\
&= 6\mathbf{i} + 3\mathbf{j} - 6\mathbf{k}
\end{aligned}$$

$$\mathbf{H}_O = (6.00 \text{ ft}\cdot\text{lb}\cdot\text{s})\mathbf{i} + (3.00 \text{ ft}\cdot\text{lb}\cdot\text{s})\mathbf{j} - (6.00 \text{ ft}\cdot\text{lb}\cdot\text{s})\mathbf{k} \blacktriangleleft$$



PROBLEM 14.13

A system consists of three particles A, B, and C. We know that $m_A = 3$ kg, $m_B = 2$ kg, and $m_C = 4$ kg and that the velocities of the particles expressed in m/s are, respectively, $\mathbf{v}_A = 4\mathbf{i} + 2\mathbf{j} + 2\mathbf{k}$, $\mathbf{v}_B = 4\mathbf{i} + 3\mathbf{j}$, and $\mathbf{v}_C = -2\mathbf{i} + 4\mathbf{j} + 2\mathbf{k}$. Determine the angular momentum $\mathbf{H}_O$ of the system about O.

SOLUTION

Linear momentum of each particle expressed in $\text{kg}\cdot\text{m/s}$.

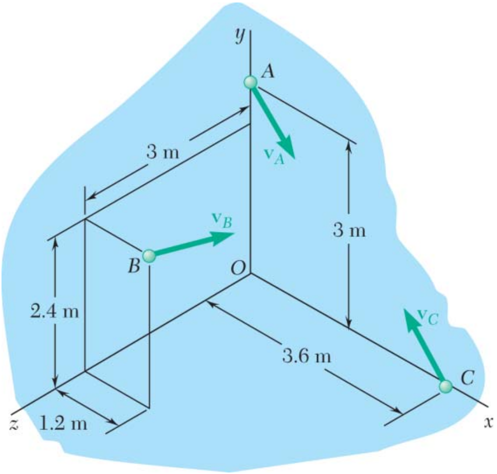
$$m_A\mathbf{v}_A = 12\mathbf{i} + 6\mathbf{j} + 6\mathbf{k}$$
$$m_B\mathbf{v}_B = 8\mathbf{i} + 6\mathbf{j}$$
$$m_C\mathbf{v}_C = -8\mathbf{i} + 16\mathbf{j} + 8\mathbf{k}$$

Position vectors, (meters): $\mathbf{r}_A = 3\mathbf{j}$, $\mathbf{r}_B = 1.2\mathbf{i} + 2.4\mathbf{j} + 3\mathbf{k}$, $\mathbf{r}_C = 3.6\mathbf{i}$

Angular momentum about O, $(\text{kg}\cdot\text{m}^2/\text{s})$.

$$\begin{aligned}
\mathbf{H}_O &= \mathbf{r}_A \times (m_A\mathbf{v}_A) + \mathbf{r}_B \times (m_B\mathbf{v}_B) + \mathbf{r}_C \times (m_C\mathbf{v}_C) \\
&= \begin{vmatrix} \mathbf{i} & \mathbf{j} & \mathbf{k} \\ 0 & 3 & 0 \\ 12 & 6 & 6 \end{vmatrix} + \begin{vmatrix} \mathbf{i} & \mathbf{j} & \mathbf{k} \\ 1.2 & 2.4 & 3 \\ 8 & 6 & 0 \end{vmatrix} + \begin{vmatrix} \mathbf{i} & \mathbf{j} & \mathbf{k} \\ 3.6 & 0 & 0 \\ -8 & 16 & 8 \end{vmatrix} \\
&= (18\mathbf{i} - 36\mathbf{k}) + (-18\mathbf{i} + 24\mathbf{j} - 12\mathbf{k}) + (-28.8\mathbf{j} + 57.6\mathbf{k}) \\
&= 0\mathbf{i} - 4.8\mathbf{j} + 9.6\mathbf{k}
\end{aligned}$$

$$\mathbf{H}_O = -(4.80\ \text{kg}\cdot\text{m}^2/\text{s})\mathbf{j} + (9.60\ \text{kg}\cdot\text{m}^2/\text{s})\mathbf{k} \blacktriangleleft$$



PROBLEM 14.14

For the system of particles of Prob. 14.13, determine (*a*) the position vector $\overline{\mathbf{r}}$ of the mass center *G* of the system, (*b*) the linear momentum $m\overline{\mathbf{v}}$ of the system, (*c*) the angular momentum $\mathbf{H}_G$ of the system about *G*. Also verify that he answers to this problem and to problem 14.13 satisfy the equation given in Prob. 14.27.

SOLUTION

Position vectors, (meters): $\mathbf{r}_A = 3\mathbf{j}, \quad \mathbf{r}_B = 1.2\mathbf{i} + 2.4\mathbf{j} + 3\mathbf{k}, \quad \mathbf{r}_C = 3.6\mathbf{i}$

(*a*) Mass center: $(m_A + m_B + m_C)\overline{\mathbf{r}} = m_A\mathbf{r}_A + m_B\mathbf{r}_B + m_C\mathbf{r}_C$

$$9\overline{\mathbf{r}} = (3)(3\mathbf{j}) + (2)(1.2\mathbf{i} + 2.4\mathbf{j} + 3\mathbf{k}) + (4)(3.6\mathbf{i})$$

$$\overline{\mathbf{r}} = 1.86667\mathbf{i} + 1.53333\mathbf{j} + 0.66667\mathbf{k}$$

$$\overline{\mathbf{r}} = (1.867\text{ m})\mathbf{i} + (1.533\text{ m})\mathbf{j} + (0.667\text{ m})\mathbf{k} \blacktriangleleft$$

Linear momentum of each particle, $(\text{kg}\cdot\text{m}^2/\text{s})$.

$$m_A\mathbf{v}_A = 12\mathbf{i} + 6\mathbf{j} + 6\mathbf{k}$$

$$m_B\mathbf{v}_B = 8\mathbf{i} + 6\mathbf{j}$$

$$m_C\mathbf{v}_C = -8\mathbf{i} + 16\mathbf{j} + 8\mathbf{k}$$

(*b*) Linear momentum of the system, $(\text{kg}\cdot\text{m/s.})$

$$m\overline{\mathbf{v}} = m_A\mathbf{v}_A + m_B\mathbf{v}_B + m_C\mathbf{v}_C = 12\mathbf{i} + 28\mathbf{j} + 14\mathbf{k}$$

$$m\overline{\mathbf{v}} = (12.00\text{ kg}\cdot\text{m/s})\mathbf{i} + (28.0\text{ kg}\cdot\text{m/s})\mathbf{j} + (14.00\text{ kg}\cdot\text{m/s})\mathbf{k} \blacktriangleleft$$

Position vectors relative to the mass center, (meters).

$$\mathbf{r}'_A = \mathbf{r}_A - \overline{\mathbf{r}} = -1.86667\mathbf{i} + 1.46667\mathbf{j} - 0.66667\mathbf{k}$$

$$\mathbf{r}'_B = \mathbf{r}_B - \overline{\mathbf{r}} = -0.66667\mathbf{i} + 0.86667\mathbf{j} + 2.33333\mathbf{k}$$

$$\mathbf{r}'_C = \mathbf{r}_C - \overline{\mathbf{r}} = 1.73333\mathbf{i} - 1.53333\mathbf{j} - 0.66667\mathbf{k}$$

(*c*) Angular momentum about *G*, $\left(\text{kg}\cdot\text{m}^2/\text{s}\right)$.

$$\begin{aligned}
\mathbf{H}_G &= \mathbf{r}'_A \times m_A\mathbf{v}_A + \mathbf{r}'_B \times m_B\mathbf{v}_B + \mathbf{r}'_C \times m_C\mathbf{v}_C \\
&= \begin{vmatrix} \mathbf{i} & \mathbf{j} & \mathbf{k} \\ -1.86667 & 1.46667 & -0.66667 \\ 12 & 6 & 6 \end{vmatrix} + \begin{vmatrix} \mathbf{i} & \mathbf{j} & \mathbf{k} \\ -0.66667 & 0.86667 & 2.33333 \\ 8 & 6 & 0 \end{vmatrix} \\
&\quad + \begin{vmatrix} \mathbf{i} & \mathbf{j} & \mathbf{k} \\ 1.73333 & -1.53333 & -0.66667 \\ -8 & 16 & 8 \end{vmatrix} \\
&= \left(12.8\mathbf{i} + 3.2\mathbf{j} - 28.8\mathbf{k}\right) + \left(-14\mathbf{i} + 18.6667\mathbf{j} - 10.9333\mathbf{k}\right) \\
&\quad + \left(-1.6\mathbf{i} - 8.5333\mathbf{j} + 15.4667\mathbf{k}\right) \\
&= -2.8\mathbf{i} + 13.3333\mathbf{j} - 24.2667\mathbf{k}
\end{aligned}$$

$$\mathbf{H}_G = -\left(2.80\ \text{kg}\cdot\text{m}^2/\text{s}\right)\mathbf{i} + \left(13.33\ \text{kg}\cdot\text{m}^2/\text{s}\right)\mathbf{j} - \left(24.3\ \text{kg}\cdot\text{m}^2/\text{s}\right)\mathbf{k} \blacktriangleleft$$

$$\begin{aligned}
\bar{\mathbf{r}} \times m\bar{\mathbf{v}} &= \begin{vmatrix} \mathbf{i} & \mathbf{j} & \mathbf{k} \\ 1.86667 & 1.53333 & 0.66667 \\ 12 & 28 & 14 \end{vmatrix} \\
&= \left(2.8\ \text{kg}\cdot\text{m}^2/\text{s}\right)\mathbf{i} - \left(18.1333\ \text{kg}\cdot\text{m}^2/\text{s}\right)\mathbf{j} + \left(33.8667\ \text{kg}\cdot\text{m}^2/\text{s}\right)\mathbf{k}
\end{aligned}$$

$$\mathbf{H}_G + \bar{\mathbf{r}} \times m\bar{\mathbf{v}} = -\left(4.8\ \text{kg}\cdot\text{m}^2/\text{s}\right)\mathbf{j} + \left(9.6\ \text{kg}\cdot\text{m}^2/\text{s}\right)\mathbf{k}$$

Angular momentum about *O*.

$$\begin{aligned}
\mathbf{H}_O &= \mathbf{r}_A \times \left(m_A\mathbf{v}_A\right) + \mathbf{r}_B \times \left(m_B\mathbf{v}_B\right) + \mathbf{r}_C \times \left(m_C\mathbf{v}_C\right) \\
&= \begin{vmatrix} \mathbf{i} & \mathbf{j} & \mathbf{k} \\ 0 & 3 & 0 \\ 12 & 6 & 6 \end{vmatrix} + \begin{vmatrix} \mathbf{i} & \mathbf{j} & \mathbf{k} \\ 1.2 & 2.4 & 3 \\ 8 & 6 & 0 \end{vmatrix} + \begin{vmatrix} \mathbf{i} & \mathbf{j} & \mathbf{k} \\ 3.6 & 0 & 0 \\ -8 & 16 & 8 \end{vmatrix} \\
&= \left(18\mathbf{i} - 36\mathbf{k}\right) + \left(-18\mathbf{i} + 24\mathbf{j} - 12\mathbf{k}\right) + \left(-28.8\mathbf{j} + 57.6\mathbf{k}\right) \\
&= -\left(4.8\ \text{kg}\cdot\text{m}^2/\text{s}\right)\mathbf{j} + \left(9.6\ \text{kg}\cdot\text{m}^2/\text{s}\right)\mathbf{k}
\end{aligned}$$

Note that

$$\mathbf{H}_O = \mathbf{H}_G + \bar{\mathbf{r}} \times m\bar{\mathbf{v}}$$

PROBLEM 14.15

A 13-kg projectile is passing through the origin *O* with a velocity $\mathbf{v}_0 = (35\text{ m/s})\mathbf{i}$ when it explodes into two fragments *A* and *B*, of mass 5 kg and 8 kg, respectively. Knowing that 3 s later the position of fragment *A* is (90 m, 7 m, –14 m), determine the position of fragment *B* at the same instant. Assume $a_y = -g = -9.81\,\text{m/s}^2$ and neglect air resistance.

SOLUTION

Motion of mass center:

It moves as if projectile had not exploded.

$$\begin{aligned}\bar{\mathbf{r}} &= v_0 t\mathbf{i} - \frac{1}{2}gt^2\mathbf{j}\\ &= (35\text{ m/s})(3\text{ s})\mathbf{i} - \frac{1}{2}(9.81\text{ m/s}^2)(3\text{ s})^2\,\mathbf{j}\\ &= (105\text{ m})\mathbf{i} - (44.145\text{ m})\,\mathbf{j}\end{aligned}$$

Equation (14.12):

$$m\bar{\mathbf{r}} = \Sigma m_i \mathbf{r}_i:$$

$$m\bar{\mathbf{r}} = m_A\mathbf{r}_A + m_B\mathbf{r}_B$$

$$13(105\mathbf{i} - 44.145\mathbf{j}) = 5(90\mathbf{i} + 7\,\mathbf{j} - 14\mathbf{k}) + 8\mathbf{r}_B$$

$$\begin{aligned}8\mathbf{r}_B &= (13\times 105 - 5\times 90)\mathbf{i}\\ &\quad + (-13\times 44.145 - 5\times 7)\,\mathbf{j} + (5\times 14)\mathbf{k}\\ &= 915\mathbf{i} - 608.89\,\mathbf{j} + 70\mathbf{k}\end{aligned}$$

$$\mathbf{r}_B = (114.4\text{ m})\mathbf{i} - (76.1\text{ m})\,\mathbf{j} + (8.75\text{ m})\mathbf{k} \ \blacktriangleleft$$

PROBLEM 14.16

A 300-kg space vehicle traveling with a velocity $\mathbf{v}_0 = (360 \text{ m/s})\mathbf{i}$ passes through the origin *O* at $t = 0$. Explosive charges then separate the vehicle into three parts *A*, *B*, and *C*, with mass, respectively, 150 kg, 100 kg, and 50 kg. Knowing that at $t = 4$ s, the positions of parts *A* and *B* are observed to be *A* (1170 m, –290 m, –585 m) and *B* (1975 m, 365 m, 800 m), determine the corresponding position of part *C*. Neglect the effect of gravity.

SOLUTION

Motion of mass center:

Since there is no external force,

$$\overline{\mathbf{r}} = \mathbf{v}_0 t = (360 \text{ m/s})\mathbf{i}(4 \text{ s}) = (1440 \text{ m})\mathbf{i}$$

Equation (14.12):

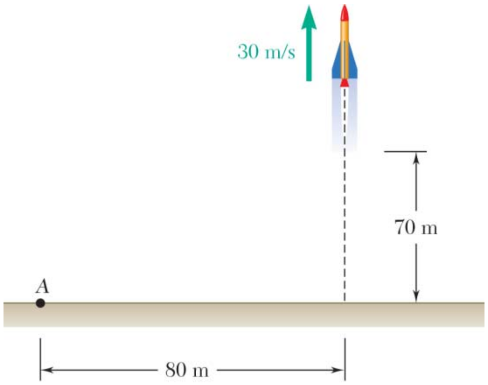
$$m\overline{\mathbf{r}} = \Sigma m_i \mathbf{r}_i:$$

$$\begin{aligned}(300)(1440\mathbf{i}) &= (150)(1170\mathbf{i} - 290\mathbf{j} - 585\mathbf{k})\\ &\quad + (100)(1975\mathbf{i} + 365\mathbf{j} + 800\mathbf{k})\\ &\quad + (50)\mathbf{r}_C\end{aligned}$$

$$\begin{aligned}50\mathbf{r}_C &= (300\times 1440 - 150\times 1170 - 100\times 1975)\mathbf{i}\\ &\quad + (150\times 290 - 100\times 365)\mathbf{j} + (150\times 585 - 100\times 800)\mathbf{k}\end{aligned}$$

$$= 59,000\mathbf{i} + 7,000\mathbf{j} + 7,750\mathbf{k}$$

$$\mathbf{r}_C = (1180 \text{ m})\mathbf{i} + (140 \text{ m})\mathbf{j} + (155 \text{ m})\mathbf{k} \blacktriangleleft$$



PROBLEM 14.17

A 2-kg model rocket is launched vertically and reaches an altitude of 70 m with a speed of 30 m/s at the end of powered flight, time $t = 0$. As the rocket approaches its maximum altitude it explodes into two parts of masses $m_A = 0.7\text{ kg}$ and $m_B = 1.3\text{ kg}$. Part A is observed to strike the ground 80 m west of the launch point at $t = 6$ s. Determine the position of part B at that time.

SOLUTION

Choose a planar coordinate system having coordinates x and y with the origin at the launch point on the ground and the x-axis pointing east and the y-axis vertically upward.

Let subscript E refer to the point where the explosion occurs, and A and B refer to the fragments A and B.
Let t be the time elapsed after the explosion.

Motion of the mass center:

$$\bar{x} = x_E + (\bar{v}_x)t = 0$$

$$\bar{y} = y_E + (\bar{v}_y)_0^t - \frac{1}{2}gt^2$$

where $\quad y_E = 70\text{ m} \quad \text{and} \quad (\bar{v}_y)_0 = 30\text{ m/s}$

At $\quad t = 6\text{ s}, \quad \bar{x} = 0$

$$\bar{y} = 70 + (30)(6) - \frac{1}{2}(9.81)(6)^2 = 73.42\text{ m}$$

Definition of mass center:

$$m_A\bar{x} = m_Ax_A + m_Bx_B$$

$$0 = (0.7\text{ kg})(-80\text{ m}) + (1.3\text{ kg})x_B$$

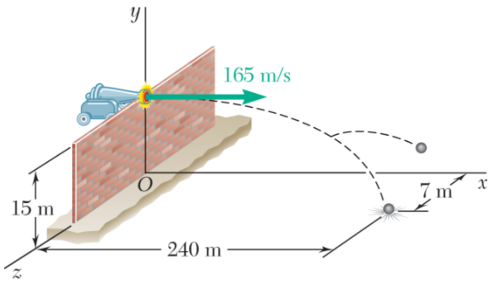
$$x_B = 43.1\text{ m}$$

$$m\bar{y} = m_Ay_A + m_By_B$$

$$(2\text{ kg})(73.42\text{ m}) = (0.7\text{ kg})(0) + (1.3\text{ kg})y_B$$

$$y_B = 113.0\text{ m}$$

Position of part B: $\quad 43.1\text{ m (east)}, \quad 113.0\text{ m (up)}$ ◀



PROBLEM 14.18

An 18-kg cannonball and a 12-kg cannonball are chained together and fired horizontally with a velocity of 165 m/s from the top of a 15-m wall. The chain breaks during the flight of the cannonballs and the 12-kg cannonball strikes the ground at $t = 1.5$ s, at a distance of 240 m from the foot of the wall, and 7 m to the right of the line of fire. Determine the position of the other cannonball at that instant. Neglect the resistance of the air.

SOLUTION

Let subscript A refer to the 12-kg cannonball and B to the 18-kg cannonball.

The motion of the mass center of A and B is uniform in the x-direction, uniformly accelerated with acceleration $-g = -9.81\ \text{m/s}^2$ in the y-direction, and zero in the z-direction.

$$\bar{x} = (v_0)_x t = (165\ \text{m/s})(1.5\ \text{s}) = 247.5\ \text{m}$$

$$\bar{y} = \bar{y}_0 + (\bar{v}_0)_y t - \frac{1}{2}gt^2$$

$$= 15\ \text{m} + 0 - \frac{1}{2}(9.81\ \text{m/s}^2)(1.55)^2 = 3.964\ \text{m}$$

$$\bar{z} = 0$$

$$\bar{\mathbf{r}} = (247.5\ \text{m})\mathbf{i} + (3.964\ \text{m})\mathbf{j}$$

Definition of mass center:

$$m\bar{\mathbf{r}} = m_A\mathbf{r}_A + m_B\mathbf{r}_B$$

Data:

$$m_A = 12\ \text{kg}, \quad m_B = 18\ \text{kg}, \quad m = m_A + m_B = 30\ \text{kg}$$

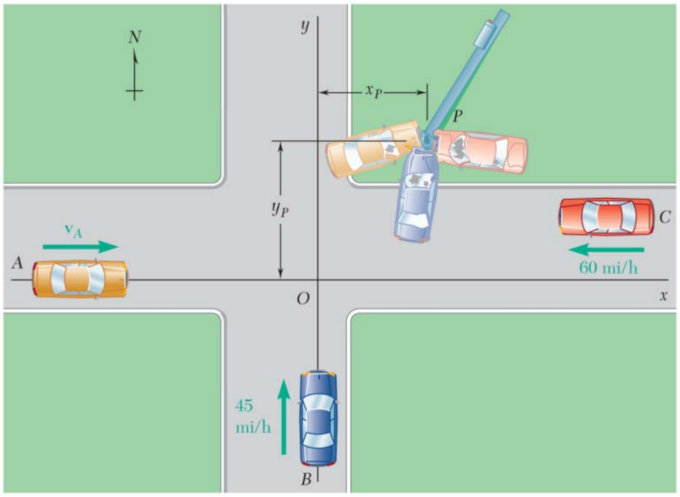
$$t = 1.5\ \text{s}, \quad x_A = 240\ \text{m}, \quad y_A = 0, \quad z_A = 7\ \text{m}$$

$$(30)(247.5\mathbf{i} + 3.964\ \mathbf{j}) = (12)(240\mathbf{i} + 7\mathbf{k}) + (18)(x_B\mathbf{i} + y_B\mathbf{j} + z_B\mathbf{k})$$

$$\mathbf{i}: \quad (30)(247.5) = (12)(240) + 18\,x_B \qquad x_B = 253\ \text{m} \ \blacktriangleleft$$

$$\mathbf{j}: \quad (30)(3.964) = (12)(0) + 18\,y_B \qquad y_B = 6.61\ \text{m} \ \blacktriangleleft$$

$$\mathbf{k}: \quad (30)(0) = (12)(7) + 18\,z_B \qquad z_B = -4.67\ \text{m} \ \blacktriangleleft$$



PROBLEM 14.19

Car A was traveling east at high speed when it collided at Point O with car B, which was traveling north at 45 mi/h. Car C, which was traveling west at 60 mi/h, was 32 ft east and 10 ft north of Point O at the time of the collision. Because the pavement was wet, the driver of car C could not prevent his car from sliding into the other two cars, and the three cars, stuck together, kept sliding until they hit the utility pole P. Knowing that the weights of cars A, B, and C are, respectively, 3000 lb, 2600 lb, and 2400 lb, and neglecting the forces exerted on the cars by the wet pavement, solve the problems indicated.

Knowing that the speed of car A was 75 mi/h and that the time elapsed from the first collision to the stop at P was 2.4 s, determine the coordinates of the utility pole P.

SOLUTION

Let t be the time elapsed since the first collision. No external forces in the xy plane act on the system consisting of cars A, B, and C during the impacts with one another. The mass center of the system moves at the velocity it had before the collision.

Setting the origin at O, we can find the initial mass center $\overline{\mathbf{r}}_0$: at the moment of the first collision:

$$(m_A + m_B + m_C)(\overline{x}_0\mathbf{i} + \overline{y}_0\mathbf{j}) = m_A(0) + m_B(0) + m_C(x_C\mathbf{i} + y_C\mathbf{j})$$

$$\overline{x}_0 = 0.3x_C = (0.3)(32) = 9.6 \text{ ft}, \quad \overline{y}_0 = 0.3y_C = (0.3)(10) = 3 \text{ ft}$$

Given velocities:

$$\mathbf{v}_A = (75 \text{ mi/h})\mathbf{i} = (110 \text{ ft/s})\mathbf{i}, \quad \mathbf{v}_B = (45 \text{ mi/h})\mathbf{i} = (66 \text{ ft/s})\mathbf{j}, \quad \mathbf{v}_C = (60 \text{ mi/h})\mathbf{i} = (88 \text{ ft/s})\mathbf{i}$$

Velocity of mass center:

$$(m_A + m_B + m_C)\overline{\mathbf{v}} = m_A\mathbf{v}_A + m_B\mathbf{v}_B + m_C\mathbf{v}_C$$

$$\overline{\mathbf{v}} = 0.375\mathbf{v}_A + 0.325\mathbf{v}_B + 0.3\mathbf{v}_C$$

Since the collided cars hit the pole at

$$\mathbf{r}_P = x_P\mathbf{i} + y_P\mathbf{j}$$

$$\mathbf{x}_P\mathbf{i} + y_P\mathbf{j} = \overline{x}_0\mathbf{i} + \overline{y}_0\mathbf{j} + \overline{\mathbf{v}}t \qquad \text{Resolve into components.}$$

$$x: \quad x_P = \overline{x}_0 + 0.375v_At_P - 0.3v_Ct_P \tag{1}$$

$$y: \quad y_P = \overline{y}_0 + 0.325v_Bt_P \tag{2}$$

PROBLEM 14.19 (Continued)

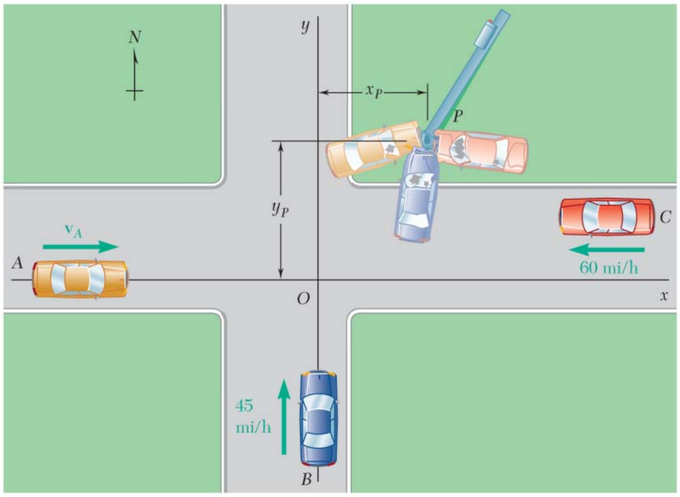
Data: $t_P = 2.4\text{ s}$

From (1), $x_P = 9.6 + (0.375)(110)(2.4) - (0.3)(88)(2.4) = 45.240$

From (2), $y_P = 3.0 + (0.325)(66)(2.4) = 54.480\text{ ft}$

$x_P = 45.2\text{ ft}$ ◀

$y_P = 54.5\text{ ft}$ ◀



PROBLEM 14.20

Car *A* was traveling east at high speed when it collided at Point *O* with car *B*, which was traveling north at 45 mi/h. Car *C*, which was traveling west at 60 mi/h, was 32 ft east and 10 ft north of Point *O* at the time of the collision. Because the pavement was wet, the driver of car *C* could not prevent his car from sliding into the other two cars, and the three cars, stuck together, kept sliding until they hit the utility pole *P*. Knowing that the weights of cars *A*, *B*, and *C* are, respectively, 3000 lb, 2600 lb, and 2400 lb, and neglecting the forces exerted on the cars by the wet pavement, solve the problems indicated. Knowing that the coordinates of the utility pole are $x_P = 46$ ft and $y_P = 59$ ft, determine (*a*) the time elapsed from the first collision to the stop at *P*, (*b*) the speed of car *A*.

SOLUTION

Let *t* be the time elapsed since the first collision. No external forces in the *xy* plane act on the system consisting of cars *A*, *B*, and *C* during the impacts with one another. The mass center of the system moves at the velocity it had before the collision.

Setting the origin at *O*, we can find the initial mass center $\bar{\mathbf{r}}_0$: at the moment of the first collision:

$$(m_A + m_B + m_C)(\bar{x}_0\mathbf{i} + \bar{y}_0\mathbf{j}) = m_A(0) + m_B(0) + m_C(x_C\mathbf{i} + y_C\mathbf{j})$$

$$\bar{x}_0 = 0.3x_C = (0.3)(32) = 9.6\text{ ft},\quad \bar{y}_0 = 0.3y_C = (0.3)(10) = 3\text{ ft}$$

Given velocities:

$$\mathbf{v}_A = v_A\mathbf{i},\quad \mathbf{v}_B = (45\text{ mi/h})\mathbf{i} = (66\text{ ft/s})\mathbf{j},\quad \mathbf{v}_C = (60\text{ mi/h})\mathbf{i} = (88\text{ ft/s})\mathbf{i}$$

Velocity of mass center:

$$(m_A + m_B + m_C)\mathbf{v} = m_A\mathbf{v}_A + m_B\mathbf{v}_B + m_C\mathbf{v}_C$$

$$\bar{\mathbf{v}} = 0.375\mathbf{v}_A + 0.325\mathbf{v}_B + 0.3\mathbf{v}_C$$

Since the collided cars hit the pole at

$$\mathbf{r}_P = x_P\mathbf{i} + y_P\mathbf{j}$$

$$x_P\mathbf{i} + y_P\mathbf{j} = \bar{x}_0\mathbf{i} + \bar{y}_0\mathbf{j} + \bar{\mathbf{v}}t$$ Resolve into components.

$$x:\quad x_P = \bar{x}_0 + 0.375v_At_P - 0.3v_Ct_P \tag{1}$$

$$y:\quad y_P = \bar{y}_0 + 0.325v_Bt_P \tag{2}$$

PROBLEM 14.20 (Continued)

Data: $x_P = 46\text{ ft},\ y_P = 59\text{ ft}$

(a) From (2), $59 = 3 + 0.325(66)t_P$

$t_P = 2.611\text{ s}$ $\qquad t_P = 2.61\text{ s}$ ◀

(b) From (1), $46 = 9.6 + (0.375)v_A(2.611) - (0.3)(88)(2.611)$

$v_A = 107.58\text{ ft/s}$ $\qquad v_A = 73.3\text{ mi/h}$ ◀

PROBLEM 14.21

An expert archer demonstrates his ability by hitting tennis balls thrown by an assistant. A 2-oz tennis ball has a velocity of (32 ft/s)**i** – (7 ft/s)**j** and is 33 ft above the ground when it is hit by a 1.2-oz arrow traveling with a velocity of (165 ft/s)**j** + (230 ft/s)**k** where **j** is directed upwards. Determine the position *P* where the ball and arrow will hit the ground, relative to Point *O* located directly under the point of impact.

SOLUTION

Assume that the ball and arrow move together after the hit.

Conservation of momentum of ball and arrow during the hit.

$$m_A = \frac{1.2/16}{32.2} = 2.3292\times 10^{-3}\ \text{slug} \qquad m_B = \frac{2/16}{32.2} = 3.8820\times 10^{-3}\ \text{slug}$$

$$m_A\mathbf{v}_A + m_B\mathbf{v}_B = (m_A + m_B)\overline{\mathbf{v}}$$

$$(2.3292\times 10^{-3})(165\mathbf{j} + 230\mathbf{k}) + (3.8820\times 10^{-3})(32\mathbf{i} - 7\mathbf{j}) = (2.3292\times 10^{-3} + 3.8820\times 10^{-3})\overline{\mathbf{v}}$$

$$\overline{\mathbf{v}} = (20.0\ \text{ft/s})\mathbf{i} + (57.5\ \text{ft/s})\mathbf{j} + (86.25\ \text{ft/s})\mathbf{k}$$

After the hit, the ball and arrow move as a projectile.

Vertical motion:

$$y = y_0 + (v_y)_0 t - \frac{1}{2}gt^2$$

$$y = 33 + 57.5t - \frac{1}{2}(32.2)t^2$$

$y = 0$ at ground.

$$-16.1t^2 + 57.5t + 33 = 0 \qquad \text{Solve for } t.$$

After rejecting the negative root, $t = 4.0745\ \text{s}$

Horizontal motion:

$$x = x_0 + (v_x)_0 t$$

$$z = z_0 + (v_2)_0 t$$

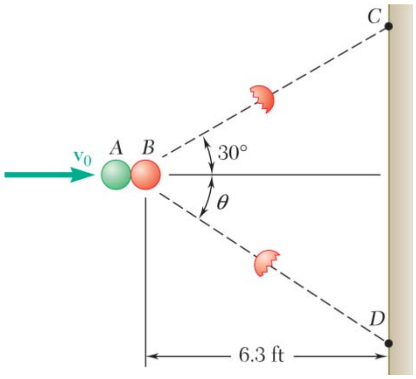
$$x = 0 + (20)(4.07448)$$

$$= 81.490\ \text{ft}$$

$$z = 0 + (86.25)(4.07448)$$

$$= 351.42\ \text{ft}$$

$$\mathbf{r}_P = (81.5\ \text{ft})\mathbf{i} + (351\ \text{ft})\mathbf{k}\ ◀$$



PROBLEM 14.22

Two spheres, each of mass m, can slide freely on a frictionless, horizontal surface. Sphere A is moving at a speed $v_0 = 16$ ft/s when it strikes sphere B which is at rest and the impact causes sphere B to break into two pieces, each of mass $m/2$. Knowing that 0.7 s after the collision one piece reaches Point C and 0.9 s after the collision the other piece reaches Point D, determine (a) the velocity of sphere A after the collision, (b) the angle θ and the speeds of the two pieces after the collision.

SOLUTION

Velocities of pieces C and D after impact and fracture.

$$(v'_C)_x = \frac{x_C}{t_C} = \frac{6.3}{0.7} = 9 \text{ ft/s}, \qquad (v'_C)_y = 9\tan 30° \text{ ft/s}$$

$$(v'_D)_x = \frac{x_D}{t_D} = \frac{6.3}{0.9} = 7 \text{ ft/s}, \qquad (v'_D)_y = -7\tan\theta \text{ ft/s}$$

Assume that during the impact the impulse between spheres A and B is directed along the x-axis. Then, the y component of momentum of sphere A is conserved.

$$0 = m(v'_A)_y$$

Conservation of momentum of system:

$$\xrightarrow{+}: \quad m_A v_0 + m_B(0) = m_A v'_A + m_C(v'_C)_x + m_D(v'_D)_x$$

$$m(16) + 0 = mv'_A + \frac{m}{2}(9) + \frac{m}{2}(7)$$

(a) $\mathbf{v}'_A = 8.00 \text{ ft/s} \longrightarrow$ ◀

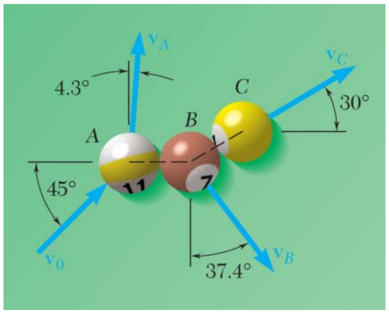
$$+\uparrow: \quad m_A(0) + m_B(0) = m_A(v'_A)_y + m_C(v'_C)_y + m_D(v'_D)_y$$

$$0 + 0 = 0 + \frac{m}{2}(9\tan 30°) - \frac{m}{2}(7\tan\theta)$$

(b) $$\tan\theta = \frac{9}{7}\tan 30° = 0.7423$$ $\theta = 36.6°$ ◀

$$v_C = \sqrt{(v_C)_x^2 + (v_C)_y^2} = \sqrt{(9)^2 + (9\tan 30°)^2}$$ $v_C = 10.39$ ft/s ◀

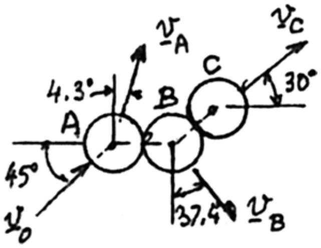
$$v_D = \sqrt{(v_D)_x^2 + (v_D)_y^2} = \sqrt{(7)^2 + (7\tan 36.6°)^2}$$ $v_D = 8.72$ ft/s ◀



PROBLEM 14.23

In a game of pool, ball *A* is moving with a velocity $\mathbf{v}_0$ when it strikes balls *B* and *C* which are at rest and aligned as shown. Knowing that after the collision the three balls move in the directions indicated, and that $v_0 = 12$ ft/s and $v_C = 6.29$ ft/s, determine the magnitude of the velocity of (*a*) ball *A*, (*b*) ball *B*.

SOLUTION



Conservation of linear momentum. In *x* direction:

$$m(12 \text{ ft/s})\cos 45° = mv_A \sin 4.3° + mv_B \sin 37.4°$$
$$+m(6.29)\cos 30°$$
$$0.07498v_A + 0.60738v_B = 3.0380 \qquad (1)$$

In *y* direction:

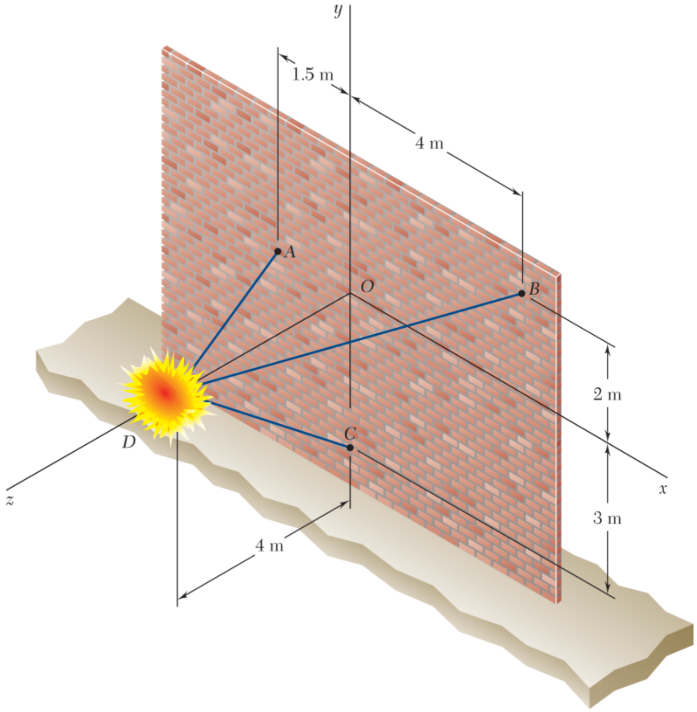
$$m(12 \text{ ft/s})\sin 45° = mv_A \cos 4.3° - mv_B \cos 37.4°$$
$$+m(6.29)\sin 30°$$
$$0.99719v_A - 0.79441v_B = 5.3403 \qquad (2)$$

(*a*) Multiply (1) by 0.79441, (2) by 0.60738, and add:

$$0.66524v_A = 5.6570 \qquad v_A = 8.50 \text{ ft/s} \blacktriangleleft$$

(*b*) Multiply (1) by 0.99719, (2) by –0.07498, and add:

$$0.66524v_B = 2.6290 \qquad v_B = 3.95 \text{ ft/s} \blacktriangleleft$$



PROBLEM 14.24

A 6-kg shell moving with a velocity $\mathbf{v}_0 = (12\text{ m/s})\mathbf{i} - (9\text{ m/s})\mathbf{j} - (360\text{ m/s})\mathbf{k}$ explodes at Point *D* into three fragments *A*, *B*, and *C* of mass, respectively, 3 kg, 2 kg, and 1 kg. Knowing that the fragments hit the vertical wall at the points indicated, determine the speed of each fragment immediately after the explosion. Assume that elevation changes due to gravity may be neglected.

SOLUTION

Position vectors (m): $\mathbf{r}_D = 4\mathbf{k}$

$$\mathbf{r}_A = -1.5\mathbf{i} \qquad \mathbf{r}_{A/D} = -1.5\mathbf{i} - 4\mathbf{k} \qquad r_{A/D} = 4.272$$

$$\mathbf{r}_B = 4\mathbf{i} + 2\mathbf{j} \qquad \mathbf{r}_{B/D} = 4\mathbf{i} + 2\mathbf{j} - 4\mathbf{k} \qquad r_{B/D} = 6$$

$$\mathbf{r}_C = -3\mathbf{j} \qquad \mathbf{r}_{C/D} = -3\mathbf{j} - 4\mathbf{k} \qquad r_{C/D} = 5$$

Unit vectors: Along $\mathbf{r}_{A/D}$, $\boldsymbol{\lambda}_A = \dfrac{1}{4.272}(-1.5\mathbf{i} - 4\mathbf{k})$

Along $\mathbf{r}_{B/D}$, $\boldsymbol{\lambda}_B = \dfrac{1}{6}(4\mathbf{i} + 2\mathbf{j} - 4\mathbf{k})$

Along $\mathbf{r}_{C/D}$, $\boldsymbol{\lambda}_C = \dfrac{1}{5}(-3\mathbf{j} - 4\mathbf{k})$

Assume that elevation changes due to gravity may be neglected. Then, the velocity vectors after the explosion have the directions of the unit vectors.

$$\mathbf{v}_A = v_A \boldsymbol{\lambda}_A$$

$$\mathbf{v}_B = v_B \boldsymbol{\lambda}_B$$

$$\mathbf{v}_C = v_C \boldsymbol{\lambda}_C$$

Conservation of momentum: $m\mathbf{v}_0 = m_A\mathbf{v}_A + m_B\mathbf{v}_B + m_C\mathbf{v}_C$

$$6(12\mathbf{i} - 9\mathbf{j} - 360\mathbf{k}) = 3\left(\frac{v_A}{4.272}\right)(-1.5\mathbf{i} - 4\mathbf{k}) + 2\left(\frac{v_B}{6}\right)(4\mathbf{i} + 2\mathbf{j} - 4\mathbf{k})$$

$$+1\left(\frac{v_C}{5}\right)(-3\mathbf{j} - 4\mathbf{k})$$

PROBLEM 14.24 (Continued)

Resolve into components.

$$72 = -1.0534v_A + 1.3333v_B$$
$$-54 = 0.66667v_B - 0.60000v_C$$

PROBLEM 14.25

A 6-kg shell moving with a velocity $\mathbf{v}_0 = (12\text{ m/s})\mathbf{i} - (9\text{ m/s})\mathbf{j} - (360\text{ m/s})\mathbf{k}$ explodes at Point D into three fragments A, B, and C of mass, respectively, 2 kg, 1 kg, and 3 kg. Knowing that the fragments hit the vertical wall at the points indicated, determine the speed of each fragment immediately after the explosion. Assume that elevation changes due to gravity may be neglected.

SOLUTION

Position vectors (m):

$$\mathbf{r}_D = 4\mathbf{k}$$

$$\mathbf{r}_A = -1.5\mathbf{i} \qquad \mathbf{r}_{A/D} = -1.5\mathbf{i} - 4\mathbf{k} \qquad r_{A/D} = 4.272$$

$$\mathbf{r}_B = 4\mathbf{i} + 2\mathbf{j} \qquad \mathbf{r}_{B/D} = 4\mathbf{i} + 2\mathbf{j} - 4\mathbf{k} \qquad r_{B/D} = 6$$

$$\mathbf{r}_C = -3\mathbf{j} \qquad \mathbf{r}_{C/D} = -3\mathbf{j} - 4\mathbf{k} \qquad r_{C/D} = 5$$

Unit vectors:

Along $\mathbf{r}_{A/D}$, $$\boldsymbol{\lambda}_A = \frac{1}{4.272}(-1.5\mathbf{i} - 4\mathbf{k})$$

Along $\mathbf{r}_{B/D}$, $$\boldsymbol{\lambda}_B = \frac{1}{6}(4\mathbf{i} + 2\mathbf{j} - 4\mathbf{k})$$

Along $\mathbf{r}_{C/D}$, $$\boldsymbol{\lambda}_C = \frac{1}{5}(-3\mathbf{j} - 4\mathbf{k})$$

Assume that elevation changes due to gravity may be neglected. Then the velocity vectors after the explosion have the directions of the unit vectors.

$$\mathbf{v}_A = v_A\boldsymbol{\lambda}_A$$
$$\mathbf{v}_B = v_B\boldsymbol{\lambda}_B$$
$$\mathbf{v}_C = v_C\boldsymbol{\lambda}_C$$

Conservation of momentum: $$m\mathbf{v}_0 = m_A\mathbf{v}_A + m_B\mathbf{v}_B + m_C\mathbf{v}_C$$

Resolve into components.

$$6(12\mathbf{i} - 9\mathbf{j} - 360\mathbf{k}) = 2\left(\frac{v_A}{4.272}\right)(-1.5\mathbf{i} - 4\mathbf{k}) + 1\left(\frac{v_B}{6}\right)(4\mathbf{i} + 2\mathbf{j} - 4\mathbf{k})$$
$$+3\left(\frac{v_C}{5}\right)(3\mathbf{j} - 4\mathbf{k})$$

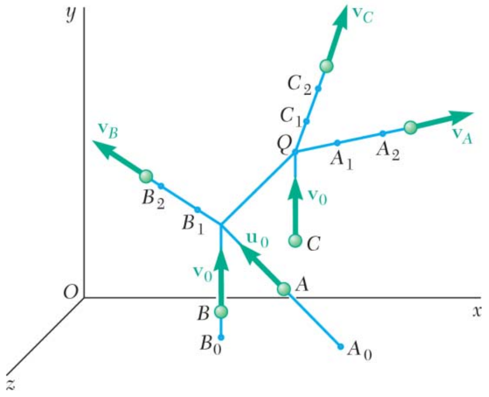
PROBLEM 14.25 (Continued)

$$72 = -0.70225 v_A + 0.66667 v_B$$
$$-54 = 0.33333 v_B - 1.8000 v_C$$
$$-2160 = -1.8727 v_A - 0.66667 v_B - 2.40000 v_C$$

Solving, $v_A = 646\text{ m/s}$ ◀

$v_B = 789\text{ m/s}$ ◀

$v_C = 176\text{ m/s}$ ◀



PROBLEM 14.26

In a scattering experiment, an alpha particle A is projected with the velocity $\mathbf{u}_0 = -(600\text{ m/s})\mathbf{i} + (750\text{ m/s})\mathbf{j} - (800\text{ m/s})\mathbf{k}$ into a stream of oxygen nuclei moving with a common velocity $\mathbf{v}_0 = (600\text{ m/s})\mathbf{j}$. After colliding successively with nuclei B and C, particle A is observed to move along the path defined by the Points $A_1(280, 240, 120)$and $A_2(360, 320, 160)$, while nuclei B and C are observed to move along paths defined, respectively, by $B_1(147, 220, 130)$, $B_2(114, 290, 120)$,and by $C_1(240, 232, 90)$ and $C_2(240, 280, 75)$. All paths are along straight lines and all coordinates are expressed in millimeters. Knowing that the mass of an oxygen nucleus is four times that of an alpha particle, determine the speed of each of the three particles after the collisions.

SOLUTION

Position vectors (mm): $\overrightarrow{A_1A_2} = 80\mathbf{i} + 80\mathbf{j} + 40\mathbf{k}$ $\quad (A_1A_2) = 120$

$\overrightarrow{B_1B_2} = -33\mathbf{i} + 70\mathbf{j} - 10\mathbf{k}$ $\quad (B_1B_2) = 78.032$

$\overrightarrow{C_1C_2} = 48\mathbf{j} - 15\mathbf{k}$ $\quad (C_1C_2) = 50.289$

Unit vectors: Along A_1A_2, $\quad \lambda_A = 0.66667\mathbf{i} + 0.66667\mathbf{j} + 0.33333\mathbf{k}$

Along B_1B_2, $\quad \lambda_B = -0.42290\mathbf{i} + 0.89707\mathbf{j} - 0.12815\mathbf{k}$

Along C_1C_2, $\quad \lambda_C = 0.95448\mathbf{j} - 0.29828\mathbf{k}$

Velocity vectors after the collisions:

$$\mathbf{v}_A = v_A\lambda_A$$
$$\mathbf{v}_B = v_B\lambda_B$$
$$\mathbf{v}_C = v_C\lambda_C$$

Conservation of momentum:

$$m\mathbf{u}_0 + 4m\mathbf{v}_0 + 4m\mathbf{v}_0 = m\mathbf{v}_A + 4m\mathbf{v}_B + 4m\mathbf{v}_C$$

Divide by m and substitute data.

$$(-600\mathbf{i} + 750\mathbf{j} - 800\mathbf{k}) + 2400\mathbf{j} + 2400\mathbf{j} = v_A\lambda_A + 4v_B\lambda_B + 4v_C\lambda_C$$

Resolving into components,

$$\mathbf{i}: \quad -600 = 0.66667v_A - 1.69160v_B$$
$$\mathbf{j}: \quad 5550 = 0.66667v_A + 3.58828v_B + 3.81792v_C$$
$$\mathbf{k}: \quad -800 = 0.33333v_A - 0.51260v_B - 1.19312v_C$$

PROBLEM 14.26 (Continued)

Solving the three equations simultaneously,

$$v_A = 919.26 \text{ m/s}$$
$$v_B = 716.98 \text{ m/s}$$
$$v_C = 619.30 \text{ m/s}$$

$v_A = 919$ m/s ◀

$v_B = 717$ m/s ◀

$v_C = 619$ m/s ◀

PROBLEM 14.27

Derive the relation

$$\mathbf{H}_O = \bar{\mathbf{r}} \times m\bar{\mathbf{v}} + \mathbf{H}_G$$

between the angular momenta $\mathbf{H}_O$ and $\mathbf{H}_G$ defined in Eqs. (14.7) and (14.24), respectively. The vectors $\bar{\mathbf{r}}$ and $\bar{\mathbf{v}}$ define, respectively, the position and velocity of the mass center G of the system of particles relative to the newtonian frame of reference *Oxyz*, and m represents the total mass of the system.

SOLUTION

From Eq. (14.7),

$$\begin{aligned} \mathbf{H}_O &= \sum_{i=1}^{n} (\mathbf{r}_i \times m_i \mathbf{v}_i) \\ &= \sum_{i=1}^{n} \left[\left(\bar{\mathbf{r}} + \mathbf{r}_i' \right) \times m_i \mathbf{v}_i \right] \\ &= \bar{\mathbf{r}} \times \sum_{i=1}^{n} (m_i v_i) + \sum_{i=1}^{n} \left(r_i' \times m_i \mathbf{v}_i \right) \\ &= \bar{\mathbf{r}} \times m\bar{\mathbf{v}} + \mathbf{H}_G \end{aligned}$$

PROBLEM 14.28

Show that Eq. (14.23) may be derived directly from Eq. (14.11) by substituting for $\mathbf{H}_O$ the expression given in Problem 14.27.

SOLUTION

From Eq. (14.7),

$$\begin{aligned}\mathbf{H}_O &= \sum_{i=1}^{n}(\mathbf{r}_i \times m_i\mathbf{v}_i)\\ &= \sum_{i=1}^{n}\left[\left(\overline{\mathbf{r}} + \mathbf{r}_i'\right)\times m_i\mathbf{v}_i\right]\\ &= \overline{\mathbf{r}} \times \sum_{i=1}^{n}(m_i v_i) + \sum_{i=1}^{n}\left(r_i' \times m_i\mathbf{v}_i\right)\\ &= \overline{\mathbf{r}} \times m\overline{\mathbf{v}} + \mathbf{H}_G\end{aligned}$$

Differentiating,

$$\dot{\mathbf{H}}_O = \dot{\overline{\mathbf{r}}} \times m\overline{\mathbf{v}} + \overline{\mathbf{r}} \times m\dot{\overline{\mathbf{v}}} + \dot{\mathbf{H}}_G$$

Using Eq. (14.11),

$$\begin{aligned}\Sigma\mathbf{M}_O &= \dot{\overline{\mathbf{r}}} \times m\overline{\mathbf{v}} + \overline{\mathbf{r}} \times m\dot{\overline{\mathbf{v}}} + \dot{\mathbf{H}}_G\\ &= \overline{\mathbf{v}} \times m\overline{\mathbf{v}} + \overline{\mathbf{r}} \times m\overline{\mathbf{a}} + \dot{\mathbf{H}}_G\\ &= 0 + \overline{\mathbf{r}} \times \left(\sum_{i=1}^{n}\mathbf{F}_i\right) + \dot{\mathbf{H}}_G \qquad (1)\end{aligned}$$

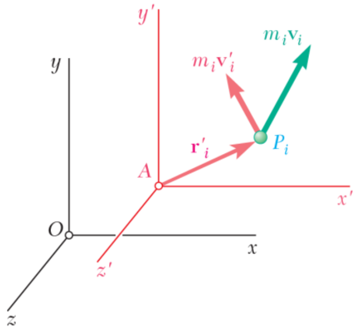
But

$$\sum_{i=1}^{n}\mathbf{M}_O = \sum_{i=1}^{n}\mathbf{M}_G + \sum_{i=1}^{n}\overline{\mathbf{r}} \times \left(\sum_{i=1}^{n}F_i\right)$$

Subtracting $\overline{\mathbf{r}} \times \left(\Sigma_{i=1}^{n}F_i\right)$ from each side of Eq. (1) gives

$$\Sigma\mathbf{M}_G = \dot{\mathbf{H}}_G$$

PROBLEM 14.29



Consider the frame of reference $Ax'y'z'$ in translation with respect to the newtonian frame of reference $Oxyz$. We define the angular momentum $\mathbf{H}'_A$ of a system of n particles about A as the sum

$$\mathbf{H}'_A = \sum_{i=1}^{n} \mathbf{r}'_i \times m_i \mathbf{v}'_i \qquad (1)$$

of the moments about A of the momenta $m_i\mathbf{v}'_i$ of the particles in their motion relative to the frame $Ax'y'z'$. Denoting by $\mathbf{H}_A$ the sum

$$\mathbf{H}_A = \sum_{i=1}^{n} \mathbf{r}'_i \times m_i \mathbf{v}_i \qquad (2)$$

of the moments about A of the momenta $m_i\mathbf{v}_i$ of the particles in their motion relative to the newtonian frame $Oxyz$, show that $\mathbf{H}_A = \mathbf{H}'_A$ at a given instant if, and only if, one of the following conditions is satisfied at that instant: (*a*) A has zero velocity with respect to the frame $Oxyz$, (*b*) A coincides with the mass center G of the system, (*c*) the velocity $\mathbf{v}_A$ relative to $Oxyz$ is directed along the line AG.

SOLUTION

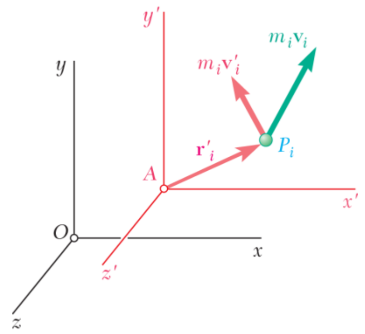
$$\mathbf{v}_i = \mathbf{v}_A + \mathbf{v}'_i$$

$$\begin{aligned}
\mathbf{H}_A &= \sum_{i=1}^{n} \mathbf{r}'_i \times m_i \mathbf{v}_i \\
&= \sum_{i=1}^{n} \mathbf{r}'_i \times m_i \left(\mathbf{v}_A + \mathbf{v}'_i\right) \\
&= \sum_{i=1}^{n} \left(\mathbf{r}'_i \times m_i \mathbf{v}_A\right) + \sum_{i=1}^{n} \mathbf{r}'_i \times m_i \mathbf{v}_i \\
&= \sum_{i=1}^{n} \left(m_i \mathbf{r}'_i\right) \times \mathbf{v}_A + \mathbf{H}'_A \\
&= \sum_{i=1}^{n} m_i (\mathbf{r}_i - \mathbf{r}_A) \times \mathbf{v}_A + \mathbf{H}'_A \\
&= m(\overline{\mathbf{r}} - \mathbf{r}_A) \times \mathbf{v}_A + \mathbf{H}'_A
\end{aligned}$$

$$\mathbf{H}_A = \mathbf{H}'_A \quad \text{if, and only if,} \qquad m(\mathbf{r} - \mathbf{r}_A) \times \mathbf{v}_A = 0$$

This condition is satisfied if

	(*a*)	$\mathbf{v}_A = 0$	Point A has zero velocity.
or	(*b*)	$\overline{\mathbf{r}} = \mathbf{r}_A$	Point A coincides with the mass center.
or	(*c*)	$\mathbf{v}_A$ is parallel to $\overline{\mathbf{r}} - \mathbf{r}_A$.	Velocity $\mathbf{v}_A$ is directed along line AG.



PROBLEM 14.30

Show that the relation $\Sigma\mathbf{M}_A = \dot{\mathbf{H}}'_A$, where $\mathbf{H}'_A$ is defined by Eq. (1) of Problem 14.29 and where $\Sigma\mathbf{M}_A$ represents the sum of the moments about A of the external forces acting on the system of particles, is valid if, and only if, one of the following conditions is satisfied: (*a*) the frame $Ax'y'z'$ is itself a newtonian frame of reference, (*b*) A coincides with the mass center G, (*c*) the acceleration $\mathbf{a}_A$ of A relative to $Oxyz$ is directed along the line AG.

SOLUTION

From equation (1),

$$\mathbf{H}'_A = \sum_{i=1}^{n}\left(\mathbf{r}'_i \times m_i\mathbf{v}'_i\right)$$

$$\mathbf{H}'_A = \sum_{i=1}^{n}[(\mathbf{r}_i - \mathbf{r}_A)\times m_i(\mathbf{v}_i - \mathbf{v}_A)]$$

Differentiate with respect to time.

$$\dot{\mathbf{H}}'_A = \sum_{i=1}^{n}[(\dot{\mathbf{r}}_i - \dot{\mathbf{r}}_A)\times m_i(\mathbf{v}_i - \mathbf{v}_A)] + \sum_{i=1}^{n}[(\mathbf{r}_i - \mathbf{r}_A)\times m_i(\dot{\mathbf{v}}_i - \dot{\mathbf{v}}_A)]$$

But $\dot{\mathbf{r}}_i = \mathbf{v}_i$

$\dot{\mathbf{v}}_i = \mathbf{a}_i$

$\dot{\mathbf{r}}_A = \mathbf{v}_A$

and $\dot{\mathbf{v}}_A = \mathbf{a}_A$

Hence,

$$\dot{\mathbf{H}}'_A = 0 + \sum_{i=1}^{n}[(\mathbf{r}_i - \mathbf{r}_A)\times m_i(\mathbf{a}_i - \mathbf{a}_A)]$$

$$= \sum_{i=1}^{n}[(\mathbf{r}_i - \mathbf{r}_A)\times(\mathbf{F}_i - m_i\mathbf{a}_A)]$$

$$= \sum_{i=1}^{n}[(\mathbf{r}_i - \mathbf{r}_A)\times\mathbf{F}_i] - \sum_{i=1}^{n}[m_i(\mathbf{r}_i - \mathbf{r}_A)]\times\mathbf{a}_A$$

$$= \mathbf{M}_A - m(\bar{\mathbf{r}} - r_A)\times\mathbf{a}_A$$

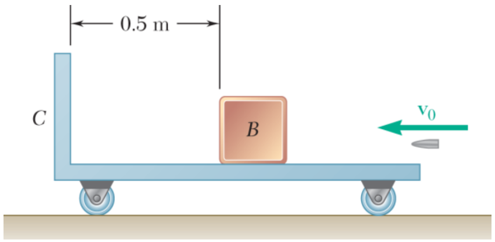
$$\dot{\mathbf{H}}'_A = M_A \qquad \text{if, and only if,} \qquad m(\bar{\mathbf{r}} - \mathbf{r}_A)\times\mathbf{a}_A = 0$$

This condition is satisfied if

(*a*) $\mathbf{a}_A = 0$ The frame is newtonian.

or (*b*) $\bar{\mathbf{r}} = \mathbf{r}_A$ Point A coincides with the mass center.

or (*c*) $\mathbf{a}_A$ is parallel to $\bar{\mathbf{r}} - \mathbf{r}_A$. Acceleration $\mathbf{a}_A$ is directed along line AG.



PROBLEM 14.31

Determine the energy lost due to friction and the impacts for Problem 14.1.

PROBLEM 14.1 A 30-g bullet is fired with a horizontal velocity of 450 m/s and becomes embedded in block *B* which has a mass of 3 kg. After the impact, block *B* slides on 30-kg carrier *C* until it impacts the end of the carrier. Knowing the impact between *B* and *C* is perfectly plastic and the coefficient of kinetic friction between *B* and *C* is 0.2, determine (*a*) the velocity of the bullet and *B* after the first impact, (*b*) the final velocity of the carrier.

SOLUTION

From the solution to Problem 4.1 the velocity of *A* and *B* after the first impact is $v' = 4.4554$ m/s and the velocity common to *A*, *B*, and *C* after the sliding of block *B* and bullet *A* relative to the carrier *C* has ceased in $v'' = 0.4087$ m/s.

Friction loss due to sliding:

Normal force:
$$N = W_A + W_B = (m_A + m_B)g$$
$$= (0.030 \text{ kg} + 3 \text{ kg})(9.81 \text{ m/s}) = 29.724 \text{ N}$$

Friction force:
$$F_f = \mu_k N = (0.2)(29.724) = 5.945 \text{ N}$$

Relative sliding distance: Assume $d = 0.5$ m.

Energy loss due to friction: $F_f d = (5.945)(0.5)$ $\qquad F_f d = 2.97 \text{ J}$ ◀

Kinetic energy of block with embedded bullet immediately after first impact:

$$T'_{AB} = \frac{1}{2}(m_A + m_B)(v')^2 = \frac{1}{2}(3.03 \text{ kg})(4.4554 \text{ m/s})^2 = 30.07 \text{ J}$$

Final kinetic energy of *A*, *B*, and *C* together

$$T''_{ABC} = \frac{1}{2}(m_A + m_B + m_C)(v'')^2 = \frac{1}{2}(33.03 \text{ kg})(0.4087 \text{ m/s})^2 = 2.76 \text{ J}$$

Loss due to friction and stopping impact: $T'_{AB} - T''_{ABC} = 30.07 - 2.76 = 27.31 \text{ J}$

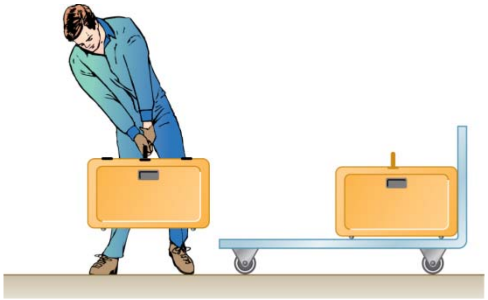
Since $27.31 \text{ J} \geq 2.97 \text{ J}$, the block slides 0.5 m relative to the carrier as assumed above.

Impact loss due to *AB* impacting the carrier: $27.31 - 2.97 = 24.34$ $\qquad \text{Loss} = 24.3 \text{ J}$ ◀

Initial kinetic energy of system *ABC*.

$$T_0 = \frac{1}{2}m_A v_0^2 = \frac{1}{2}(0.030 \text{ kg})(450 \text{ m/s})^2 = 3037.5 \text{ J}$$

Impact loss at first impact: $T_0 - T'_{AB} = 3037.5 - 30.07$ $\qquad \text{Loss} = 3007 \text{ J}$ ◀



PROBLEM 14.32

Assuming that the airline employee of Prob. 14.3 first tosses the 30-lb suitcase on the baggage carrier, determine the energy lost (*a*) as the first suitcase hits the carrier, (*b*) as the second suitcase hits the carrier.

PROBLEM 14.3 An airline employee tosses two suitcases, of weight 30 lb and 40 lb, respectively, onto a 50-lb baggage carrier in rapid succession. Knowing that the carrier is initially at rest and that the employee imparts a 9-ft/s horizontal velocity to the 30-lb suitcase and a 6-ft/s horizontal velocity to the 40-lb suitcase, determine the final velocity of the baggage carrier if the first suitcase tossed onto the carrier is (a) the 30-lb suitcase,(b) the 40-lb suitcase.

SOLUTION

The weights are $W_A = 30\text{ lb}, \quad W_B = 40\text{ lb}, \quad \text{and} \quad W_C = 50\text{ lb}.$

Initial velocities: $(v_A)_0 = 9\text{ ft/s} \longrightarrow, \quad (v_B)_0 = 6\text{ ft/s} \longrightarrow, \quad \text{and} \quad (v_C)_0 = 0.$

There are no horizontal external forces acting during the impacts, and the baggage carrier is free to coast between the impacts.

Let v_1 be the common velocity of suitcase *A* and the carrier after the first impact and v_2 be the common velocity of the two suitcases and the carrier after the second impact.

Initial momenta: $\frac{W_A}{g}(v_A)_0, \quad \frac{W_B}{g}(v_B)_0, \quad \text{and} \quad 0.$

Suitcase A impacts carrier. Conservation of momentum.

$$\frac{W_A}{g}(v_A)_0 + 0 = \frac{W_A + W_C}{g}v_1 \qquad v_1 = \frac{W_A(v_A)_0}{W_A + W_C} = \frac{(30)(9)}{80} = 3.375\text{ ft/s}$$

Kinetic energies:

Before: $$T_0 = \frac{1}{2}\frac{W_A}{g}(v_A)_0^2 = \frac{1}{2}\frac{30}{32.2}(9)^2 = 37.733\text{ ft}\cdot\text{lb}$$

After: $$T_1 = \frac{1}{2}\frac{W_A + W_C}{g}v_1^2 = \frac{1}{2}\frac{30+50}{32.2}(3.375)^2 = 14.150\text{ ft}\cdot\text{lb}$$

(*a*) Lost: $T_0 - T_1 = 23.583\text{ ft}\cdot\text{lb}$ energy lost $= 23.6\text{ ft}\cdot\text{lb}$ ◀

Suitcase B impacts on suitcase A and carrier. Conservation of momentum.

$$\frac{W_B}{g}(v_B)_0 + \frac{W_A + W_C}{g}v_1 = \frac{W_A + W_B + W_C}{g}v_2$$

$$v_2 = \frac{W_B(v_B)_0 + (W_A + W_C)v_1}{W_A + W_B + W_C} = \frac{(40)(6) + (80)(3.375)}{120} = 4.25\text{ ft/s}$$

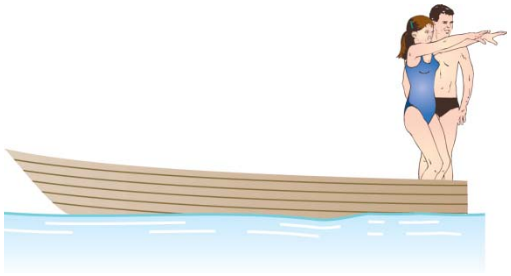
PROBLEM 14.32 (Continued)

Kinetic energies:

Before: $T_1' = \frac{1}{2}\frac{W_A + W_C}{g}v_1^2 + \frac{1}{2}\frac{W_B}{g}(v_B)_0^2 = 14.150 + \frac{1}{2}\frac{40}{32.2}(6)^2 = 36.510 \text{ ft}\cdot\text{lb}$

After: $T_2 = \frac{1}{2}\frac{W_A + W_B + W_C}{g}v_2^2 = \frac{1}{2}\frac{120}{32.2}(4.25)^2 = 33.657 \text{ ft}\cdot\text{lb}$

(*b*) Lost: $T_1' - T_2 = 2.853 \text{ ft}\cdot\text{lb}$ energy lost $= 2.85 \text{ ft}\cdot\text{lb}$ ◀



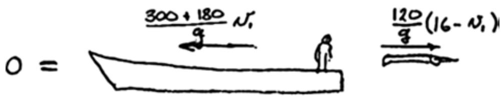
PROBLEM 14.33

In Problem 14.6, determine the work done by the woman and by the man as each dives from the boat, assuming that the woman dives first.

PROBLEM 14.6 A 180-lb man and a 120-lb woman stand side by side at the same end of a 300-lb boat, ready to dive, each with a 16-ft/s velocity relative to the boat. Determine the velocity of the boat after they have both dived, if (*a*) the woman dives first, (*b*) the man dives first.

SOLUTION

Woman dives first.



Conservation of momentum: $\frac{120}{g}(16-v_1)-\frac{300+180}{g}v_1=0$

$$v_1=\frac{(120)(16)}{600}=3.20\text{ ft/s}\leftarrow \quad\text{and}\quad 16-v_1=12.80\text{ ft/s}\rightarrow$$

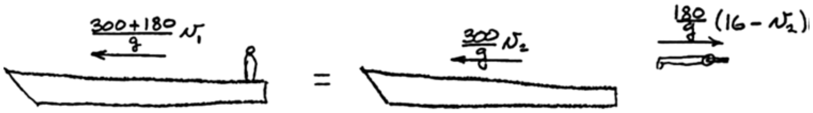
Kinetic energy before dive: $T_0=0$

Kinetic energy after dive: $T_1=\frac{1}{2}\frac{300+180}{32.2}(3.20)^2+\frac{1}{2}\frac{120}{32.2}(12.80)^2$

$$=381.61\text{ ft}\cdot\text{lb}$$

Work of woman: $T_1-T_0=381.61\text{ ft}\cdot\text{lb}$ $\qquad T_1-T_0=382\text{ ft}\cdot\text{lb}$ ◀

Man dives next. Conservation of momentum:



$$-\frac{300+180}{g}v_1=-\frac{300}{g}v_2+\frac{180}{g}(16-v_2)$$

$$v_2=\frac{480v_1+(180)(16)}{480}=9.20\text{ ft/s}\longleftarrow$$

$$16-9.20=6.80\text{ ft/s}\longrightarrow$$

Kinetic energy before dive: $T_1'=\frac{1}{2}\frac{300+180}{32.2}(3.20)^2$

$$=76.323\text{ ft}\cdot\text{lb}$$

Kinetic energy after dive: $T_2'=\frac{1}{2}\frac{300}{32.2}(9.20)^2+\frac{1}{2}\frac{180}{32.2}(6.80)^2$

$$=523.53\text{ ft}\cdot\text{lb}$$

Work of man: $T_2'-T_1'=447.2\text{ ft}\cdot\text{lb}$ $\qquad T_2'-T_1'=447\text{ ft}\cdot\text{lb}$ ◀

PROBLEM 14.34

Determine the energy lost as a result of the series of collisions described in Problem 14.8.

PROBLEM 14.8 Two identical cars *A* and *B* are at rest on a loading dock with brakes released. Car *C*, of a slightly different style but of the same weight, has been pushed by dockworkers and hits car *B* with a velocity of 1.5 m/s. Knowing that the coefficient of restitution is 0.8 between *B* and *C* and 0.5 between *A* and *B*, determine the velocity of each car after all collisions have taken place.

SOLUTION

From the solution to Problem 14.8

$$v_A = 2 \text{ m/s}, \quad v_B = v_C = 0,$$

$$v'_B = 1.35 \text{ m/s}, \quad v'_C = 0.15 \text{ m/s}$$

$$v'_A = 1.013 \text{ m/s} \quad v''_B = 0.338 \text{ m/s},$$

$$m_A = m_B = m_C = m$$

C hits *B*:

$$T_1 = \frac{1}{2} m_C v_C^2 = \frac{1}{2} m(1.5 \text{ m/s})^2 = 1.125m \text{ J}$$

$$T_2 = \frac{1}{2} m_B (v'_B)^2 + \frac{1}{2} m_C (v'_C)^2$$

$$T = \frac{1}{2} m(1.35 \text{ m/s})^2 + \frac{1}{2} \text{m}(0.15 \text{ m/s})^2 = 0.9m \text{ J}$$

$\text{Loss} = T_1 - T_2$: $\text{Loss} = 0.225m \text{ J}$ ◀

B hits *A*:

$$T_3 = \frac{1}{2} m_B (v'_B)^2 = \frac{1}{2} m(1.35)^2 = 0.9113m \text{ J}$$

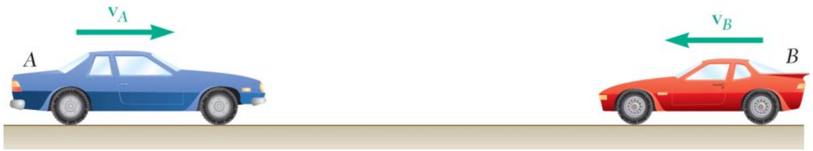
$$T_4 = \frac{1}{2} m_B (v''_B)^2 + \frac{1}{2} m_A (v'_A)^2$$

$$= \frac{1}{2} \text{m}(0.338 \text{ m/s})^2 + \frac{1}{2} m(1.013 \text{ m/s})^2 = 0.5702 \text{m J}$$

$\text{Loss} = T_3 - T_4$: $\text{Loss} = 0.341m \text{ J}$ ◀

PROBLEM 14.35

Two automobiles *A* and *B*, of mass m_A and m_B, respectively, are traveling in opposite directions when they collide head on. The impact is assumed perfectly plastic, and it is further assumed that the energy absorbed by each automobile is equal to its loss of kinetic energy with respect to a moving frame of reference attached to the mass center of the two-vehicle system. Denoting by E_A and E_B, respectively, the energy absorbed by automobile *A* and by automobile *B*, (*a*) show that $E_A/E_B = m_B/m_A$, that is, the amount of energy absorbed by each vehicle is inversely proportional to its mass, (*b*) compute E_A and E_B, knowing that $m_A = 1600$ kg and $m_B = 900$ kg and that the speeds of *A* and *B* are, respectively, 90 km/h and 60 km/h.



SOLUTION

Velocity of mass center: $(m_A + m_B)\overline{\mathbf{v}} = m_A\mathbf{v}_A + m_B\mathbf{v}_B$

$$\overline{\mathbf{v}} = \frac{m_A\mathbf{v}_A + m_B\mathbf{v}_B}{m_A + m_B}$$

Velocities relative to the mass center:

$$\mathbf{v}'_A = \mathbf{v}_A - \overline{\mathbf{v}} = \mathbf{v}_A - \frac{m_A\mathbf{v}_A + m_B\mathbf{v}_B}{m_A + m_B} = \frac{m_B(\mathbf{v}_A + \mathbf{v}_B)}{m_A + m_B}$$

$$\mathbf{v}'_B = \mathbf{v}_B - \overline{\mathbf{v}} = \mathbf{v}_B - \frac{m_A\mathbf{v}_A + m_B\mathbf{v}_B}{m_A + m_B} = \frac{m_A(\mathbf{v}_A + \mathbf{v}_B)}{m_A + m_B}$$

Energies:

$$E_A = \frac{1}{2}m_A\mathbf{v}'_A \cdot \mathbf{v}'_A = \frac{m_A m_B^2(\mathbf{v}_A + \mathbf{v}_B)\cdot(\mathbf{v}_A + \mathbf{v}_B)}{2(m_A + m_B)^2}$$

$$E_B = \frac{1}{2}m_B\mathbf{v}'_B \cdot \mathbf{v}'_B = \frac{m_A^2 m_B(\mathbf{v}_A + \mathbf{v}_B)\cdot(\mathbf{v}_A + \mathbf{v}_B)}{2(m_A + m_B)^2}$$

(*a*) Ratio: $$\frac{E_A}{E_B} = \frac{m_B}{m_A} \blacktriangleleft$$

(*b*)

$$\mathbf{v}_A = 90 \text{ km/h} = 25 \text{ m/s} \longrightarrow$$

$$\mathbf{v}_B = 60 \text{ km/h} = 16.667 \text{ m/s} \longleftarrow$$

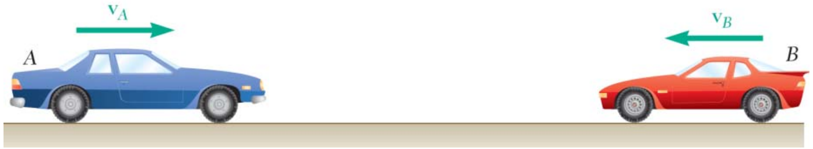
$$\mathbf{v}_A + \mathbf{v}_B = 41.667 \text{ m/s} \longrightarrow$$

$$E_A = \frac{(1600)(900)^2(41.667)^2}{(2)(2500)^2} = 180.0\times10^3 \text{ J} \qquad E_A = 180.0 \text{ kJ} \blacktriangleleft$$

$$E_B = \frac{(1600)^2(900)(41.667)^2}{(2)(2500)^2} = 320\times10^3 \text{ J} \qquad E_B = 320 \text{ kJ} \blacktriangleleft$$

PROBLEM 14.36

It is assumed that each of the two automobiles involved in the collision described in Problem 14.35 had been designed to safely withstand a test in which it crashed into a solid, immovable wall at the speed v_0. The severity of the collision of Problem 14.35 may then be measured for each vehicle by the ratio of the energy it absorbed in the collision to the energy it absorbed in the test. On that basis, show that the collision described in Problem 14.35 is $(m_A/m_B)^2$ times more severe for automobile B than for automobile A.



SOLUTION

Velocity of mass center:

$$(m_A + m_B)\overline{\mathbf{v}} = m_A\mathbf{v}_A + m_B\mathbf{v}_B$$

$$\overline{\mathbf{v}} = \frac{m_A\mathbf{v}_A + m_B\mathbf{v}_B}{m_A + m_B}$$

Velocities relative to the mass center:

$$\mathbf{v}'_A = \mathbf{v}_A - \overline{\mathbf{v}} = \mathbf{v}_A - \frac{m_A\mathbf{v}_A + m_B\mathbf{v}_B}{m_A + m_B} = \frac{m_B(\mathbf{v}_A + \mathbf{v}_B)}{m_A + m_B}$$

$$\mathbf{v}'_B = \mathbf{v}_B - \overline{\mathbf{v}} = \mathbf{v}_B - \frac{m_A\mathbf{v}_A + m_B\mathbf{v}_B}{m_A + m_B} = \frac{m_A(\mathbf{v}_A + \mathbf{v}_B)}{m_A + m_B}$$

Energies:

$$E_A = \frac{1}{2}m_A\mathbf{v}'_A \cdot \mathbf{v}'_A = \frac{m_A m_B^2(\mathbf{v}_A + \mathbf{v}_B)\cdot(\mathbf{v}_A + \mathbf{v}_B)}{2(m_A + m_B)^2}$$

$$E_B = \frac{1}{2}m_B\mathbf{v}'_B \cdot \mathbf{v}'_B = \frac{m_A^2 m_B(\mathbf{v}_A + \mathbf{v}_B)\cdot(\mathbf{v}_A + \mathbf{v}_B)}{2(m_A + m_B)^2}$$

Energies from tests:

$$(E_A)_0 = \frac{1}{2}m_A v_0^2, \quad (E_B)_0 = \frac{1}{2}m_B v_0^2$$

Severities:

$$S_A = \frac{E_A}{(E_A)_0} = \frac{m_B^2(\mathbf{v}_A + \mathbf{v}_B)\cdot(\mathbf{v}_A + \mathbf{v}_B)}{(m_A + m_B)^2 v_0^2}$$

$$S_B = \frac{E_B}{(E_B)_0} = \frac{m_A^2(\mathbf{v}_A + \mathbf{v}_B)\cdot(\mathbf{v}_A + \mathbf{v}_B)}{(m_A + m_B)^2 v_0^2}$$

Ratio:

$$\frac{S_A}{S_B} = \frac{m_B^2}{m_A^2} \blacktriangleleft$$

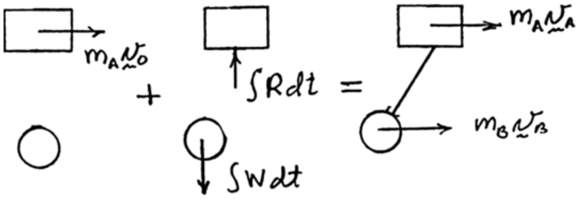
PROBLEM 14.37

Solve Sample Problem 14.5, assuming that cart *A* is given an initial horizontal velocity $\mathbf{v}_0$ while ball *B* is at rest.

SOLUTION

(*a*) Velocity of *B* at maximum elevation: At maximum elevation, ball *B* is at rest relative to cart *A*. $\mathbf{v}_B = \mathbf{v}_A$

Use impulse-momentum principle.



$m_A \underset{\sim}{v}_0$
+
$\int R\,dt$
=
$\int W\,dt$
$m_A \underset{\sim}{v}_A$
$m_B \underset{\sim}{v}_B$

x components:

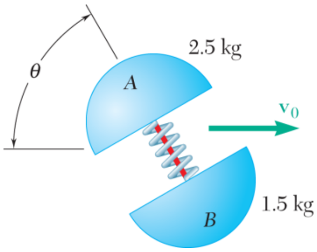
$$m_A v_0 + 0 = m_A v_A + m_B v_B$$
$$= (m_A + m_B) v_B$$

$$v_B = \frac{m_A v_0}{m_A + m_B} \longrightarrow \blacktriangleleft$$

(*b*) Conservation of energy:

$$T_1 = \frac{1}{2} m_A v_0^2, \quad V_1 = 0$$
$$T_2 = \frac{1}{2} m_A v_A^2 + \frac{1}{2} m_B v_B^2$$
$$= \frac{1}{2}(m_A + m_B) v_B^2$$
$$= \frac{m_A^2 v_0^2}{2(m_A + m_B)}$$
$$V_2 = m_B g h$$
$$T_2 + V_2 = T_1 + V_1$$
$$\frac{m_A^2 v_0^2}{2(m_A + m_B)} + m_B g h = \frac{1}{2} m_A v_0^2$$

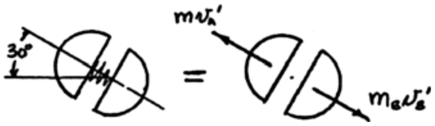
$$h = \frac{1}{2 m_B g}\left[m_A v_0^2 - \frac{m_A^2 v_0^2}{m_A + m_B} \right] \qquad h = \frac{m_A}{m_A + m_B} \frac{v_0^2}{2g} \blacktriangleleft$$



PROBLEM 14.38

Two hemispheres are held together by a cord which maintains a spring under compression (the spring is not attached to the hemispheres). The potential energy of the compressed spring is 120 J and the assembly has an initial velocity $\mathbf{v}_0$ of magnitude $v_0 = 8$ m/s. Knowing that the cord is severed when $\theta = 30°$, causing the hemispheres to fly apart, determine the resulting velocity of each hemisphere.

SOLUTION



Use a frame of reference moving with the mass center.

Conservation of momentum:

$$0 = -m_A v_A' + m_B v_B'$$

$$v_A' = \frac{m_B}{m_A} v_B'$$

Conservation of energy:

$$V = \frac{1}{2} m_A (v_A')^2 + \frac{1}{2} m_B (v_B')^2$$

$$= \frac{1}{2} m_A \left(\frac{m_B}{m_A} v_B' \right)^2 + \frac{1}{2} m_B (v_B')^2$$

$$= \frac{m_B (m_A + m_B)}{2m_A} (v_B')^2$$

$$v_B' = \sqrt{\frac{2m_A V}{m_B (m_A + m_B)}}$$

Data: $m_A = 2.5$ kg $\quad m_B = 1.5$ kg

$$V = 120 \text{ J}$$

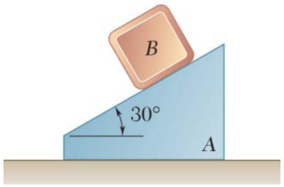
$$v_B' = \sqrt{\frac{(2)(2.5)(120)}{(1.5)(4.0)}} = 10 \qquad v_B' = 10 \text{ m/s} \searrow 30°$$

$$v_A' = \frac{1.5}{2.5}(10) = 6 \qquad v_A' = 6 \text{ m/s} \nwarrow 30°$$

Velocities of *A* and *B*.

$$\mathbf{v}_A = [8 \text{ m/s} \rightarrow] + [6 \text{ m/s} \nwarrow 30°] \qquad \mathbf{v}_A = 4.11 \text{ m/s} \nearrow 46.9° \blacktriangleleft$$

$$\mathbf{v}_B = [8 \text{ m/s} \rightarrow] + [10 \text{ m/s} \searrow 30°] \qquad \mathbf{v}_B = 17.39 \text{ m/s} \searrow 16.7° \blacktriangleleft$$



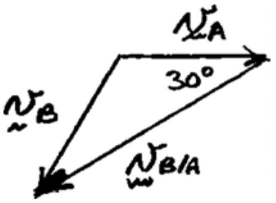
PROBLEM 14.39

A 15-lb block *B* starts from rest and slides on the 25-lb wedge *A*, which is supported by a horizontal surface. Neglecting friction, determine (*a*) the velocity of *B* relative to *A* after it has slid 3 ft down the inclined surface of the wedge, (*b*) the corresponding velocity of *A*.

SOLUTION

Kinematics:

$$\mathbf{v}_B = \mathbf{v}_A + \mathbf{v}_{B/A}$$

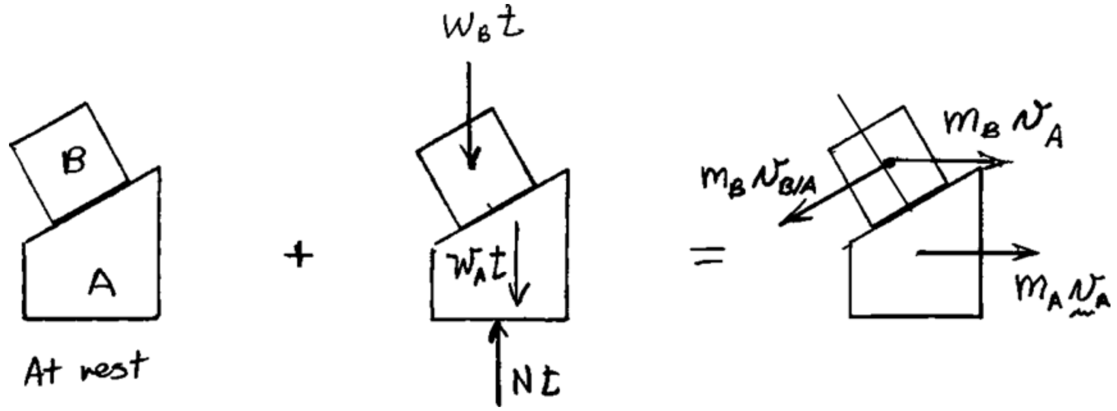


Law of cosines:

$$v_B^2 = v_A^2 + v_{B/A}^2 - 2v_A v_{B/A}\cos 30° \tag{1}$$

Principle of impulse and momentum:

$$\Sigma m\mathbf{v}_0 + \Sigma \mathbf{F}t = \Sigma m\mathbf{v}$$



Components →:

$$0 + 0 = m_A v_A + m_B(v_A - v_{B/A}\cos 30°)$$

$$v_A = \frac{m_B v_{B/A}\cos 30°}{m_A + m_B} = \frac{15\cos 30°}{25+15}v_{B/A}$$
$$= 0.32476\, v_{B/A}$$

From Eq. (1)

$$v_B^2 = (0.32476)^2\, v_{B/A}^2 + v_{B/A}^2 - (2)(0.32476)\cos 30° v_{B/A}^2$$
$$= 0.54297\ v_{B/A}^2$$

Principle of conservation of energy:

$$T_0 + V_0 = T_1 + V_1$$
$$0 + 0 = \frac{1}{2}m_A v_A^2 + \frac{1}{2}m_B v_B^2 - W_B d\sin 30°$$
$$\frac{1}{2}\frac{W_A}{g}(0.32476 v_{B/A})^2 + \frac{1}{2}\frac{W_B}{g}(0.54297)\, v_{B/A}^2 = W_B d\sin 30°$$

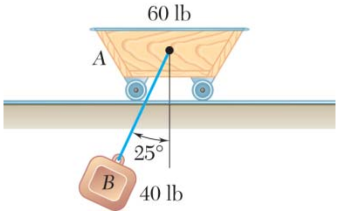
PROBLEM 14.39 (Continued)

$$\left[\frac{1}{2}\frac{25}{32.2}(0.32476)^2+\frac{1}{2}\frac{15}{32.2}(0.54297)\right]v_{B/A}^2=(15)(3)\sin 30°$$

$$0.16741v_{B/A}^2=22.5$$

(*a*) $\mathbf{v}_{B/A}=11.59\text{ ft/s}$ ↙ 30° ◀

(b) $v_A=(0.32476)(11.59)$ $\mathbf{v}_A=3.76\text{ ft/s}$ → ◀



60 lb
A
25°
B
40 lb

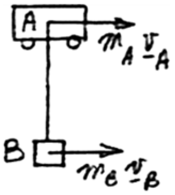
PROBLEM 14.40

A 40-lb block B is suspended from a 6-ft cord attached to a 60-lb cart A, which may roll freely on a frictionless, horizontal track. If the system is released from rest in the position shown, determine the velocities of A and B as B passes directly under A.

SOLUTION

Conservation of linear momentum:

Since block and cart are initially at rest,



A
$m_A \underline{v}_A$
B
$m_B \underline{v}_B$

$$\mathbf{L}_0 = 0$$

Thus, as B passes under A,

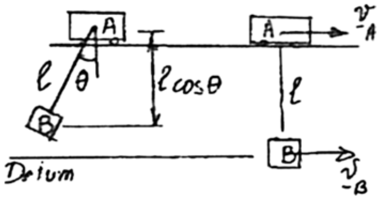
$$\mathbf{L} = m_A \mathbf{v}_A + m_B \mathbf{v}_B = 0$$

$$\xrightarrow{+} m_A v_A + m_B v_B = 0$$

$$v_A = -\frac{m_B}{m_A} v_B \qquad (1)$$

Conservation of energy:

Initially,



A
ℓ
θ
ℓ cos θ
Datum
A
$\underline{v}_A$
ℓ
B
$\underline{v}_B$
B

$$T_0 = 0$$

$$V_0 = m_B gl(1 - \cos\theta)$$

As B passes under A,

$$T = \frac{1}{2} m_A v_A^2 + \frac{1}{2} m_B v_B^2$$

$$V = 0$$

Thus,

$$T_0 + V_0 = T + V: \quad m_B gl(1 - \cos\theta) = \frac{1}{2} m_A v_A^2 + \frac{1}{2} m_B v_B^2$$

Substituting for v_A from (1) and multiplying by 2:

$$2m_B gl(1 - \cos\theta) = m_A \left(\frac{m_B^2}{m_A^2} v_B^2 \right) + m_B v_B^2$$

$$= \left(\frac{m_B^2}{m_A} + m_B \right) v_B^2 = m_B \frac{m_B + m_A}{m_A} v_B^2$$

$$v_B = \sqrt{\frac{2m_A}{m_A + m_B} gl(1 - \cos\theta)} \qquad (2)$$

PROBLEM 14.40 (Continued)

Given data:

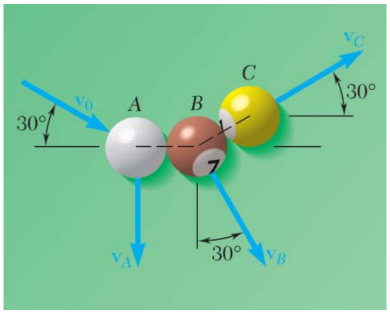
$$w_A = 60 \text{ lb} \quad w_B = 40 \text{ lb}, \quad l = 6 \text{ ft}$$

$$g = 32.2 \text{ ft/s}^2 \quad \theta = 25°$$

$$\frac{2m_A}{m_A + m_B} = \frac{2w_A}{w_A + w_B} = \frac{(2)(60)}{60+40} = 1.2$$

From Eq. (2), $v_B = \sqrt{(1.2)(32.2)(6)(1-\cos 25°)}$ $\mathbf{v}_B = 4.66 \text{ ft/s} \longrightarrow$ ◀

From Eq. (1), $v_A = -\dfrac{w_B}{w_A} v_B = -\dfrac{40}{60}(4.66)$ $\mathbf{v}_A = 3.11 \text{ ft/s} \longleftarrow$ ◀



PROBLEM 14.41

In a game of pool, ball A is moving with a velocity $\mathbf{v}_0$ of magnitude $v_0 = 15$ ft/s when it strikes balls B and C, which are at rest and aligned as shown. Knowing that after the collision the three balls move in the directions indicated and assuming frictionless surfaces and perfectly elastic impact (that is, conservation of energy), determine the magnitudes of the velocities $\mathbf{v}_A$, $\mathbf{v}_B$, and $\mathbf{v}_C$.

SOLUTION

Velocity vectors:

$$\mathbf{v}_0 = v_0(\cos 30°\mathbf{i} - \sin 30°\mathbf{j}) \qquad v_0 = 15 \text{ ft/s}$$

$$\mathbf{v}_A = -v_A\mathbf{j}$$

$$\mathbf{v}_B = v_B(\sin 30°\mathbf{i} - \cos 30°\mathbf{j})$$

$$\mathbf{v}_C = v_C(\cos 30°\mathbf{i} + \sin 30°\mathbf{j})$$

Conservation of momentum:

$$m\mathbf{v}_0 = m\mathbf{v}_A + m\mathbf{v}_B + m\mathbf{v}_C$$

Divide by m and resolve into components.

$$\mathbf{i}: \quad v_0 \cos 30° = v_B \sin 30° + v_C \cos 30°$$

$$\mathbf{j}: \quad -v_0 \sin 30° = -v_A - v_B \cos 30° + v_C \sin 30°$$

Solving for v_B and v_C,

$$v_B = \frac{\sqrt{3}}{2}(v_0 - v_A) \qquad v_C = \frac{1}{2}(v_0 + v_A)$$

Conservation of energy: $$\frac{1}{2}mv_0^2 = \frac{1}{2}mv_A^2 + \frac{1}{2}mv_B^2 + \frac{1}{2}mv_C^2$$

Divide by $\frac{1}{2}m$ and substitute for v_B and v_C.

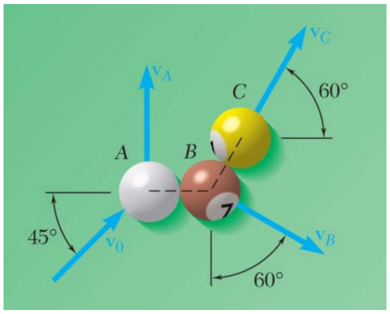
$$v_0^2 = v_A^2 + \frac{3}{4}(v_0 - v_A)^2 + \frac{1}{4}(v_0 + v_A)^2$$

$$= 2v_A^2 + v_0^2 - v_0 v_A$$

$$v_A = \frac{1}{2}v_0 = 7.5 \text{ ft/s} \qquad v_A = 7.50 \text{ ft/s} \blacktriangleleft$$

$$v_B = \frac{\sqrt{3}}{2}(15 - 7.5) = 6.4952 \text{ ft/s} \qquad v_B = 6.50 \text{ ft/s} \blacktriangleleft$$

$$v_C = \frac{1}{2}(15 + 7.5) = 11.25 \text{ ft/s} \qquad v_C = 11.25 \text{ ft/s} \blacktriangleleft$$



PROBLEM 14.42

In a game of pool, ball *A* is moving with a velocity $\mathbf{v}_0$ of magnitude $v_0 = 15$ ft/s when it strikes balls *B* and *C*, which are at rest and aligned as shown. Knowing that after the collision the three balls move in the directions indicated and assuming frictionless surfaces and perfectly elastic impact (that is, conservation of energy), determine the magnitudes of the velocities $\mathbf{v}_A$, $\mathbf{v}_B$ and $\mathbf{v}_C$.

SOLUTION

Velocity vectors:

$$\mathbf{v}_0 = v_0(\cos 45°\,\mathbf{i} + \sin 45°\,\mathbf{j}) \qquad v_0 = 15 \text{ ft/s}$$

$$\mathbf{v}_A = v_A\mathbf{j}$$

$$\mathbf{v}_B = v_B(\sin 60°\,\mathbf{i} - \cos 60°\,\mathbf{j})$$

$$\mathbf{v}_C = v_C(\cos 60°\,\mathbf{i} + \sin 60°\,\mathbf{j})$$

Conservation of momentum:

$$m\mathbf{v}_0 = m\mathbf{v}_A + m\mathbf{v}_B + m\mathbf{v}_C$$

Divide by *m* and resolve into components.

$$\mathbf{i}\text{:} \quad v_0 \cos 45° = v_B \sin 60° + v_C \cos 60°$$

$$\mathbf{j}\text{:} \quad v_0 \sin 45° = v_A - v_B \cos 60° + v_C \sin 60°$$

Solving for v_B and v_C,

$$v_B = 0.25882 v_0 - 0.5 v_A \qquad v_C = 0.96593 v_0 - 0.86603 v_A$$

Conservation of energy:

$$\frac{1}{2}mv_0^2 = \frac{1}{2}mv_A^2 + \frac{1}{2}mv_B^2 + \frac{1}{2}mv_C^2$$

Divide by m and substitute for v_B and v_C.

$$v_0^2 = v_A^2 + (0.25882 v_0 + 0.5 v_A)^2 + (0.96593 v_0 - 0.86603 v_A)^2$$

$$= v_0^2 + 1.4142 v_0 v_A + 2v_A^2$$

$$v_A = 0.70711 v_0 = 10.607 \text{ ft/s} \qquad v_A = 10.61 \text{ ft/s} ◀$$

$$v_B = 0.61237 v_0 = 9.1856 \text{ ft/s} \qquad v_B = 9.19 \text{ ft/s} ◀$$

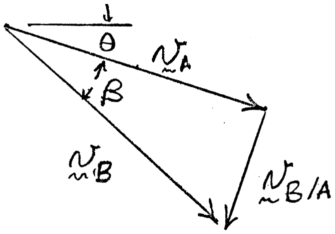
PROBLEM 14.43

Three spheres, each of mass *m*, can slide freely on a frictionless, horizontal surface. Spheres *A* and *B* are attached to an inextensible, inelastic cord of length *l* and are at rest in the position shown when sphere *B* is struck squarely by sphere *C* which is moving with a velocity $\mathbf{v}_0$. Knowing that the cord is taut when sphere *B* is struck by sphere *C* and assuming perfectly elastic impact between *B* and *C*, and thus conservation of energy for the entire system, determine the velocity of each sphere immediately after impact.

SOLUTION

$$\sin\theta = \frac{1}{3}, \qquad \cos\theta = \frac{\sqrt{8}}{3}, \qquad \theta = 19.471°$$

Velocity vectors



$$\mathbf{v}_0 = -v_0\mathbf{j}$$

$$\mathbf{v}_A = v_A(\cos\theta\,\mathbf{i} - \sin\theta\,\mathbf{j})$$

$$\mathbf{v}_{B/A} = u_B(-\sin\theta\,\mathbf{i} - \cos\theta\,\mathbf{j})$$

$$\mathbf{v}_B = \mathbf{v}_A + \mathbf{v}_{B/A}$$

$$\mathbf{v}_C = v_C\mathbf{j}$$

Conservation of momentum: $m\mathbf{v}_0 = m\mathbf{v}_A + m\mathbf{v}_B + m\mathbf{v}_C = 2m\mathbf{v}_A + m\mathbf{v}_{B/A} + m\mathbf{v}_C$

Divide by *m* and resolve into components.

$$\mathbf{i}: \quad 0 = 2v_A\cos\theta - u_B\sin\theta$$

$$-\mathbf{j}: \quad v_0 = +2v_A\sin\theta + u_B\cos\theta - v_C$$

Solving for v_A and u_B, $\quad v_A = \frac{1}{6}(v_0 + v_C) \qquad u_B = 0.94281(v_0 + v_C)$

Conservation of energy: $\frac{1}{2}mv_0^2 = \frac{1}{2}mv_A^2 + \frac{1}{2}mv_B^2 + \frac{1}{2}mv_C^2$

$$= \frac{1}{2}mv_A^2 + \frac{1}{2}m\left(v_A^2 + u_B^2\right) + \frac{1}{2}mv_C^2$$

Divide by $\frac{1}{2}m$ and substitute for v_A and u_B.

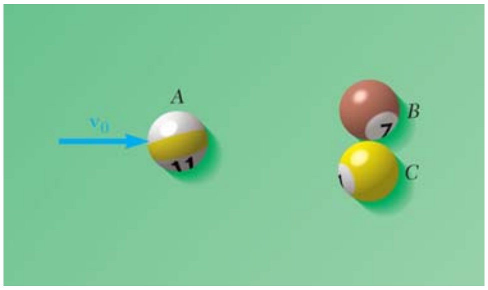
$$v_0^2 = 2\left(\frac{1}{6}\right)^2(v_0 + v_C)^2 + (0.94281)^2(v_0 + v_C)^2 + v_C^2$$

$$v_0^2 - v_C^2 = 0.94445(v_0 + v_C)^2 \qquad v_C = 0.02857v_0 \qquad \mathbf{v}_C = 0.0286v_0 \uparrow ◀$$

$$v_A = 0.17143v_0 \qquad \mathbf{v}_A = [0.17143v_0 \searrow 19.471°], \qquad \mathbf{v}_A = 0.1714v_0 \searrow 19.5° ◀$$

$$u_B = 0.96975v_0 \qquad \mathbf{v}_{B/A}[0.96975v_0 \swarrow 19.471°]$$

$$\mathbf{v}_B = \mathbf{v}_A + \mathbf{v}_{B/A} \qquad \mathbf{v}_B = 0.985 \searrow 80.1° ◀$$



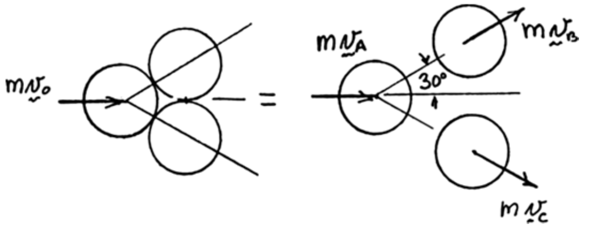
PROBLEM 14.44

In a game of pool, ball *A* is moving with the velocity $\mathbf{v}_0 = v_0\mathbf{i}$ when it strikes balls *B* and *C*, which are at rest side by side. Assuming frictionless surfaces and perfectly elastic impact (i.e., conservation of energy), determine the final velocity of each ball, assuming that the path of *A* is (*a*) perfectly centered and that *A* strikes *B* and *C* simultaneously, (*b*) not perfectly centered and that *A* strikes *B* slightly before it strikes *C*.

SOLUTION

(*a*) *A* strikes *B* and *C* simultaneously:

During the impact, the contact impulses make 30° angles with the velocity $\mathbf{v}_0$.



Thus, $\mathbf{v}_B = v_B(\cos 30°\mathbf{i} + \sin 30°\mathbf{j})$

$\mathbf{v}_C = v_C(\cos 30°\mathbf{i} - \sin 30°\mathbf{j})$

By symmetry, $\mathbf{v}_A = v_A\mathbf{i}$

Conservation of momentum: $m\mathbf{v}_0 = m\mathbf{v}_A + m\mathbf{v}_B + m\mathbf{v}_C$

y component: $0 = 0 + mv_B \sin 30° - mv_C \sin 30° \qquad v_C = v_B$

x component: $mv_0 = mv_A + mv_B \cos 30° + mv_C \cos 30°$

$$v_B + v_C = \frac{v_0 - v_A}{\cos 30°} = \frac{2}{\sqrt{3}}(v_0 - v_A)$$

$$v_B = v_C = \frac{v_0 - v_A}{\sqrt{3}}$$

Conservation of energy: $\frac{1}{2}mv_0^2 = \frac{1}{2}mv_A^2 + \frac{1}{2}mv_B^2 + \frac{1}{2}mv_C^2$

$$v_0^2 = v_A^2 + \frac{2}{3}(v_0 - v_A)^2$$

$$v_0^2 - v_A^2 = (v_0 - v_A)(v_0 + v_A) = \frac{2}{3}(v_0 - v_A)^2$$

$$v_0 + v_A = \frac{2}{3}(v_0 - v_A) \qquad \frac{1}{3}v_0 = -\frac{5}{3}v_A \qquad v_A = -\frac{1}{5}v_0$$

$$v_B = v_C = \frac{6}{5\sqrt{3}}v_0 = \frac{2\sqrt{3}}{5}v_0$$

$\mathbf{v}_A = 0.200 v_0 \longleftarrow$ ◀

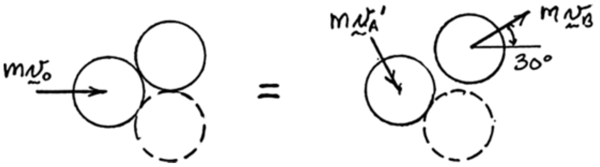
$\mathbf{v}_B = 0.693 v_0 \measuredangle 30^\circ$ ◀

$\mathbf{v}_C = 0.693 v_0 \searrow 30^\circ$ ◀

(*b*) *A* strikes *B* before it strikes *C*:

First impact: *A* strikes *B*.

During the impact, the contact impulse makes a 30° angle with the velocity $\mathbf{v}_0$.



Thus, $\mathbf{v}_B = v_B(\cos 30^\circ \mathbf{i} + \sin 30^\circ \mathbf{j})$

Conservation of momentum: $m\mathbf{v}_0 = m\mathbf{v}_A + m\mathbf{v}_B$

y component: $0 = m(v_A')_y + mv_B \sin 30^\circ \qquad (v_A')_y = -v_B \sin 30^\circ$

x component: $v_0 = m(v_A')_x + mv_B \cos 30^\circ \qquad (v_A')_x = v_0 - v_B \cos 30^\circ$

Conservation of energy:

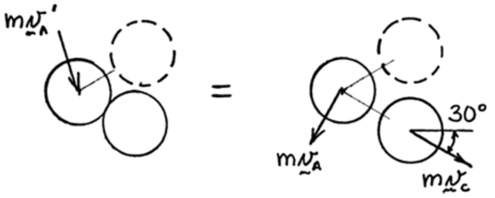
$$\begin{aligned}\frac{1}{2}mv_0^2 &= \frac{1}{2}m(v_A')_x^2 + \frac{1}{2}m(v_A')_y^2 + \frac{1}{2}mv_B^2\\ &= \frac{1}{2}m(v_0 - v_B\cos 30^\circ)^2 + \frac{1}{2}(v_B \sin 30^\circ)^2 + \frac{1}{2}v_B^2\\ &= \frac{1}{2}m\left(v_0^2 - 2v_0v_B + v_B^2\cos^2 30^\circ + v_B^2 \sin^2 30^\circ + v_B^2\right)\end{aligned}$$

$$v_B = v_0\cos 30^\circ = \frac{\sqrt{3}}{2}v_0, \quad (v_A')_x = v_0 \sin^2 30^\circ = \frac{1}{4}v_0,$$

$$(v_A')_y = -v_0 \cos 30^\circ \sin 30^\circ = -\frac{\sqrt{3}}{4}v_0$$

PROBLEM 14.44 (Continued)

Second impact: *A* strikes *C*.
During the impact, the contact impulse makes a 30° angle with the velocity $\mathbf{v}_0$.



Thus, $\mathbf{v}_C = v_C(\cos 30°\mathbf{i} - \sin 30°\mathbf{j})$

Conservation of momentum: $m\mathbf{v}_A' = m\mathbf{v}_A + m\mathbf{v}_C$

x component: $m(v_A')_x = m(v_A)_x + mv_C\cos 30°,$

$$(v_A)_x = (v_A')_x - v_C\cos 30° = \frac{1}{4}v_0 - v_C\cos 30°$$

y component: $m(v_A')_y = m(v_A)_y - mv_C\sin 30°$

$$(v_A)_y = (v_A')_y + v_C\sin 30° = -\frac{\sqrt{3}}{4}v_0 + v_C\sin 30°$$

Conservation of energy:

$$\frac{1}{2}m(v_A')_x^2 + \frac{1}{2}m(v_A')_y^2 = \frac{1}{2}m(v_A)_x^2 + \frac{1}{2}m(v_A)_y^2 + \frac{1}{2}mv_C^2$$

$$\frac{1}{2}m\left[\frac{1}{16}v_0^2 + \frac{3}{16}v_0^2\right] = \frac{1}{2}m\left[\left(\frac{1}{4}v_0 - v_C\cos 30°\right)^2 + \left(-\frac{\sqrt{3}}{4}v_0 + v_C\sin 30°\right)^2 + v_C^2\right]$$

$$= \frac{1}{2}m\left[\frac{1}{16}v_0^2 - \frac{1}{2}v_0v_C\cos 30° + v_C^2\cos^2 30° + \frac{3}{16}v_0^2 - \frac{\sqrt{3}}{2}v_0v_C\sin 30° + v_C^2\sin^2 30° + v_C^2\right]$$

$$0 = -v_0v_C\left(\frac{1}{2}\cos 30° + \frac{\sqrt{3}}{2}\sin 30°\right) + 2v_C^2$$

$$v_C = v_0\left(\frac{1}{4}\cos 30° + \frac{\sqrt{3}}{4}\sin 30°\right) = \frac{\sqrt{3}}{4}v_0$$

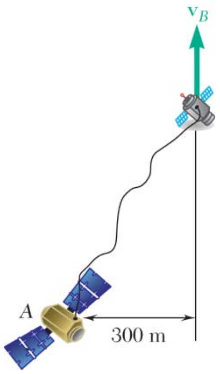
$$(v_A)_x = \frac{1}{4}v_0 - \frac{\sqrt{3}}{4}v_0\cos 30° = -\frac{1}{8}v_0$$

$$(v_A)_y = -\frac{\sqrt{3}}{4}v_0 + \frac{\sqrt{3}}{4}v_0\sin 30° = -\frac{\sqrt{3}}{8}v_0$$

$\mathbf{v}_A = 0.250v_0$ ↙ 60° ◀

$\mathbf{v}_B = 0.866v_0$ ↗ 30° ◀

$\mathbf{v}_C = 0.433v_0$ ↘ 30° ◀



PROBLEM 14.45

The 2-kg sub-satellite B has an initial velocity $\mathbf{v}_B = 3$ m/s $\mathbf{j}$. It is connected to the 20-kg base-satellite A by a 500-m space tether. Determine the velocity of the base satellite and sub-satellite immediately after the tether becomes taut (assuming no rebound).

SOLUTION

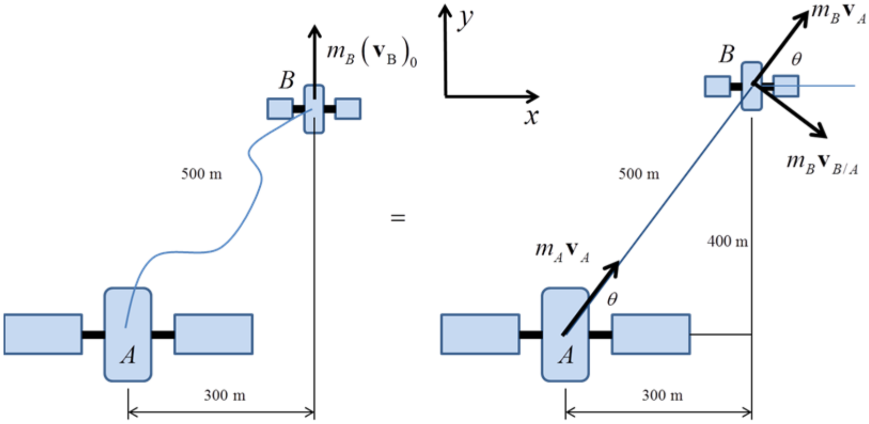
Given:

$$m_A = 20 \text{ kg},\ m_B = 2 \text{ kg}$$

$$(\mathbf{v}_A)_0 = 0,\ (\mathbf{v}_B)_0 = 3\mathbf{j} \text{ m/s}$$

Because the cord is inextensible, after it becomes taut, the component of $\mathbf{v}_B$ along AB must be equal to $\mathbf{v}_A$.

Impulse-Momentum Diagram:



Linear momentum is conserved:

x-components:

$$0 = m_A v_A \cos\theta + m_B v_A \cos\theta + m_B v_{B/A} \sin\theta$$

$$0 = 13.2 v_A + 1.6 v_{B/A} \qquad (1)$$

y-components:

$$2 \text{ kg}(3 \text{ m/s}) = m_A v_A \sin\theta + m_B v_A \sin\theta - m_B v_{B/A} \cos\theta$$

$$6 = 17.6 v_A - 1.2 v_{B/A} \qquad (2)$$

Solving (1) and (2) simultaneously: $v_A = 0.2182$ m/s, $v_{B/A} = -1.8$ m/s

$$\mathbf{v}_A = 0.218 \text{ m/s} \measuredangle 53.1° \blacktriangleleft$$

$$\mathbf{v}_B = \mathbf{v}_A + \mathbf{v}_{B/A}$$

$$= (v_A \cos\theta + v_{B/A} \sin\theta)\mathbf{i} + (v_A \sin\theta - v_{B/A} \cos\theta)\mathbf{j}$$

$$= -1.3091\mathbf{i} + 1.2545\mathbf{j} \text{ m/s}$$

$$\mathbf{v}_B = 1.813 \text{ m/s} \measuredangle 43.8° \blacktriangleleft$$

PROBLEM 14.46

A 900-lb space vehicle traveling with a velocity $\mathbf{v}_0 = (1500\text{ ft/s})\mathbf{k}$ passes through the origin *O*. Explosive charges then separate the vehicle into three parts *A*, *B*, and *C*, with masses of 150 lb, 300 lb, and 450 lb, respectively. Knowing that shortly thereafter the positions of the three parts are, respectively, *A*(250, 250, 2250), *B* (600, 1300, 3200), and *C* (–475, –950, 1900), where the coordinates are expressed in ft, that the velocity of *B* is $\mathbf{v}_B = (500\text{ ft/s})\mathbf{i} + (1100\text{ ft/s})\mathbf{j} + (2100\text{ ft/s})\mathbf{k}$, and that the *x* component of the velocity of *C* is -400 ft/s, determine the velocity of part *A*.

SOLUTION

Position vectors (ft):
$$\mathbf{r}_A = 250\mathbf{i} + 250\mathbf{j} + 2250\mathbf{k}$$
$$\mathbf{r}_B = 600\mathbf{i} + 1300\mathbf{j} + 3200\mathbf{k}$$
$$\mathbf{r}_C = -475\mathbf{i} - 950\mathbf{j} + 1900\mathbf{k}$$

Since there are no external forces, linear momentum is conserved.

$$(m_A + m_B + m_C)\mathbf{v}_0 = m_A\mathbf{v}_A + m_B\mathbf{v}_B + m_C\mathbf{v}_C$$

$$\mathbf{v}_A = \frac{m_A + m_B + m_C}{m_A}\mathbf{v}_0 - \frac{m_B}{m_A}\mathbf{v}_B - \frac{m_C}{m_A}\mathbf{v}_C = 6\mathbf{v}_0 - 2\mathbf{v}_B - 3\mathbf{v}_C \qquad (1)$$

$$= (6)(1500\mathbf{k}) - (2)(500\mathbf{i} + 1100\mathbf{j} + 2100\mathbf{k}) - (3)[-400\mathbf{i} + (v_C)_y\,\mathbf{j} + (v_C)_z\,\mathbf{k}]$$

$$= -3(v_C)_y\,\mathbf{j} - 3(v_C)_z\,\mathbf{k} + 200\mathbf{i} - 2200\mathbf{j} + 4800\mathbf{k}$$

$$(v_A)_x = 200, \quad (v_C)_y = -3(v_C)_y - 2200, \quad (v_A)_z = -3(v_C)_z + 4800$$

Conservation of angular momentum about *O*:

$$(\mathbf{H}_O)_2 = (\mathbf{H}_O)_1$$

Since the vehicle passes through the origin, $(\mathbf{H}_O)_1 = 0.$

$$(\mathbf{H}_O)_2 = \mathbf{r}_A \times (m_A\mathbf{v}_A) + \mathbf{r}_B \times (m_B\mathbf{v}_B) + \mathbf{r}_C \times (m_C\mathbf{v}_C) = 0$$

Divide by m_A.

$$\begin{aligned}
\mathbf{r}_A \times \mathbf{v}_A + \frac{m_B}{m_A}\mathbf{r}_B \times \mathbf{v}_B + \frac{m_C}{m_A}\mathbf{r}_C \times \mathbf{v}_C &= \mathbf{r}_A \times \mathbf{v}_A + 2\mathbf{r}_B \times \mathbf{v}_B + 3\mathbf{r}_C \times \mathbf{v}_C \\
&= \mathbf{r}_A \times (6\mathbf{v}_0 - 2\mathbf{v}_B - 3\mathbf{v}_C) + 2\mathbf{r}_B \times \mathbf{v}_B + 3\mathbf{r}_C \times \mathbf{v}_C \\
&= 3(\mathbf{r}_C - \mathbf{r}_A) \times \mathbf{v}_C + 6\mathbf{r}_A \times \mathbf{v}_0 + 2(\mathbf{r}_B - \mathbf{r}_A) \times \mathbf{v}_B \\
&= (-2175\mathbf{i} - 3600\mathbf{j} - 1050\mathbf{k}) \times \mathbf{v}_C + (1500\mathbf{i} + 1500\mathbf{j} + 13500\mathbf{k}) \times \mathbf{v}_0 \\
&\quad + (700\mathbf{i} + 2100\mathbf{j} + 1900\mathbf{k}) \times \mathbf{v}_B = 0
\end{aligned}$$

$$\begin{vmatrix} \mathbf{i} & \mathbf{j} & \mathbf{k} \\ -2175 & -3600 & -1050 \\ (v_C)_x & (v_C)_y & (v_C)_z \end{vmatrix} + \begin{vmatrix} \mathbf{i} & \mathbf{j} & \mathbf{k} \\ 1500 & 1500 & 13500 \\ 0 & 0 & 1500 \end{vmatrix} + \begin{vmatrix} \mathbf{i} & \mathbf{j} & \mathbf{k} \\ 700 & 2100 & 1900 \\ 500 & 1100 & 2100 \end{vmatrix} = 0$$

Resolve into components.

i: $1050(v_C)_y - 3600(v_C)_z + 2,250,000 + 2,320,000 = 0$ (2)

j: $2175(v_C)_z - 1050(v_C)_x - 2,250,000 - 520,000 = 0$ (3)

k: $3600(v_C)_x - 2175(v_C)_y + 0 - 280,000 = 0$ (4)

Set $(v_C)_x = -400$ ft/s

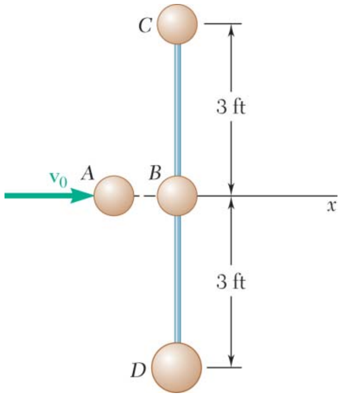
From Eq. (4), $(v_C)_y = -790.80$ ft/s

From Eq. (3), $(v_C)_z = 1080.5$ ft/s

From Eq. (1),

$$\begin{aligned} \mathbf{v}_A &= (6)(1500\mathbf{k}) - (2)(500\mathbf{i} + 1100\mathbf{j} + 2100\mathbf{k}) - (3)[-400\mathbf{i} + (790.80)\mathbf{j} + (1080.5)\mathbf{k}] \\ &= 200\mathbf{i} + 172.4\mathbf{j} + 1558.6\mathbf{k} \end{aligned}$$

$\mathbf{v}_A = (200 \text{ ft/s})\mathbf{i} + (172 \text{ ft/s})\mathbf{j} + (1560 \text{ ft/s})\mathbf{k}$ ◀

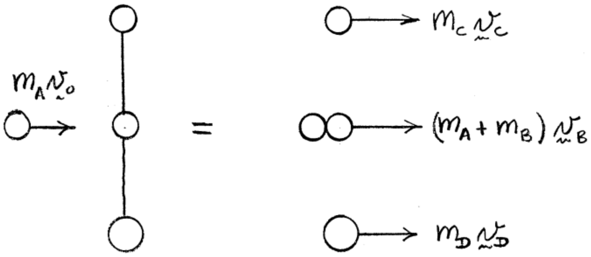


PROBLEM 14.47

Four small disks A, B, C, and D can slide freely on a frictionless horizontal surface. Disks B, C, and D are connected by light rods and are at rest in the position shown when disk B is struck squarely by disk A, which is moving to the right with a velocity $\mathbf{v}_0 = (38.5\ \text{ft/s})\mathbf{i}$. The weights of the disks are $W_A = W_B = W_C = 15$ lb, and $W_D = 30$ lb. Knowing that the velocities of the disks immediately after the impact are $\mathbf{v}_A = \mathbf{v}_B = (8.25\ \text{ft/s})\mathbf{i}$, $\mathbf{v}_C = v_C\,\mathbf{i}$, and $\mathbf{v}_D = v_D\,\mathbf{i}$, determine (*a*) the speeds v_C and v_D, (*b*) the fraction of the initial kinetic energy of the system which is dissipated during the collision.

SOLUTION

There are no external forces. Momentum is conserved.



$m_A \underset{\sim}{v}_0$
=
$m_C \underset{\sim}{v}_C$
$(m_A + m_B)\underset{\sim}{v}_B$
$m_D \underset{\sim}{v}_D$

(*a*) Moments about D $+\circlearrowright$: $\quad 3m_A v_0 = 6m_C v_C + 3(m_A + m_B)v_B$

$$v_C = \frac{3m_A}{6m_C}v_0 - \frac{3(m_A + m_B)}{6m_C}v_B = (0.5)(38.5) - (8.25) = 11$$

$v_C = 11.00$ ft/s ◀

Moments about C $+\circlearrowleft$: $\quad 3m_A v_0 = 3(m_A + m_B)v_B + 6m_D v_D$

$$v_D = \frac{3m_A v_0}{6m_D} - \frac{3(m_A + m_B)}{6m_D}v_B = (0.25)(38.5) - (0.5)(8.25) = 5.5\ \text{ft/s}$$

$v_D = 5.50$ ft/s ◀

(*b*) Initial kinetic energy:

$$T_1 = \frac{1}{2}\frac{W_A}{g}v_0^2 = \frac{1}{2}\frac{15}{32.2}(38.5)^2 = 345.24\ \ \text{ft}\cdot\text{lb}$$

Final kinetic energy:

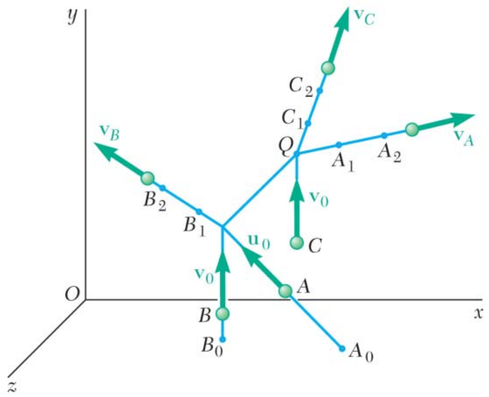
$$T_2 = \frac{1}{2}\frac{W_A + W_B}{g}v_B^2 + \frac{1}{2}\frac{W_C}{g}v_C^2 + \frac{1}{2}\frac{W_D}{g}v_D^2$$

$$= \frac{1}{2}\frac{30}{32.2}(8.25)^2 + \frac{1}{2}\frac{15}{32.2}(11.00)^2 + \frac{1}{2}\frac{30}{32.2}(5.50)^2 = 73.98\ \text{ft}\cdot\text{lb}$$

Energy lost: $\quad 345.24 - 73.98 = 271.26\ \text{ft}\cdot\text{lb}$

Fraction of energy lost $= \dfrac{271.26}{345.24} = 0.786$

$$\frac{(T_1 - T_2)}{T_1} = 0.786 \blacktriangleleft$$



PROBLEM 14.48

In the scattering experiment of Problem 14.26, it is known that the alpha particle is projected from $A_0(300, 0, 300)$ and that it collides with the oxygen nucleus C at $Q(240, 200, 100)$, where all coordinates are expressed in millimeters. Determine the coordinates of Point B_0 where the original path of nucleus B intersects the zx plane. (*Hint:* Express that the angular momentum of the three particles about Q is conserved.)

PROBLEM 14.26 In a scattering experiment, an alpha particle A is projected with the velocity $\mathbf{u}_0 = -(600 \text{ m/s})\mathbf{i} + (750 \text{ m/s})\mathbf{j} - (800 \text{ m/s})\mathbf{k}$ into a stream of oxygen nuclei moving with a common velocity $\mathbf{v}_0 = (600 \text{ m/s})\mathbf{j}$. After colliding successively with nuclei B and C, particle A is observed to move along the path defined by the Points $A_1(280, 240, 120)$ and $A_2(360, 320, 160)$, while nuclei B and C are observed to move along paths defined, respectively, by $B_1(147, 220, 130)$, $B_2(114, 290, 120)$, and by $C_1(240, 232, 90)$ and $C_2(240, 280, 75)$. All paths are along straight lines and all coordinates are expressed in millimeters. Knowing that the mass of an oxygen nucleus is four times that of an alpha particle, determine the speed of each of the three particles after the collisions.

SOLUTION

Conservation of angular momentum about Q:

$$\overrightarrow{QA}_0 \times (m\mathbf{u}_0) + \overrightarrow{QB}_0 \times (4m\mathbf{v}_0) + \overrightarrow{QC}_0 \times (4m\mathbf{v}_0) = \overrightarrow{QA}_1 \times (m\mathbf{v}_A) + \overrightarrow{QB}_1 \times (4m\mathbf{v}_B) + \overrightarrow{QC}_1 \times (4m\mathbf{v}_C)$$

$$\overrightarrow{QA}_0 \times (m\mathbf{u}_0) + \overrightarrow{QB}_0 \times (4m\mathbf{v}_0) + 0 = 0 + \overrightarrow{QB}_1 \times (4m\mathbf{v}_B) + 0 \qquad (1)$$

where

$$\overrightarrow{QA}_0 = \mathbf{r}_{A_0} - \mathbf{r}_Q = (300\mathbf{i} + 300\mathbf{k}) - (240\mathbf{i} + 200\mathbf{j} + 100\mathbf{k})$$

$$= (60 \text{ mm})\mathbf{i} - (200 \text{ mm})\mathbf{j} + (200 \text{ mm})\mathbf{k}$$

$$\overrightarrow{QB}_0 = (\Delta x)\mathbf{i} + (\Delta y)\mathbf{j} + (\Delta z)\mathbf{k}$$

$$\overrightarrow{QB}_1 = \mathbf{r}_{B_1} - \mathbf{r}_Q = (147\mathbf{i} + 220\mathbf{j} + 130\mathbf{k}) - (240\mathbf{i} + 200\mathbf{j} + 100\mathbf{k})$$

$$-(93 \text{ mm})\mathbf{i} + (20 \text{ mm})\mathbf{j} + (30 \text{ mm})\mathbf{k}$$

$$\mathbf{u}_0 = -(600 \text{ m/s})\mathbf{i} + (750 \text{ m/s})\mathbf{j} - (800 \text{ m/s})\mathbf{k} \qquad \mathbf{v}_0 = (600 \text{ m/s})\mathbf{j}$$

and from the solution to Problem 14.26,

$$\mathbf{v}_B = v_B \boldsymbol{\lambda}_B = (716.98)(-0.42290\mathbf{i} + 0.89707\mathbf{j} - 0.12815\mathbf{k})$$

$$= -(303.21 \text{ m/s})\mathbf{i} + (643.18 \text{ m/s})\mathbf{j} - (91.88 \text{ m/s})\mathbf{k}$$

PROBLEM 14.48 (Continued)

Calculating each term and dividing by *m*,

$$\overrightarrow{QA}_0 \times \mathbf{u}_0 \begin{vmatrix} \mathbf{i} & \mathbf{j} & \mathbf{k} \\ 60 & -200 & 200 \\ -600 & 750 & -800 \end{vmatrix} = 10,000\,\mathbf{i} - 72,000\,\mathbf{j} - 75,000\,\mathbf{k}$$

$$\begin{aligned} \overrightarrow{QB}_0 \times (4\mathbf{v}_0) &= [(\Delta x)\mathbf{i} + (\Delta y)\mathbf{j} + (\Delta z)\mathbf{k}] \times (2400\mathbf{j}) \\ &= -2400(\Delta z)\mathbf{i} + 2400(\Delta x)\mathbf{k} \end{aligned}$$

$$\overrightarrow{QB}_1 \times (4\mathbf{v}_B) = \begin{vmatrix} \mathbf{i} & \mathbf{j} & \mathbf{k} \\ -93 & 20 & 30 \\ -1212.84 & 2572.72 & -367.52 \end{vmatrix} = -84,532\,\mathbf{i} - 70,565\,\mathbf{j} - 215,006\,\mathbf{k}$$

Collect terms and resolve into components.

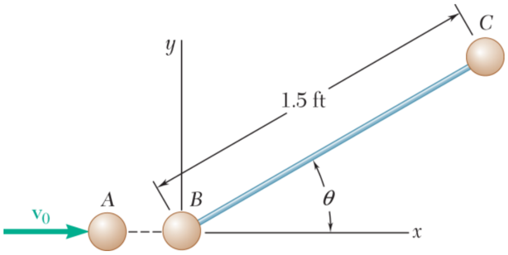
$\mathbf{i}$: $\quad 10,000 - 2400(\Delta z) = -84,532 \qquad \Delta z = 39.388 \text{ mm}$

$\mathbf{k}$: $\quad -75,000 + 2400(\Delta x) = -215,006 \qquad \Delta x = -58.336 \text{ mm}$

Coordinates: $\quad x_{B_0} = x_Q + \Delta x = 240 - 58.336 \qquad x_{B_0} = 181.7 \text{ mm}$ ◀

$y_{B_0} = 0$ ◀

$z_{B_0} = z_Q + \Delta z = 100 + 39.388 \qquad z_{B_0} = 139.4 \text{ mm}$ ◀



PROBLEM 14.49

Three identical small spheres, each of weight 2 lb, can slide freely on a horizontal frictionless surface. Spheres *B* and *C* are connected by a light rod and are at rest in the position shown when sphere *B* is struck squarely by sphere *A* which is moving to the right with a velocity $\mathbf{v}_0 = (8\text{ ft/s})\mathbf{i}$. Knowing that $\theta = 45°$ and that the velocities of spheres *A* and *B* immediately after the impact are $\mathbf{v}_A = 0$ and $\mathbf{v}_B = (6\text{ ft/s})\mathbf{i} + (\mathbf{v}_B)_y\,\mathbf{j}$, determine $(v_B)_y$ and the velocity of *C* immediately after impact.

SOLUTION

Let *m* be the mass of one ball.

Conservation of linear momentum: $(\Sigma m\mathbf{v}) = (\Sigma m\mathbf{v})_0$

$$m\mathbf{v}_A + m\mathbf{v}_B + m\mathbf{v}_C = m(\mathbf{v}_A)_0 + (m\mathbf{v}_B)_0 + (m\mathbf{v}_C)_0$$

Dividing by *m* and applying numerical data,

$$0 + [(6\text{ ft/s})\mathbf{i} + (v_B)_y\mathbf{j}] + [(v_C)_x\mathbf{i} + (v_C)_y\mathbf{j}] = (8\text{ ft/s})\mathbf{i} + 0 + 0$$

Components:

$$x:\quad 6 + (v_C)_x = 8 \qquad\qquad (v_C)_x = 2\text{ ft/s}$$

$$y:\quad (v_B)_y + (v_C)_y = 0 \qquad (1)$$

Conservation of angular momentum about *O*:

$$\Sigma[\mathbf{r} \times (m\mathbf{v})] = \Sigma[\mathbf{r} \times (m\mathbf{v}_0)]$$

where $\mathbf{r}_A = 0, \quad \mathbf{r}_B = 0, \quad \mathbf{r}_C = (1.5\text{ ft})(\cos 45°\mathbf{i} + \sin 45°\mathbf{j})$

$$(1.5)(\cos 45°\mathbf{i} + \sin 45°\mathbf{j}) \times [m(v_C)_x\mathbf{i} + m(v_C)_y\mathbf{j}] = 0$$

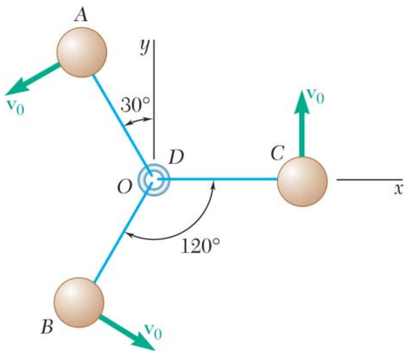
Since their cross product is zero, the two vectors are parallel.

$$(v_C)_y = (v_C)_x \tan 45° = 2\tan 45° = 2\text{ ft/s}$$

From (1), $(v_B)_y = -2$ ft/s

$$(v_B)_y = -2.00\text{ ft/s} \blacktriangleleft$$

$$\mathbf{v}_C = (2.00\text{ ft/s})\mathbf{i} + (2.00\text{ ft/s})\mathbf{j} \blacktriangleleft$$



PROBLEM 14.50

Three small spheres *A, B,* and *C*, each of mass *m*, are connected to a small ring *D* of negligible mass by means of three inextensible, inelastic cords of length *l*. The spheres can slide freely on a frictionless horizontal surface and are rotating initially at a speed v_0 about ring *D* which is at rest. Suddenly the cord *CD* breaks. After the other two cords have again become taut, determine (*a*) the speed of ring *D*, (*b*) the relative speed at which spheres *A* and *B* rotate about *D*, (*c*) the fraction of the original energy of spheres *A* and *B* that is dissipated when cords *AD* and *BD* again became taut.

SOLUTION

Let the system consist of spheres *A* and *B*.

State 1: Instant cord *DC* breaks.

$$m(\mathbf{v}_A)_1 = mv_0\left(-\frac{\sqrt{3}}{2}\mathbf{i} - \frac{1}{2}\mathbf{j}\right)$$

$$m(\mathbf{v}_B)_1 = mv_0\left(\frac{\sqrt{3}}{2}\mathbf{i} - \frac{1}{2}\mathbf{j}\right)$$

$$\mathbf{L}_1 = m(\mathbf{v}_A)_1 + m(\mathbf{v}_B)_1 = -mv_0\mathbf{j}$$

$$\overline{\mathbf{v}} = \frac{\mathbf{L}_1}{2m} = -\frac{1}{2}v_0\mathbf{j}$$

Mass center lies at Point *G* midway between balls *A* and *B*.

$$(\mathbf{H}_G)_1 = \frac{\sqrt{3}}{2}l\mathbf{j} \times (m\mathbf{v}_A)_1 + -\frac{\sqrt{3}}{2}l\mathbf{j} \times (m\mathbf{v}_B)_1$$

$$= \frac{3}{2}lmv_0\mathbf{k}$$

$$T_1 = \frac{1}{2}mv_0^2 + \frac{1}{2}mv_0^2 = mv_0^2$$

State 2: The cord is taut. Conservation of linear momentum:

(*a*) $$\mathbf{v}_D = \overline{\mathbf{v}} = -\frac{1}{2}v_0\mathbf{j}$$ $v_D = 0.500v_0$ ◀

Let $(\mathbf{v}_A)_2 = \overline{\mathbf{v}} + \mathbf{u}_A$ and $\mathbf{v}_B = \overline{\mathbf{v}} + \mathbf{u}_B$

$$\mathbf{L}_2 = 2m\overline{\mathbf{v}} + m\mathbf{u}_A + m\mathbf{u}_B = \mathbf{L}_1$$

$$\mathbf{u}_B = -\mathbf{u}_A \qquad u_B = u_A$$

$$(\mathbf{H}_G)_2 = lmu_A\mathbf{k} + lmu_B\mathbf{k} = 2lmu_A\mathbf{k}$$

PROBLEM 14.50 (Continued)

(*b*) Conservation of angular momentum:

$$(\mathbf{H}_G)_2 = (\mathbf{H}_G)_1$$

$$2lmu_A\mathbf{k} = \frac{3}{2}lmv_0\mathbf{k} \qquad u_A = u_B = \frac{3}{4}v_0$$

$$u = 0.750v_0 \blacktriangleleft$$

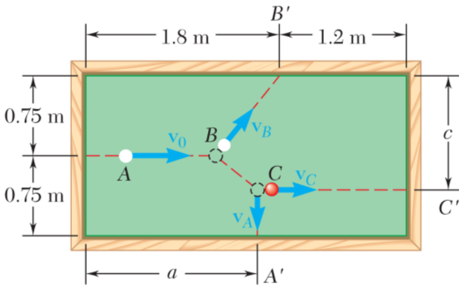
$$T_2 = \frac{1}{2}(2m)\bar{v}^2 + \frac{1}{2}mu_A^2 + \frac{1}{2}mu_B^2$$

$$= \frac{1}{2}mv_0^2\left(\frac{1}{2} + \frac{9}{16} + \frac{9}{16}\right) = \frac{13}{16}mv_0^2$$

(*c*) Fraction of energy lost:

$$\frac{T_1 - T_2}{T_1} = \frac{1 - \frac{13}{16}}{1} = \frac{3}{16}$$

$$\frac{T_1 - T_2}{T_1} = 0.1875 \blacktriangleleft$$



PROBLEM 14.51

In a game of billiards, ball A is given an initial velocity $\mathbf{v}_0$ along the longitudinal axis of the table. It hits ball B and then ball C, which are both at rest. Balls A and C are observed to hit the sides of the table squarely at A' and C', respectively, and ball B is observed to hit the side obliquely at B'. Knowing that $v_0 = 4$ m/s, $v_A = 1.92$ m/s, and $a = 1.65$ m, determine (*a*) the velocities $\mathbf{v}_B$ and $\mathbf{v}_C$ of balls B and C, (*b*) the Point C' where ball C hits the side of the table. Assume frictionless surfaces and perfectly elastic impacts (that is, conservation of energy).

SOLUTION

Velocities in m/s. Lengths in meters. Assume masses are 1.0 for each ball.

Before impacts: $(\mathbf{v}_A)_0 = v_0\mathbf{i} = 4\mathbf{i}, \qquad (\mathbf{v}_B)_0 = (\mathbf{v}_C)_0 = 0$

After impacts: $\mathbf{v}_A = -1.92\mathbf{j}, \qquad \mathbf{v}_B = (v_B)_x\mathbf{i} + (v_B)_y\mathbf{j}, \qquad \mathbf{v}_C = v_C\mathbf{i}$

Conservation of linear momentum: $\mathbf{v}_0 = \mathbf{v}_A + \mathbf{v}_B + \mathbf{v}_C$

$$\mathbf{i}: \quad 4 = 0 + (v_B)_x + v_C \qquad (v_B)_x = 4 - v_C$$

$$\mathbf{j}: \quad 0 = -1.92 + (v_B)_y + 0 \qquad (v_B)_y = 1.92$$

Conservation of energy: $\frac{1}{2}v_0^2 = \frac{1}{2}v_A^2 + \frac{1}{2}v_B^2 + \frac{1}{2}v_C^2$

$$\frac{1}{2}(4)^2 = \frac{1}{2}(1.92)^2 + \frac{1}{2}(1.92)^2 + \frac{1}{2}(4 - v_C)^2 + \frac{1}{2}v_C^2$$

$$v_C^2 - 4v_C + 3.6864 = 0$$

$$v_C = \frac{4 \pm \sqrt{(4)^2 - (4)(3.6864)}}{2} = 2 \pm 0.56 = 2.56 \qquad \text{or} \qquad 1.44$$

Conservation of angular momentum about B':

$$0.75v_0 = (1.8 - a)v_A + cv_C$$

$$cv_C = (0.75)(4) - (1.8 - 1.65)(1.92) = 2.712$$

$$c = \frac{2.712}{v_C}$$

If $v_C = 1.44$, $\qquad c = 1.8833$ off the table. Reject.

If $v_C = 2.56$, $\qquad c = 1.059$

PROBLEM 14.51 (Continued)

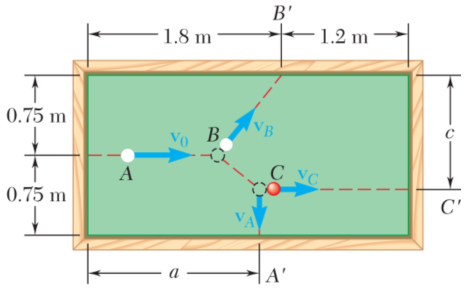
Then, $(v_B)_x = 4 - 2.56 = 1.44, \qquad \mathbf{v}_B = 1.44\mathbf{i} + 1.92\mathbf{j}$

Summary.

(*a*) $\mathbf{v}_B = 2.40\text{ m/s} \measuredangle 53.1°$ ◀

$\mathbf{v}_C = 2.56\text{ m/s} \longrightarrow$ ◀

(*b*) $c = 1.059\text{ m}$ ◀



PROBLEM 14.52

For the game of billiards of Problem 14.51, it is now assumed that $v_0 = 5$ m/s, $v_C = 3.2$ m/s, and $c = 1.22$ m. Determine (*a*) the velocities $\mathbf{v}_A$ and $\mathbf{v}_B$ of balls *A* and *B*, (*b*) the Point *A*′ where ball *A* hits the side of the table.

PROBLEM 14.51 In a game of billiards, ball *A* is given an initial velocity $\mathbf{v}_0$ along the longitudinal axis of the table. It hits ball *B* and then ball *C*, which are both at rest. Balls *A* and *C* are observed to hit the sides of the table squarely at *A*′ and *C*′, respectively, and ball *B* is observed to hit the side obliquely at *B*′. Knowing that $v_0 = 4$ m/s, $v_A = 1.92$ m/s, and $a = 1.65$ m, determine (*a*) the velocities $\mathbf{v}_B$ and $\mathbf{v}_C$ of balls *B* and *C*, (*b*) the Point *C*′ where ball *C* hits the side of the table. Assume frictionless surfaces and perfectly elastic impacts (that is, conservation of energy).

SOLUTION

Velocities in m/s. Lengths in meters. Assume masses are 1.0 for each ball.

Before impacts: $(\mathbf{v}_A)_0 = v_0\mathbf{i} = 5\mathbf{i}, \qquad (\mathbf{v}_B)_0 = (\mathbf{v}_C)_0 = 0$

After impacts: $\mathbf{v}_A = -v_A\mathbf{j}, \qquad \mathbf{v}_B = (v_B)_x\mathbf{i} + (v_B)_y\mathbf{j}, \qquad \mathbf{v}_C = 3.2\mathbf{i}$

Conservation of linear momentum: $\mathbf{v}_0 = \mathbf{v}_A + \mathbf{v}_B + \mathbf{v}_C$

$$\mathbf{i}: \quad 5 = 0 + (v_B)_x + 3.2 \qquad (v_B)_x = 1.8$$

$$\mathbf{j}: \quad 0 = -v_A + (v_B)_y + 0 \qquad (v_B)_y = v_A$$
